

WILDLIFE VIABILITY, MONITORING AND MIS:

Primary Objectors:

Center for Biological Diversity and the John Muir Project, Earth Island Institute, **Justin Augustine**

Sierra Forest Legacy, **Craig Thomas and Michael Graf**

Summary: Our previous briefing paper distinguished three distinct elements of this broad issue of MIS requirements. This included the 1982 requirement to provide habitat for viable populations within the planning area; the monitoring requirements for MIS and the analysis requirement for MIS. Discussion during the May 20th meeting included objectors clarifying that beyond the requirements of the 1982 Planning Rule, the viability of California Spotted owl and Pacific marten is an issue. Objectors re-iterated that they believe that plan components were not going to be able to deliver owl conservation because key concepts suitable habitat, highly suitable habitat were not properly defined.

Parties discussed the potential remedy of transitioning from monitoring MIS species the monitoring of focal species per the 2012 planning rule. There was an elaboration of the current peer review of MIS that the Forest Service and some of the objector parties are working on that may provide some helpful direction to this transition to focal species.

While much of the discussion focused on California Spotted owl and the plan components, and asserted analysis deficiencies, objectors were also interested in elaborating on the viability issues of pacific marten. With limitations on time, objectors requested that this be brought forward in more detail at the subsequent meeting.

Previous Forest Service Instruction:

Instruct the Regional Forester to require the Lake Tahoe Basin to clarify in the EIS how the quality of habitat and trends of MIS varies by alternative.

PROPOSED DISCUSSIONS

MIS Monitoring Issues

The LTBMU will transition to the focal species monitoring requirements of the 2012 Planning Rule (36 CFR 219.12(c)(1)), which states that all forest plan monitoring programs developed under a previous planning rule shall be modified meet the requirements of the new rule by May 9, 2016.

- The development of the focal species list and associated monitoring will be informed by the finalized recommendations of the panel of independent and Forest Service scientists being developed under the settlement agreement for the Sierra Nevada Forests MIS Amendment.

Viability Issue:

Owl

Modifications to plan direction as it concerns California Spotted Owl:

1. Revision of the SG 33, the 30" diameter exceptions (see other issue paper for SG 33)
2. Provide clarification on Spectrum modeling and its limitations.
3. Improve definition of 'Restoration ' activities so it includes wildlife objectives not just fuels and forest health objectives.
4. Include recommendations from General Technician Report 220 and GTR 337.

Marten

Add desired Conditions for Marten (missing in FEIS/Plan, use existing direction from Framework.)

Hear more about concerns with Marten from Objectors
