

# 2013 Aerial Insect and Disease Survey

## USGS 100K Quad: KLAMATH FALLS - A142121; 4N

Mortality Agents		
Code	Damaging Agent	Primary Host
4	Fire engraver	True firs
6L	Mtn. pine beetle	Lockeopole pine
7	Mtn. pine beetle	Ponderosa pine
8	Oregon pine Ips	Ponderosa pine
8B	W. pine beetle	Ponderosa pine
F	Flatheaded fir borer	Douglas-fir

Defoliators		
Code	Damaging Agent	Primary Host
PC	Needle cast	Ponderosa pine

Other Damaging Agents		
Code	Damaging Agent	Primary Host
HDA	Hardwood decline	Quaking aspen
NF	Not flown	

**NOTE:** Only the damage agents present in this quad are listed in this legend. The cause of damage is described by an alpha numeric symbol on the map and is followed by the number of trees affected; number of trees per acre (example: 5A); or the intensity of damage (L - Light, M - Moderate, H - Heavy).

**USGS 100K Quad: KLAMATH FALLS - A142121; 4N**  
**2013 Aerial Insect and Disease Survey**  
**Map Scale: 1:100,000**  
**Date: 15 January 2014**

### Legend

- Defoliating Agents
- Mortality Agents
- Other Damage
- Areas Not Flown During Overview Survey
- 2013 Large Fires

#### How the Aerial Surveys Are Conducted

Data represented on this map are based on trees visibly affected by forest insects and diseases detected and recorded during aerial survey flights conducted by the USDA Forest Service, the Washington Department of Natural Resources and the Oregon Department of Forestry. Observers have just a few seconds to recognize the color difference between healthy and damaged trees of different species; diagnose causal agents correctly; estimate intensity; delineate the extent of damage; and precisely record this information on a georeferenced, digital map. Air turbulence, cloud shadows, distance from aircraft, haze, smoke and observer experience can all affect the quality of the survey. These data summaries provide an estimate of conditions on the ground and may differ from estimates derived by other methods.

The aerial survey provides information on the current status for many causal agents and is important when examining insect activity trends by comparing historical and current survey data over large areas.

Overview surveys are a 'snap shot' in time and therefore may not be timed to accurately capture the true extent or severity of a particular disturbance activity. Specially designed surveys with modified flight patterns and timing may be conducted to more accurately delineate the extent and severity of a particular disturbance agent. Special surveys, such as Swiss needle cast surveys, are conducted when resources are available to address situations of sufficient economic, political or environmental importance.
