

Timber Supply and Demand: 2010

Alaska National Interest Lands Conservation Act
Section 706(a) Report to Congress
USDA Forest Service, Alaska Region

Dec 21 2011

Report Number 26

Preface

This is the 26th report prepared in accordance with Section 706(a) of the Alaska National Interest Lands Conservation Act (ANILCA), which directs the Secretary of Agriculture to monitor and report on timber supply and demand in Southeast Alaska. The report provides a summary of timber sale activity in the region and a review of the primary factors affecting timber markets in 2010. This report was prepared by Susan J. Alexander, PhD, Regional Economist for the Alaska Region.

Director of Ecosystem Planning
USDA Forest Service, Alaska Regional Office
P.O. Box 21628
Juneau, AK 99802

Summary

The annual volume of timber sold on the Tongass National Forest in the years from 2006 to 2010 ranged from 5.4 to 85 million board feet (MMBF). The volume sold in 2010 was 45.6 MMBF. Harvested volumes in the same time period ranged from 18.7 to 43.2 MMBF; in 2010 35.4 MMBF were harvested from the Tongass National Forest. Private suppliers in Southeast Alaska, comprised of the Native corporations, harvested 66.4 MMBF in 2010, a slight increase from the 51.8 MMBF harvested in 2009. Harvests in Southeast Alaska from State of Alaska lands (DNR, University, and Mental Health lands) were 10.5 MMBF in 2010, a decrease from the 13.5 MMBF cut in 2009. Wood product employment (logging and sawmilling) in the region rose to approximately 247 full-time positions in 2010, an increase of about 30 jobs from 2009. Tongass National Forest-related employment in logging and sawmilling was 107 in 2010, a 23 percent increase from the 87 jobs in logging and manufacturing in 2009 associated with timber harvest on the Tongass.

Markets for Southeast Alaskan manufactured wood products appear to be primarily U.S. domestic destinations, but the final destination for manufactured products can be difficult to track using trade data. Sawmills in Southeast Alaska reported lumber sales to US markets (73 percent) and to the Pacific Rim (27 percent) in 2010. In 2009, 59 percent of lumber sawn in Southeast Alaska was sold to domestic markets, and 40 percent went to Pacific Rim markets.

Between 2006 and 2010, about 30 percent of Tongass National Forest timber harvests were shipped out of state as whole logs, to foreign and domestic markets. Log exports from the Tongass National Forest to foreign ports constitute about five percent of all softwood log exports from the Alaska customs district. The majority of whole log exports from Alaska originates from Native corporation lands. Producers will sell products into markets based on price. Alaskan wood products markets are closely tied to North American and Pacific Rim markets, and are being impacted by the global recession, tight credit markets, and a sharp and continuing downturn nationwide in housing starts.

1. Introduction

Section 706(a) of the Alaska National Interest Lands Conservation Act (ANILCA) (Public Law 96-487, December 2, 1980) directs the Secretary of Agriculture to monitor and report on timber supply and demand in Southeast Alaska. Accordingly, this report describes the status of the timber market in Southeast Alaska during the 2010 federal fiscal year (October 1 - September 30). Many of the statistics presented in this report, however, are based on calendar years. In the appendix tables, data are labeled as to whether they represent fiscal years or calendar years.

The report is divided into three main sections, the first providing a general overview of conditions within the region's timber economy, the second discussing timber supply, and the third addressing demand for regional timber. The general overview looks at current

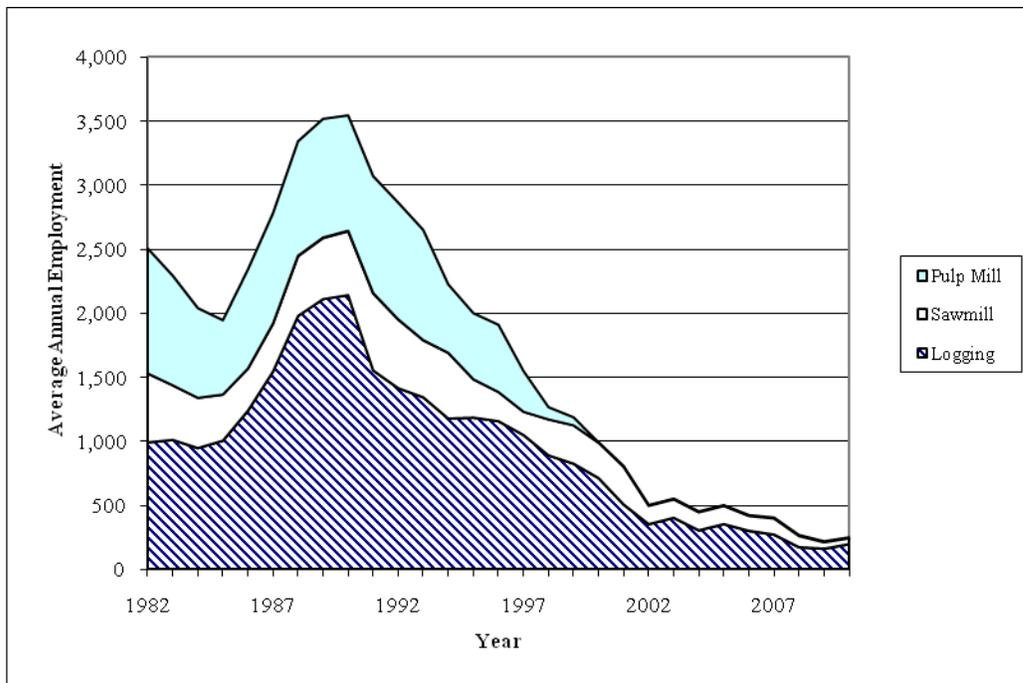

developments in the timber sector with particular emphasis on timber employment. The supply section focuses on the timber sale program of the Tongass National Forest. The demand section considers the various factors outside of the Tongass National Forest that help determine the willingness of local buyers to purchase Tongass National Forest timber. These factors include Asian and domestic U.S. markets, current processing capacity in Southeast Alaska, and other suppliers of timber in the region. Supporting data for the analysis are presented in the various tables included in the appendix.

2. Overview of the Region's Timber Economy

Abrahamson (2011) reported mild job recovery in 2010 in Southeast Alaska after a decline in 2009. However, Southeast Alaska is expected to lose jobs in 2011. The economy of Alaska has lost less ground than other states due to a large oil industry and federal government spending. The national construction industry has been hit hard by issues in mortgage and banking industries. Trends in construction directly impact demand for wood products. According to the World Economic Outlook (April 2009; IMF), this is the most severe and synchronized global recession in the past 50 years. The impacts are particularly severe for any industry tied to housing.

Southeast Alaska's economic well-being is closely tied to resource-dependent industries, including fishing, forestry, and mining, and many jobs also result from tourism. Declining population and projected declines in cruise ship visitation will continue to erode employment in transportation, trade, accommodation, and leisure. However, mining, government, and health care will keep overall losses small (Abrahamson 2011). Employment in the timber industry rose by 31 jobs, from 216 in 2009 to 247 in 2010 (Figure 1 and Appendix table A-2). U.S. Forest Service job losses in the region accounted for nearly all of the federal employment losses in the past five years (Wilkinson 2010).

Figure 1. Southeast Alaska Wood Products Employment, 1982-2010.

Total timber sector employment has dropped from about 560 to 247 in Southeast Alaska in the wood products industry (logging, pulp and paper, and sawmilling) from 2003 to 2010 (see Figure 1, and Table A-2 in appendix). Tongass National Forest-related employment in logging and sawmilling has declined from 199 in 2003 to 107 in 2010, a drop of about 50 percent (see Table A-2 in the appendix for how the Tongass National Forest - related employment numbers were calculated). At the same time, non-Tongass logging and sawmilling employment dropped from 362 to 140, a decline of 61 percent. Several factors contribute to the difference in employment decline between manufacturing and logging. Logging employment is generated from all ownerships, including state sales, Native corporation harvests, and Forest Service timber sales. Sawmilling employment has historically been primarily the result of Forest Service timber sales, with a small contribution from state timber harvest. As the total volume of harvest declined regionally, state timber sales became a larger proportion of harvested volume (see appendix table A-6), and contributed proportionally more to both logging and sawmilling employment. Starting in 2008, however, harvest from state lands has dropped precipitously. Volume harvested from Alaska Department of Natural Resource (DNR) lands dropped after reaching decadal allowable cut volumes due to offering surplus volume in the early part of the decade (C. Clark, personal communication, 8-10-11). Alaska Native harvests have continued to contribute to logging employment, although harvested volume from Native lands in Southeast Alaska has also declined in the past decade.

Until recently, Southeast Alaska has produced most of the timber harvested in Alaska. Halbrook et al. (2009) conducted a statewide assessment of the timber industry in Alaska, and found that in 2005, the Southeast region supplied 74 percent of Alaska's total timber harvest. Most harvest in Alaska in 2005 (60.7 percent) came from Native and private

lands. State and other public lands supplied 21.7 percent, and the remaining 17.5 percent came from national forests. In contrast, most mill supply came from national forests (53 percent), followed by state and other public lands (38 percent), and then by private and Native lands (8 percent). Timber harvest in Southwest Alaska, including Kodiak and Afognak Islands, has recently been increasing. Since 2007, timber harvests from private Native Corporation lands in Southwest Alaska have steadily increased from 30 to 59 MMBF per year. Exports of these logs show up in the statewide export data in appendix tables A-7 and A-9. Since 2007, timber harvests in the northern region from Alaska DNR lands has ranged from 3.5 to 5.8 MMBF. Much of this timber is being used to manufacture pellet fuel in Fairbanks. Timber harvests reported in Table A-6 show totals for Southeast and South-Central Alaska, but do not include harvests occurring in South-central or the northern region. Warren (2011) reports annual statewide timber harvests for Alaska by ownership.

The wood products industry in Southeast Alaska, and in fact the entire state, consists of individual- and family-owned sawmills, and independent logging businesses. Sales of Southeast Alaska manufactured products to domestic markets, including Alaska, have comprised about 80 percent of all sales from 2002 through 2010, on average. However, poor domestic markets for wood products prompted a shift in 2009. Sawmills in Southeast Alaska reported selling about 60 percent of their lumber in US markets and 40 percent to Pacific Rim countries in 2009. In 2010, sawmills reported selling about 74 percent of their lumber in domestic markets and about 27 percent to Pacific Rim markets. Most lumber sales from Southeast Alaska are the result of the one remaining operating medium-sized sawmill, which has close ties to businesses in Washington state. The wood products industry in Southeast Alaska has changed considerably since the end of the long-term sales program, and seemed to stabilize somewhat between 2002 and 2006. However, the industry has been declining further since 2007, as measured by employment (appendix table A-2) and total regional timber harvest (appendix table A-6). The industry is vulnerable both to supply and demand issues.

Wood used in sawmills in Southeast Alaska comes from the Tongass National Forest, State lands, and some private lands. Data from Kilborn et al. (2004), Brackley et al. (2006b), Brackley and Crone (2009), Alexander and Parrent (2010), Parrent (2010), and Parrent (2011) show that the Tongass National Forest contributed an average of about 67 percent of wood sawn in Southeast Alaska from 2002 to 2010 (see footnote 3, appendix table A-2). Since 2006, about 32 percent of total volume harvested on the Tongass National Forest has been shipped out of state as whole logs, primarily to Asian markets although some goes to domestic processors in the west coast. Purchasers of Tongass National Forest timber sales maximize profits and are able to stay in business by selecting which logs to saw locally and which to sell to other markets, within regulatory and contractual boundaries.

For a few years, State of Alaska lands, including lands managed by the Alaska DNR, Mental Health Trust, and University of Alaska, became an important source of logs processed by local sawmills in Southeast. The Trust Office is a state agency but Trust lands are regulated more like private land ownerships, in terms of forest practices and

access. There have not been any timber harvests on University of Alaska lands for several years. Timber harvests from mental health and State lands comprise a relatively small percentage of Southeast Alaska forest lands, and state lands could not indefinitely supply such a high proportion of the needs of remaining Southeast Alaska sawmills. Harvest on state lands in Southeast Alaska has fallen from 44.6 MMBF in 2006 to 10.5 in 2010. This could be a serious problem for the local industry if the Forest Service is unable to offer sufficient economic timber sales to meet estimates of demand. A small amount of sawlogs and chips are imported into Alaska ports from other countries (primarily Canada) (appendix table A-6).

While supply and demand are treated separately in the following sections, it is important to remember that the interaction of these two forces is what is important. Both supply and demand present challenges for the region's timber sector as it is currently configured.

3. Supply

The supply of timber from the Tongass National Forest is determined by two main factors. The first is the volume of timber offered for sale by the Forest Service. Demand for National Forest timber is estimated annually, using procedures that were developed by the Alaska Region of the Forest Service with the aim of adjusting volume offered to meet projected demand (Morse 2000). Long-term demand estimates were re-calculated by the US Forest Service Pacific Northwest Research Station in 2006 (Brackley et al. 2006a; Brackley and Haynes 2008). The basic procedure of calculating needed annual offerings as outlined by Morse (2000) did not change, but was modified by Alexander (2008) to fit the most recent estimates of long-term demand. The second factor affecting timber supply is the cost of harvesting and delivering wood to its respective intermediate markets: mills in the case of locally processed material, and ports in the case of log exports.

This section of the report describes the Tongass National Forest timber sale program as it stood at the end of FY 2010. While timber harvests from sources other than the Forest Service help determine regional log supply, their impact on the FS sale program is, if anything, on the demand side. This is because these other sources may act as substitutes for federal timber. Accordingly, private and Alaska state harvests will be discussed in the next section on timber demand.

3.1 The Timber Sale Preparation Process

The Forest Service timber sale process involves a number of stages (or "gates"). The first stage (Gate 1) involves the completion of a "Position Statement," which provides a brief analysis of the project area with the intent of determining the feasibility of the potential timber sale. Gate 2 entails gathering public comment and conducting environmental analysis in accordance with the National Environmental Policy Act (NEPA). The remaining gates involve, respectively, plan implementation and field layout (Gate 3), sale appraisal and advertising the sale (Gate 4), bid opening (Gate 5), and sale award (Gate 6).

The NEPA process entailed in Gate 2 often comprises the bulk of work devoted by the Forest Service to any given sale. This work formally begins with public scoping, describing the Forest Service's proposed action and intent to conduct an environmental analysis. This stage concludes with the publication of an Environmental Assessment or (in the case of projects with potentially significant effects) an Environmental Impact Statement, and ultimately a Decision Notice or a Record of Decision in which the Forest Service authorizes the sale and documents the conditions for implementing it. Tongass timber sale NEPA decisions are frequently subject to administrative appeals and litigation. Having cleared these requirements, timber sales can then progress through the remaining four gates.

The volume cleared by the NEPA decision is often broken up into separate sales, which may or may not be prepared and offered in the same fiscal year as that in which the decision was made. During the period covered by this report, volume was officially reported as being offered at the time of advertisement. In 2005, as directed by Public Law No. 108-108 (Sec. 318, HR 2691; 2004), the Alaska Region began using a residual value approach in sale appraisals. Using forest cruise data, current market prices for products, mill processing information, and estimates of harvest, transportation, and processing costs, the Forest Service determines the value at which the sale will be advertised. A timber sale must appraise with a positive value to be offered for sale. Further details on timber valuation methods in the Alaska Region can be viewed by going to the US Forest Service Alaska Region website and selecting "Resource Management" under the "Land and Resource Management" heading. Private firms are invited to bid at or above the advertised rate. Sales are then awarded to the high bidder subject to certain additional considerations designed to ensure the bidder's ability to comply with the conditions laid out in the sale contract.

For various reasons, within any given year, a portion of the timber volume planned for sale may not be sold. In some instances, sales or portions of sales that are planned are not offered. In other instances, a sale is offered and does not receive a valid bid. If there is no indication of competition from other purchasers, those sales may be available to purchasers at their original advertised rates and conditions for up to one year without additional advertisement. The Forest Service may repackage the sale to enhance its economic attractiveness.

After a sale has been awarded, the purchaser usually has around three to five years in which to harvest the sale volume. The sum total of volume yet to be harvested is termed "volume under contract," and this constitutes a pool of timber from which contract holders may draw depending on market conditions and their business plans. Details on volume under contract as of the end of FY 2010 are in Appendix Table A-10.

To evaluate the status of the timber flow, Morse (2000) established that it is important to assess the ratio of contract volume to harvest. This ratio can indicate how many years of supply (volume under contract) mills have compared to what they are sawing (i.e., harvest). During the 1981-1995 time period, historical ratios of volume under contract to harvest for the independent sale program (in other words, not including volume in the

long-term contracts associated with the pulp mills in Ketchikan and Sitka) ranged from 1.0 to 3.4 with an average of 1.8 (Morse 2000). The ratio of contract volume to harvest peaked in 2002 at 6.8, but dropped closer to the three-year supply objective in 2003. In 2004 and 2005 the ratio dropped to 1.7, and increased to 2.6 in 2006. In 2007, the ratio rose to 6.1, reflecting poor wood market conditions in 2007. The ratio dropped back to about 3 from 2008 to 2010.

Table 1. Available Timber Volumes and Harvest (Fiscal Years, MMBF).

	2002	2003	2004	2005	2006	2007	2008	2009	2010
Volume Under Contract ¹	230	193	78	83	111	114	97	84	98
Harvest	34	51	46	50	43	18.7	28	28	35
Contract Volume / Harvest ratio	6.8	3.8	1.7	1.7	2.6	6.1	3.5	3.0	2.8

1. Volume in 2002 does not include volume under injunction. Volumes in 2004 and 2005 do not include cancelled sales. The decline in volume under contract in 2004 and 2005 was largely due to cancelled timber sales (Alexander 2010). See appendix tables A-3 and A-10.

The ratio of volume under contract to harvest is only one indication of whether there is sufficient timber volume under contract to ensure industry viability. There can be increasing contract volume to harvest ratios while there are declining contract volumes. Some volume under contract in 2002 and 2003 was in sales cancelled in 2004 and 2005. Timber flow volumes are far lower than the allowable harvest rates outlined in the 2008 Tongass Land Management Plan (TLMP). The allowable sale quantity (ASQ) is partitioned into two non-interchangeable components (NICs). About 238 MMBF would be available for harvest under most market conditions (NIC I), as this volume is located on the most operable, accessible ground. The maximum ASQ is 267 MMBF, of which about 29 MMBF is in areas that are difficult to harvest or are isolated (NIC II) (USDA 2008).

Figure 2 illustrates trends in timber offered, sold, and harvested since 1980.

Figure 2. Volumes of timber offered, sold and harvested from the Tongass National Forest, 1980-2010 (Fiscal Years, MMBF).

In 2008, sawmills in Southeast Alaska were operating at about 8 percent of estimated capacity (Alexander and Parrent 2010). Capacity utilization dropped to 5.4 percent in 2009 (Parrent 2010) and increased to 10.1 percent in 2010. Much of the increase in capacity utilization was the result of loss of regional mill capacity due to one large mill being dismantled, sales of equipment from other mills, and losses due to fires. By comparison, sawmills in Idaho, Oregon, California, and Montana generally utilize more than 80 percent of their capacity, unless there is a severe economic downturn (Brandt et al. 2006, Keegan et al. 2001, Morgan et al 2004a, Morgan et al. 2004b). In 2009, sawmills in the western US were running at about 55 percent of capacity (Dietz 2010). The capacity utilization rate of the last operating medium-sized sawmill in Southeast Alaska in 2010 was estimated at about 17 percent (Parrent 2011). At such low utilization rates it is extremely difficult for sawmill owners to cover their fixed costs, much less make a profit.

4. Demand

Economists commonly define “demand” as the different amounts of a product buyers are willing to purchase at different prices. As such, demand cannot be characterized as a single number but should be viewed as a series of price-quantity relationships. The same is true for “supply,” and it is the combination of these two forces (supply and demand) that determine both the quantity and price of goods produced and consumed in the market place.

Softwood lumber exports from Alaska (Appendix Table A-7) dropped sharply in 2008 and 2009, and picked back up slightly in 2010. Mills report that they shipped lumber to foreign markets, but lumber shipped from other ports (e.g. Seattle) as recorded through

the Harmonized Trade data cannot be traced back to its origin. Wood chip exports from the Anchorage customs district fluctuated widely from 2004 to 2010 (Appendix Table A-8). In 2007 and 2008, wood chip exports from the Alaska customs district fell to almost zero. Log exports from the Alaska customs district constitute the vast majority of wood product exports value (Appendix Table A-9). For the past two years, the top three markets in order of significance for log exports were China, Korea, and Japan. While Japanese and Korean Alaskan log imports have generally been declining, log exports to China from Alaska have been steadily climbing as China consumes an ever-increasing proportion of Alaska timber.

Exports of whole logs from Tongass National Forest timber sales occur because of several factors. The 2007 decision to appraise sales for limited log shipments allows small diameter Sitka spruce and western hemlock to be shipped out of state. Alaska yellow-cedar is appraised under the assumption that it will be exported to foreign markets, as allowed under Section 318 of the Consolidated Appropriations Resolution, 2003 (Public Law 108-7). Even if a given species or diameter is appraised for out of state shipment, the purchaser can still process the wood in local sawmills if they choose to do so. The purchaser might be required to pay additional fees if they ship whole logs to markets other than what the timber sale was appraised for. However, a purchaser can apply for an export permit after a timber sale is sold, under certain conditions. Volumes of log exports from the Tongass National Forest (Appendix Tables A-4 and A-5) have been too small to make specific inferences from one year to the next; in 2010, log exports from the Tongass to foreign ports constituted 4.5 percent of all softwood log exports from the Alaska customs district (Appendix table A-7). Most logs shipped from the Tongass to markets outside Alaska have gone to Asian markets, with some going to domestic markets. Canada was not a destination for logs from the Tongass from 2003 through 2006, or in 2008, 2009, or 2010, but in 2007 more logs were shipped to Canada from the Tongass than were shipped to domestic markets in the Lower 48. These shifts in the destination of wood products from Alaska illustrate that sellers are going to maximize profits by selling logs or lumber wherever they get the best price.

Table 2 compares timber volumes harvested to log volumes shipped out of state from the Tongass National Forest (see appendix tables A-3 and A-5 for more detail). Table 2 shows how log exports have fluctuated compared to total harvest since 2006. Since the export policy was implemented, about 32 percent of total volume harvested has been shipped out of state as whole logs.

Table 2. Volumes harvested and exported from the Tongass National Forest, 2006-2010, MMBF.

<i>Fiscal Year</i>	<i>Harvest</i>	<i>Exports</i>		
		<i>Foreign</i>	<i>Domestic</i>	<i>Total</i>
2006	43.2	1.8	2.5	4.3
2007	18.7	3.4	0.2	3.6
2008	28.0	4.4	1.4	5.8
2009	28.4	13.1	0.3	13.4
2010	35.4	12.8	0.1	12.9

According to Brackley et al. (2009, p. 7), “much of the growth in US softwood lumber consumption since the early 1990s was a result of a prolonged increase in residential construction”. US construction demand spurred increased imports of lumber from Canada, a resurgence of softwood lumber production in the Pacific Northwest, and shifts in the types of lumber produced as markets shifted and suppliers jockeyed for market share. In the past, lumber from Alaska was often shipped into foreign markets. However, shipments of finished products milled in Southeast Alaska to domestic markets have become more significant, as can be seen in Table 3. Table 3 summarizes data gathered from sawmill operators in Southeast Alaska in log scale.

Table 3. Destination of Products Manufactured by Southeast Alaska Sawmills (MBF log scale).

<i>Year</i>	<i>Alaska</i>	<i>Other US states</i>	<i>Canada</i>	<i>Other foreign exports</i>	<i>Total</i>
2000 ^a	8,135	54,287	3,774	20,920	87,116
Percent of total	9	62	4	24	
2002	1,842	30,847	480	6,532	39,701
Percent of total	5	78	1	16	
2003	1,758	24,591	382	5,274	32,005
Percent of total	5	77	1	16	
2004	1,468	19,553	5,951	4,056	31,027
Percent of total	5	63	19	13	
2005	2,342	26,177	724	5,423	34,665
Percent of total	7	75	2	16	
2006	3,408	23,250	296	5,186	32,141
Percent of total	11	72	1	16	
2007	3,600	22,113	708	5,296	31,717
Percent of total	11	70	2	17	
2008	2,295	15,663	0	5,707	23,666

2010	1,475	10,026	0	4,307	15,807
Percent of total	9	64		27	

a. Data for 2001 are not available.

The conversion from log scale to lumber tally in Southeast Alaska at present is roughly 30 percent; i.e., lumber tally will be 1.3 times greater (approximately) than log scale. Appendix Table A-7 summarizes lumber export data from the Anchorage customs district in MBF lumber tally. There are several reasons the data in Appendix Table A-7 is different from the data in Table 3, although they are both about sawn product exports from Alaska. One is that Table 3 is estimates by Southeast Alaska mill owners of how much material went to various markets. Some of this material may have been shipped from ports in other states. Appendix Table A-7 summarizes data from all Alaska foreign exports as reported in the International Trade Commission Harmonized Trade Code (ITC

HTS) data. In addition, Table 3 and Appendix Table A-7 are in different scales (lumber tally versus log scale).

Table 4 compares the data in Table 3 and Appendix Table A-7 with the same scale (lumber tally). One would expect the foreign exports of sawn material from all of Alaska as reported by the Alaska Customs District to be equal to or greater than the amount reported by sawmills in Southeast Alaska if all products were shipped directly to their destination from Alaska producers. As can be seen in Table 4, export data from the Alaska customs district for at least the past decade has represented only about 15 percent, on average, of foreign exports of sawn products reported by Southeast Alaska mill owners alone. It is likely that mills in other regions of Alaska also export sawn products. This discrepancy could reflect where products were routed before being shipped out of the U.S. It is possible that Southeast Alaska sawn product exports are being shipped from the Seattle customs district, an issue called transshipments (products are shipped to other domestic ports and then re-routed to foreign destinations). This illustrates some of the difficulty in getting accurate data regarding wood product production and trade in Alaska. Estimating demand for Alaska wood depends on being able to determine where the markets are, so these discrepancies become important when trying to address the 1990 Tongass Timber Reform Act (P.L. 101-626, Sec. 101) requirement that the “Secretary shall....seek to provide a supply of timber from the Tongass National Forest which (1) meets the annual market demand for timber from such forest, and (2) meets the market demand from such forest for the planning cycle.”.

Table 4. Sawn wood products exports from Alaska, different reporting sources, lumber tally (conversion of log scale mill reports to lumber tally using a factor of 1.3).

<i>Year^a</i>	<i>SE sawmills reported foreign exports, MBF</i>	<i>ITC HTS data on exports from the Alaska customs District, MBF</i>
2000	32,102	3,609
2002	9,116	85
2003	7,353	1,217
2004	13,009	1,825
2005	7,991	2,669
2006	7,127	2,166
2007	7,806	1,761
2008	7,419	118
2009	7,041	176
2010	5,598	400

a. Data for 2001 are not available

The volume of timber sold from the Tongass National Forest in the past five years ranged from a low of 5.4 MMBF in 2008 to a high of 85 MMBF in 2006 (Appendix Table A-3). In the same time period, the timber offered for sale ranged from 24 MMBF in 2006 to 110 MMBF in 2005. Harvested volumes ranged from 18.7 MMBF in 2007 to 43 MMBF in 2006. Harvested volume in 2007 reflects poor wood products markets in 2007 due to

national home mortgage problems and their impacts on housing markets. Although harvested volume in 2008 and 2009 picked back up to 28 MMBF from the low of 18.7 in 2007, the small sold volume of 5.4 MMBF in 2008 reflected the continued global economic uncertainty and worsening wood products markets, in addition to issues purchasers may have had with how individual timber sales were configured. Sold volume in 2009 rose to 23 MMBF, but this included “opted”, and “contract” volumes. Opted is optional volume the purchaser can choose to harvest and pay for if market conditions are suitable. Local purchasers are wary about the risk of accumulating inventory in the uncertain markets facing all wood products industries in western North America. However, sold volume in 2010 was the second highest in five years at 45.6 MMBF and did not include “opted” volume. Sale design, purchaser preferences, uncertain global wood products markets, and a tight credit market beginning in 2008 all influenced the willingness and ability of Southeast Alaska wood purchasers to buy Forest Service timber sales. The export policy of 2007 may have reduced the perception of risk among timber purchasers enough to stimulate sales as the economy slowly recovers.

Profitability for Tongass National Forest Timber can be affected by the combination of valuable materials versus logging costs in a given timber sale, market options for lower grade material coming off the Forest, and prices for Southeast Alaskan premium species and grades. Although contracts allow the option of leaving utility logs in the woods, current market conditions still challenge profitability. Brackley et al. (2009) report that the combined costs of logging, manufacturing, and transportation of stumpage in Alaska are roughly \$149 per thousand board feet higher than in the Pacific Northwest, on average. These higher costs make it more difficult for Alaskan producers to compete in lower value commodity markets. During the current recession, wood manufacturers nationwide have been experiencing problems with tight margins, meaning the cost of producing wood products is only slightly less than or even greater than revenue. If this situation continues too long in any given manufacturing facility, they will go out of business. Details of prescriptions, bid prices, and species mixes for Tongass National Forest timber sales in 2010 are presented in Appendix Table A-1.

Minimum rates for forest products sold by the Forest Service are determined at the national level. The minimum rate is the lowest price that a product can be sold for. In many cases the national minimum rate equates to the national standard rate, which is the lowest rate at which a product can be sold without a supporting appraisal. Each Region, National Forest, or appraisal zone may establish and publish their own standard rates, so long as they are greater than or equal to the national rates. Those local standard rates are the minimum rates that the Forest Service can sell a product for without a supporting appraisal. The Tongass National Forest uses standard rates for timber on sales up to 500 MBF. The Region bases standard rates on either a large scale appraisal for a species or area, or on a set of transactions for a similar set of sales.

Appendix table A-1 lists sales sold in FY 2010 that were also offered in the same fiscal year; the total volume for the sales was 45.1 MMBF. The total volume of timber sold in FY 2010, as noted in appendix table A-3, was 45.6 MMBF. Some of the 45.6 MMBF sold was offered in the previous fiscal year.

A final consideration in relation to regional demand for Tongass National Forest timber is the supply of timber from other producers in Southeast Alaska. Both the Native Corporations and the State of Alaska also produce timber. Since the early 1980s, the Native Corporations have harvested over half of the total log volume produced in the region. In 2000, owing primarily to sales on Mental Health Trust and University of Alaska lands, the State emerged as a major producer, outstripping Forest Service production in 2001, 2002, 2006, and 2007. Harvest from state lands in Southeast Alaska dropped sharply in 2008 and remains at about 10 MMBF (see Appendix Table A-6). Native Corporation harvests have declined from a high of 434 MMBF in 1990 to a range of 50 to 106 MMBF in each of the last seven years—a level close to earlier predictions of the long-term supply potential of Native Corporation lands (Knapp 1992). In 2007, Sealaska Timber Corporation announced that their projected harvest levels will be declining in the near future; volume harvested from Native Corporations lands in Southeast Alaska dropped by almost half from 2005 to 2007. Harvests in 2008 and 2009 were about the same as 2007. Harvests in 2010 picked up somewhat, perhaps due to improving lag markets in China. In 2010, Sealaska Timber Co. provided over 210 jobs for employees and contractors.

According to Alaska State forestry specialists, Native Corporation, Mental Health Trust, and University timber, can be, and frequently is, exported in raw log form. Timber sold by the Alaska DNR can be processed locally or exported. Native Corporation and trust sales don't compete with National Forest timber in the local processing market. DNR sales may compete locally, but ultimately the volume available from the relatively small State timber base is far less than the volume from federal lands in Southeast Alaska. Although private and trust sales may compete with National Forest log exports (of yellow cedar, for example), the total market share of Alaska wood in the export market is too small for any one owner to influence demand for wood from other sources in Southeast Alaska (Brackley et al. 2006a). Small volumes of sawtimber and sometimes chips are imported to Alaska from other countries (appendix table A-6), but foreign imports are generally not utilized by Southeast Alaska sawmills.

Conclusion

According to Balter (2009), a major reconfiguration is occurring in the forest products sector in the US. Nationwide, over-capacity in lumber and panel manufacturing points to an extended period of tight margins. Sawmills have been closing nationwide, and mill closures will probably continue. In the short run, depleted cash reserves and restricted access to capital will limit new investment. Balter (2009) sees emerging markets for timber in wood-biomass energy applications, such as pellets, electrical generation, and bio-fuels, and carbon markets. However, in Oregon, the largest timber producer in the country, timber harvest in 2009 was the lowest it has been since the middle of the Great Depression (Dietz 2010). Western timber markets began to recover during the first half of 2010, fueled by optimism in domestic housing markets and strong Asian markets. However, when the home-buyer credit expired, new home starts fell, and remain lower than expected (Walker 2010). The lone stabilizing factor in western timber and log markets is export demand, primarily from China and Korea. However, exports are not

likely to keep prices from falling; experts expect exports to moderate falling prices (Walker 2010). Domestic markets are not likely to recover soon, and timber prices are projected to continue to fall. When demand for logs does recover, the lean inventories being held throughout the domestic supply chain make it likely that there will be a temporary price spike until inventories can be rebuilt (Walker 2010). Alaskan wood products markets are closely tied to North America and the Pacific Rim, and are deeply affected by tight credit, low cost margin issues, and the continued depression in the domestic housing market.

Source: Alaska Department of Labor, Kilborn et al. (2004), Brackley et al. (2006b), Brackley and Crone (2009), Alexander and Parrent (2010), Parrent (2010), and Parrent (2011). Data on file with: Regional Economist, Ecosystems Planning, USDA Forest Service, PO Box 21628, Juneau, AK 99802-1628

1. 2000 and after reported in calendar years. Prior to 2000, federal fiscal years were used.
2. Tongass National Forest logging estimated based on the ratio of Tongass timber harvest to total timber harvest in Southeast Alaska.
3. Through 2001, assumes all sawmill and pulp mill employment is dependent upon Tongass National Forest timber supply. Beginning in 2002, this assumption no longer held. Data from Kilborn et al. (2004), Brackley et al. (2006b), Brackley and Crone (2009), Alexander and Parrent (2010), Parrent (2010), and Parrent (2011) show that Federal timber supplied 73% of the wood sawn in Southeast Alaska mills in 2002, 59% in 2003, 64% in 2004, 65% in 2005, 62% in 2006, 53% in 2007, 75% in 2008,

66% in 2009, and 87% in 2010. Tongass National Forest sawmill employment from 2002 through 2010 is estimated based on sawmill employment numbers and the ratio of sources of wood (Federal versus the total) reported by Kilborn et al. (2004), Brackley et al. (2006b), Brackley and Crone (2009), Alexander and Parrent (2010), Parrent (2010), and Parrent (2011).

4. Beginning in 2001, employment estimates are being published under a new classification system. The Standard Industrial Classification (SIC) system has been replaced by the North American Industrial (NAI) Classification system. "Sawmill" in this table is reported by the Alaska Department of Labor as "wood manufacturing" which in the NAI system includes sawmills, wood preservation, veneer, plywood, engineered wood, and other wood products. In Southeast Alaska, this category is assumed to represent only sawmill employment. Beginning in 2001, sawmill employment figures are adjusted based on regional mill studies, which take into account self employed mill owners.

1. HTC 4401.30.0000, "sawdust and wood waste and scrap" is the only chip product shipped from the Anchorage CD in 2007. It went to Canada; the original data are 18,289 kg at a total value of \$4,323. In 2008, 25 tons of wood chips were exported to Vietnam from Alaska. In 2010, wood shavings were exported to Canada and Japan from Alaska.

Source: U.S. Department of Commerce 2011, at <http://dataweb.usitc.gov/> (last accessed June 2011) and Warren 2011. The valuation definition used in the export statistics is the value at the seaport or border port of exportation. It is based on the selling price (or cost if not sold) and includes inland freight, insurance, and other charges to the port of exportation. Seattle Customs District includes all ports in the State of Washington, except Longview and Vancouver. Columbia-Snake Customs District includes all Oregon ports and Longview and Vancouver, Washington. San Francisco Customs District includes all coastal and inland ports in the State of California from Monterey north. The Anchorage Customs District is the State of Alaska.
