

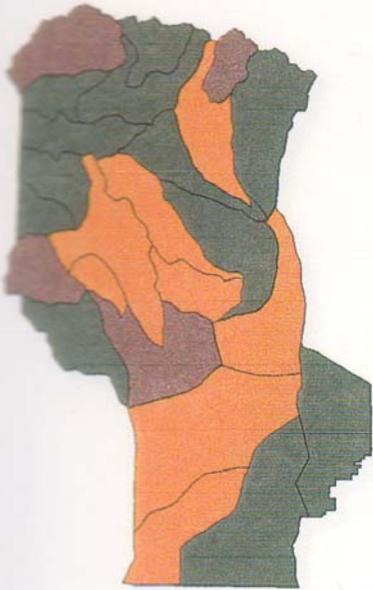

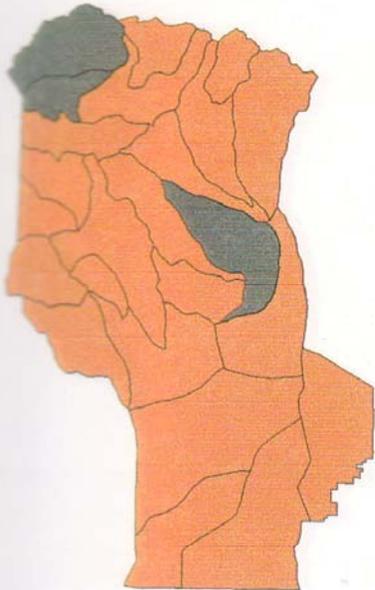

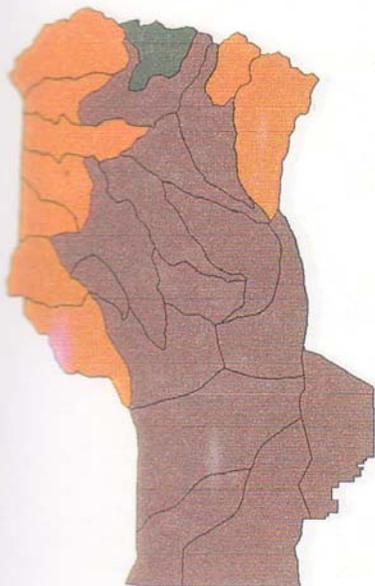

# Figure 9. Wildlife Disturbance 6th Level HUC's

**Status:** Describes the level of disturbance within a watershed relative to other watersheds within the subbasin. Watersheds with greater than 1.7 miles/square mile would rate high, watersheds with road densities between 0.7 - 1.7 miles/square mile are medium, and watersheds with less than 0.7 miles of road/square mile will get a low rating.

**Risk:** The likelihood that some type of disturbance would degrade the site from its current condition, for example, the probability that recreational use or motorized access routes will increase. High indicates that this use will increase and medium indicates the recreational use or motorized access is limited by agency regulation or topography.

**Opportunity:** The relative potential of a watershed to respond favorably to actions to reduce disturbance to sensitive species. High opportunity can mean ORV education, travel restrictions, or natural inaccessibility due to topography. Low opportunity is where gentle terrain makes cross country travel management difficult.
