

# Apache-Sitgreaves National Forests Draft Wilderness Evaluation Report

## Painted Bluffs Potential Wilderness

PW-03-01-051

June 2009

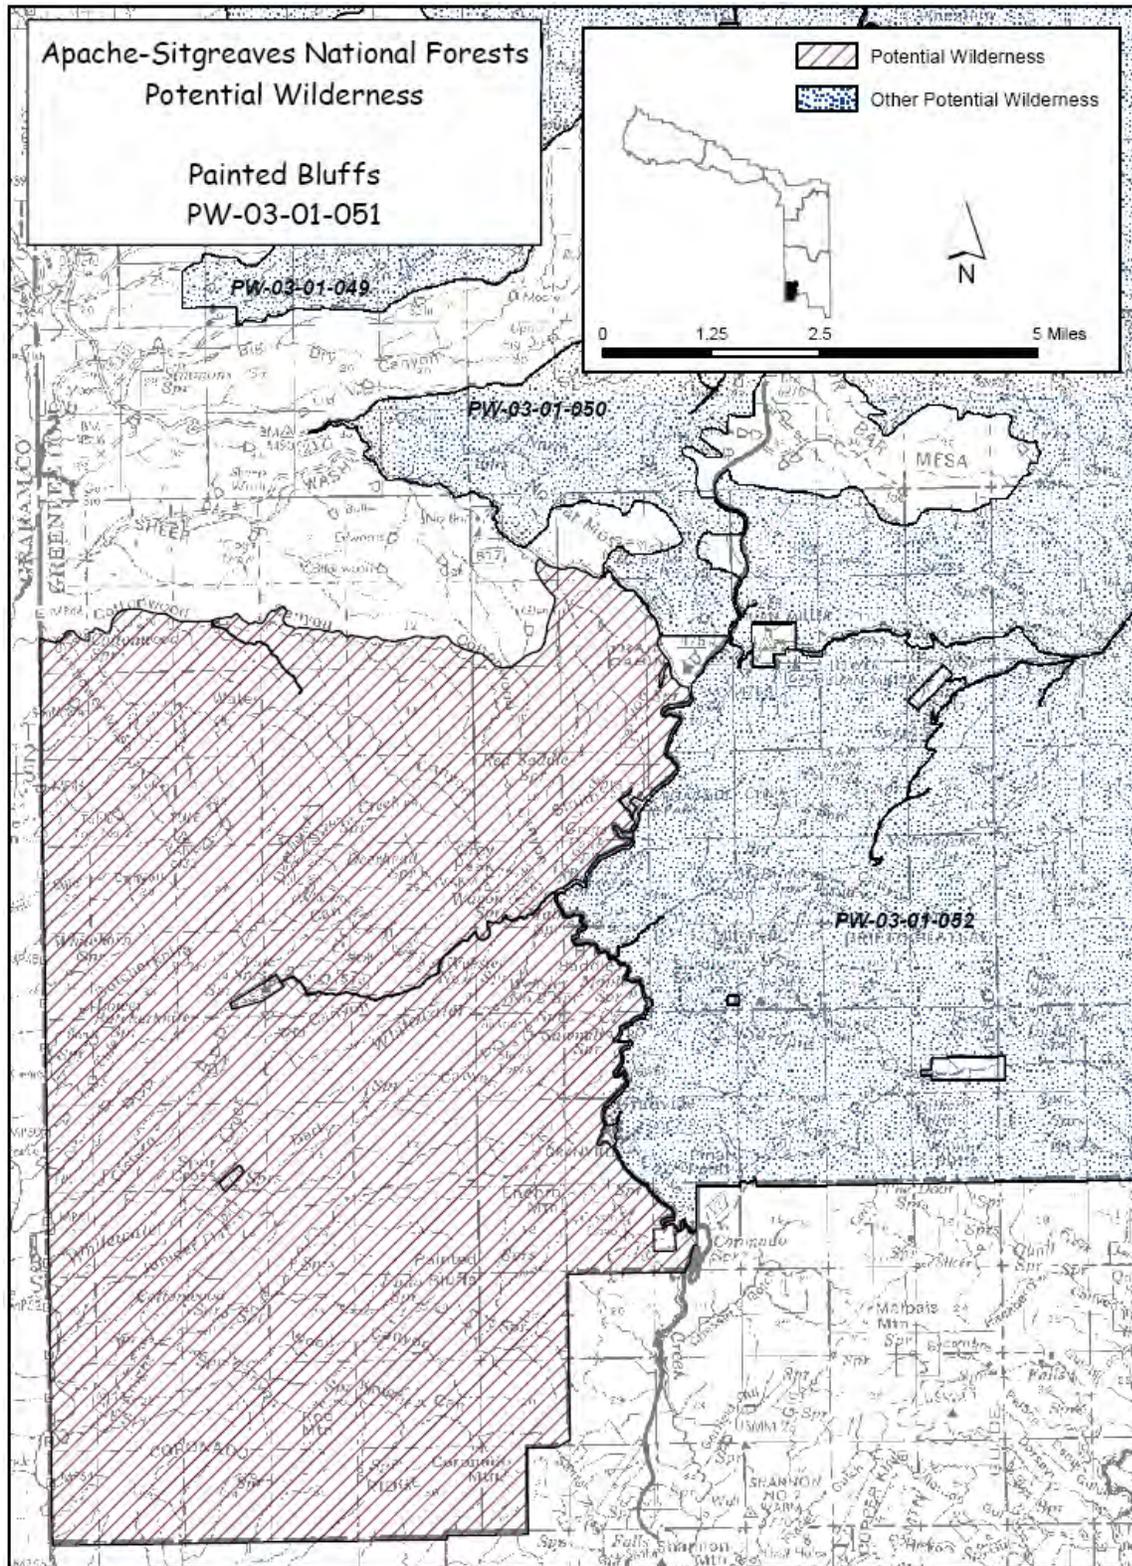

This draft potential wilderness evaluation report is divided into four parts: background, capability, availability, and need. Capability and availability are intended to be objective evaluations of existing conditions in the Painted Bluffs Potential Wilderness.

The most important area of focus for public comment is the “need” evaluation. The intent of this part of the evaluation is to consider if the potential wilderness fits into the National Wilderness Preservation System at the regional level. This report offers data that helps us understand different sources that might generate need. Ultimately, however, need for wilderness is generated by public demand. Therefore, public input is an essential component of this part of the potential wilderness evaluation.

We would like your feedback on this draft report - if we have missed an important detail or if you would like to share your comments or other input, please contact us. Written comments can be sent to: Apache-Sitgreaves National Forests, Attention: Forest Plan Revision Team, P.O. Box 640, Springerville, Arizona 85938, or E-mail: [asnf.planning@fs.fed.us](mailto:asnf.planning@fs.fed.us). We are also available by phone; ask for a planning team member at 928-333-4301 or 928-333-6292 (TTY).

**Disclaimer Statement**

The USDA Forest Service uses the most current and complete data available. GIS data and product accuracy may vary. Using GIS products for purposes other than those for which they were intended may yield inaccurate or misleading results. The USDA Forest Service reserves the right to correct, update, modify, or replace GIS products without notification. This map is not a legal land line or ownership document. Public lands are subject to change and leasing, and may have access restrictions; check with local offices. Obtain permission before entering private land.  
 Map created June 2009 by etreiman.

## *Introduction*

---

As part of the Forest Plan Revision process for the Apache-Sitgreaves National Forests (ASNFs), the Forest Service has prepared this Wilderness Evaluation Report for the Painted Bluffs potential wilderness.

### *Purpose*

The Forest Service must evaluate all lands possessing wilderness characteristics for potential wilderness during plan revision (39 CFR 219.17). Completion of a potential wilderness inventory and evaluation is an essential step in the plan revision process. Wilderness is just one of many special area designations that the Forest Service considers during plan revision, but it is one of only three special area evaluations that are mandatory. If an area is recommended for wilderness designation, then the revised plan would contain desired conditions, objectives, and/or guidelines that would protect its wilderness characteristics.

### *The Process*

The wilderness evaluation began with an inventory of potential wilderness, which includes areas of federal land over 5,000 contiguous acres and other areas that meet the criteria in FSH 1909.12 Ch. 71, and then determined if those areas meet the definition of wilderness. Once a list of potential wilderness areas was created, each area was evaluated for capability, availability, and need. These evaluation factors are described in the introduction to each evaluation step and in Appendix A. This report summarizes the wilderness capability, availability, and need evaluations based on the best available information.

The ASNFs will use this report to determine whether or not to make a preliminary administrative recommendation for wilderness designation for the Painted Bluffs potential wilderness. The Responsible Official's (Forest Supervisor) recommendation will be documented in the final Plan and the Plan Approval Document. Public comments on this report will be accepted and considered throughout the plan revision process. If a potential wilderness is recommended for wilderness, the recommendation will receive further review by the Chief of the Forest Service and the Secretary of Agriculture. If the Chief of the Forest Service intends to move forward with a wilderness recommendation, the Forest Service will complete a detailed analysis of the trade-offs and impacts in accordance with the National Environmental Policy Act, including further public review and comment. Ultimately, only Congress has the authority to designate wilderness.

## *Background*

---

<b>Name</b>	Painted Bluffs
<b>Number</b>	PW-03-01-051
<b>Acres</b>	44,106
<b>Ranger District</b>	Clifton
<b>History (if applicable)</b>	The potential wilderness includes RARE II analysis area 03135, Painted Bluffs (42,910 acres). The Painted Bluffs Inventoried Roadless Area (IRA) (2001 Roadless Rule) has 43,162 acres.
<b>Location, Vicinity, and Access</b>	Approximately 8 miles northwest of Clifton, Arizona in Greenlee County. It is located in the ASNFs in eastern Arizona. Primary access is via U.S. Highway 191, the Coronado Trail Scenic Byway.
<b>Geography and Topography</b>	The potential wilderness is characterized by rolling terrain that is dissected by numerous canyons draining primarily to the west. There is little flat terrain in the area. The south half of the potential wilderness is very rugged with deep canyons, numerous ledges, cliffs, and rock outcrops. The north half is also rough, but the canyons are shallower and there are few rock outcrops. Portions of Eagle Creek flow through the western edge of the area. Elevations range from almost 7,700 feet on Grey Peak to less than 4,000 feet in the southwest corner near Eagle Creek. Major landmarks include Coronado, Red, and Enebro Mountains, Painted Bluffs, Coronado Ridge, Grey Peak, Table Mountain, and Butcherknife, Wood, Whitewater, Cottonwood, and Dark Canyons.
<b>Surroundings</b>	<p>U.S. Highway 191 generally delineates the east boundary. The forest boundary forms the south and west boundaries. The north boundary generally follows Cottonwood Canyon and Greenlee County road 67018. Lands to the west of the potential wilderness are part of the San Carlos Indian Reservation. Lands to the south are private, State or administered by the Bureau of Land Management (BLM).</p> <p>There are three parcels of private land within the potential wilderness. Two have been excluded, along with their access roads. The third parcel has no vehicle access.</p> <p>West Blue/San Francisco potential wilderness to the east is generally separated from this area by the U.S. Highway 191 corridor. The Greenlee County road 67018 corridor separates this area from Sheep Wash potential wilderness to the northeast.</p> <p>An active mining operation is approximately 1 mile southeast of the potential wilderness.</p>
<b>Vegetation</b>	A mosaic of vegetative communities is found within Painted Bluffs potential wilderness. Vegetation types vary with elevation, aspect, and slope and include Madrean pine-oak woodland, interior chaparral, semi-desert grassland, ponderosa pine forest, and mixed broadleaf deciduous forest. Mullein, a Class C noxious weed, is found along the boundary roads. Field bindweed, also a Class C noxious weed, is found along Greenlee County road 67018 at the northeast boundary of the potential wilderness. Tamarisk, a Class B noxious weed, is found along Eagle Creek in the extreme southwestern part of the area.

There are some nearly pure stands of Arizona cypress in the canyon bottoms in the southern half of the potential wilderness. This species is unique to the area and some trees are quite large (>2 feet across). Some cypress stumps in Whitewater Canyon are more than 3 feet across. Populations of Arizona hedgehog cactus are found throughout the potential wilderness.

**Appearance and Key Attractions** The potential wilderness is dominated by steep slopes, rugged canyons, and views of the Mogollon Rim. Vegetation varies considerably with elevation and aspect. Key attractions are petroglyphs and wildlife for viewing and hunting.

**Special Designations** There are no special designations in the potential wilderness. The Coronado Trail Scenic Byway is just east of the area.

## CURRENT USES

**Recreation** Current recreation activities are primarily hunting and viewing scenery and wildlife. There are no developed recreation sites within the potential wilderness. Granville Campground is just east of the area. There are seven trails (22.1 miles) that provide non-motorized access to the area. Most of the area has recreation emphases of Semi-Primitive Non-Motorized and Primitive, with the remainder Semi-Primitive Motorized and Roaded Natural.

**Wildlife** Large wildlife species found in the area include mule deer, black bear, and mountain lion. A variety of small animals and birds also inhabit the area. Mexican spotted owl (threatened) protected activity centers are found on lands within and adjoining the potential wilderness. Threatened loach minnow are found in Eagle Creek. Eagle Creek is also designated critical habitat for spikedace. Other threatened wildlife species include Chiricahua leopard frog. Candidate wildlife species include western yellow-billed cuckoo and Mexican gartersnake. Sensitive wildlife species include bald eagle, common black-hawk, Springville silky pocket mouse, narrow-headed gartersnake, Arizona toad, northern leopard frog, lowland leopard frog, and Arizona Bell's vireo. Eagle Creek is an important migration corridor for neotropical birds.

**Range** Grazing is the primary use in the potential wilderness. The area is within the Double Circle, Tule, Dark Canyon, and Granville Allotments. There are 40.8 miles of fence, of which 5.8 are forest boundary, and 1.8 miles of pipeline in the area.

**Water** Eagle Creek is the only perennial stream. Other drainages are primarily intermittent. Of the 45 springs in the area, 32 are developed. There are also 13 stock tanks, 3 trick tanks/guzzlers, and a well in the area.

**Minerals** There are no mineral withdrawals or coal, oil and gas, or geothermal leases in the potential wildernesses. There are approximately 47 lode mineral claims in the potential wilderness along the southeast edge. These claims are located in association with the Copper Mountain Metallic Mineral District. This district contains copper, molybdenum, manganese, gold, and peripheral lead-zinc-silver mineralization.

**Heritage Resources** There is considerable evidence of cultural resources within the potential wilderness. Overall site density is believed to be relatively low, but the sites are probably significant.

**Fire** Thirty-seven fires (most < ¼ acre and the largest approximately 490 acres) occurred between 1969 and 2006. The majority were caused by lightning. Campfires were the second highest cause. Smoking caused the largest.

## Capability Evaluation

---

Wilderness capability describes the basic characteristics that make the area appropriate and valuable for wilderness designation, regardless of the area's availability or need. Five sets of factors are used to determine capability: naturalness, level of development, opportunities for solitude or primitive and unconfined recreation, special features, and the ability of the Forest Service to manage the area as wilderness. The first four factors consider how the current conditions of the potential wilderness fit the definition of wilderness. Manageability is slightly different because it evaluates features of the area that would make it more or less difficult to manage as wilderness, such as size, shape, and juxtaposition to external influences. The following summarizes the information found in Appendix B.

### Summary

#### Natural

##### High

The potential wilderness is essentially natural and the diversities of vegetation and wildlife species are key features. Vegetation includes Madrean pine-oak woodland, interior chaparral, semi-desert grassland, and mixed broadleaf riparian and ponderosa pine forests. The potential wilderness provides habitat for a variety of special status animal species including Mexican spotted owl, loach minnow, Chiricahua leopard frog, western yellow-billed cuckoo, Mexican gartersnake, bald eagle, common black-hawk, Springerville silky pocket mouse, narrow-headed gartersnake, Arizona toad, northern leopard frog, lowland leopard frog, and Arizona Bell's vireo. Perennial streams include Eagle Creek. There are no known impoundments or water quality concerns. Tamarisk is found along Eagle Creek in the extreme southwestern part of the area. Mullein and field bindweed have been found along boundary roads, but there are no records of these plants within the potential wilderness. For most of the area there is little to no light pollution. However, the night sky in the southern portion is affected by lights associated with mining operations.

#### Undeveloped

##### Medium

There is some evidence of human activity throughout most of the potential wilderness, including fences, pipelines, developed springs, stock tanks, and trick tanks/guzzlers.

#### Outstanding Opportunities for Solitude or Primitive and Unconfined Recreation

##### High

The potential wilderness has outstanding opportunities for primitive and unconfined recreation because of the area's size and diversity of terrain. Recreation opportunities include hiking, hunting, viewing wildlife, and photography. There are opportunities for solitude, but signs of civilization are visible in conjunction with the highway along the eastern boundary and the mining activity near southeastern portion.

#### Special Features and Values

##### High

Special features and values include the many canyons, Arizona cypress trees, petroglyphs, high potential for cultural research, and habitat for threatened, sensitive, and unique or rare plant and animal species (see list above in **Natural**).

**Manageability**

**Medium to High**

The potential wilderness could be managed to protect its wilderness character. The area's rugged terrain generally limits access, motor vehicle use, and the effects of outside activities. Most of the area, except the southeast corner, is isolated and has no resource conflicts. However, the southeast corner is close to Morenci, Clifton, and a large open-pit mine.

**OVERALL CAPABILITY**

**High**

## *Availability Evaluation*

---

Availability criteria indicate the availability of a potential wilderness for wilderness designation by describing other resource and land use potentials for the area. Availability examines the potential impact of designating an area as wilderness to both the current and future land uses and activities. In essence, it is a summary of the trade-offs between wilderness and other uses. The following summarizes the information found in Appendix C.

### *Summary*

#### **Water Yield**

**High**

The area is of value for water yield, but no impoundments are needed.

#### **Habitat Management**

**High**

Management needs for wildlife or aquatic animals are minimal.

#### **Aquatic Restoration**

**High**

Restoration activities are not needed in the potential wilderness.

#### **Vegetation Restoration**

**Medium**

Vegetation treatments, primarily burning, may be needed to reduce fuels and to restore ecosystems.

#### **Public Access Needed**

**High**

There are no unique characteristics that would require developed public access.

#### **Land Use Authorizations**

**Low**

Current permitted grazing use and the ability to use motorized tools and equipment within the area and tools to maintain range developments is critical to the operation and effective of grazing management.

#### **Adjacent Non-FS Lands**

**Low**

There are one inholding and two pieces of private land adjacent to the area, one at the end of a road that has been excluded from the potential wilderness.

#### **Minerals**

**Low to Medium** - southeast edge

**High** - remainder of area

The southeast portion of the area has a moderate to high potential for future mineral uses. The remainder has a low potential for future mineral uses.

**OVERALL AVAILABILITY**

**Medium to High**

## *Need Evaluation*

---

The evaluation criteria below indicate how the potential wilderness might fit into the National Wilderness Preservation System, which includes all wilderness areas in the United States. Need is considered at the regional level and must incorporate public participation. The criteria used to evaluate need include consideration of other wilderness and non-wilderness areas that provide opportunities for unconfined outdoor recreation or preservation of certain ecosystem characteristics. The following summarizes the information found in Appendix D.

### *Summary*

**Factor 1** - The location, size, and type of other wildernesses in the general vicinity and their distance from the proposed area. Consider accessibility of areas to population centers and user groups. Public demand for wilderness may increase with proximity to growing population centers.

#### **Low**

There are adequate wilderness opportunities in the vicinity of Painted Bluffs potential wilderness. Within 100 miles of this potential wilderness there are 1,697,941 wilderness and primitive area<sup>1</sup> acres. Within 100 miles of Silver City, New Mexico, the closest population center, there are 472,888 potential wilderness acres on the ASNFs and 1,204,467 wilderness and primitive area acres. Within 130 miles of Tucson, there are 354,490 potential wilderness acres on the ASNFs and 1,487,287 Wilderness and primitive area acres.

**Factor 2** - Present visitor pressure on other wildernesses, the trends in use, changing patterns of use, population expansion factors, and trends and changes in transportation.

#### **Medium**

According to the 2001 National Visitor Use Monitoring study, approximately 38,000 people visited the three Wilderness areas on the ASNFs. Most of this use was concentrated in the two smaller, more easily accessed Wildernesses, Mount Baldy and Escudilla. Visitor use in Mount Baldy is locally considered high, while visitor use in Escudilla is considered moderate to high. Use in Bear Wallow Wilderness is lighter because it is less easily accessed and slightly larger. Wilderness users on the ASNFs are predominantly male, white or Hispanic/Latino, between the ages of 31 and 60, and live in the Phoenix and Tucson areas.

Approximately 70 percent of the Arizona visitors to the ASNFs are from the Phoenix (58 percent) and Tucson (11 percent) metropolitan areas. Populations in these areas have increased much faster than in the more rural areas. Visitors from the four counties where the ASNFs are located account for another 20 percent. In general, there has been no to moderate population growth in these counties. Recently, there have been major highway improvements between Phoenix and the ASNFs.

It can be assumed that with increasing populations and improved transportation features, wilderness use on the ASNFs would continue to increase, especially in those areas where the trailheads are easily accessed.

---

<sup>1</sup> The Blue Range Primitive Area is the last remaining such area in the United States. It is managed as wilderness in accordance with Forest Service Manual 2320.3(11).

Surrounding National Forests (Coconino, Coronado, Gila, and Tonto) all have much higher numbers of wilderness visits than the ASNFs. Use on the Coconino, Coronado, and Gila is high, while use on the ASNFs and Tonto is moderate.<sup>2</sup>

Regionally, increased demand for additional wilderness in both Arizona and New Mexico should be anticipated based on population growth that occurred from 1990 to 2000, which far exceeded the national growth rate. Assuming Arizona continues to grow at a rate much higher the national rate, visits to wilderness will continue to increase. Arizona, in particular, could benefit from additional wilderness.

Public demand increases with proximity to six population centers: Flagstaff, Phoenix, Tucson, Santa Fe, Taos, and Albuquerque. Consider wilderness recommendations within 100-150 miles of those cities to provide for that demand. Some additional public demand for wilderness in the Southwestern Region will occur from people moving to rural communities near the National Forests.

Nationwide, Wilderness represents 17 percent of all federal agency acres. In the Southwestern Region 13 percent of the Forest Service lands are Wilderness. Only 6 percent of the federal acres in northeast Arizona are wilderness acres. For wilderness acres in the Southwestern Region to be at the national average would require the addition of about 1 million acres.

**Factor 3** - The extent to which nonwilderness lands on the NFS unit or other Federal lands are likely to provide opportunities for unconfined outdoor recreation experiences.

#### Low

There are adequate nonwilderness lands on or near the ASNFs that could provide unconfined outdoor recreation experiences. Within 100 miles of the Silver City, New Mexico, the closest population center, there are over 1.5 million acres of primitive area, IRAs, and BLM Wilderness Study Areas (WSA). Additionally, there are over 900,000 acres managed for semi-primitive and primitive recreation on the ASNFs. Many of these acres overlap with Wilderness, the Blue Range Primitive Area, IRAs, and potential wilderness.

Within 130 miles of Tucson, there are over 1 million acres of primitive area, IRAs, and WSAs. Additionally, there are over 383,000 acres managed for semi-primitive and primitive recreation on the ASNFs. Many of these acres overlap with Wilderness, the Blue Range Primitive Area, IRAs, and potential wilderness.

**Factor 4** - The need to provide a refuge for those species that have demonstrated an inability to survive in less than primitive surroundings or the need for a protected area for other unique scientific values or phenomena.

#### Low

The ASNFs have identified 11 Threatened and Endangered species, 105 Species of Concern<sup>3</sup>, and 208 Species of Interest<sup>4</sup> that occur or are found on the forests. None of these species require a primitive wilderness environment to survive. However, some (Mexican gray wolf, for example) would benefit from reduced disturbance and human encounters.

---

<sup>2</sup> This is based on use categories developed by the Forest Service Wilderness Advisory Group, with low use defined as 0-10,000 visits, medium as 10,001 – 30,000 visits, and high being greater than 30,000 visits. Total wilderness use for a forest from NVUM was divided by the number of wildernesses the forest is lead for, to get an average amount of use per wilderness.

<sup>3</sup> Species of Concern are species for which management actions may be necessary to prevent listing under the Endangered Species Act.

<sup>4</sup> Species of Interest are species for which management actions may be necessary to achieve ecological or other multiple-use objectives.

**Factor 5** - Within social and biological limits, management may increase the capacity of established wildernesses to support human use without unacceptable depreciation of the wilderness resource.

**Low**

There is little opportunity for management to increase the capacity of the established wildernesses on the ASNFs. Both Mount Baldy and Escudilla Wildernesses are heavily used, are less than 10,000 acres, are easily accessed by motor vehicles, and have limited trail systems. Encounters with other wilderness visitors in both areas are high. No management changes have been identified for Bear Wallow Wilderness because the use is much lighter.

**Factor 6** - An area's ability to provide for preservation of identifiable landform types and ecosystems. Consideration of this factor may include utilization of Edwin A. Hammond's subdivision of landform types and the Bailey-Kuchler ecosystem classification. This approach is helpful from the standpoint of rounding out the National Wilderness Preservation System and may be further subdivided to suit local, subregional, and regional needs.

**Medium**

This potential wilderness contains one underrepresented ecosystem, 6,896 acres of semi-desert grassland.

**OVERALL NEED**

**Low to Medium**, contains one underrepresented ecosystem

## *Appendix A: Wilderness Evaluation Process*

---

The following is summarized from Forest Service Handbook 1909.12, Chapter 70. This process is used by the Forest Service to determine whether there are areas that could be recommended for wilderness designation by Congress. The process includes three steps: an inventory of potential wilderness areas, an evaluation of the potential wilderness areas, and a determination if a recommendation will be pursued for any potential wilderness areas.

### **Inventory of Potential Wilderness Areas**

The first step in the evaluation of potential wilderness is to identify and inventory all areas within National Forest System Lands that satisfy the definition of wilderness found in the 1964 Wilderness Act.

Areas identified through this process are called potential wilderness areas. This inventory of potential wilderness is not a land designation. It is completed with the express purpose of identifying all lands that meet the criteria for being evaluated for wilderness suitability and possible recommendation to Congress for wilderness designation.

The inventory of areas relies on local knowledge and judgment regarding unique, site-specific conditions of each area being considered. The boundaries of areas for the potential wilderness inventory should facilitate easy on-the-ground identification.

### **Inventory Criteria**

Areas qualify for inclusion in the potential wilderness inventory if they meet the statutory definition of wilderness and meet either criteria 1 and 3 or criteria 2 and 3 below.

1. Areas contain 5,000 acres or more.
2. Areas contain less than 5,000 acres, but meet one or more of the following criteria:
  - a. Can be preserved due to physical terrain and natural conditions.
  - b. Self-contained ecosystems, such as an island, that can be effectively managed as a separate unit of the National Wilderness Preservation System.
  - c. Contiguous to existing wilderness, primitive areas, Administration-endorsed wilderness, or potential wilderness in other Federal ownership, regardless of their size.
3. Areas do not contain forest roads (36 CFR 212.1) or other permanently authorized roads, except as permitted in areas east of the 100<sup>th</sup> meridian (sec. 71.12).

Areas may be included in the potential wilderness inventory even though they include the types of areas or features listed in FSH 1909.12, 71.11.

On the ASNFs, GIS was used to identify those areas that met the inventory criteria. Site-specific information was gathered from Ranger District (District) personnel to provide background information, identify features not shown in GIS, and determine where the Region 3 criteria on roaded areas, fingers, and extrusions should be applied.

### **Evaluation of Potential Wilderness Areas**

An area recommended for wilderness must meet the tests of capability, availability, and need. In addition to the inherent wilderness quality it possesses, an area must provide opportunities and experiences that are dependent upon or enhanced by a wilderness environment. The ability of the Forest Service to manage the area as wilderness is also considered.

## **Capability**

The capability of a potential wilderness is the degree to which an area contains the basic characteristics that make it suitable for wilderness recommendation without regard to its availability for or need as wilderness. The following characteristics are considered in evaluating a potential wilderness area:

1. Natural - an area is substantially free from the effects of modern civilization and generally appears to have been affected primarily by the forces of nature.
2. Undeveloped - the degree to which an area is without permanent improvements or human habitation.
3. Outstanding Opportunities for Solitude or Primitive and Unconfined Recreation - the capability of the area to provide solitude or primitive and unconfined types of recreation. This includes a wide range of experiential opportunities. Solitude is the opportunity to experience isolation from sights, sounds, and the presence of others from developments and evidence of humans.
4. Special Features and Values - an area is capable of providing other values such as those with ecologic, geologic, scientific, educational, scenic, historical, or cultural significance.
5. Manageability - the ability to manage an area as wilderness as required by the Wilderness and how boundaries affect manageability of an area.

Responses to the capability questions were drafted at the ASNFs Supervisors Office and reviewed by District personnel. Any changes were incorporated into the capability evaluation.

If an area is found to not be capable of being wilderness (a rating of Low), it is not carried forward into the Availability Evaluation.

## **Availability**

Areas determined to meet wilderness capability requirements are considered potentially available for wilderness designation. The determination of availability is conditioned by the value of and need for the wilderness resource compared to the value of and need for other resources. Other resource potential including current use and potential future use is analyzed for the various resources involved.

Constraints and encumbrances on lands may also govern the availability of lands for wilderness. The degree of Forest Service control over the surface and subsurface of the area is also considered. The Forest Service should have sufficient control to prevent development of incompatible uses that would negatively affect wilderness character and potential.

Responses to the availability questions were drafted by at the ASNFs Supervisors Office and reviewed by District personnel. Any changes were incorporated into the availability evaluation.

## **Need**

The need for an area to be designated as wilderness is determined through an analysis on a regional basis by evaluating such factors as the geographic distribution of areas and representation of landforms and ecosystems to which it contributes to the overall National Wilderness Preservation System. This need is demonstrated through a public involvement process, including public input to the evaluation report.

A set of GIS models, information papers, and analyses were provided by the Region 3 Regional Office. This information was synthesized at the ASNFs Supervisors Offices and reviewed by District personnel. Any changes were incorporated into the need evaluation.

## Appendix B: Capability Evaluation and Ratings

---

### Capability Characteristics

#### Natural

1. Presence of non-native species.

High - Non-native species are not evident.

Medium - Non-native species are evident in isolated spots.

Low - Non-native species are common or scattered throughout the area.

Rating: **Medium** - Tamarisk is found along Eagle Creek in the extreme southwestern part of the area. Mullein and field bindweed have been found along boundary roads, but there are no GIS records of these two plants within the potential wilderness.

2. Rivers within the potential wilderness are in free-flowing condition.

High - Rivers within the area are considered free-flowing.

Medium - Some rivers have impoundments or other issues that affect their free-flowing character.

Low - Rivers within the potential wilderness are seasonal or heavily impacted by impoundments.

Rating: **High** - Perennial streams include Eagle Creek. The remaining drainages are either intermittent or ephemeral. There are no known impoundments.

3. Quality of night-sky as affected by light pollution.

High - The night sky is clear with little to no interference from light pollution.

Medium - Some stars are visible and there is moderate degradation from light pollution.

Low - Few stars are visible at night and the presence of light pollution is evident.

Rating: **Medium to High** - For most of the area there is little to no light pollution. However, for the southern portion of the potential wilderness near Clifton and Morenci, the night sky is affected by lights associated with mining operations.

4. Presence of pollutants that degrade water.

High - All rivers/streams have been sampled and there are no water quality issues.

Medium - There are no known water quality issues within the area but not all rivers/streams have been sampled.

Low - There are rivers within the area that are listed on the State Impaired Waters List (303d).

Rating: **Medium** - Only Eagle Creek has been sampled. No water quality concerns were found. The remaining streams have not been sampled; there are no known water quality issues.

5. Area provides elements of biological diversity and naturalness, including unique habitats, TES or rare plants and wildlife.

High - Has critical or unique habitats and diverse ecological conditions.

Medium - Has a mix of habitats and ecological conditions.

Low - Has limited ecological conditions and habitats.

**Rating:** **High** - Biological diversity is high and essentially natural. The potential wilderness provides habitat for a wide variety of special status animal species including Mexican spotted owl, loach minnow, Chiricahua leopard frog, western yellow-billed cuckoo, Mexican gartersnake, bald eagle, common black-hawk, Springerville silky pocket mouse, narrow-headed gartersnake, Arizona toad, northern leopard frog, lowland leopard frog, and Arizona Bell's vireo.

6. Area contains a variety of natural resources, including a variety of tree species and structures, intermingled grasslands or meadows, numerous recreation opportunities, diversity of wildlife habitats, and wildlife, etc.

High - Diverse amount of natural resources.

Medium - Mixed amount of natural resources.

Low - Limited amount of natural resource diversity.

**Rating:** **High** - Diversity of natural vegetation and wildlife species are key natural features. Vegetation includes Madrean pine-oak woodland, interior chaparral, semi-desert grassland, mixed broadleaf riparian forest, and ponderosa pine forest. Hiking, hunting, wildlife viewing, and photography are the main recreation opportunities. Wildlife species and habitat are diverse because the varied topographic, soil, and vegetative conditions within the area combine with the perennial stream to provide habitat for numerous wildlife species.

### **Undeveloped**

7. Area has current or past evidence of human activity.

High - Little or no evidence of human activity.

Medium - Unnoticeable or unobjectionable human activity.

Low - Obvious evidence of human activity.

**Rating:** **High** - There is little evidence of human activity throughout most of the potential wilderness, including fences, pipelines, developed springs, stock tanks, and trick tanks/guzzlers.

### **Outstanding Opportunities for Solitude or Primitive and Unconfined Recreation**

8. Area provides physically and mentally challenging recreation opportunities that promote adventure and self-reliance.

High - Most of the area provides challenging recreation opportunities.

Medium - Some parts of the area have the potential for challenging recreation opportunities.

Low - Few parts of the area can provide challenging recreation opportunities.

**Rating:** **High** - The potential wilderness provides physically challenging recreation opportunities. The physical and mental challenges are increased by the area's size and diversity of terrain.

9. Opportunity to experience solitude and isolation from human activities while recreating in the area.

High - Significant feeling of being alone or remote from civilization.

Medium - Feeling of being alone is possible but signs of civilization are likely.

Low - Little opportunity of feeling alone.

**Rating:** **High** - The potential wilderness provides opportunities for solitude throughout the area. Signs of civilization are only visible in conjunction with the highway along the eastern boundary and the southern portion of the potential wilderness near Clifton and Morenci.

10. Opportunity to engage in primitive and unconfined recreation such as backpacking, kayaking, hunting, fishing, etc

High - There are many opportunities for engaging in primitive recreation.

Medium - There are some opportunities for engaging in primitive recreation.

Low - There are few to no opportunities to engage in primitive recreation.

**Rating:** **High** - There are opportunities for hiking, hunting, viewing wildlife, and photography in the potential wilderness.

### **Special Features and Values**

11. Area contains outstanding or distinct features like rock formations, panoramic views, etc.

High - Many distinct features or few but exceptional features.

Medium - Some distinct features.

Low - One or no distinct features.

**Rating:** **High** - There are many distinctive features in the potential wilderness. These include the many canyons, Arizona cypress trees in some of these canyons, and the petroglyphs on Painted Bluff.

12. Area has potential for scientific research, environmental education, or historic/cultural opportunities.  
High - Good potential for two or more types of these opportunities.  
Medium - Potential for one type of opportunity.  
Low - Little or no potential for this type of opportunity.

Rating: **Medium** - The petroglyphs on Painted Bluff provide cultural viewing opportunities.

13. Area contains unique or rare species of plants and/or animals.  
High - Area has several unique or rare plants and/or animals.  
Medium - Area has a few unique or rare plants and/or animals.  
Low - Area has no unique or rare plants and/or animals.

Rating: **High** - The threatened loach minnow is found in Eagle Creek. Mexican spotted owl (threatened) protected activity centers are found on lands within and adjoining the potential wilderness. Populations of Arizona hedgehog cactus are found throughout the area. Other rare or unique species include loach minnow, Chiricahua leopard frog, western yellow-billed cuckoo, Mexican gartersnake, bald eagle, common black-hawk, Springerville silky pocket mouse, narrow-headed gartersnake, Arizona toad, northern leopard frog, lowland leopard frog, and Arizona Bell's vireo.

**Overall Capability: High**

#### Manageability

14. Ability to manage the area for wilderness character, including distance and influence from outside activities; opportunity to access the area; and resource conflicts or encumbrances.  
High - Isolated from areas of activity; controlled or limited access; no encumbrances or resource conflicts.  
Medium - Somewhat isolated from areas of activity; adequate access opportunities; some resource conflicts and/or encumbrances.  
Low - Areas of activity are nearby; many access opportunities; many resource conflicts and/or encumbrances.

Rating: **Medium to Low** - The potential wilderness has very limited access. Most of the area, except the southeast corner, is isolated and has no resource conflicts. The southeast corner is closest to Morenci, Clifton, and a large open-pit mine.

15. Motorized use within the area.  
Yes - Has motorized vehicle use.  
No - Does not have any motorized vehicle use.

Rating: **Yes** - The upper third of the potential wilderness is generally accessible. However, terrain limits motorized vehicle use in the rest of the area.

**Overall Manageability: Medium to High**

## Appendix C: Availability Evaluation and Ratings

---

### Availability Characteristics

1. Areas that are of high value for water yield or on-site storage where installation and maintenance of improvements may be required.

High - No impoundment needed.

Medium - Minor improvements will have an effect.

Low - Identified impoundment that will have an effect on wild characteristics.

Rating: **High** - The area is of value for water yield, but no impoundments are needed.

2. Areas needing management for wildlife or aquatic animals that MIGHT conflict with wilderness management.

Low - Intense management (motorized equipment: helicopters, chainsaws, broadcast burning) and frequent entries (= or <5 yrs).

Medium - Management requires helicopters but no motorized equipment on the ground and frequency is generally less than 10 years.

High - Low management requirements with no motorized equipment required to meet objectives and infrequent entries.

Rating: **High** - Management needs for wildlife or aquatic animals are minimal.

3. Area needing active aquatic restoration activities.

Low - The majority of watershed needs attention.

Medium - Site-specific improvements needed.

High - Properly functioning with no or little restoration activities needed.

Rating: **High** - Restoration activities are not needed in the potential wilderness.

4. Area needing active vegetative restoration activities due to specific species survival (such as White Bark Pine restoration) or identifiable fuel reduction activity to reduce the risk of catastrophic wildfire or known areas of severe insect infestation that will lead to heavy tree mortality.

Low - The need for vegetation restoration is a higher priority and requires long-term management and mechanized or motorized equipment.

Medium - Areas needing high intensity management activities for a short time period (< or = 5 years). These areas could be available for wilderness after those activities are completed (like fuel reduction activities). Some intense restoration work over small areas could be accomplished without conflicting with wilderness management (species conservation work not requiring motorized equipment).

High - The area needs little vegetative restoration.

Rating: **Medium** - Vegetation treatments, primarily burning, may be needed to reduce fuels and to restore ecosystems.

5. Areas having such unique characteristics or natural phenomena that general public access should be developed to facilitate public use and enjoyment.

High - Does not exist or minimal development will be provided.

Medium - Requires minor development or improvement that does not qualify as a developed recreation site but is a higher development level than is normally found within wilderness.

Low - Has a developed recreation site or features that warrant construction of a developed recreation site.

Rating: **High** - There are no unique characteristics that would require developed public access.

6. Lands committed through contracts, permits or agreements that would be in conflict with wilderness management (some minor permitted uses may be still be allowed).

High - Current authorizations do not conflict with potential wilderness.

Medium - Current authorization(s) but can be terminated or there is long-term authorization or commitment but does not require motorized equipment for access or maintenance.

Low - Currently exists, must be retained (long-term commitments), and requires motorized equipment for access or maintenance.

Rating: **Low** - Current permitted grazing use and the ability to use motorized equipment within the area and tools to maintain range developments is critical to the operation and effective of grazing management.

7. Forest Service has sufficient control to prevent development of irresolvable, incompatible use that would lessen wilderness character and potential.

High - No inholdings and no-non-federal lands adjacent to potential wilderness.

Medium - No inholdings but adjacent lands may be private.

Low - Inholdings exist.

Rating: **Low** - There are one inholding and two pieces of private land adjacent to the area, one at the end of a road that has been excluded from the potential wilderness. There is a potential for mining claim development in the extreme southeastern portion of the area.

***Overall Availability: Medium to High***

## Appendix D: Need Evaluation

*Factor 1 - The location, size, and type of other wildernesses in the general vicinity and their distance from the proposed area. Consider accessibility of areas to population centers and user groups. Public demand for wilderness may increase with proximity to growing population centers.*

There are 25 Wildernesses and 1 primitive area<sup>5</sup> within 100 miles of PW-03-01-051. The total acreage of these areas is 1,697,941 acres. The Forest Service (FS) manages 16 of these areas, the Bureau of Land Management (BLM) manages 8, and the National Park Service (NPS) manages 2.

Potential Wilderness	Existing Wilderness within 100 Miles	Existing Wilderness Acreage	Distance from Potential Wilderness	Managing Agency

*Factor 2 - Present visitor pressure on other wildernesses, the trends in use, changing patterns of use, population expansion factors, and trends and changes in transportation.*

#### Item 1

Each Federal agency that manages wilderness collects and reports visitor use information differently. The Forest Service reports wilderness use by each national forest, not each wilderness. The National Park Service collects backcountry visitor use only for overnight stays. The Bureau of Land Management reports use for each wilderness.

According to the 2001 National Visitor Use Monitoring study, approximately two percent of the Apache-Sitgreaves National Forests (ASNFs) users visited the three wilderness areas on the forest. This figure is similar to other non-urban forests in the Southwestern Region. More urban forests (Cibola and Coronado) reported approximately 25% of their users visited wilderness areas.

Most of the wilderness use on the ASNFs is concentrated in the two smaller wilderness areas, Mount Baldy and Escudilla. These areas are each less than 10,000 acres, are easily accessible by motor vehicles, and have limited trail systems. Visitor use in Mount Baldy is considered high with use concentrated on two of the three trails. Visitor use in Escudilla is considered moderate to high with use concentrated on one trail. Encounters with other wilderness visitors in both areas are high. Use in Bear Wallow Wilderness is lighter because it is less accessible and is slightly larger. There are no accurate use figures for the Blue Range Primitive Area, which is managed as wilderness.

Approximately 70 percent of the Arizona visitors to the ASNFs are from the Phoenix and Tucson metropolitan areas. Populations in these areas have increased much faster than in the more rural areas. Visitors from the four counties where the ASNFs are located account for another 20 percent. In general, there has been no to moderate population growth in these counties. Recently, there have been major highway improvements between Phoenix and the ASNFs.

It can be assumed that with increasing populations and improved transportation features, wilderness use would continue to increase in those wilderness areas on the ASNFs that are easily accessible to the recreating public.

#### Item 2

The ASNFs include three designated wilderness areas, the nation's sole remaining primitive area, and 322,000 acres of inventoried roadless areas. Users of designated wilderness areas fit a profile similar to other forests' users: 1) they are predominantly male (81 percent), 2) white (91 percent) or Hispanic/Latino (6 percent), 3) between the ages of 31 and 60, and 4) often travel from the Phoenix and Tucson areas. NVUM data suggest that roughly 45,000 wilderness visits were made during fiscal year 2001 although the error rate on this data is very high ( $\pm 56$  percent) because of the relatively low number of visitors interviewed (Kocis et al. 2002). There are no use figures specific to the Blue Range Primitive Area or the inventoried roadless areas.

### **Regional Demand for Wilderness**

1. Increased demand for additional wilderness in both Arizona and New Mexico should be anticipated based on population growth that occurred during the period of 1990 to 2000, which exceeded the national growth rate.

2. Assuming Arizona continues to grow at a rate greatly outpacing the national rate (predicted to be about 3 times the national rate), the number of visits to existing wilderness will continue to increase, and Arizona in particular could benefit from additional wilderness.
3. Demographics related to visitor race and ethnicity will affect the rate of increase in wilderness visits in the Southwestern Region. Even though the faster growing racial/ethnic groups have relatively low participation rates, wilderness use is still expected to increase because of the overall population growth rate.
4. Public demand increases with proximity to six population centers: Flagstaff, Phoenix, Tucson, Santa Fe, Taos, and Albuquerque. Consider wilderness recommendations within 100-150 miles of those cities to provide for that demand.
5. Some additional public demand for wilderness in the Southwestern Region will occur from the influx of people moving to communities in the vicinity of the National Forests.
6. In terms of geographic distribution of wilderness, the Southwestern Region is under-represented with five percent fewer wilderness acres as compared with the representation nationally. Additionally, all quadrants in Arizona and New Mexico are under-represented with the exception of the southwest and southeast quadrants in Arizona. The most under-represented quadrants when compared with total federal wilderness acres are southeast and northwest New Mexico, and northeast Arizona which are at 6 percent or less in the number of wilderness acres.
7. Desirability of the scenic mountainous settings available in the rural communities within and adjacent to national forests in the Southwestern Region will attract new retirees and others, further contributing to a growth in wilderness visitation.

*Factor 3 - The extent to which nonwilderness lands on the NFS unit or other Federal lands are likely to provide opportunities for unconfined outdoor recreation experiences.*

There are 53 Inventoried Roadless Areas (IRA) and 1,206,507 IRA acres within 100 miles of Silver City. There are 11 BLM Wilderness Study Areas (WSA) and 173,476 WSA acres within 100 miles of Silver City (only acres within 100 miles are shown; actual IRAs and WSAs may be larger).

Within 100 miles of Silver City and on the ASNFs, there are 359,469 acres managed for Semi-Primitive Motorized (SPM) recreation, 282,175 acres managed for Semi-Primitive Non-motorized (SPNM) recreation, and 287,933 acres managed for Primitive recreation. Many of these acres overlap with existing wilderness areas, the Blue Range Primitive Area, IRAs, and potential wilderness areas.

*Factor 4 - The need to provide a refuge for those species that have demonstrated an inability to survive in less than primitive surroundings or the need for a protected area for other unique scientific values or phenomena.*

The ASNFs have identified 11 Threatened and Endangered species, 105 Species of Concern<sup>6</sup>, and 208 Species of Interest<sup>7</sup> that occur or are found on the forests. None of these species require a primitive wilderness environment to survive. However, some (Mexican gray wolf, for example) would benefit from reduced disturbance and human encounters.

<sup>6</sup> Species of Concern are species for which management actions may be necessary to prevent listing under the Endangered Species Act.

<sup>7</sup> Species of Interest are species for which management actions may be necessary to achieve ecological or other multiple-use objectives.

*Factor 5 - Within social and biological limits, management may increase the capacity of established wildernesses to support human use without unacceptable depreciation of the wilderness resource.*

There are three existing wildernesses on the ASNFs, all on the Apache side. Two, Mount Baldy and Escudilla, are less than 10,000 acres, are easily accessible by motor vehicles, and have limited trail systems. Visitor use in Mount Baldy is considered high with use concentrated on two of the three trails. Visitor use in Escudilla is considered moderate to high with use concentrated on one trail. Encounters with other wilderness visitors in both areas are high. For these two areas there are limited management opportunities to accommodate additional use. The third wilderness, Bear Wallow, is slightly larger, is more difficult to access, and has four trails. Visitor use is considered low. Here, additional demand could be accommodated without management changes.

*Factor 6 - An area's ability to provide for preservation of identifiable landform types and ecosystems. Consideration of this factor may include utilization of Edwin A. Hammond's subdivision of landform types and the Bailey-Kuchler ecosystem classification. This approach is helpful from the standpoint of rounding out the National Wilderness Preservation System and may be further subdivided to suit local, subregional, and regional needs.*

The Southwestern Regional Office used the process outlined in Loomis and Echohawk (1999)<sup>8</sup> to determine the underrepresented landforms and ecosystem types in Wilderness within Region 3.

The following landforms within the White Mountains-San Francisco Peaks-Mogollon Rim ecoregion section (where the ASNFs are located) are underrepresented in Wilderness in the region: Burro Mountains Oak-Juniper Woodland, Coconino Plateau Woodland, and San Francisco Peaks Coniferous Forest. Only Burro Mountain Oak-Juniper Woodland and Coconino Plateau Woodland are found on the ASNFs.

The following ecosystem types are underrepresented in Wilderness in the region: Desert Communities, Great Basin/Colorado Plateau Grassland, Great Plains Grassland, Piñon-Juniper Woodland, Sagebrush Shrubland, and Semi-desert Grassland. Only Great Basin Grassland, Piñon-Juniper Woodland, and Semi-desert Grassland are found on the ASNFs.

This potential wilderness contains one underrepresented ecosystem, 6,896 acres of Semi-Desert Grassland.

***Overall Need: Low***
