**Location and a description of a recommended boundary for each area:**

This potential recommended wilderness that is being considered for further analysis consists of two areas located on the Kern Plateau that are contiguous with the western boundary of the existing Domeland Wilderness, and primarily consist of areas that are in Inventoried Roadless Areas. The potential additions include:

An area located east of Snow Creek in the northwest section of the original evaluation polygon. The eastern and southern boundary is contiguous with the existing Domeland Wilderness and the western boundary is setback from trail 34E12 and then follows south of the Twisselman Botanical Area along the 8000 ft. elevation contour line to the Manter Meadow North trailhead and then east along that trail to the existing wilderness boundary.

An area located on the southwestern boundary of the existing Domeland Wilderness that extends west and south of the Church Dome Research Natural Area. The north and eastern boundaries are contiguous with the existing Domeland Wilderness. From the north end, the western and southern boundary follows a ridgeline to a setback from road 24S30A to a setback from trail 34E17 and then it follows the 7200 ft. elevation contour to section 11. From there it follows the 7600 ft. elevation contour to a south flowing tributary to Taylor Creek. The remaining western boundary is defined by a combination of a ridgeline over to the next drainage to the 6960 ft. elevation contour which it follows until it adjoins the existing wilderness at the south end of the area.
