2022 Alaska Region Wildfire Summary

Calm on the Forests, Active Beyond

No major wildfires occurred on USDA Forest Service lands, with 31 wildfires burning 12.6 acres on Alaska’s two national forests. In contrast, the state as a whole, recorded its seventh largest wildfire season ever with 591 wildfires burning over 3.1 million acres.

Later in the summer, as fire season picked up in the Pacific Northwest, crews and IMTs from Alaska traveled south to return the favor.

Mutual Support

The USDA Forest Service Alaska (Region 10) and the Pacific Northwest (Region 6) provided mutual wildfire support to each other. By June, all Interagency Hotshot Crews (IHC’s) and three Incident Management Teams (IMT’s) from the Pacific Northwest Region participated in fire assignments in Alaska. By July 30, most crews and fire personnel working in Alaska returned home.

Raising Awareness

Alaska’s national forests initiated fire restrictions and fire danger warnings to decrease the potential for human caused wildfires. The Tongass National Forest experienced warm and dry conditions in early June that lead to high fire danger in the north zone of the Forest. Though no fire restrictions were implemented in the Tongass, the public was encouraged to be extra vigilant with campfire safety and burning. Drier than normal conditions in early July prompted two-weeks of fire restrictions on the Chugach National Forest in the Seward Ranger District and portions of the Glacier Ranger Districts. This order coincided with a larger emergency burn closure issued for much of south central and interior Alaska.
Spruce Beetle Mitigation

The Chugach National Forest initiated spruce beetle mitigation beginning in March. Approximately 80 acres were planned for completion in early spring. Prescribed burning of slash piles created as a result of on-going spruce beetle mitigation and hazardous fuels reduction projects is necessary to reduce wildfire potential and severity.

Cause of Fires

Typically, lightning is the leading cause of wildfires in Alaska, but in 2022 slightly more wildfires were caused by humans state-wide. This contrasts with the number of acres burned from lightning-caused fires (3,094,575) which is far greater than the number of acres burned from human-caused wildfires (11,722) and wildfires with undetermined causes (39). Most lighting fires started in remote or inaccessible areas.

Big Picture: Regional Context

Dry weather in late May and June, along with early season lightning, started many fires in southwest Alaska. The state reached Preparedness Level (PL) 5, the highest level of preparedness, by the end of June. Fires were numerous in southwestern and central interior Alaska. At the peak of fire activity on July 13, there were at least 11 IMT’s and over 2,200 firefighters assigned to incidents in the state. The typical mid-summer shift towards a wetter weather pattern started around July 12. It continued to be cool and wet into August, especially in the west and south resulting in the end of the fire season. Southeast and southcentral Alaska were particularly wet.
