

It's been a hot and dry summer in your forest. Your trees have to search deep in their roots for water. They may not survive the winter.

Not much snow has fallen this winter in your forest. In fact, the snowfall is well below average. The lack of moisture makes your forest susceptible to an early summer forest fire.

There has been little rain in your forest,
and the berry crop notices. Many of
your berry-producing trees aren't
producing. The birds and mammals that
rely on the berries will be hungry.
