

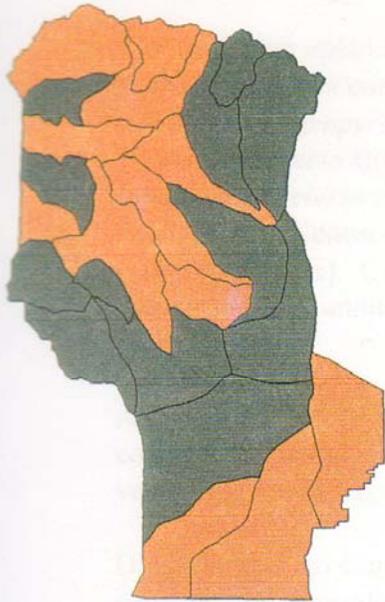

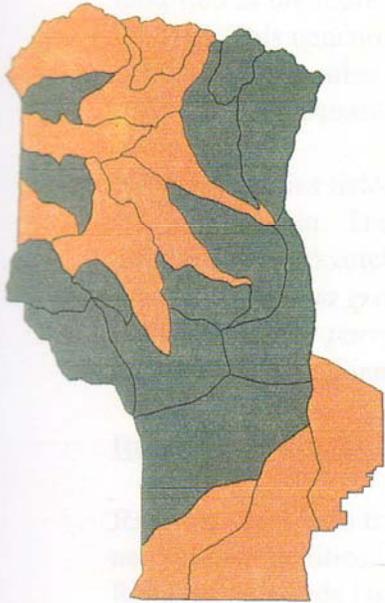

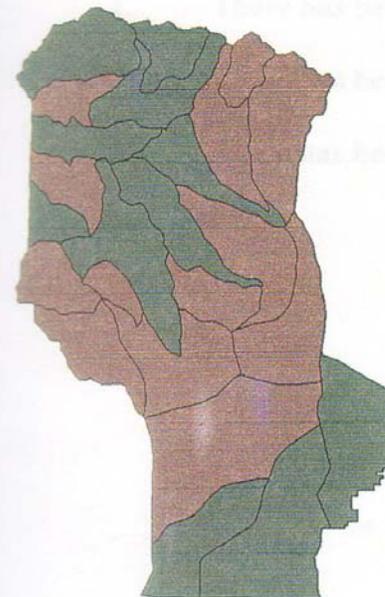

# Figure 12. Soil Erosion from Water and Wind Erosion; Soil Transport and Loss from Mass Wasting 6th Level HUC's

**Status:** The current condition of the soil resource. A high condition denotes high soil loss through wind, water and mass wasting. A moderate condition is soil that has a medium level of soil erosion and loss.

**Risk:** This is the relative risk of accelerated soil erosion loss. High risk watersheds exhibit naturally high soil erosion characteristics or have a high likelihood for erosion due to management actions. Medium risk watersheds have a moderate likelihood of natural and accelerated erosion loss, and low risk watersheds have soils with low natural soil erosion characteristics or the likelihood of accelerated erosion in the future is low.

**Opportunity:** This is the relative potential of maintaining or improving the current soil condition to reduce soil erosion and loss. A high opportunity means the potential is high to prevent future erosion; a medium opportunity has a moderate potential to maintain or achieve good condition; and a low opportunity means that either the soils cannot easily achieve good condition or that the current condition is good and the potential for continued, future improvement is low.
