Northern Pike

Voracious predators on young salmon and trout

In Alaska, most northern pike occur naturally north and west of the Alaska range.

In their natural range, northern pike are a valued sport fish.

However, when transported illegally out of their natural range, northern pike can destroy salmon and trout fisheries.

This 18-inch pike consumed over a dozen juvenile silver salmon.

This 14-inch pike was able to entirely consume this 10-inch rainbow trout.
