

Apache-Sitgreaves National Forests Draft Wilderness Evaluation Report

Chevelon Lake Potential Wilderness

PW-03-01-062

June 2009

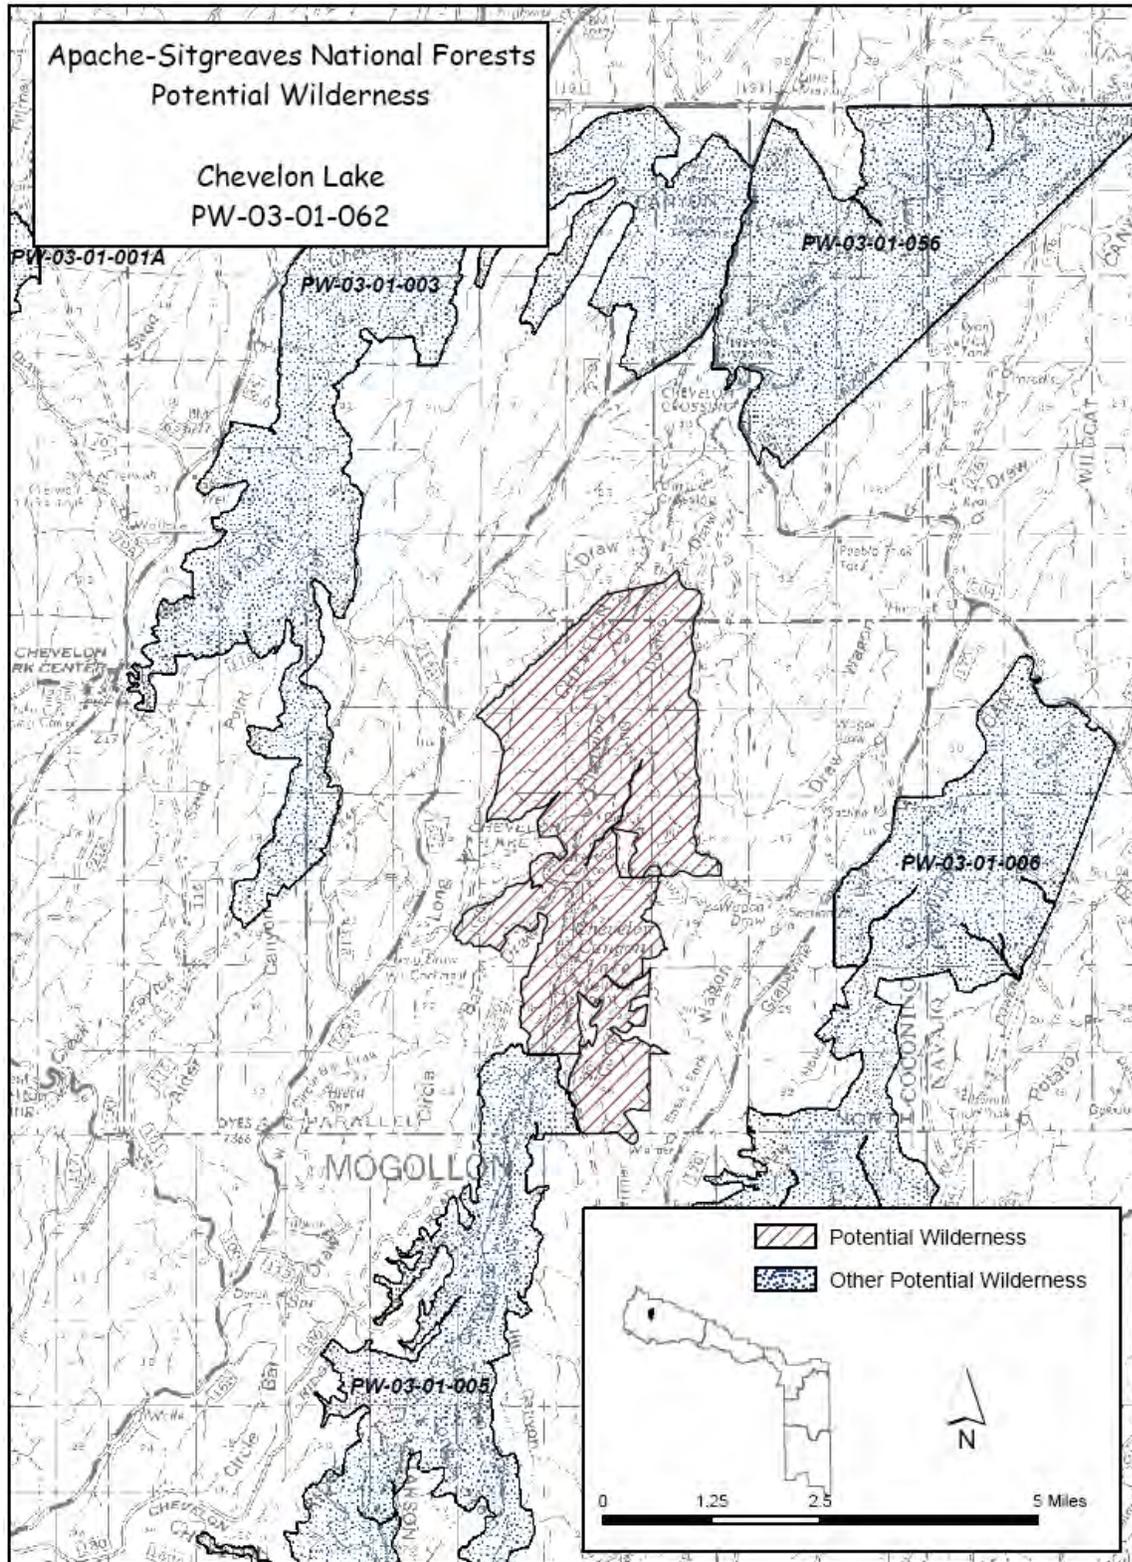

This draft potential wilderness evaluation report is divided into four parts: background, capability, availability, and need. Capability and availability are intended to be objective evaluations of existing conditions in the Chevelon Lake Potential Wilderness.

The most important area of focus for public comment is the “need” evaluation. The intent of this part of the evaluation is to consider if the potential wilderness fits into the National Wilderness Preservation System at the regional level. This report offers data that helps us understand different sources that might generate need. Ultimately, however, need for wilderness is generated by public demand. Therefore, public input is an essential component of this part of the potential wilderness evaluation.

We would like your feedback on this draft report - if we have missed an important detail or if you would like to share your comments or other input, please contact us. Written comments can be sent to: Apache-Sitgreaves National Forests, Attention: Forest Plan Revision Team, P.O. Box 640, Springerville, Arizona 85938, or E-mail: asnf.planning@fs.fed.us. We are also available by phone; ask for a planning team member at 928-333-4301 or 928-333-6292 (TTY).

Disclaimer Statement

The USDA Forest Service uses the most current and complete data available. GIS data and product accuracy may vary. Using GIS products for purposes other than those for which they were intended may yield inaccurate or misleading results. The USDA Forest Service reserves the right to correct, update, modify, or replace GIS products without notification. This map is not a legal land line or ownership document. Public lands are subject to change and leasing, and may have access restrictions; check with local offices. Obtain permission before entering private land.
Map created June 2009 by etreiman.

Introduction

As part of the Forest Plan Revision process for the Apache-Sitgreaves National Forests (ASNFs), the Forest Service has prepared this Wilderness Evaluation Report for the Chevelon Lake potential wilderness.

Purpose

The Forest Service must evaluate all lands possessing wilderness characteristics for potential wilderness during plan revision (39 CFR 219.17). Completion of a potential wilderness inventory and evaluation is an essential step in the plan revision process. Wilderness is just one of many special area designations that the Forest Service considers during plan revision, but it is one of only three special area evaluations that are mandatory. If an area is recommended for wilderness designation, then the revised plan would contain desired conditions, objectives, and/or guidelines that would protect its wilderness characteristics.

The Process

The wilderness evaluation began with an inventory of potential wilderness, which includes areas of federal land over 5,000 contiguous acres and other areas that meet the criteria in FSH 1909.12 Ch. 71, and then determined if those areas meet the definition of wilderness. Once a list of potential wilderness areas was created, each area was evaluated for capability, availability, and need. These evaluation factors are described in the introduction to each evaluation step and in Appendix A. This report summarizes the wilderness capability, availability, and need evaluations based on the best available information.

The ASNFs will use this report to determine whether or not to make a preliminary administrative recommendation for wilderness designation for the Chevelon Lake potential wilderness. The Responsible Official's (Forest Supervisor) recommendation will be documented in the final Plan and the Plan Approval Document. Public comments on this report will be accepted and considered throughout the plan revision process. If a potential wilderness is recommended for wilderness, the recommendation will receive further review by the Chief of the Forest Service and the Secretary of Agriculture. If the Chief of the Forest Service intends to move forward with a wilderness recommendation, the Forest Service will complete a detailed analysis of the trade-offs and impacts in accordance with the National Environmental Policy Act, including further public review and comment. Ultimately, only Congress has the authority to designate wilderness.

Background

Name	Chevelon Lake
Number	PW-03-01-062
Acres	6,585
Ranger District	Black Mesa
History (if applicable)	N/A
Location, Vicinity, and Access	<p>The Chevelon Lake potential wilderness is located in the western part of the ASNFs in Arizona. It is located in Coconino County, approximately 49 miles west-northwest of Show Low. Chevelon Lake potential wilderness can be accessed by following State Highway 260 west from Heber/ Overgaard and Forest Roads 169 or 170. Two trails, one motorized and one non-motorized, provide additional access to the potential wilderness.</p>
Geography and Topography	<p>The potential wilderness is located on the Mogollon Plateau, which drains north into the Little Colorado River. The area includes a portion of Chevelon Canyon with elevations ranging from about 6,200 feet at the power lines to over 7,000 feet on the uplands.</p>
Surroundings	<p>The Chevelon Lake potential wilderness boundary follows a combination of forest roads, activity areas, terrain features, and a power line corridor. There are no adjacent private lands.</p>
Vegetation	<p>A variety of vegetative communities is found within Chevelon Lake potential wilderness. Vegetation varies with elevation, aspect, and slope. Chevelon Canyon passes through ponderosa pine forests and piñon-juniper woodlands. The steep-walled canyons create complex environmental conditions with associated vegetation, including cottonwood-willow riparian forest and mixed conifer forest. The riparian community along the stream channel consists primarily of boxelder, ash, narrowleaf cottonwood, willow, Gambel oak, rose, wild grape, and poison ivy. Small benches or sand and gravel bars are found near the mouths of side canyons and support a variety of grasses, herbaceous ground cover, and low shrubs. Some mullein, a Class C noxious weed, is found along the boundary roads.</p> <p>Vegetation is a Wild and Scenic River (WSR) Outstandingly Remarkable Value (ORV) for Woods Canyon/Chevelon Creek because diversity of plant species found within the canyon system.</p>
Appearance and Key Attractions	<p>The primary scenic features below the dam are primitive, steep-walled, and twisting canyons, with cliffs rising as much as 600 feet above deep pools in the stream channels. The vegetation diversity along the stream corridor adds to the scenic quality of the area. At and above the dam the scenery is dominated by the steep canyon walls and the man-made lake.</p> <p>The natural beauty, wildlife, and remoteness of the area are the primary attractions.</p> <p>Scenery is a WSR ORV because Woods Canyon/Chevelon Creek is an exemplary example of the sandstone and limestone canyons on the Sitgreaves portion of the ASNFs.</p>

Special Designations Woods Canyon/Chevelon Creek eligible WSR is located partially within the potential wilderness. No motor vehicles are allowed in Chevelon Canyon north of Chevelon Lake.

CURRENT USES

Recreation There is some recreation activity, primarily associated with Chevelon Lake. OHVs are currently allowed on the trail to the dam. Otherwise, there is very little recreation activity, due to the remoteness and difficult access. Current recreation activities are primarily fishing, hunting, hiking, backpacking, OHV use, and viewing scenery and wildlife. Chevelon Lake is stocked by Arizona Department of Fish and Game. There are no developed recreation sites within the area. Chevelon Lake Campground is located $\frac{3}{4}$ miles west of Chevelon Lake. The One-Eighty Trail (1.1 miles) provides non-motorized access to the south end of Chevelon Lake. The area has recreation emphases of Semi-Primitive Non-Motorized and Semi-Primitive Motorized.

Wildlife Large wildlife species found in the area include elk, mule deer, black bear, and mountain lion. Small animals and birds also inhabit the area. Threatened wildlife species include Mexican spotted owl. Candidate fish species include roundtail chub. Sensitive fish and wildlife species include Little Colorado sucker, bluehead sucker, bald eagle, American peregrine falcon, common black-hawk, and northern goshawk. Habitat for the threatened Chiricahua leopard frog and the sensitive northern leopard frog and California floater exists along the river, but these species are not currently found in the area.

Fish species are a WSR ORV below Chevelon Lake Dam because diversity of native fish species.

Range Sheep grazing occurs on the uplands east of the canyon in the Long Tom Allotment. A very small portion of the Chevelon Canyon Allotment, on the west side of the canyon, is within the potential wilderness. There are 3.6 miles of fence in the potential wilderness.

Water Chevelon Creek is the only perennial stream in the potential wilderness. All other drainages are intermittent or ephemeral. There is one trick tank/guzzler within the potential wilderness.

Special Uses Arizona Public Service (APS) has a right-of-way (ROW) for a 345 kV power line that borders the northern edge of the potential wilderness. Vegetation in the full 600-foot wide ROW is/will be cleared. Also, the existing forest plan was recently amended by the West-wide Energy Corridor Study to allow expansion of this energy corridor to a total width of 3,500 feet.

Minerals There are no mining claims, mineral districts, mineral withdrawals, or coal, oil and gas, or geothermal leases in the potential wilderness.

Heritage Resources Isolated hunting camps and rock art from the Mogollon culture are found in the potential wilderness.

Fire Forty-seven fires (most < $\frac{1}{4}$ acre and the largest approximately 198 acres) occurred between 1970 and 2006. The primary causes were lightning and campfires.

Capability Evaluation

Wilderness capability describes the basic characteristics that make the area appropriate and valuable for wilderness designation, regardless of the area's availability or need. Five sets of factors are used to determine capability: naturalness, level of development, opportunities for solitude or primitive and unconfined recreation, special features, and the ability of the Forest Service to manage the area as wilderness. The first four factors consider how the current conditions of the potential wilderness fit the definition of wilderness. Manageability is slightly different because it evaluates features of the area that would make it more or less difficult to manage as wilderness, such as size, shape, and juxtaposition to external influences. The following summarizes the information found in Appendix B.

Summary

Natural

Medium to High

The potential wilderness is essentially natural and the diversities of vegetation and wildlife species are key features. Vegetation types include piñon-juniper woodland and cottonwood-willow riparian, ponderosa pine, and mixed conifer forests. The potential wilderness provides habitat for Mexican spotted owl, roundtail chub, bald eagle, American peregrine falcon, northern goshawk, common black-hawk, Little Colorado sucker, and bluehead sucker. Habitat for Chiricahua leopard frog and northern leopard frog and California floater exists in the area, but these species are not currently present. Chevelon Creek is perennial but is subject to impoundment from the southern boundary to Chevelon Lake Dam. Below the dam, the creek is free-flowing and is an eligible WSR with a proposed classification of Scenic. There are no known water quality concerns. Mullein is found along area roads, but there are no records of the plant within the potential wilderness. Yellow sweet clover may be found along area roads. No surveys have specifically been conducted for non-native species in the area. The night sky is not affected because there are no nearby population centers.

Undeveloped

Low

The water impounded behind Chevelon Lake Dam is obvious evidence of human activity. The dam access road and the dam itself, although not within the potential wilderness, are quite visible. There are also user-created routes in the uplands.

Outstanding Opportunities for Solitude or Primitive and Unconfined Recreation

Medium (canyon)

Low (uplands)

Canyon - The canyon below Chevelon Lake Dam has outstanding opportunities for solitude and primitive and unconfined recreation. Recreation opportunities include hiking, backpacking, viewing wildlife, and photography. Above the dam there are few opportunities for solitude.

Uplands - The uplands have opportunities for primitive and unconfined recreation but they are not outstanding because of the rolling terrain. Hunting occurs primarily in the uplands because of the difficulty of packing big game out of the canyon. Solitude may be affected by motor vehicle travel on boundary roads and user-created routes.

Special Features and Values

Medium

Special features and values include sandstone and limestone canyon walls, trees and lush undergrowth along the drainage, potential for ecological and cultural research, and habitat for the wildlife and fish species listed above in **Natural**.

Manageability

Medium (canyon)

Low (uplands)

Canyon - Portions of the canyon could be manageable as wilderness because of the terrain and limited access. However, areas of activity (Chevelon Lake Campground and the ATV trail to Chevelon Lake) are nearby. Resource conflicts are possible with AZ Department of Fish and Game management of Chevelon Lake.

Uplands - It would be difficult to manage the uplands as wilderness because of the rolling terrain, lack of physical barriers to motor vehicle use, easy access to the area, and many boundaries that follow roads. User-created routes are associated with firewood cutting, hunting, and motorized recreation.

OVERALL CAPABILITY

Medium (canyon and uplands)

Availability Evaluation

Availability criteria indicate the availability of a potential wilderness for wilderness designation by describing other resource and land use potentials for the area. Availability examines the potential impact of designating an area as wilderness to both the current and future land uses and activities. In essence, it is a summary of the trade-offs between wilderness and other uses. The following summarizes the information found in Appendix C.

Summary

Water Yield

Low

Chevelon Lake affects wilderness characteristics of the area, especially the southern half. The dam itself is not in the potential wilderness, but will need to be maintained.

Habitat Management

Medium

Rotenone treatments to remove non-native fish species may be needed in Chevelon Creek to prepare for Little Colorado spinedace reintroduction.

Aquatic Restoration

High

No specific treatments have been identified for the watershed. Restoration of Little Colorado River spinedace habitat would require removal non-native species.

Vegetation Restoration

High (canyon)

Medium (uplands)

Canyon - No vegetation restoration has been identified for the canyons.

Uplands - Piñon-juniper thinning is needed in the uplands on the west side of Chevelon Canyon, but no treatments are currently planned.

Public Access Needed

Medium

Chevelon Lake is a Blue Ribbon trout fishery. However, there are no plans in improve access or further develop the site.

OHV Use

Low

Although motor vehicle use will generally not be allowed off designated roads and trails when the travel management rule is implemented on the forest, enforcement efforts in this area will be minimal because of its lower priority. Illegal motor vehicle use for recreation, hunting, and firewood cutting is expected to continue.

Land Use Authorizations

Low

Land use authorizations include grazing permits and structures and nearby rights-of way. Grazing permittees and the Forest Service need motorized access to check, repair, and replace fences and to clean out stock tanks. Additional energy transportation facilities could affect the northern end of the potential wilderness, should proposals be submitted.

Arizona Department of Fish and Game (AZFG) has the water rights to Chevelon Lake and requires motorized access for dam maintenance. AZFG has proposed access road improvements and does periodic dam and spillway maintenance.

Adjacent Non-FS Lands

Medium

There are no inholdings or adjacent non-federal lands, but Chevelon Lake Dam is bounded by the potential wilderness.

Minerals

High

There is a low potential for future mineral uses.

OVERALL AVAILABILITY

Medium

Need Evaluation

The evaluation criteria below indicate how the potential wilderness might fit into the National Wilderness Preservation System, which includes all wilderness areas in the United States. Need is considered at the regional level and must incorporate public participation. The criteria used to evaluate need include consideration of other wilderness and non-wilderness areas that provide opportunities for unconfined outdoor recreation or preservation of certain ecosystem characteristics. The following summarizes the information found in Appendix D.

Summary

Factor 1 - The location, size, and type of other wildernesses in the general vicinity and their distance from the proposed area. Consider accessibility of areas to population centers and user groups. Public demand for wilderness may increase with proximity to growing population centers.

Low

There are adequate wilderness opportunities in the vicinity of Chevelon Lake potential wilderness. Within 100 miles of this potential wilderness there are 978,576 wilderness acres. Within 100 miles of Flagstaff, there are 66,446 potential wilderness acres on the ASNFs and 687,395 wilderness acres. Within 100 miles of Phoenix, there are 61,535 potential wilderness acres on the ASNFs and 1,684,972 wilderness acres.

Factor 2 - Present visitor pressure on other wildernesses, the trends in use, changing patterns of use, population expansion factors, and trends and changes in transportation.

Medium

According to the 2001 National Visitor Use Monitoring study, approximately 38,000 people visited the three Wilderness areas on the ASNFs. Most of this use was concentrated in the two smaller, more easily accessed Wildernesses, Mount Baldy and Escudilla. Visitor use in Mount Baldy is locally considered high, while visitor use in Escudilla is considered moderate to high. Use in Bear Wallow Wilderness is lighter because it is less easily accessed and slightly larger. Wilderness users on the ASNFs are predominantly male, white or Hispanic/Latino, between the ages of 31 and 60, and live in the Phoenix and Tucson areas.

Approximately 70 percent of the Arizona visitors to the ASNFs are from the Phoenix (58 percent) and Tucson (11 percent) metropolitan areas. Populations in these areas have increased much faster than in the more rural areas. Visitors from the four counties where the ASNFs are located account for another 20 percent. In general, there has been no to moderate population growth in these counties. Recently, there have been major highway improvements between Phoenix and the ASNFs.

It can be assumed that with increasing populations and improved transportation features, wilderness use on the ASNFs would continue to increase, especially in those areas where the trailheads are easily accessed.

Surrounding National Forests (Coconino, Coronado, Gila, and Tonto) all have much higher numbers of wilderness visits than the ASNFs. Use on the Coconino, Coronado, and Gila is high, while use on the ASNFs and Tonto is moderate.¹

¹ This is based on use categories developed by the Forest Service Wilderness Advisory Group, with low use defined as 0-10,000 visits, medium as 10,001 – 30,000 visits, and high being greater than 30,000 visits. Total wilderness use for a forest from NVUM was divided by the number of wildernesses the forest is lead for, to get an average amount of use per wilderness.

Regionally, increased demand for additional wilderness in both Arizona and New Mexico should be anticipated based on population growth that occurred from 1990 to 2000, which far exceeded the national growth rate. Assuming Arizona continues to grow at a rate much higher than the national rate, visits to wilderness will continue to increase. Arizona, in particular, could benefit from additional wilderness.

Public demand increases with proximity to six population centers: Flagstaff, Phoenix, Tucson, Santa Fe, Taos, and Albuquerque. Consider wilderness recommendations within 100-150 miles of those cities to provide for that demand. Some additional public demand for wilderness in the Southwestern Region will occur from people moving to rural communities near the National Forests.

Nationwide, Wilderness represents 17 percent of all federal agency acres. In the Southwestern Region 13 percent of the Forest Service lands are Wilderness. Only 6 percent of the federal acres in northeast Arizona are wilderness acres. For wilderness acres in the Southwestern Region to be at the national average would require the addition of about 1 million acres.

Factor 3 - The extent to which nonwilderness lands on the NFS unit or other Federal lands are likely to provide opportunities for unconfined outdoor recreation experiences.

Low

There are adequate nonwilderness lands on or near the ASNFs that could provide unconfined outdoor recreation experiences. Within 100 miles of the Flagstaff, there are 310,343 acres of Inventoried Roadless Areas (IRA). Additionally, there are 285,599 acres managed for semi-primitive recreation on the ASNFs. Many of these acres overlap with IRAs and potential wilderness.

Within 100 miles of Phoenix, there are 354,977 acres of IRAs. Additionally, there are 457,285 acres managed for semi-primitive recreation on the ASNFs. Many of these acres overlap with IRAs and potential wilderness.

Factor 4 - The need to provide a refuge for those species that have demonstrated an inability to survive in less than primitive surroundings or the need for a protected area for other unique scientific values or phenomena.

Low

The ASNFs have identified 11 Threatened and Endangered Species, 105 Species of Concern², and 208 Species of Interest³ that occur or are found on the forests. None of these species require a primitive wilderness environment to survive. However, some (Mexican gray wolf, for example) would benefit from reduced disturbance and human encounters.

Factor 5 - Within social and biological limits, management may increase the capacity of established wildernesses to support human use without unacceptable depreciation of the wilderness resource.

Low

There is little opportunity for management to increase the capacity of the established wildernesses on the ASNFs. Both Mount Baldy and Escudilla Wildernesses are heavily used, are less than 10,000 acres, are easily accessed by motor vehicles, and have limited trail systems. Encounters with other wilderness visitors in both areas are high. No management changes have been identified for Bear Wallow Wilderness because the use is much lighter.

² Species of Concern are species for which management actions may be necessary to prevent listing under the Endangered Species Act.

³ Species of Interest are species for which management actions may be necessary to achieve ecological or other multiple-use objectives.

Factor 6 - An area's ability to provide for preservation of identifiable landform types and ecosystems. Consideration of this factor may include utilization of Edwin A. Hammond's subdivision of landform types and the Bailey-Kuchler ecosystem classification. This approach is helpful from the standpoint of rounding out the National Wilderness Preservation System and may be further subdivided to suit local, subregional, and regional needs.

Low

This potential wilderness contains one underrepresented ecosystem, 596 acres of piñon-juniper woodland.

OVERALL NEED

Low, but contains one underrepresented ecosystem

Appendix A: Wilderness Evaluation Process

The following is summarized from Forest Service Handbook 1909.12, Chapter 70. This process is used by the Forest Service to determine whether there are areas that could be recommended for wilderness designation by Congress. The process includes three steps: an inventory of potential wilderness areas, an evaluation of the potential wilderness areas, and a determination if a recommendation will be pursued for any potential wilderness areas.

Inventory of Potential Wilderness Areas

The first step in the evaluation of potential wilderness is to identify and inventory all areas within National Forest System Lands that satisfy the definition of wilderness found in the 1964 Wilderness Act.

Areas identified through this process are called potential wilderness areas. This inventory of potential wilderness is not a land designation. It is completed with the express purpose of identifying all lands that meet the criteria for being evaluated for wilderness suitability and possible recommendation to Congress for wilderness designation.

The inventory of areas relies on local knowledge and judgment regarding unique, site-specific conditions of each area being considered. The boundaries of areas for the potential wilderness inventory should facilitate easy on-the-ground identification.

Inventory Criteria

Areas qualify for inclusion in the potential wilderness inventory if they meet the statutory definition of wilderness and meet either criteria 1 and 3 or criteria 2 and 3 below.

1. Areas contain 5,000 acres or more.
2. Areas contain less than 5,000 acres, but meet one or more of the following criteria:
 - a. Can be preserved due to physical terrain and natural conditions.
 - b. Self-contained ecosystems, such as an island, that can be effectively managed as a separate unit of the National Wilderness Preservation System.
 - c. Contiguous to existing wilderness, primitive areas, Administration-endorsed wilderness, or potential wilderness in other Federal ownership, regardless of their size.
3. Areas do not contain forest roads (36 CFR 212.1) or other permanently authorized roads, except as permitted in areas east of the 100th meridian (sec. 71.12).

Areas may be included in the potential wilderness inventory even though they include the types of areas or features listed in FSH 1909.12, 71.11.

On the ASNFs, GIS was used to identify those areas that met the inventory criteria. Site-specific information was gathered from Ranger District (District) personnel to provide background information, identify features not shown in GIS, and determine where the Region 3 criteria on roaded areas, fingers, and extrusions should be applied.

Evaluation of Potential Wilderness Areas

An area recommended for wilderness must meet the tests of capability, availability, and need. In addition to the inherent wilderness quality it possesses, an area must provide opportunities and experiences that are dependent upon or enhanced by a wilderness environment. The ability of the Forest Service to manage the area as wilderness is also considered.

Capability

The capability of a potential wilderness is the degree to which an area contains the basic characteristics that make it suitable for wilderness recommendation without regard to its availability for or need as wilderness. The following characteristics are considered in evaluating a potential wilderness area:

1. Natural - an area is substantially free from the effects of modern civilization and generally appears to have been affected primarily by the forces of nature.
2. Undeveloped - the degree to which an area is without permanent improvements or human habitation.
3. Outstanding Opportunities for Solitude or Primitive and Unconfined Recreation - the capability of the area to provide solitude or primitive and unconfined types of recreation. This includes a wide range of experiential opportunities. Solitude is the opportunity to experience isolation from sights, sounds, and the presence of others from developments and evidence of humans.
4. Special Features and Values - an area is capable of providing other values such as those with ecologic, geologic, scientific, educational, scenic, historical, or cultural significance.
5. Manageability - the ability to manage an area as wilderness as required by the Wilderness and how boundaries affect manageability of an area.

Responses to the capability questions were drafted at the ASNFs Supervisors Office and reviewed by District personnel. Any changes were incorporated into the capability evaluation.

If an area is found to not be capable of being wilderness (a rating of Low), it is not carried forward into the Availability Evaluation.

Availability

Areas determined to meet wilderness capability requirements are considered potentially available for wilderness designation. The determination of availability is conditioned by the value of and need for the wilderness resource compared to the value of and need for other resources. Other resource potential including current use and potential future use is analyzed for the various resources involved.

Constraints and encumbrances on lands may also govern the availability of lands for wilderness. The degree of Forest Service control over the surface and subsurface of the area is also considered. The Forest Service should have sufficient control to prevent development of incompatible uses that would negatively affect wilderness character and potential.

Responses to the availability questions were drafted by at the ASNFs Supervisors Office and reviewed by District personnel. Any changes were incorporated into the availability evaluation.

Need

The need for an area to be designated as wilderness is determined through an analysis on a regional basis by evaluating such factors as the geographic distribution of areas and representation of landforms and ecosystems to which it contributes to the overall National Wilderness Preservation System. This need is demonstrated through a public involvement process, including public input to the evaluation report.

A set of GIS models, information papers, and analyses were provided by the Region 3 Regional Office. This information was synthesized at the ASNFs Supervisors Offices and reviewed by District personnel. Any changes were incorporated into the need evaluation.

Appendix B: Capability Evaluation and Ratings

Capability Characteristics

Natural

1. Presence of non-native species.

High - Non-native species are not evident.

Medium - Non-native species are evident in isolated spots.

Low - Non-native species are common or scattered throughout the area.

Rating: **Medium to High** - Mullein is found along the roads near the area, but there are no GIS records of the plant within the potential wilderness. Yellow sweet clover may have been used for erosion control along roads in the past. No surveys have specifically been conducted for non-native species in the area.

2. Rivers within the potential wilderness are in free-flowing condition.

High - Rivers within the area are considered free-flowing.

Medium - Some rivers have impoundments or other issues that affect their free-flowing character.

Low - Rivers within the potential wilderness are seasonal or heavily impacted by impoundments.

Rating: **Medium** - Chevelon Creek, from the southern potential wilderness boundary to Chevelon Lake Dam is subject to impoundment. Chevelon Creek, below the dam, has been found to be free-flowing. This section of Woods Canyon/Chevelon Creek is an eligible WSR with a proposed classification of Scenic.

3. Quality of night-sky as affected by light pollution.

High - The night sky is clear with little to no interference from light pollution.

Medium - Some stars are visible and there is moderate degradation from light pollution.

Low - Few stars are visible at night and the presence of light pollution is evident.

Rating: **High** - There are no nearby population centers and the lights from Heber/Overgaard are not visible from the area.

4. Presence of pollutants that degrade water.

High - All rivers/streams have been sampled and there are no water quality issues.

Medium - There are no known water quality issues within the area but not all rivers/streams have been sampled.

Low - There are rivers within the area that are listed on the State Impaired Waters List (303d).

Rating: **Medium** - Chevelon Creek is perennial, but has not been sampled. No water quality issues are known.

5. Area provides elements of biological diversity and naturalness, including unique habitats, TES or rare plants and wildlife.

High - Has critical or unique habitats and diverse ecological conditions.

Medium - Has a mix of habitats and ecological conditions.

Low - Has limited ecological conditions and habitats.

Rating: **High** - Biological diversity is high and essentially natural. The potential wilderness provides habitat for the threatened Mexican spotted owl. Candidate fish species include roundtail chub. Sensitive wildlife species include bald eagle, American peregrine falcon, northern goshawk, and common black-hawk. Sensitive fish species include Little Colorado sucker and bluehead sucker. Habitat for the threatened Chiricahua leopard frog and the sensitive northern leopard frog and California floater exists in the area, but these species are not currently present. Scenery, Fish species, and Vegetation are WSR ORVs for the eligible Woods Canyon/Chevelon Creek within the potential wilderness.

6. Area contains a variety of natural resources, including a variety of tree species and structures. Intermingled grasslands or meadows, numerous recreation opportunities, diversity of wildlife habitats, and wildlife, etc.

High - Diverse amount of natural resources.

Medium - Mixed amount of natural resources.

Low - Limited amount of natural resource diversity.

Rating: **High** - Diversity of natural vegetation and wildlife species are key natural features. Vegetation types include piñon-juniper woodland, cottonwood-willow riparian forest, ponderosa pine forest, and mixed conifer forest. The potential wilderness also contains several areas of old ponderosa pine. Hiking, hunting, wildlife viewing, photography, and backpacking are some of the available recreation opportunities. Wildlife species and habitat are diverse because the varied topographic, soil, and vegetative conditions within the canyon combine with permanent water (pools) to provide habitat for numerous wildlife species.

Undeveloped

7. Area has current or past evidence of human activity.

High - Little or no evidence of human activity.

Medium - Unnoticeable or unobjectionable human activity.

Low - Obvious evidence of human activity.

Rating: **Low** - The water impounded behind Chevelon Lake Dam is obvious evidence of human activity. The access road to the dam and the dam itself, although not within the potential wilderness, are quite visible.

Outstanding Opportunities for Solitude or Primitive and Unconfined Recreation

8. Area provides physically and mentally challenging recreation opportunities that promote adventure and self-reliance.

High - Most of the area provides challenging recreation opportunities.

Medium - Some parts of the area have the potential for challenging recreation opportunities.

Low - Few parts of the area can provide challenging recreation opportunities.

Rating: **Medium** - Chevelon Canyon below Chevelon Lake Dam has the potential for challenging recreation opportunities.

9. Opportunity to experience solitude and isolation from human activities while recreating in the area.

High - Significant feeling of being alone or remote from civilization.

Medium - Feeling of being alone is possible but signs of civilization are likely.

Low - Little opportunity of feeling alone.

Rating: **Medium** (canyon) - The presence of Chevelon Canyon Dam and Lake dominate the southern portion of the potential wilderness, while the area between the dam and the power line corridor on the northern boundary does contain opportunities for solitude and isolation from human activities.

Low (uplands) - Solitude in the uplands may be affected by the number of boundaries that are defined by system roads or activity areas and by use on user-created routes.

10. Opportunity to engage in primitive and unconfined recreation such as backpacking, kayaking, hunting, fishing, etc

High - There are many opportunities for engaging in primitive recreation.

Medium - There are some opportunities for engaging in primitive recreation.

Low - There are few to no opportunities to engage in primitive recreation.

Rating: **Medium** - There are opportunities for hiking, photography, wildlife viewing, backpacking, but they are limited primarily to the canyon. Hunting occurs primarily in the uplands because of the difficulty of packing big game out of the canyon. There are two developed trails that provide access into the canyon.

Special Features and Values

11. Area contains outstanding or distinct features like rock formations, panoramic views, etc.

High - Many distinct features or few but exceptional features.

Medium - Some distinct features.

Low - One or no distinct features.

Rating: **Medium** - The canyon's beauty is based on its orange, white, and gray sandstone and limestone components. The lush undergrowth and towering tree canopy characterize the area's beauty.

12. Area has potential for scientific research, environmental education, or historic/cultural opportunities.
High - Good potential for two or more types of these opportunities.
Medium - Potential for one type of opportunity.
Low - Little or no potential for this type of opportunity.

Rating: **Medium** - The potential exists for scientific research because of the unique ecological characteristics in the area. Cultural sites have been found in the potential wilderness, but no formal survey has been completed.

13. Area contains unique or rare species of plants and/or animals.
High - Area has several unique or rare plants and/or animals.
Medium - Area has a few unique or rare plants and/or animals.
Low - Area has no unique or rare plants and/or animals.

Rating: **High** - The potential wilderness provides habitat for a variety of unique or rare animal species including roundtail chub, Mexican spotted owl, bald eagle, American peregrine falcon, northern goshawk, common black-hawk, Little Colorado sucker, and bluehead sucker.

Overall Capability: Medium (canyon and uplands)

Manageability

14. Ability to manage the area for wilderness character, including distance and influence from outside activities; opportunity to access the area; and resource conflicts or encumbrances.
High - Isolated from areas of activity; controlled or limited access; no encumbrances or resource conflicts.
Medium - Somewhat isolated from areas of activity; adequate access opportunities; some resource conflicts and/or encumbrances.
Low - Areas of activity are nearby; many access opportunities; many resource conflicts and/or encumbrances.

Rating: **Low** (canyon) - Portions of the canyon could be manageable as wilderness because of the limited access. However, areas of activity (Chevelon Lake Campground and the ATV trail to Chevelon Lake) are nearby. Resource conflicts are possible with AZ Department of Fish and Game management of Chevelon Lake.

Low (uplands) - Because of the lack of physical barriers in the uplands, there could be some difficulty in managing motor vehicle use. Much of the boundary follows roads and activity areas, which are generally accessible to all motorized vehicles. The potential wilderness would easily be accessed from FRs 170 and 169.

15. Motorized use within the area.

Yes - Has motorized vehicle use.

No - Does not have any motorized vehicle use.

Rating: **No** (canyon) - There is no motorized vehicle use in the canyon because of the terrain and a forest order that restricts such use below Chevelon Lake Dam.

Yes (uplands) - Much of the potential wilderness includes rolling upland areas around the canyons. Roads and activity areas generally delineate the potential wilderness; there are few physical barriers that limit motorized vehicle use in the uplands. User-created routes are associated with firewood cutting, hunting, and motorized recreation.

Overall Manageability: Medium (canyon)

Low (uplands)

Appendix C: Availability Evaluation and Ratings

Availability Characteristics

1. Areas that are of high value for water yield or on-site storage where installation and maintenance of improvements may be required.

High - No impoundment needed.

Medium - Minor improvements will have an effect.

Low - Identified impoundment that will have an effect on wild characteristics.

Rating: **Low** - Chevelon Lake affects wilderness characteristics of the area, especially the southern half. The dam itself is not in the potential wilderness, but will need to be maintained.

2. Areas needing management for wildlife or aquatic animals that MIGHT conflict with wilderness management.

Low - Intense management (motorized equipment: helicopters, chainsaws, broadcast burning) and frequent entries (= or <5 yrs).

Medium - Management requires helicopters but no motorized equipment on the ground and frequency is generally less than 10 years.

High - Low management requirements with no motorized equipment required to meet objectives and infrequent entries.

Rating: **Medium** - Rotenone treatments to remove non-native fish species may be needed in Chevelon Creek to prepare for Little Colorado spinedace reintroduction.

3. Area needing active aquatic restoration activities.

Low - The majority of watershed needs attention.

Medium - Site-specific improvements needed.

High - Properly functioning with no or little restoration activities needed.

Rating: **High** - No specific treatments have been identified for the watershed. Restoration of Little Colorado River spinedace habitat would require removal non-native species.

4. Area needing active vegetative restoration activities due to specific species survival (such as White Bark Pine restoration) or identifiable fuel reduction activity to reduce the risk of catastrophic wildfire or known areas of severe insect infestation that will lead to heavy tree mortality.

Low - The need for vegetation restoration is a higher priority and requires long-term management and mechanized or motorized equipment.

Medium - Areas needing high intensity management activities for a short time period (< or = 5 years). These areas could be available for wilderness after those activities are completed (like fuel reduction activities). Some intense restoration work over small areas could be accomplished without conflicting with wilderness management (species conservation work not requiring motorized equipment).

High - The area needs little vegetative restoration.

Rating: **High** (canyon) - No vegetation restoration has been identified for the canyons.

Medium (uplands) - Piñon-juniper thinning is needed in the uplands on the west side of Chevelon Canyon, but no treatments are currently planned.

5. Areas having such unique characteristics or natural phenomena that general public access should be developed to facilitate public use and enjoyment.

High - Does not exist or minimal development will be provided.

Medium - Requires minor development or improvement that does not qualify as a developed recreation site but is a higher development level than is normally found within wilderness.

Low - Has a developed recreation site or features that warrant construction of a developed recreation site.

Rating: **Medium** - Chevelon Lake is a Blue Ribbon trout fishery. However, there are no plans in improve access or further develop the site.

6. Lands committed through contracts, permits or agreements that would be in conflict with wilderness management (some minor permitted uses may be still be allowed).

High - Current authorizations do not conflict with potential wilderness.

Medium - Current authorization(s) but can be terminated or there is long-term authorization or commitment but does not require motorized equipment for access or maintenance.

Low - Currently exists, must be retained (long-term commitments), and requires motorized equipment for access or maintenance.

Rating: **Low** - Arizona Department of Fish and Game (AZFG) has the water rights to Chevelon Lake and requires motorized access for dam maintenance. AZFG has proposed improvements to the access road and does periodic maintenance on the dam and spillway. There is a potential for additional energy transportation facilities across the northern end of the potential wilderness as part of the West Wide Energy Corridor, but there have been no proposals yet. The grazing permittee and Forest Service need access to these fences to check and repair them. Various mechanical tools would be needed to complete fence maintenance.

7. Forest Service has sufficient control to prevent development of irresolvable, incompatible use that would lessen wilderness character and potential.

High - No inholdings and no-non-federal lands adjacent to potential wilderness.

Medium - No inholdings but adjacent lands may be private.

Low - Inholdings exist.

Rating: **Medium** - There are no inholdings or adjacent non-federal lands, but Chevelon Lake Dam is bounded by the potential wilderness.

Low - The Forest Service will have little control over expansion of the power line within the approved corridor, should the need ever develop. Expansion of the lines could possible encroach on the potential wilderness area.

Overall Availability: Medium

Appendix D: Need Evaluation

Factor 1 - The location, size, and type of other wildernesses in the general vicinity and their distance from the proposed area. Consider accessibility of areas to population centers and user groups. Public demand for wilderness may increase with proximity to growing population centers.

There are 29 Wildernesses within 100 miles of PW-03-01-062. The total acreage of these wilderness areas is 978,576 acres. The Forest Service manages 23 of these areas, BLM manages 5, and the National Park Service manages 1.

Factor 2 - Present visitor pressure on other wildernesses, the trends in use, changing patterns of use, population expansion factors, and trends and changes in transportation.

Item 1

Each Federal agency that manages wilderness collects and reports visitor use information differently. The Forest Service reports wilderness use by each national forest, not each wilderness. The National Park Service collects backcountry visitor use only for overnight stays. The Bureau of Land Management reports use for each wilderness.

According to the 2001 National Visitor Use Monitoring study, approximately two percent of the Apache-Sitgreaves National Forests (ASNFs) users visited the three wilderness areas on the forest. This figure is similar to other non-urban forests in the Southwestern Region. More urban forests (Cibola and Coronado) reported approximately 25% of their users visited wilderness areas.

Most of the wilderness use on the ASNFs is concentrated in the two smaller wilderness areas, Mount Baldy and Escudilla. These areas are each less than 10,000 acres, are easily accessible by motor vehicles, and have limited trail systems. Visitor use in Mount Baldy is considered high with use concentrated on two of the three trails. Visitor use in Escudilla is considered moderate to high with use concentrated on one trail. Encounters with other wilderness visitors in both areas are high. Use in Bear Wallow Wilderness is lighter because it is less accessible and is slightly larger. There are no accurate use figures for the Blue Range Primitive Area, which is managed as wilderness.

Approximately 70 percent of the Arizona visitors to the ASNFs are from the Phoenix and Tucson metropolitan areas. Populations in these areas have increased much faster than in the more rural areas. Visitors from the four counties where the ASNFs are located account for another 20 percent. In general, there has been no to moderate population growth in these counties. Recently, there have been major highway improvements between Phoenix and the ASNFs.

It can be assumed that with increasing populations and improved transportation features, wilderness use would continue to increase in those wilderness areas on the ASNFs that are easily accessible to the recreating public.

Item 2

The ASNFs include three designated wilderness areas, the nation's sole remaining primitive area, and 322,000 acres of inventoried roadless areas. Users of designated wilderness areas fit a profile similar to other forests' users: 1) they are predominantly male (81 percent), 2) white (91 percent) or Hispanic/Latino (6 percent), 3) between the ages of 31 and 60, and 4) often travel from the Phoenix and Tucson areas. NVUM data suggest that roughly 45,000 wilderness visits were made during fiscal year 2001 although the error rate on this data is very high (± 56 percent) because of the relatively low number of visitors interviewed (Kocis et al. 2002). There are no use figures specific to the Blue Range Primitive Area or the inventoried roadless areas.

Regional Demand for Wilderness

1. Increased demand for additional wilderness in both Arizona and New Mexico should be anticipated based on population growth that occurred during the period of 1990 to 2000, which exceeded the national growth rate.

2. Assuming Arizona continues to grow at a rate greatly outpacing the national rate (predicted to be about 3 times the national rate), the number of visits to existing wilderness will continue to increase, and Arizona in particular could benefit from additional wilderness.
3. Demographics related to visitor race and ethnicity will affect the rate of increase in wilderness visits in the Southwestern Region. Even though the faster growing racial/ethnic groups have relatively low participation rates, wilderness use is still expected to increase because of the overall population growth rate.
4. Public demand increases with proximity to six population centers: Flagstaff, Phoenix, Tucson, Santa Fe, Taos, and Albuquerque. Consider wilderness recommendations within 100-150 miles of those cities to provide for that demand.
5. Some additional public demand for wilderness in the Southwestern Region will occur from the influx of people moving to communities in the vicinity of the National Forests.
6. In terms of geographic distribution of wilderness, the Southwestern Region is under-represented with five percent fewer wilderness acres as compared with the representation nationally. Additionally, all quadrants in Arizona and New Mexico are under-represented with the exception of the southwest and southeast quadrants in Arizona. The most under-represented quadrants when compared with total federal wilderness acres are southeast and northwest New Mexico, and northeast Arizona which are at 6 percent or less in the number of wilderness acres.
7. Desirability of the scenic mountainous settings available in the rural communities within and adjacent to national forests in the Southwestern Region will attract new retirees and others, further contributing to a growth in wilderness visitation.

Factor 3 - The extent to which nonwilderness lands on the NFS unit or other Federal lands are likely to provide opportunities for unconfined outdoor recreation experiences.

There are 28 Inventoried Roadless Areas (IRA) and 310 343 IRA acres within 100 miles of Flagstaff, Arizona, and 37 IRAs and 354,977 IRA acres within 100 miles of Phoenix, Arizona. (only acres within 100 miles are shown; actual IRAs may be larger).

Within 100 miles of Flagstaff and on the ASNFs, there are 250,203 acres managed for Semi-Primitive Motorized (SPM) recreation and 33,396 acres managed for Semi-Primitive Non-motorized (SPNM) recreation. Many of these acres overlap with the IRAs and potential wilderness areas.

Within 100 miles of Phoenix and on the ASNFs, there are 140,290 acres managed for Semi-Primitive Motorized (SPM) recreation and 33,396 acres managed for Semi-Primitive Non-motorized (SPNM) recreation. Many of these acres overlap with the IRAs and potential wilderness areas.

	TOTAL	354,977	

Factor 4 - The need to provide a refuge for those species that have demonstrated an inability to survive in less than primitive surroundings or the need for a protected area for other unique scientific values or phenomena.

The ASNFs have identified 11 Threatened and Endangered Species, 105 Species of Concern⁴, and 208 Species of Interest⁵ that occur or are found on the forests. None of these species require a primitive wilderness environment to survive. However, some (Mexican gray wolf, for example) would benefit from reduced disturbance and human encounters.

Factor 5 - Within social and biological limits, management may increase the capacity of established wildernesses to support human use without unacceptable depreciation of the wilderness resource.

There are three existing wildernesses on the Apache-Sitgreaves National Forests (ASNFs), all on the Apache side. Two, Mount Baldy and Escudilla, are less than 10,000 acres, are easily accessible by motor vehicles, and have limited trail systems. Visitor use in Mount Baldy is considered high with use concentrated on two of the three trails. Visitor use in Escudilla is considered moderate to high with use concentrated on one trail. Encounters with other wilderness visitors in both areas are high. For these two areas there are limited management opportunities to accommodate additional use. The third wilderness, Bear Wallow, is slightly larger, is more difficult to access, and has four trails. Visitor use is considered low. Here, additional demand could be accommodated without management changes.

⁴ Species of Concern are species for which management actions may be necessary to prevent listing under the Endangered Species Act.

⁵ Species of Interest are species for which management actions may be necessary to achieve ecological or other multiple-use objectives.

Factor 6 - An area's ability to provide for preservation of identifiable landform types and ecosystems. Consideration of this factor may include utilization of Edwin A. Hammond's subdivision of landform types and the Bailey-Kuchler ecosystem classification. This approach is helpful from the standpoint of rounding out the National Wilderness Preservation System and may be further subdivided to suit local, subregional, and regional needs.

The Southwestern Regional Office used the process outlined in Loomis and Echohawk (1999)⁶ to determine the underrepresented landforms and ecosystem types in Wilderness within Region 3.

The following landforms within the White Mountains-San Francisco Peaks-Mogollon Rim ecoregion section (where the ASNFs are located) are underrepresented in Wilderness in the region: Burro Mountains Oak-Juniper Woodland, Coconino Plateau Woodland, and San Francisco Peaks Coniferous Forest. Only Burro Mountain Oak-Juniper Woodland and Coconino Plateau Woodland are found on the ASNFs.

The following ecosystems types are underrepresented in Wilderness in the region: Desert Communities, Great Basin/Colorado Plateau Grassland, Great Plains Grassland, Piñon-Juniper Woodland, Sagebrush Shrubland, and Semi-desert Grassland. Only Great Basin Grassland, Piñon-Juniper Woodland, and Semi-desert Grassland are found on the ASNFs.

This potential wilderness contains one underrepresented ecosystem, 596 acres of Piñon-Juniper Woodland.

Overall Need: Low

UNDERREPRESENTED LANDFORMS

Potential Wilderness	Name	Acreage	Acres of Burro Mountains Oak-Juniper Woodland	Acres of Coconino Plateau Woodland
PW-03-01-001	Leonard Canyon	22,405		7,171
