## APPENDIX D

### ROAD MAINTENANCE

In analyzing the cost and benefit of roads for the Uinta Wasatch Cache National Forests, six major factors should be considered. These are:

- Commercial use and contributing funds;
- Shared road maintenance agreements;
- Byway/Backway designation;
- Public Forest Service Roads (PFSR); and
- Annual maintenance costs.

Each factor is important but to a different degree, therefore they are weighed based on existing and potential benefits. The degree to which each factor has potential is identified by numeric values listed under their associated measurement indicator.

#### Commercial Use

**Description of Indicator.** Several roads on the Forest are utilized by commercial users, but many have not been identified. These users may or may not be contributing to road maintenance costs. Identifying these roads is essential to properly collect funds needed to maintain the infrastructure to provide for safe passage and use.

**Measurement Indicator.** The commercial use rating is based on identifying existing users, determining if funds are being collected, and potential to collect funds. A list of ratings for each road segment is in Table D.1.

- 4 = Road segment has commercial users, users have been identified and funds are being collected.
- 2 = Road segment has existing or potential commercial use, users have or have not been identified and funds are not being collected.
- 0 = Road segment does not have existing or potential commercial users.

**Data Limitations.** Limitation of data and analysis include ability to identify commercial users, formulate agreements, and collect funds. Analysis was based on data in INFRA and corporate knowledge of road use.

**Analysis Results.** The analysis showed that 12 percent of road segments analyzed have been identified with commercial users in place and funds being collected and 17 percent have existing or potential commercial user but funds are not being collected. The other 71 percent were rated as not having existing or potential commercial use. Further analysis at sub-Forest scale should evaluate roads for potential or existing commercial uses were funds are not being collected.

## Shared Road Maintenance Agreement

**Description of Indicator.** The Forest has several roads that are under agreement for shared road maintenance in Utah, including Utah, Juab, Wasatch and Toole Counties. Counties are currently provided with federal funding based on percentage of National Forests lands within their county. Identifying existing and potential shared road maintenance agreements can provide mutually beneficial results.

**Measurement Indicator.** The shared road maintenance agreement rating is based on identified and potential agreements. A list of ratings for each road segment is in Table D.1.

- 4 = Road segment is currently identified in a shared road maintenance agreement
- 2 = Road segment has potential for agreement, but no agreement is in place.
- 0 = Road segment does not have existing or potential for shared road maintenance agreement.

**Data Limitations.** Limitation of data and analysis include counties interest in entering into shared-road maintenance agreements and road location relative to county facilities. Analysis was based on data in INFRA and corporate knowledge of road maintenance. Confirmation of potential road maintenance agreements with non-Forest Service has yet to be addressed with proposed road users.

**Analysis Results.** Of the 2,851 road segments analyzed for shared road maintenance, 298 road segments or 584 miles of road have current shared maintenance agreements in place. Nine road segments or 5 miles of road were identified as having the potential for agreements but no agreements are in place. The remaining 2,543 road segments or 1,975 miles were identified as not having existing agreements or the potential for shared road maintenance agreements.

## Byway/Backway

**Description of Indicator.** There are FSR's that have been identified as Forest Byways and Backways. A re-evaluation should be made to determine if any of these roads have potential to be designated as a Forest Byway, and in turn become eligible for Federal Highway Administration funding.

**Measurement Indicator.** The Forest Byways and Backways rating is based on identified and potential Byways and Backways. A list of ratings for each road segment is in Table D.1.

- 4 = Road segment is currently identified as a Forest Byways or Backways
- 2 = Road segment has potential for designation as a Forest Byways or Backways.
- 0 = Road segment does not have existing and potential for Forest Byways or Backway designation was analyzed.

**Data Limitations.** None

**Analysis Results.** The analysis showed that 4 road segments analyzed are currently designated as Forest Byway or Backway and 25 road segments have the potential for designation as a scenic byway or backway. It is not anticipated that these percentages will increase dramatically, but potential designation was not analyzed. As use continues to increase on the Forest, during future

analysis or access and travel management revisions, roads should be evaluated for potential designation.

## Public Forest Service Road

**Description of Indicator.** There are several roads on the Forest that are identified as potential Public Forest Roads (PFSR). In coordination with the Intermountain Region these roads have been identified and the Forest Service has been identified as a potential public road authority. If the agency becomes a public road agency we would have potential to collect funds for the maintenance and upgrade of these roads identified as public routes.

The PFSR rating is based on identified potential public roads in INFRA. A list of ratings for each road segment is in Table D-2.

- 4 = Road segment is currently listed as potential public road and is in the top 50 roads identified on the Regional priority list.
- 2 = Road segment is currently listed as potential public road, but is not in the top 50 roads identified on the Regional priority list.
- 0 = Road segment does not have existing or potential for public road designation.

**Data Limitations.** Forest Service has not officially been designated as a public roads agency.

**Analysis Results.** The analysis showed that 9 percent of road segments analyzed are currently listed as potential public roads, with 1.5 percent (or 42 road segments) in the top 50 of the regional priority. The opportunity for the Forest Service to be considered as a public road authority has yet to be decided. These roads should be considered a high priority and benefit in terms of potential shared maintenance.

## Annual Maintenance Costs

**Description of Indicator.** With road maintenance budgets declining and traffic volumes on the Forest road system dramatically increasing, many roads have not been maintained to the levels established in road management objectives. The percentage of road miles maintained has been on a steady decline due to better reporting of actual system miles, reduction in appropriated funds, impacts associated with increased use. This reduction in ability to maintain the road system to standard is a direct correlation to the large back-log of deferred maintenance. Table D.2 identifies estimated annual cost for each road. These costs were generated from INFRA database.

**Measurement Indicator.** The maintenance rating is based on estimated annual maintenance needs identified compared to average cost per mile relative to maintenance level. A list of ratings for each road segment is in Table D.1.

- 6 = Maintenance costs are less than 75% of average cost per mile for objective ML.
- 3 = Maintenance costs are between 75% and 125% of average cost per mile for objective ML.
- 0 = Maintenance costs are greater than 125% of average cost per mile for objective ML.

**Data Limitations.** Costs per mile were generated from road condition survey data collected. Not all roads have been individually surveyed. Roads not surveyed were assigned the average annual cost by associated maintenance level as calculated by INFRA through extrapolated costs from roads

surveyed. As more accurate data is collected on existing condition of roads these ratings should be re-evaluated. In addition, allocated funding is the primary source of dollars to maintain and repair roads. Since, we can't estimate future funding trends and it is anticipated that the minimum road system will be higher than allocated funding; these values can only assess the roads that are the highest unit costs and provide opportunities to change ML.

**Analysis Results.** The analysis showed that annual costs vary dramatically by road segment. Roads that have annual costs that are less than 75 percent of average cost per mile include 211 miles (or 6% of segments). Roads that have annual maintenance costs that are between 75 and 125 percent of average per mile include 930 miles (or 54% of segments). Roads that have annual maintenance costs that are greater than 125 percent of average per mile include 1426 miles (or 40% of segments). Road segments with high costs per mile need to be evaluated further for opportunities to lower maintenance costs (i.e. through shared maintenance agreements or reevaluation of maintenance level).

## Overall Rating

**Description of Indicator.** The overall road maintenance rating each road segment incorporates existing and potential commercial use, shared road maintenance agreements, Forest Highway designation, public Forest Service roads, and annual and deferred maintenance costs. Each factor is important but to a different degree. The largest factor is appropriated funding for road construction, maintenance, operation and/or decommissioning. While all other factors have potential for large contributing dollars, they require external partnerships that need to be developed and maintained.

**Measurement Indicator.** The overall road segment rating weighs each of the five factors based on values assigned through analysis. Commercial use, shared road maintenance agreements, Forest Highway and Scenic byway and backway designation, and PFSR are assessed numeric values of 0, 2, or 4. Annual and Deferred maintenance are assessed numeric value of 0, 3, or 6. Numeric values were indicators of low, moderate, and high benefit for each factor, respectively. An overall rating is then assessed for each road segment based on cumulative value. An overall rating for each road segment visually displayed in Figure D.1 and a list is available in Table D.1.

High = Cumulative value is greater than or equal to 12  
Moderate = Cumulative value is between 1 and 11  
Low = Cumulative value is equal to 0.

**Analysis Results.** In terms of existing and potential maintenance funding the analysis shows that 75 miles, or 2 percent of road segments, received a high benefit rating; 1798 miles, or 72 percent of road segments received a moderate rating; and 694 miles, or 26 percent of road segments received a low rating. Since one of the primary purposes of this road analysis process is to provide a cost efficient road system, careful comparison of road segments receiving a low benefit rating to other benefits and costs should be evaluated.

## APPENDIX E

### MANAGEMENT OPPORTUNITIES, PRIORITIES AND RECOMMENDATIONS

In identifying management opportunities, priorities and recommendations the following outcomes were produced from this analysis:

- Costs/Risks, Benefits and Priorities for all classified roads (Table E.1);
- Road Management Objective description (p. 32);
- Forest Management Direction (p.32)
- Direction for Future Transportation Analysis (p.34)

#### Costs / Risks

**Description of Indicator:** The cost of a road segment includes threats, problems and risks associated with indicators identified and analyzed under watershed health, riparian function, aquatic species (WRA) and terrestrial wildlife (TW).

**Measurement Indicator.** In general, WRA rating is considered twice the risk as TW. The following is criteria for the overall cost rating assigned to each road segment. Overall cost/risk rating for each road segment is listed in Table E.1.

- High:        WRA = High AND TW = High or Moderate  
 Moderate:    All other ratings not evaluated as High or Low  
 Low:         WRA = Low AND TW = Low or Moderate

**Data Limitations.** Limitation of data and analysis include ability to compare and weight costs and risks identify through analysis. Analysis was based on data in INFRA, Transportation Atlas, GIS spatial data and corporate knowledge of road use.

**Analysis Results.** Based on the analysis 184 miles of road (or 5 percent of road segments) have been assessed a high cost or risk to the physical environment. In addition, 1262 miles (or 42 percent of road segments) have been assessed a moderate rating and 1121 miles (or 53 percent of road segments) have been assessed a low rating. Overall, this indicates that the majority of the classified road system is not contributing negatively to the physical environment. This is a good indication that concentrated efforts to relocate roads out of riparian areas, over the last 15 years, have been successful. Efforts should continue to prioritize action and/or assessment to decrease the number of miles with a high risk. Potential management opportunities may include modifications to use, relocation of roads, and/or harden surfaces within riparian areas. In addition, consideration to seasonally close roads to protect the physical and biological environment should be emphasized.

#### Benefits

**Description of Indicator:** The overall benefit of a road segment incorporates indicators identified under access (ACCESS) and maintenance costs (RM).

**Measurement Indicator.** In general, overall access rating is considered equivalent to maintenance costs. The following is criteria for the overall benefit rating assigned to each road segment. Overall benefit rating for each road segment is listed in Table E.1.

- High: ACCESS = High AND RM = High OR Moderate OR  
ACCESS = Moderate AND RM = High
- Moderate: All ratings not evaluated as High or Low
- Low: ACCESS = Low OR Moderate AND RM = Low

**Data Limitations.** Limitation of data and analysis include ability to compare and weight benefits identify through analysis. Analysis was based on data in INFRA, Transportation Atlas, GIS spatial data and corporate knowledge of road use.

**Analysis Results.** Based on the analysis 976 miles of road (or 35 percent of road segments) have been assessed a high benefit for access and road maintenance indicators. In addition, 1134 miles (or 50 percent of road segments) have been assessed a moderate rating and 457 miles (or 15 percent of road segments) have been assessed a low rating. Overall, this indicates that the road system is in-place. Specifically, those roads with low benefit rating should be prioritized for further analysis, review and/or action. Indicators should be individually assessed and confirmed to determine future management. Potential management opportunities may include modifications to use (conversion), follow-up on any potential outside funding sources, and closure and rehabilitation.

## Priorities

**Description of Indicator.** A priority is assigned to best assess which road segments are recommended for action or further evaluation that includes the primary management opportunities based on the roads analysis process.

**Measurement Indicator.** A priority is assigned to each road segment based on overall cost and benefit rating. A priority for the evaluation of primary management opportunities for each road segment is listed in Table E.1. Priority criteria are as follows:

- A: Cost/Risk = High OR Benefit = Low
- B: Cost/Risk = Moderate AND Benefit = Moderate OR High
- C: Cost/Risk = Low AND Benefit = Moderate
- : Cost/Risk = Low AND Benefit = High

**Data Limitations.** Limitation of data and analysis include ability to compare and weight costs/risks with benefits identified through analysis. Analysis was based on data in INFRA, Transportation Atlas, GIS spatial data and corporate knowledge of transportation system.

**Analysis Results.** The analysis indicated that 596 miles of road (or 19 percent of road segments) have been assessed an A priority; 1074 miles or 37% of road segment a B priority; 536 miles or 27% a C priority; and 360 miles or 17% no priority. Specific action should be taken for roads evaluated with an A priority. These roads are identified as high risk with a low benefit. If several of these roads are concentrated within a watershed, the watershed should be considered a high priority for assessment and a sub-Forest scale analysis should be incorporated.

## Primary Management Opportunities (PMO)

Primary Management Opportunity (PMO) is based on comparing cost and benefit rating for a road segment. PMOs give each road a preliminary rating of “Likely Needed” or “Likely not Needed”. This allows for the identifying and prioritizing detailed analysis areas based on the PMO identified. Site specific analysis will be required to prior to any decision associated with change in management of road segment.

***Analysis Results.*** Of the 2851 road segments analyzed, the initial forest wide review suggests that 2827 road segments or 2522 miles of road are listed as “Likely Needed” and 24 road segments or 45 miles of road are listed as “Likely Not Needed”.
