

2015 Aerial Insect and Disease Survey

USGS 100K Quad: ROBINSON MOUNTAIN - E148120; 5A

Mortality Agents			Defoliators		
Code	Damaging Agent	Primary Host	Code	Damaging Agent	Primary Host
1	Douglas-fir beetle	Douglas-fir	BS	W spruce budworm	True fir, Douglas-fir, spruce
3	Spruce beetle	Engelmann spruce			
4	Fir engraver	True fir			
5	W Balsam bark beetle	Subalpine fir			
6B	Mtn. pine beetle	Whitebark pine			
6L	Mtn. pine beetle	Lodgepole pine			
6P	Mtn. pine beetle	Ponderosa pine			
7	Oregon pine ips	Ponderosa pine			
8B	W pine beetle pole	Ponderosa pine			
9	Silver fir beetle	Pacific silver fir			

Other Damaging Agents		
Code	Damaging Agent	Primary Host
AB	Balsam woolly adelgid	True fir
DH	Dying hemlock	Western hemlock
FIRE	Fire	All species
NE	Net flow	All species
WATR	Water damage	All species

NOTE: Only the damage agents present in this quad are listed in this legend. The cause of damage is described by an alpha numeric symbol on the map and is followed by the number of trees affected; number of trees per acre (example: 5A); or the intensity of damage (L - Light, M - Moderate, H - Heavy).

USGS 100K Quad: ROBINSON MOUNTAIN - E148120; 5A
2015 Aerial Insect and Disease Survey
Map Scale: 1:100,000
Date: 24 November 2015

Legend

- Defoliating Agents
- Mortality Agents
- Other Damage
- WDNR Managed Lands
- Areas Not Flown During Overview Survey
- 2015 Large Fires

The basemap is an ESRI map service of TOPOI data (Copyright 2013 National Geographic) which is comprised of seamless, scanned images of USGS paper topographic maps. For more info on this map see http://globe.arcgisonline.com/maps/USA_Topo_Maps.

A data dictionary, digital copies of this map and geospatial insect and disease data are available at: <http://www.fs.usda.gov/detail/forest-grasslandhealth/insects-diseases/>

How the Aerial Surveys Are Conducted

Data represented on this map are based on trees visibly affected by forest insects and diseases detected and recorded during aerial survey flights conducted by the USDA Forest Service, the Washington Department of Natural Resources and the Oregon Department of Forestry. Observers have just a few seconds to recognize the color difference between healthy and damaged trees of different species; diagnose causal agents correctly; estimate intensity; delineate the extent of damage; and precisely record this information on a georeferenced, digital map. Air turbulence, cloud shadows, distance from aircraft, haze, smoke and observer experience can all affect the quality of the survey. These data summaries provide an estimate of conditions on the ground and may differ from estimates derived by other methods.

The aerial survey provides information on the current status for many causal agents and is important when examining insect activity trends by comparing historical and current survey data over large areas.

Overview surveys are a 'snap shot' in time and therefore may not be timed to accurately capture the true extent or severity of a particular disturbance activity. Specially designed surveys with modified flight patterns and timing may be conducted to more accurately delineate the extent and severity of a particular disturbance agent. Special surveys, such as Swiss needle cast surveys, are conducted when resources are available to address situations of sufficient economic, political or environmental importance.
