

# 2013 Aerial Insect and Disease Survey

## USGS 100K Quad: MOUNT SAINT HELENS - A146122; 3F

Mortality Agents		
Code	Damaging Agent	Primary Host
1	Douglas-fir beetle	Douglas-fir
4	Fir engraver	True fir
5	W Balsam bark beetle	Subalpine fir
BEAR	Bear	Conifer

Defoliators		
Code	Damaging Agent	Primary Host
AM	Maple discoloration	Big-leaf maple
LC	Needle cast	Logpole pine
SF	Sawfly	True firs
TC	Tent caterpillar	Hardwoods

Other Damaging Agents		
Code	Damaging Agent	Primary Host
AB	Balsam woolly adelgid	True firs
DH	Dying hemlock	Western hemlock
HD	Hardwood decline	Hardwoods
NE	Not flown	Conifer
RD	Root disease	All species
WATR	Water damage	All species

NOTE: Only the damage agents present in this quad are listed in this legend. The cause of damage is described by an alpha numeric symbol on the map and is followed by the number of trees affected; number of trees per acre (example: 5A); or the intensity of damage (L - Light, M - Moderate, H - Heavy).

USGS 100K Quad: MOUNT SAINT HELENS - A146122; 3F  
 2013 Aerial Insect and Disease Survey  
 Map Scale: 1:100,000  
 Date: 16 January 2014

**Legend**

- Defoliating Agents
- Mortality Agents
- Other Damage
- WDNR Managed Lands
- Areas Not Flown During Overview Survey
- 2013 Large Fires

The basemap is an ESRI map service of TOPOI data (Copyright 2013 National Geographic) which is comprised of seamless, scanned images of USGS paper topographic maps. For more info on this map see [http://goto.arcgisonline.com/maps/USA\\_Topo\\_Maps](http://goto.arcgisonline.com/maps/USA_Topo_Maps).

A data dictionary, digital copies of this map and geospatial insect and disease data are available at: <http://www.fs.usda.gov/detail/forest-grasslandhealth/insects-diseases/>

**How the Aerial Surveys Are Conducted**

Data represented on this map are based on trees visibly affected by forest insects and diseases detected and recorded during aerial survey flights conducted by the USDA Forest Service, the Washington Department of Natural Resources and the Oregon Department of Forestry. Observers have just a few seconds to recognize the color difference between healthy and damaged trees of different species; diagnose causal agents correctly; estimate intensity; delineate the extent of damage; and precisely record this information on a georeferenced, digital map. Air turbulence, cloud shadows, distance from aircraft, haze, smoke and observer experience can all affect the quality of the survey. These data summaries provide an estimate of conditions on the ground and may differ from estimates derived by other methods.

The aerial survey provides information on the current status for many causal agents and is important when examining insect activity trends by comparing historical and current survey data over large areas.

Overview surveys are a 'snap shot' in time and therefore may not be timed to accurately capture the true extent or severity of a particular disturbance activity. Specially designed surveys with modified flight patterns and timing may be conducted to more accurately delineate the extent and severity of a particular disturbance agent. Special surveys, such as Swiss needle cast surveys, are conducted when resources are available to address situations of sufficient economic, political or environmental importance.

DISCLAIMER  
 Forest Health Protection (FHP), Washington Department of Natural Resources (WDNR) and Oregon Department of Forestry (ODF) have maintained an accurate Aerial Detection Survey (ADS) Dataset, but due to the conditions under which the data are collected FHP, WDNR and ODF shall not be held responsible for missing or inaccurate data. ADS are not intended to replace more specific information. An accuracy assessment has not been done for this dataset; however, ground checks are completed in accordance with local and national guidelines: <http://www.fs.fed.us/foresthealth/aviation/qualityassurance.shtml>. Maps and data may be updated without notice.
