What are the characteristics, environmental values, social and economic considerations, and other factors the Forest Service should consider as it evaluates inventoried roadless areas?

Roadless should mean the desire to keep an area free from roads, not a goal to remove roads from an area that already has them. I see no conflict with public access for recreational purposes and wilderness designations, even if the access includes motorized vehicles. I frequent routes in our National Forests that have been in place in excess of 125 years (I have adopted such a route, 3N02, Burnt Flats Trail, in the San Bernardino National Forest in California) and there is no indication of habitat destruction, let alone damage to the habitat, as a result of vehicular access to these routes. If an area is defined as Roadless, yet there are already routes established, then the Roadless Designation should mean that no new routes be established, and heightened regulation of commercial ventures should take place. But, in no case should recreational access be restricted from existing routes in our National Forests and Parks. (Individual, Murrieta, CA - #A367.45523)

910. Public Concern: The Forest Service should not penalize the whole population because of the irresponsible actions of a few.

There are a small handful of people who deliberately destroy public property and lands. Please don't penalize all of us for their actions. Let the fines be steep for those who leave designated trails and unattended fires or destroy habitat. We have gotten completely out of control by allowing people to shrug off responsibility. Make people responsible for their own actions. If the coffee is hot and it burns the person who bought it, it is an accident not a liability. Please do not restrict access to our mountains. They are our backyards. There are millions of acres that are inaccessible to motorized vehicles. These areas have no roads and no sign of human intervention. It is impossible for anyone to access these areas. (Individual, Spring City, UT - #A833.10130)

911. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule does not affect access.

I certainly will not have time to travel the existing system of roads during my lifetime. None of these existing roads would be closed as a result of the Roadless Rule, and Coloradoans would continue to have access to these lands as well as access to private and State-owned lands. (Individual, Aspen, CO - #A5119.10111)

I ride an off-road motorcycle and enjoy hiking. I would like to see the government maintain roadless areas. I believe we have enough areas for public access where we can ride, walk, etc. (Individual, No Address - #A796.10150)

There are already enough millions of miles of access roads in our National Forests. Please do all that you can to maintain the Roadless Area Conservation Rule. It is the best thing for our country now and into the future. (Individual, Bayside, CA - #A12071.10111)

TO ALASKA'S NATIONAL FORESTS, BECAUSE THERE IS UNIQUE MARINE ACCESS

Some critics of applying the roadless policy to Alaska's forests have suggested this will prevent public access to forest resources for recreation and tourism. Both of Alaska's national forests, however, encompass an unusual system of coastal islands and fiords that provide unique marine access ranging from kayaks and small boats to the Alaskan ferries and major cruise ships. The Seward Scenic Byway and Alaska Railroad bisect the Chugach National Forest and provide additional access for many different activities. With marine access, including the Alaska Marine Highway System, and the existing highways, roads, railroad, and trail system, both of Alaska's national forests offer substantial access for recreation, tourism, and local resource users, including subsistence. Not only does this provide reasonable access, it offers unique opportunities that will attract national and international visitors to our state for experiences that are becoming increasingly rare elsewhere throughout the world. (Organization, Anchorage, AK - #A22992.40000)

*Adequacy of Analysis***912. Public Concern: The Forest Service should document visitor usage on forest travelways.**

Comments and concerns expressed by motorized visitors indicate that the current allocation of recreation opportunities is not balanced. During the preparation of the environmental document, the Forest Service must count and classify visitors using the forest travelways. Our observations show that these travelways are frequently visited by hundreds of motorized visitors. We see very few non-motorized recreationists on multiple-use lands. We see very few vehicles parked at hiking trailheads leading to thousands of acres closed to motorized visitors.

The Forest Service must also interview motorized visitors on these travelways. Interviews will document that these travelways are very important to motorized visitors and that these visitors are concerned about

the declining availability of motorized recreation and access opportunities in the National Forest. (Organization, Helena, MT - #A13226.15152)

913. Public Concern: The Forest Service should use the FS-643 Roads Analysis publication.

TO DETERMINE THE SPECIFIC VALUES OF EACH MOTORIZED ROAD AND TRAIL

A science-based approach to the analysis of forest roads is presented in the Forest Service publication FS-643 Roads Analysis which was published in August 1999. This document must be used in this evaluation to determine the specific values of each motorized road and trail. This document includes a comprehensive overview of considerations and issues, suggested informational needs and sources, and analytical tools that must be evaluated during the analysis of forest roads. Many of the considerations and issues presented in FS-643, if evaluated adequately and fairly, would support keeping primitive roads and trails in the project area open for motorized recreation, handicapped, elderly, and physically impaired.

The rulemaking process must make full use of FS-643 Roads Analysis Manual in order to properly account for the social, economic, cultural, and traditional values that motorized roads and trails provide to the public. FS-643 must be used on every road and trail segment in order to properly identify and evaluate the needs of motorized visitors and in order to avoid contributing to additional cumulative impacts to motorized visitors. (Organization, Helena, MT - #A13226.16110)

914. Public Concern: The Forest Service should consider the impacts of roads described in "Conservation Biology."

As you consider the Rule, I urge you to read about impacts of roads described by Trombulak et al. 2000 in *Conservation Biology*. (Individual, Bellingham, WA - #A16218.14500)

915. Public Concern: The Forest Service should carefully examine and evaluate the entire road system.

FOR EFFECTIVE LONG-TERM MANAGEMENT

Obviously there are roads that serve no purpose. Modern logging equipment, for example, doesn't require the road densities that older equipment did. We would hope that you would carefully examine and evaluate the entire road system and determine what existing roads are needed for effective long-term management. What new roads should be built and what roads should be obliterated. Now would seem a prudent time to do that in conjunction with roadless area disposition decisions. (Individual, Lewiston, ID - #A2872.45100)

BY EVALUATING THE USE OF EACH ROAD

It is WRONG to evaluate roadless areas, as no National Forests are without roads. It should be thought of from a new direction: Where there is some distance between roads (this will vary from place to place), what will best benefit the nation? Will utilizing the resource be it? If so, more roads may be absolutely necessary. However, all roads do not have to be open for all people at all times. Use whatever roads that are necessary to manage the area. Roads may in fact not be needed until some point in the distant future. (Individual, Aloha, OR - #A3675.45000)

TO DETERMINE WHICH EXISTING ROADS ARE NEEDED FOR EFFECTIVE LONG-TERM MANAGEMENT, WHAT NEW ROADS SHOULD BE BUILT, AND WHICH ROADS SHOULD BE OBLITERATED

Roads that compose the National Forest transportation system were built and placed to support management activities and access needs into the foreseeable future. They represent a tremendous investment and serve us well. However, it seems that Forest Service leadership has forgotten the purpose of this system. The past Assistant Secretary of Agriculture, when asked by a reporter why all these roads had been built, said he had no idea. He then cited irrelevant comparisons of the mileage of national forest roads and the interstate system. Soon after the interview the agency embarked on an aggressive program to obliterate and decommission as many miles of road as they could in the time left for the

administration. Timber sales at one time maintained the lion's share of these roads, but when these disappeared funding was not requested to take up the slack. The lack of funding was then cited as the reason for obliterating the roads.

Obviously there are roads that serve no purpose. Modern logging equipment, for example, doesn't require the road densities that older equipment did. We would hope that you would carefully examine and evaluate the entire road system and determine what existing roads are needed for effective long-term management, what new roads should be built and what roads should be obliterated. Now would seem a prudent time to do that in conjunction with roadless area disposition decisions. (Individual, Cloquet, MN - #A8272.45500)

TO DETERMINE THE ENVIRONMENTAL EFFECTS OF THE ROUTES IN THEIR CURRENT CONDITIONS

Require an analysis of all existing routes to determine the environmental effects of the routes in their current conditions.

Once the inventory discussed above is completed, it will be necessary to evaluate the existing routes to ensure compliance with environmental laws and regulations. In some cases, routes that exist and are being used are resulting in unacceptable environmental impacts. These routes will need to be relocated or repaired to ensure that the impacts are reduced to an acceptable level. This evaluation would identify the actions that are necessary to accomplish this objective. (Organization, Salt Lake City, UT - #A12009.45524)

THROUGH INDIVIDUAL FOREST PLANS

Every forest has a plan. This should describe the project roading during the plan's life and reveal the total road system projected, including roads into unroaded parts of the forest. If it doesn't, that's a plan flaw that needs correction. (Professional Society, Saint Leonard, MD - #A9040.90000)

IN NORTH DAKOTA

One of the major issues regarding proposed wilderness and now roadless conservation areas in North Dakota is the fact that these areas have extensive road systems. This fact was acknowledged in the 1987 Custer Forest Plan. *See* Custer FEIS, Appendix C. The 1999 draft plan revision, which preceded the roadless rulemaking by a few months, omits any enumeration of roads, although these roads still exist. The 2001 DPG FEIS does not address the specific comments made about each unit, especially the roads found throughout these units. The Forest Service only counted state highways and forest development roads, thus omitting the roads under dispute as well as private easements.

The ANPR does not correct this failure because it assumes that all of these roadless conservation areas are in fact roadless. Unless and until the Forest Service addresses this issue, no amount of process will undo the harm to North Dakota communities and governmental interests. (Organization, Denver, CO - #A21358.45520)

916. Public Concern: The Forest Service should recognize that the evaluation of road impacts in the Roadless Area Conservation Rule is flawed.

BECAUSE MOST ROADS IN ROADLESS AREAS ARE TEMPORARY ROADS

The Environmental Impact Statement (EIS) developed for this proposal is flawed in its evaluation of road impacts. In most cases the roads identified as having significant impacts are unrestricted access permanent year-round graveled or paved roads. However, most of the roads currently found in Inventoried Roadless Areas (IRA), particularly in the Lake States National Forests, are temporary and/or closed to public access. The ecological impact of temporary roads or roads closed to the public is significantly different than those used to describe and justify the conclusions reached in the evaluation. (State Agency Madison, WI - #A28775.90120)

917. Public Concern: The Forest Service should consider that the analysis on road impacts in the Roadless Area Conservation Rule is adequate.

The original EIS thoroughly described the impact roads have on the landscape in its broadest sense. To my knowledge, no one has shown serious flaws in the analysis. Those impacts will not change just

because the timber and mining industries want to continue business as usual. The Forest Service has a duty to protect the land and water for a variety of uses. The original Roadless Rule did just that. The government should implement the rule without delay. (Individual, Marquette, MI - #A22634.10150)

918. Public Concern: The Forest Service should compare the effects of roads with other less intrusive access and recognize the basic principles of ecology.

Arguments for reopening the Roadless rule have complained about the limited management practices for improving forest health (fire suppression, pest infestations, etc). This argument neglects to compare the effects of roads with other less intrusive access and fails to recognize basic principles of ecology. Roads do not improve the health of ecosystems. The existing Roadless Rule Policy should not be altered. The existing rule should be implemented immediately. (Individual, Juneau, AK - #A11676.10150)

919. Public Concern: The Forest Service should address benefits to the Appalachian National Scenic Trail.

FOR ROADLESS AREAS IN THE VICINITY OF THE TRAIL

Direct and indirect benefits to the Appalachian National Scenic Trail should be addressed for those roadless areas in the vicinity of the Trail. (Organization, Harpers Ferry, WV - #A21737.45621)

920. Public Concern: The Forest Service should ensure that if an illegally created route is to be reclassified as a trail, it must first undergo site-specific, National Environmental Policy Act analysis.

TO GAIN CLASSIFIED STATUS UNDER THE TRAIL SYSTEM

. . . if the person mapping classified and unclassified travelways as part of the Road Management Strategy determines that the route should be reclassified as a trail (motorized or non-motorized), and if that travelway has been illegally constructed or maintained, it still must go through site-specific NEPA analysis to gain "classified" status under the trail system. While construction and reconstruction of trails is listed as a categorical exclusion, user-created travelways violate 36 CFR 261.10(a) as stated above, because they have gone through no planning, making them technically illegal. (Organization, Missoula, MT - #A21359.90420)

Funding

921. Public Concern: The Forest Service should increase the budget to fix the road system, restore degraded areas, and impose much stricter standards on any new road construction in the Tongass National Forest.

IF THE TONGASS NATIONAL FOREST IS EXEMPTED FROM A NATIONAL ROADLESS RULE

Southeast Alaska stands to benefit the least from continued entry into roadless areas and benefit the most from a permanent suspension of road building. Saving the roadless areas on the Tongass will result in preserving the best lands this country has left. If our powerful Congressional delegation wins out for a few special interests and the Tongass is exempted, the budget to fix the road system and restore degraded areas should be increased dramatically and much stricter standards imposed on any new road building. (Individual, Juneau, AK - #A23242.45623)

922. Public Concern: The Forest Service should allocate funds according to specific road priority.

I think that the Forest Service budget should prioritize roads that need maintenance first, then decommissioning unneeded roads (without limiting access in the future), and then if funds are available, build new roads. (Individual, North Bend, OR - #A30657.17240)

923. Public Concern: The Forest Service should not charge fees for road use.

Do not charge for road use. (Individual, Cody, WY - #A18367.90110)

924. Public Concern: The Forest Service should request funding to support trail programs.

Please ask for funds to adequately support the Forest Service's recreation and trail programs. For many years the Forest Service has said they support recreation but they have NOT asked for the appropriated monies to do so. "On the ground monies" have decreased for the last 3 years, while money for various other plans has increased! Please ASK for more money for field level staff and projects. (Individual, Livermore, CA - #A23445.91211)

Travelways

925. Public Concern: The Forest Service should remember the purpose of the national forest transportation system.**TO SUPPORT MANAGEMENT ACTIVITIES AND ACCESS NEEDS INTO THE FORESEEABLE FUTURE**

Roads that compose the National Forest transportation system were built and placed to support management activities and access needs into the foreseeable future. They represent a tremendous investment and serve us well. However, it seems that Forest Service leadership has forgotten the purpose of this system. The past Assistant Secretary of Agriculture, when asked by a reporter why all these roads had been built, said he had no idea. He then cited irrelevant comparisons of the mileage of national forest roads and the interstate system. Soon after the interview the agency embarked on an aggressive program to obliterate and decommission as many miles of road as they could in the time left for the administration. Timber sales at one time maintained the lion's share of these roads, but when these disappeared funding was not requested to take up the slack. The lack of funding was then cited as the reason for obliterating the roads. (Individual, Boise, ID - #A5165.16110)

926. Public Concern: The Forest Service should base road management decisions on the individual merits of each travelway.**BECAUSE THE CUMULATIVE EFFECTS OF NOT ANALYZING EACH ROAD AND TRAIL ARE SIGNIFICANT**

We are concerned about the way that area closure is approached during the planning process. Past actions have closed many roads and trails to motorized recreation and access without addressing the merits of each one. Justification has included reasons such as ghost roads, user created roads etc. that are not site specific and do not amount to adequate justification. The fact is that many forest roads and trails in use today have been created by forest users going back to the early days of history when all of the forest was "open" to motorized access. The Forest Service cannot select which roads are useful to keep and which are not without a site-specific analysis. The cumulative effect of not analyzing each road and trail segment is tremendous. The decision-making must be based on the individual merits of each travelway. (Organization, Helena, MT - #A13226.45440)

927. Public Concern: The Forest Service should establish a multiple use review board to guide travel management decisions.

Motorized recreationists are concerned that a reasonable alternative will not be adequately addressed in the environmental document and decision-making. To prevent this from happening, we request a Multiple-Use Review Board be established to assure that the decision-making reflects the multiple-use management goals and the needs of the public. We request that a Multiple-Use Review Board look into all past travel management decisions in the National Forest to determine whether all decisions have adequately considered the needs of multiple-use and motorized recreationists. Where decisions have not adequately considered the needs of multiple-use and motorized recreationists, we request that the reasons be identified and that corrective actions be taken. (Organization, Helena, MT - #A13226.50200)

928. Public Concern: The Forest Service should allow only temporary access ways in roadless areas.

WHICH ARE OBLITERATED WITHIN A YEAR OF CONSTRUCTION

No developed roads should be allowed in any roadless area for any reason. Temporary access ways, obliterated within the year, would be permissible when created for certain limited purposes. Activities dependent upon road building would be consequently, prohibited. (Individual, Pendleton, OR - #A30482.90110)

929. Public Concern: The Forest Service should not be responsible for road and trail management.

I do not believe in keeping the roadless areas roadless. I believe in dirt roads and trails without the government being involved with or being held accountable in any way shape or form. (Individual, Pittsgrove, NJ - #A8198.90410)

930. Public Concern: The Forest Service should make parking areas available.

Make parking areas available. (Individual, Carlisle, PA - #A11410.90000)

Roads

931. Public Concern: The Forest Service should incorporate management directions for public roads which are under the jurisdiction of local governments.

We note that the proposed road rules included a reference to “Public Roads” which are in addition to the “classified” and “unclassified roads.” We suggest to avoid confusion and to be consistent with the companion rulemaking that the proposed rules also incorporate management direction for these “Public Roads” which are under the jurisdiction of the local governments. (County Attorney, Grant County, OR - #A17667.45512)

932. Public Concern: The Forest Service should give due consideration to the position of local authorities regarding road rights.

As the comments filed with respect to the Draft Plan Revision and the roadless regulations show, the Forest Service needs to accept information instead of discarding it because it is contrary to policy or the Forest Service “disagrees.” In the context of the road issue, the Forest Service represents these areas as roadless on the basis that the agency does not agree with the position of the state of North Dakota that the section line laws and pre-existing easements must be acknowledged. Absent a court determination, the North Dakota Attorney General opinion is entitled to far greater deference than a Forest Service letter saying the agency does not agree. The Forest Service is not authorized to adjudicate road rights. (Organization, Denver, CO - #A21358.10135)

933. Public Concern: The Forest Service should respect states’ section line laws.

NORTH DAKOTA’S LAWS

At the beginning of the North Dakota forest plan revision process; the Forest Service presented the North Dakota counties with a “demand” for all roads and easements claimed by the counties. This demand was not only unreasonable and expensive but ran counter to the presumptions in North Dakota law that the counties need not prove existing public roads. The counties declined to spend scarce county funds on a massive title search but invited the Forest Service to conduct its own search. To date, the Forest Service has not done so, implicitly admitting that the undertaking is expensive and time-consuming.

The problem was only exacerbated by the Forest Service moratorium on R.S. 2477 roads and its official position that the North Dakota Section line law does not apply to lands owned by the United States. The problem reached the point where McKenzie County state's Attorney asked for an opinion from the state attorney general on this issue. The Attorney General concluded that North Dakota Section Line law does apply and further that the case law incorporating R.S. 2477 principles also extends those rights-of-way to the National Grasslands. The Forest Service has chosen to "disagree" and uses its disagreement to ignore all of the county public roads, especially in the context of the roadless issue.

Thus, the Forest Service approach polarizes the issue and excludes valuable information from its internal record. (Elected Official, Watford City, ND - #A27737.45400)

934. Public Concern: The Forest Service should address roads which appear on older system maps, roads which are of local importance, and Revised Statute 2477 rights-of-way.

Roadless proposal ignores roadless definition of 1964 wilderness Act and RS2477 rights-of-ways. The USFS administration interpretation of roadless areas as it has been used to identify "roadless areas" is contrary to the 1964 definition of a road and RS2477 rights-of-ways. This definition will perhaps one day be the subject of a case the Supreme Court may hear. USFS personnel in public informational meetings frequently define many existing roads in "roadless" areas as "illegal" or "unauthorized" roads. Some of the roads are recent and unauthorized, but many of these roads have existed for several decades and some predated the creation of the national forest system. We suggest that the real roadless areas are much less than those presently identified. True roadless areas are generally well deserving of the name and should be designated as such, but much of the so called "roadless areas" have significant roaded areas that don't appear on recent USFS "systems" maps. Roads appearing on older system maps, those of local importance and RD2477 rights of ways issues are yet to be resolved. It is not appropriate for the roadless proposal to ignore these outstanding issues. (Professional Society, No Address - #A27584.20200)

935. Public Concern: The Forest Service should acknowledge the existence of every access road.

The "Roadless initiative" does not even acknowledge the existence of more than 70% of existing access roads thereby eliminating them. (Individual, Reno, NV - #A1108.45100)

936. Public Concern: The Forest Service should not imply there are more roads than there are.

The agency must make a commitment to the public to be unbiased in its decision making and reporting. Example (1): Under the former administration the Forest Service wrote, "The current national forest road system includes 380,000 miles of road, enough road to circle the globe more than 15 time" [Footnote 18: 64 Fed. Reg. 56306] (making it sound like there is an extraordinarily amount of roads). However, the agency failed to make their balancing statements such as, "roads comprise less than 2% of the total National Forest System [Footnote 19: 1 mile = 5,280 feet x 100 feet (width of impact) = 528,000 square feet. 528,000 sq. feet divided by 43,560 sq. feet (1 acre) = 12.12 acres. Therefore, 1 mile of 100-foot wide road impacts 12.12 acres of land. There are 380,000 miles of roads in the National Forest System (see 64 Fed. Reg. 56306). 380,000 miles of roads impact 4.6 million acres (380,000 x 12.12 = 4.6 million). There are a total of 192 million acres in the National Forest System (See Roadless Area Conservation FEIS, p. A4). 4.6 million acres divided by 192 million acres = 2.19% 625 miles of roads could be maintained as Level 2, high-clearance roads, for 834 years for the same cost of fighting wildfires for one year! [Footnote 27: Coghlan, G.; Sowa, R. 1998. National Forest Road System Use (draft). Engineering staff, USDA Forest Service, p. 13. Average cost to maintain a Level 2 road is \$100.00/mile/year. www.fs.fed.us/new/roads/roadsummary.pdf 625 miles of road x \$100.00 x 834 years = \$52.125 million]. (Organization, Chesapeake, VA - #A11804.10141)

937. Public Concern: The Forest Service should consider temporary/short-term roads for non-timber management objectives.

SUCH AS WILDLIFE HABITAT IMPROVEMENT PROJECTS, FUEL TREATMENTS, PREVENTATIVE TREATMENTS FOR INSECT AND DISEASE PROBLEMS, ETC.

A piece that was sorely missing from the previous effort was options that included temporary/short-term roads for non-timber management objectives, such as wildlife habitat improvement projects, fuel treatments, preventative treatments for insect and disease problems, etc. These kinds of considerations are very difficult to address at a national level. (Individual, Missoula, MT - #A28297.13213)

938. Public Concern: The Forest Service should acknowledge that the Roadless Area Conservation Rule does not close roads or prevent the construction of new roads in already roaded areas.

This policy actually has a bigger bark than bite, as it will not entail the closure of existing roads or prevent the construction of new roads in already roaded areas. Most eastern forests will be virtually unaffected. Unfortunately, the small minority of Americans opposed to this plan are misstating the issues. (Individual, Syracuse, NY - #A1333.45100)

939. Public Concern: The Forest Service should approve the location of roads at the national level.

FOLLOWING PROPOSALS FROM LOCAL AUTHORITIES

Ultimately the location of roads will be proposed by local authorities and approved at the national level. This allows for the views of the States, tribes, local communities, and other organizations to be heard. This also disallows for bias at the local level. For example, if the local communities are primarily loggers, then the local authorities cannot be paid off to fight for the loggers' views. Although their views will be heard, the final decision will not be made at the local level. The checks and balances system will be implemented. (Individual, No Address - #A28579.13130)

940. Public Concern: The Forest Service should place the burden of proof on those proposing roads as roadless areas are evaluated.

As roadless areas are evaluated, the burden of proof should be on these proposing roads—established as the default as opposed to, for example, wilderness designation where the burden of proof is on the wilderness advocates and non-wilderness the default. (Individual, Spokane, WA - #A20648.45100)

Trails

941. Public Concern: The Forest Service should explain how trail rules work with roadless designation.

I'd like to see more focus on trails within Roadless areas, and how the Trails rules work with Roadless. (Individual, Meridian, ID - #A1683.45500)

942. Public Concern: The Forest Service should rotate trails in roadless areas.

TO PREVENT RESOURCE DAMAGE

Trails in roadless areas should be rotated. Much has been said about resource damage due to trails but I view trails as I view a living document. Its course and path should change gradually over time. This gives the trail time to heal and attain different qualities. (Individual, Palmer Lake, CO - #A23361.90410)

943. Public Concern: The Forest Service should stop turning existing trails into roads.**TO RESTORE TRADITIONAL USES**

Forest planning should fulfill the agency's long-neglected duties under 36 CFR 295 to determine which specific areas or trails are appropriate, if any, for off-road vehicle traffic. To this end, MWA members [suggest]:

Stop churning trails into roads. Roadless national forest trails should be restored to their traditional uses and purposes as foot and horse trails, not motor vehicle speedways. (Organization, Helena, MT - #A21370.90421)

944. Public Concern: The Forest Service should eliminate the 50-inch trail rule.

We think the roadless rule should be implemented with the elimination of the so-called 50-inch trail rule. . . . (Organization, Brookport, IL - #A30260.91221)

945. Public Concern: The Forest Service should reconsider its elimination of the 40-inch rule.**AND RESTORE TRADITIONAL TRAILS THAT HAVE BEEN DAMAGED BY OFF-ROAD VEHICLES**

Page 3 of the ANPR erroneously states that:

"Previously, the long-standing process employed by the Forest Service for all resource management decisions relied on amendments and revisions to the forest plans, governed by the National Forest Management Act. This is a highly collaborative process involving local regional and national interests."

This is not true. On June 25, 1990, the USDA-Forest Service published a federal register notice eliminating the long-standing "forty-inch rule" which protected national forest trails by prohibiting vehicles wider than 40 inches—such as ATVs—from driving on all national forest trails. This rule was considered crucial by field staff to maintain the distinction between roads and trails.

It was eliminated without amending forest plans, at the behest of ATV manufacturers wishing to expand sales of ATVs by selling them as "trail vehicles."

The administrative record shows this change was vigorously opposed by USFS field staff that correctly predicted disastrous consequences from opening trails up to ATVs. No effort was made to involve the public in the three page EA which supposedly justified this national mistake, nor is there any evidence that a single non-motorized, hunting, hiking, horseback or outdoor club was ever contacted before this change was foisted on the American people.

The U.S. Forest Service should clean up this mess and restore traditional trails that have been subsequently damaged by ATV traffic. (Organization, Helena, MT - #A21370.91221)

946. Public Concern: The Forest Service should recognize that trails which are not authorized through a public planning process are illegal.

Forest planning should fulfill the agency's long-neglected duties under 36 CFR 295 to determine which specific areas or trails are appropriate, if any, for off-road vehicle traffic. To this end, MWA members [suggest]:

Vehicle routes that were never authorized through a public planning process should be recognized for what they are: illegal scars and vandalism. (Organization, Helena, MT - #A21370.45500)

Road/Trail Construction

Summary

General Comments – The most common general comment regarding road/trail construction is that the Forest Service should construct and maintain an adequate system of roads and trails—as required by the Multiple Use and Sustained Yield Act (see also Chapter 2: Other Legal

Concerns: Federal Laws, Acts, and Policies: *Multiple Use and Sustained Yield Act*, and Chapter 4: Environmental Values: Management: *Multiple Use Management, Allow Multiple Use Management, and Do Not Allow/Reconsider Multiple Use Management*).

Funding – Some individuals state that the Forest Service has not been forthcoming regarding the availability of funds for road construction, and say the Agency should acknowledge that it has turned down money offered by Congress for road construction. Other suggestions include revising the way the accounting department handles road construction by calculating depreciation over the life of the road; shifting funding priority to trail construction and maintenance; and dividing Green Sticker and gasoline tax funds equally between management costs and new trail costs.

Road Construction – General comments regarding road construction include the suggestion that needed road construction should be determined at the local level based on situation and need; or that it be determined on a case-by-case basis by ecologists unassociated with the Forest Service or extractive interests. One respondent remarks that the Forest Service should complete a management plan for existing roads before banning new road construction. Another suggests the Agency revise its discussion of roads in the Roadless Area Conservation Rule Draft EIS to reflect current improvements in road construction and maintenance. According to this respondent its not a matter of building roads or not building roads, but simply a matter of doing it right.

A number of respondents assert that the Forest Service should allow road construction in roadless areas—to provide access to users; to disperse recreation users; under specific exceptions; or when needed for public safety. Respondents say that the Forest Service should not use the maintenance backlog as an excuse to forego road construction. One organization points out that given the size of land mass managed by the Forest Service, that some maintenance backlog should be expected and considers the existing backlog relatively minor, so consequently should not prevent moving forward with an active roads management plan.

Others assert that the Forest Service should prohibit road construction in roadless areas—because roads lead to increased active management; increased natural resource removal; increased motorized use; increased illegal activity and abusive human behavior; and increased need for rescue operations. Some individuals state that roads contribute to trail destruction and to landslide danger. Others say that the difficult terrain in most roadless areas makes road construction difficult anyway. According to one elected official, “if there had been any real significant timber value or mineral value on those lands, the roads would have been built long ago.” One common assertion, however, is that the Forest Service should prohibit more road construction because it lacks the funding to maintain existing roads; thus some say new construction should not proceed until the backlog has been taken care of.

Trail Construction – Some respondents say trail construction should be allowed to continue. According to individuals and organizations, the Forest Service should construct more recreational trails, turn unneeded roads into less damaging trails, reroute “problem” trails rather than close them, establish connector trails, and construct hiking paths and trail shelters. A few respondents say the Forest Service should engage other groups in trail construction. According to one individual, the Agency should allow trail users to construct trails because it is unable to construct them efficiently itself. According to another, the Agency should work with off-road vehicle users in constructing trails to ensure environmentally responsible usage and rider safety and satisfaction.

Road/Trail Construction General

947. Public Concern: The Forest Service should construct and maintain an adequate system of roads and trails.

AS REQUIRED BY THE MULTIPLE USE AND SUSTAINED YIELD ACT.

. . . the congressional findings and declarations section of MUSYA states:

The Congress hereby finds and declares that the construction and maintenance of an adequate system of roads and trails within and near the national forests and other lands administered by the Forest Service is essential if increasing demands for timber, recreation and other uses of such lands are to be met; that the existence of such a system would have the effect, among other things, of increasing the value of timber and other resources tributary to such roads; and that such a system is essential to enable the Secretary of Agriculture (hereinafter called the Secretary) to provide for intensive use, protection, development, and management of the lands under principles of multiple use and sustained yield of products and services. 16 U.S.C. [section] 532. (Business or Association, Washington, DC - #A29622.20202)

Funding

948. Public Concern: The Forest Service should tell the truth regarding the availability of funds for road construction.

I've been told over and over that there isn't the money to do this or that or build trails and roads, and guess what? The USFS has been turning down money for roadbuilding for years. I'm told Congress won't give you money, but the fact is that Congress has been offering money and Dombeck has been turning it down! I was told this by a staff member on the committee for forests and forest health. So, the lie is told to the field people, and now the agency looks like a bunch of liars with an agenda. Can you dispute this? Can you prove me wrong? So go ahead and side with those so-called green groups and in a few years if you feel at a distance with the public, you will know why; the public will come to resent you all for keeping us off our public land. And don't be surprised if the public cares not a whit about stewardship because making a mess for a bunch of tyrants is a lot of fun. (Individual, Burbank, CA - #A18027.15121)

949. Public Concern: The Forest Service should revise the way the accounting department handles road construction.

BY CALCULATING DEPRECIATION OVER THE LIFE OF THE ROAD

Change the way the accounting department handles road construction. Depreciation should be over the life of the road, which, if maintained correctly, should last a very long time. (Individual, Princeton, WV - #A18086.90120)

950. Public Concern: The Forest Service should shift funding priority to trail construction and maintenance.

Because of the obvious desire and need for more hiking opportunities on National Forest land, funding priority should shift to trail construction and maintenance, not taxpayer funded road building that loses millions of dollars and leaves public lands denuded and useless to all.

My family and I visit roadless areas regularly. Having hiked the Boulder Ridge trail in the Mt. Baker National Forest (and then in the Sliver that's Mt. Baker Wilderness Area) just yesterday, I found it disturbing that the trail was posted as unmaintained this year due to budget and staffing concerns. Note I had a \$30 trail-park pass on my windshield as I clambored over blow-down and bushwhacked through partially bushed trail. At the top of the ridge, the view of roads and clear-cuts crisscrossing entire mountains from top to bottom was especially galling. (Individual, Seattle, WA - #A4885.17120)

951. Public Concern: The Forest Service should divide Green Sticker and gasoline tax funds equally between management costs and new trail costs.

Green Sticker \$ and gasoline tax should be divided equally between management costs and improvement/new trails costs. Do not spend most of the money on closures (i.e., management by laying new fences, road gates, signs stating trail closed)! (Individual, Thousand Oaks, CA - #A891.17130)

Road Construction

952. Public Concern: The Forest Service should determine needed road construction at the local level.

BASED ON SITUATION AND NEED

The roadless areas should be maintained with a status quo with the local ability to build or not to build roads based upon the situation and the need. (Individual, Maricopa, CA - #A3732.25000)

953. Public Concern: The Forest Service should examine the need for new road construction on a case-by-case basis.

BY ECOLOGISTS UNASSOCIATED WITH THE AGENCY OR COMMODITY INTERESTS

The need for new road construction to facilitate management activities for forest health reasons, and/or to bring wildlands back within their natural range of ecological variability should be examined on a case by case basis, with the burden of proof falling on ecologists that are independent of, and shielded from, extractive interests within and outside the agency. (Individual, Corvallis, OR - #A650.30200)

954. Public Concern: The Forest Service should specify whether road construction and reconstruction in other unroaded areas is to be under the jurisdiction of local land managers.

The original proposed rule discussed the prohibition on road construction and reconstruction in the inventoried roadless areas, but did not provide any guidance relative to the other unroaded areas. If it is the intent that road maintenance, reconstruction and construction are management decisions left to the local land managers' discretion, then to avoid confusion and more gridlock, we recommend that the rules clearly indicate this intent. (Elected Official, Roseburg, OR - #A11811.45420)

955. Public Concern: The Forest Service should complete a management plan for existing roads before banning new road construction.

The current situation relative to roads on USFS land is a question of management. Roads are needed to properly manage land. The issue is how they are managed once their original objective for development has been met. Roads properly designed, properly maintained and properly used are not evil, as some citizens believe. We think before any long-term decisions are made relative to road building bans a management plan for existing roads should be completed. (Organization, Flagstaff, AZ - #A6011.15100)

956. Public Concern: The Forest Service should revise its discussion of roads in the Roadless Area Conservation Rule Draft EIS to reflect current improvements in road construction and maintenance.

Roads in the forest are not like freeways (as the Administration has often compared them to in other documents). Considering the little use and low density of Forest roads, their contribution to "atmospheric emission" and "volatile organic compounds" (S-36), is minuscule and such claims are silly to be included in the DEIS, while other larger aspects of the issues are ignored.

The adverse environmental impacts that the DEIS [attributes] to roads is cloaked in terms like "potential" and "can." And nowhere in the DEIS are there any statements about how these impacts can be eliminated and/or are being mitigated. You don't have to stop building roads; you just have to do it

right. This is not to say that the DEIS is totally wrong in saying that roads can impact the environment, but road building by the Forest Service has changed a lot and the DEIS does not acknowledge that. Past mistakes have been corrected, roads are no longer put where they shouldn't be, roads are being removed that were incorrectly built, and forest engineers and hydrologists have been extensively trained in cutting edge, low impact road building and maintenance.

The DEIS mixes up generic philosophical opposition to all road and technology with specific, current, legitimate environmental concerns of road impacts. (Union, No Address - #A28881.90120)

957. Public Concern: The Forest Service should protect roadless areas.

TO REDUCE THE BACKLOG OF IMPROPERLY CONSTRUCTED ROADS

The current local land management planning and scoping for individual NEPA actions works fine. However, a national policy to protect roadless areas and to reduce the backlog of improperly constructed roads is sorely needed. (Individual, Juneau, AK - #A23242.13100)

Allow Road Construction

958. Public Concern: The Forest Service should allow road construction and maintenance in roadless areas.

We believe that forest roads and trails, properly constructed and maintained, are an investment and a critical part of forest management, emergency response and recreation use. These same roads, whether classified or not under USFS rules, are an increasingly important part of the rural transportation and recreation system. Roads and recreation trails should be maintained to the appropriate standards for expected use; and, maintained in an environmentally sound manner following standards, laws and regulations. With the exception of Wilderness established under United States Law, forest roads and trails are an extremely important public asset in all forest ownerships, including the national forests, and must be treated as a significant capital investment. (Organization, Los Gatos, CA - #A1062.90120)

You might want to consider building roads into these areas so that the public can use them too. Roads are not evil. They serve many good purposes. (Individual, Portland, OR - #A1110.90120)

TO PROVIDE ACCESS TO USERS

Roads into many of the mountain areas need to be maintained and open to the public. There are ENOUGH wilderness areas that need to remain so. The public has a right into mountain/forest areas. As they have the right to see they are cared for and not abuse this right of being on forest/mountain lands. OPPOSED TO THIS ROADLESS CONSERVATION RULE!!!!!!!!!! (Individual, Florence, CO - #A985.90120)

TO DISPERSE RECREATION USERS

The forest needs to be kept open to the public. The new policy of destroying existing roads in the name of watershed protection and habitat management leaves the average public locked out of the woods. Building new roads to give new access points for public recreation is important because many areas are already over used. Dispersing usage to new areas would be wise rather than shrinking the areas available to use. (Individual, Bozeman, MT - #A59.90120)

TO SPARE LOCAL GOVERNMENTS THE COST OF REPAIRS TO MAINTAIN NEEDED ACCESS TO UTILITY SITES

By not allowing the construction of new roads or repair of damaged ones, the health of the forest would be greatly in danger as the accumulation of dead, unharvested timber would cause a severe fire hazard and the continued infestation of the bark beetle. The only way to protect against a catastrophic fire and manage the forest's health is to maintain the forest through responsible logging and the thinning of hazardous vegetation. In addition, if a road were washed out on public lands, local governments would have unnecessary costs and red tape to follow to get a road repaired to access their water system. (Individual, Mayfield, UT - #A6629.30100)

TO PROVIDE ACCESS FOR NON-TIMBER FOREST PRODUCT GATHERING

My concern is that a major stakeholder is mostly left out of the road building deliberations the Forest Service is currently undertaking. The stakeholders in question are entities within the commercial and non-commercial non-timber forest product's (NTFP) sector in this country. NTFPs are forest resources such as mushrooms, truffles, boughs, cones, and botanicals for medicine, berries, beargrass, and maple syrup. Including medicinals, the NTFP wholesale sector is a multibillion dollar a year economy. As the Forest Service and other agencies grapple with ecosystem management NTFPs have only been minimally considered, and largely misunderstood. NTFPs, as many countries already have learned, represent an opportunity to manage the forest for increased biodiversity and forest health. NTFPs do not preclude selective timber extraction and are compatible with the emerging knowledge of fire ecology and restoration.

NTFP extraction requires various types of access paths ranging from simple trails to industrial roads. In most cases NTFPs do not require the type of heavy equipment road that typifies the majority built on our public forests. Effective NTFP extraction and ecosystem management needs could be carried out on less than the existing road infrastructure, but with old roads being modified to a range of levels from those for small vehicles, to ATVs, to horses, to bicycles, and to foot trails. New access ways could be built into existing roadless areas that would allow for NTFP extraction, but without damaging the ecosystem. Existing Federal road subsidies could be reduced and made available for the construction, alteration, and maintenance of simple, low impact roads and trails.

With greater emphasis on NTFPs the forests will become healthier and visually more appealing because of their diversity. Management for NTFPs will result in economic diversity and yields that will far exceed anything seen under the timber management approach. (Individual, Portland, OR - #A22188.65290)

WHEN NEEDED TO ADD TO THE TRANSPORTATION INFRASTRUCTURE THAT IS ESSENTIAL TO THE SECURITY AND ECONOMIC HEALTH OF THE NATION

The roadless rule is an example of unnecessary government micro-management and a very extravagant use of public funds. Current roadless areas must never be considered off-limits for building new roads if they are needed to add to the transportation infrastructure that is essential to the security and economic health of the nation. Over the last few years there have been more than an adequate number of wilderness areas preserved to accommodate the environmental groups that are so vocal, and that caused this hurried and flawed approach to conservation. Long-term conservation means that we must have a policy that allows placing roads such that they reduce the miles between cities, towns, and recreational areas. As an example: For me to drive to Roosevelt Lake in Arizona, a very popular recreational spot for those in the Phoenix area, I must drive about 180 miles, round trip. It could be less than half that with a new road that was placed properly. This kind of conservation is just as important as improving vehicle fuel efficiency and emissions controls for long term environmental preservation. (Individual, Fountain Hills, AZ - #A5990.10112)

UNDER SPECIFIC EXCEPTIONS

The exceptions for road construction include the following; (1) A road is needed to protect public health and safety in cases of an imminent threat of flood, fire, or other catastrophic event that, without intervention, would cause the loss of life or property.

(2) A road is needed to conduct a response under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) or to conduct a natural resource restoration under CERCLA, Section 311 of the Clean Water Act, or Oil Pollution Act. (3) A road is needed pursuant to reserved or outstanding rights, or as provided for by statute or treaty. (4) Road realignment is needed to prevent irreparable resource damage that arises from the design, location, use, or deterioration of a classified road and that cannot be mitigated by road maintenance. Road realignment may occur under this paragraph only if the road is deemed essential for public or private access, natural resource management, or public health and safety. (5) Road construction is needed to implement a road safety improvement project on a classified road determined to be hazardous on the basis of accident experience or accident potential on that road. (6) The Secretary of Agriculture determines that a Federal Aid Highway project, authorized pursuant to Title 23 of the United States Code, is in the public interest or is consistent with purposes for which the land was reserved or acquired and no other reasonable and

prudent alternative exists; or (7) A road is needed in conjunction with the continuation, extension, or renewal of mineral lease on lands that are under lease by the Secretary of Interior. (Individual, Asheville, NC - #A22623.90130)

BOTH PERMANENT AND TEMPORARY ROADS

Providing sustainable healthy forests should be the goal of all management. Our western forests are disturbance dependent, therefore plans for all Roadless areas must include descriptions of how such disturbance may be allowed or purposefully carried out. Such disturbances will logically favor orderly timber harvest and subsequent post-harvest measures—slash disposal, site preparation, reforestation, and stand stocking control. Road access may be provided by some permanent roads as well as temporary ‘roll-up roads’. (Individual, Evergreen, CO - #A19178.30100)

It is important to note that in many cases the removal of small-diameter trees is used as an excuse for logging groups to implement roads that are later used as justification for further logging. This should be addressed directly in a way that would allow roads to be “expired” after a short time period after their initial use has been satisfied. (Individual, Rochester, NY - #A8831.30100)

TWO-TRACK ROADS

I am totally opposed to the Clinton-Gore Roadless plan. We must have our two track roads in Nevada if we are able to use the Forest for grazing, mining, recreation and hunting. (Individual, Park Valley, UT - #A15252.10130)

WHEN NEEDED FOR PUBLIC SAFETY

I believe the entire area immediately East of Ogden, Utah has been inaccurately inventoried as Roadless. There are a number of current and future roads that are now, or soon will need to be, located in this area.

Even if boundary adjustments could be made to exclude these existing and future roads from what is being called the Burch Creek Roadless Area, I believe the resulting area, (sandwiched by private mountain land on the North, developed ski resort land on the East, Ogden City on the West, and Interstate 84 on the South,) is too small to have the characteristics that are desirable in a roadless area. With roads, mountain bike trails, ski runs, ski race buildings and mountain restaurants at the upper fringes of the Burch, Beus, Strongs, Malans and Taylor drainages and with city streets and homes less than 3 miles away on the lower fringes, a roadless designation seems to invite unnecessary conflicts with the adjoining high-density recreation and urban uses. To effectively administer this land, I believe the Ogden Ranger District should have at its disposal the full range of National Forest uses without the strictures imposed by a roadless designation.

Current roads in the inventoried Burch Creek roadless area, as mapped on the FS website:

- 1) The road to the Mt. Ogden Telecommunications site in Section 6 of Township 5 North, Range 1 East, Salt Lake Base and Meridian.
- 2) The road and ski run at the top of Burch Bowl between DeMoisy Peak and Strawberry Peak in Section 8 of Township 5 North, Range 1 East, Salt Lake Base and Meridian.

New road needed in the inventoried roadless area:

- 1) A skier trail from the top of Snowbasin Resort’s Strawberry Gondola north into Middle bowl. This skier road will improve skier egress from Strawberry Bowl at the end of the day, and when this road is built, it will allow the current, above ground high voltage electric line (from the top of the Mid Bowl Gondola to the top of the Strawberry Gondola) to be buried. This path is now used extensively by skiers taking the shortcut from Strawberry to Middle Bowl, resulting in a hazard as metal ski and snowboard edges cut through the insulation on the high-voltage line. A bigger hazard of not having this road (and accompanying underground power line) is that avalanche control charges are exploded in close proximity to the surface-power line. An unlucky avalanche charge could cut off power to the Strawberry Gondola for weeks if not months.

Given the two existing roads in this “roadless” area, and the need for a third, I respectfully request that the Burch Creek Roadless area near Ogden, Utah be deleted from the map of inventoried roadless areas. (Individual, Ogden, UT - #A30540.45510)

IN CENTRAL UTAH

In the Central Utah area where I live, there has been considerable road development in the mountains along the Skyline Drive. Today this beautiful area is enjoyed by thousands of camper, hikers and fishermen every weekend. Deer and Elk are abundant and unharmed by the people using the resource. If the Forest Service's rule is put into place, the only way to get into many of those places will be by foot or horseback. A fact that will deny me and thousands of others access to the public lands their taxes pay for. (Individual, Mount Pleasant, UT - #A26116.90000)

959. Public Concern: The Forest Service should not use the maintenance backlog as an excuse to forego road construction.

Much has been made of there being a *\$8 billion total* maintenance backlog on forest roads, but the DEIS fails totally to explain that this is the result of three circumstances: 1) a severe underfunding and downsizing of the Agency for the last eight years; 2) a result of new, important environmental standards that the Forest Service now has for its roads; and 3) normal degradation as a result of time and use.

To put this in another perspective, the annual cost of maintaining *other* public highways is about \$150 billion *per year* plus another \$100 billion *per year* is needed for rebuilding (Civil Engineering, May 2000) plus an unknown amount for private roads. And in 1998, the American Society of Civil Engineers estimated that the repair and renewal of America's infrastructure would take **\$1.3 trillion**. The Forest Service's \$8 billion road need is a minuscule part of that total. The Forest Service also has \$5 billion maintenance backlog on Forest facilities, but no one (rightly so) is using that as a justification for advocating closing campgrounds and visitor centers.

The DEIS should point out that the Forest Service is the 2nd largest landowner in the United States (next to the BLM). So the Forest Service's facilities and road maintenance backlogs are a very small, and an expected, part of our country's normal infrastructure needs. We shouldn't stop our roads program, we should start taking proper care of our road systems. And that should mean that the Forest Service should do **appropriate** planning—as compared to no planning as in IRAs, or making blanket road closure statements. (Union, No Address - #A28881.17240)

Do Not Allow/Restrict Road Construction

960. Public Concern: The Forest Service should prohibit road construction in roadless areas.

I do not wish to see any new roads established in either national or state parks. These resources are precious and should remain pristine and free from development of any kind. (Individual, Los Angeles, CA - #A42.90130)

I am in favor of keeping all currently roadless areas in their roadless condition. The majority of public land already has roads, and I, for one, would like to preserve the few roadless areas we still have for backpacking, hiking, and enjoying nature without the disturbances associated with roads. I support a ban on all further road building in roadless areas. (Individual, Reno, NV - #A149.90130)

The Best way to manage roadless areas in order to maintain forest health is to keep these areas ROADLESS and inaccessible to perturbations such as logging and non-point pollution caused by roads. Using roads to enable fire suppression only allows for buildup of forest debris that eventually results in catastrophic fires. Maintaining these areas in a roadless condition allows historic low intensity uses such as hunting. Construction of roads opens these areas up to high intensity use, which can result in stresses to the ecological system. (Individual, No Address - #A621.90130)

I am well aware of how little territory in America is actually "roadless" I put that in quotation marks because even so-called "roadless" areas are riddled with access to vehicles and other. I support any laws that prevent the building of new roads in Public lands or closes already existing roads to vehicle travel. (Individual, Sheffield, MA - #A4297.90130)

BECAUSE ROADS LEAD TO INCREASED ACTIVE MANAGEMENT

Roads lead to development. In a recent trip my wife and I took to the Sequoia National Park, I noted that a development company that has received a contract from the Federal Government has displaced the existing small businesses (condemned as “ecologically unsound” by the Federal EPA) and is in the process of developing a huge hotel complex with a convention center, restaurant, and gift shop. This development is apparently inevitable (and aided by the Federal Government) even in a National Park. The only defense is to not allow commercial development, and this includes roads. (Individual, Santa Barbara, CA - #A504.90220)

BECAUSE ROADS LEAD TO INCREASED NATURAL RESOURCE USE

The public property of the United States has been exploited enough by PRIVATE corporations. Opening the roads will only lead to increased logging and oil drilling—something that court designated president Bush would like. However, the majority of Americans surveyed support the protection of our national resources, and road building is a direct assault on the protection. (Individual, Albuquerque, NM - #A34.90130)

Unless, of course, you are talking about timber, energy and mining companies (TEM) which is a different type of situation from a private landowner. The traffic from the TEM entities would disrupt the wilderness areas and provide access to areas they do not own, but could exploit by virtue of a road being present. I say they give up the land within these areas for the common good, since they get enough tax credits from their other activities. (Individual, Ogden, UT - #A1166.90130)

BECAUSE ROADS LEAD TO EXCESSIVE GATHERING

It is best not to build roads in these places, to leave them remote and not easily accessed. If gathering is allowed in these places on a more primitive level, the resources will not be endangered. For example, when I hike into DNR land with permission to gather bark from Western Red Cedars that have been sold by the DNR to perhaps a shingle or fencing company, I am limited by what I myself can carry out on my own back. This limitation keeps me from gathering in an exploitative manner, selling for profit the raw resource of inner bark. Instead it encourages the value added by my practicing an ancient craft, keeping alive traditional technologies, which have historical and cultural importance. (Individual, Indianola, WA - #A25409.90130)

BECAUSE ROADS LEAD TO INCREASED MOTORIZED USE

Forest roads have proven to be almost worse than over cutting. The best way to ruin an area is to build a road into it. Roads only attract people with their ATVs and 4 X 4s who drive off-road, litter, start fires, spread noxious weeds, and otherwise damage the environment. Roads are also associated with landslides. (Individual, Missoula, MT - #A90.90130)

Roads in our national forests have been extremely harmful to the health of these forests. We don't need ORVs and ATVs chewing up our forests. (Individual, Anderson, CA - #A717.90130)

BECAUSE ROADS LEAD TO INCREASED ILLEGAL ACTIVITY

Roads cause erosion, encourage out-of-season hunting and other illegal activities (including meth labs and marijuana cultivation.) (Individual, No Address - #A470.90130)

Allowing roads to be put in National Forests would just be an invitation to poach. (Individual, Charleston, SC - #A3611.90130)

BECAUSE ROADS PROVIDE AN AVENUE FOR ABUSIVE HUMAN BEHAVIOR

By putting roads into roadless areas is to invite litter, toxic dumping, and trash, from uncaring and/or unthinking people. I am sure the forest rangers, park rangers etc. have seen this all too often. (Individual, Buffalo, NY - #A11029.10110)

Roadless areas make sense. Many roads are maintained at cost and little used, and hardship of access eliminates shooters, beer cans, plastic waterbottles, whatever litter, and firebugs. The ills of maintenance, cut branches, dirt, and rock shoved downhill, soiling watersheds, stop. The immediate environment gains. (Individual, No Address - #A5286.10111)

I wish to voice my support of the National Forest Roadless Area Conservation Rule. There is so precious little “backcountry” left. I live near a national forest—some years ago the Forest Service put culverts in and a primitive road into a pristine area where I used to hike. Now I have seen trash dumped here (old stoves, mattresses), garbage, evidence of a “hill climb” with automobiles, and once even a burning pallet. Keep the roads out! (Individual, Bozeman, MT - #A8188.10111)

Count me in to save the Forest system. I can’t believe the way the campers are taking over the land we use to hunt on they go in there set up their tents they leave their trash they put used tires in to the streams they leave their body waste and toilet paper laying around so people step in it and I’m sure the animals don’t like it either. (Individual, Lincolnton, NC - #A7407.10000)

I commented extensively on the Roadless Policy over the past three years and wish to see the January 5, 2001 rule implemented. Roding areas brings in invasive species, trash fire hazard (smoking, campfires etc.), and causes erosion which damages riparian areas. Roding areas fragments wildlife habitat and destroys it, and facilitates uses which are detrimental to wildlife (off-road vehicle use and illegal firearm use). Roding areas represents a loss of taxpayer dollars and impairs critical watersheds, as occurred in 1995-96 and loads in the Santain River due to roads [and] logging. In the Willamette National Forest lands closest to Salmon are roded, so I don’t go there—the trash, vandalism, noise and firearm use disgust me. I have hiked in to Mt. Jefferson Wilderness and Opal creek Wilderness and the difference in abundance of wildlife, quiet, beauty, and lack of trash is dramatic and makes the recreational experience worthwhile. Once areas are roded, the Forest Service must spend even more money maintaining them by trash removal and enforcement of safety laws. (Individual, Salem, OR - #A14529.30100)

BECAUSE INCREASED ACCESS WILL LEAD TO INCREASED NEED FOR RESCUE OPERATIONS

Some examples of problems caused by roads are:

Increased opportunities for violation of forest protective measures (e.g. poaching, illicit logging) with more human ingress into formerly inaccessible areas and increased need for air or ground human rescue operations which may negatively impact natural areas. (Organization, Pritchett, CO - #A21442.50500)

BECAUSE ROADS CONTRIBUTE TO TRAIL DESTRUCTION

Roads destroy more primitive transportation routes—our trail system. Trails are important to animals and humans in remote areas. Our trail system is part of our national heritage—in many cases these trails were developed by the C.C.C.s [Civilian Conservation Corp] and in some cases animals and prehistoric humans actually developed the trail routes. (Individual, Troy, MT - #A1180.90410)

BECAUSE ROADS CONTRIBUTE TO LANDSLIDE DANGER

Roads have also contributed significantly to landslides, endangering person and property. (Individual, Davis, CA - #A6615.90130)

I’ve seen neighbors swept to their deaths by mudslides due to clear-cuts approved by professional loggers. (Individual, Roseburg, OR - #A4788.90520)

BECAUSE THE DIFFICULT TERRAIN IN MOST ROADLESS AREAS IMPEDES ROAD CONSTRUCTION

Why are the areas that are proposed as roadless areas roadless? If there had been any real significant timber value or mineral value on those lands, the roads would have been built long ago. The simple truth is that those areas where roads have yet to be built are roadless because it was simply too costly and difficult to get roads into those areas. It makes little sense to build expensive roads into areas that are hard to reach when the Forest Service is unable to maintain or repair thousands of miles of failing roads.

I am very familiar with several of the proposed roadless areas in Washington, Idaho and Montana. I have done extensive geologic mapping in several of them as a researcher and under contract with state

governments. It would be a remarkable engineering feat to get a road into some of those areas. Certainly that is the case for the proposed roadless areas in Whatcom County. (Elected Official, Bellingham, WA - #A4955.90130)

BECAUSE THE FOREST SERVICE LACKS THE FUNDING TO MAINTAIN EXISTING ROADS

Roads have a profound effect on the natural landscape and once built interfere with the local ecology indefinitely. As the Forest Service well knows, maintenance costs are huge and the backlog of such costs on existing roads will never be met. It is unwise to build new roads on lands currently designated as roadless. (Individual, Olympia, WA - #A510.90130)

Note that roads are expensive to build and that taxpayers are rarely reimbursed for the many Forest Service roads built for the de facto exclusive purposes of private logging and mining firms. Road maintenance and erosion control measures add to the cost of these roads. Additional helicopters and hiring of pedestrian forest management personnel could be had for similar cost to road construction. (Individual, No Address - #A117.90130)

I am concerned, as a tax payer and voter, that building additional roads into these areas would be primarily at the tax payers expense for the benefit of a few special interests, such as the subsidized timber and mining interests who do not bear the appropriate share of the costs in building, maintenance, and cleanup. The forest service cannot afford to keep most existing roads properly maintained. (Individual, Gallatin Gateway, MT - #A17684.75600)

Protecting and preserving the remaining roadless areas on our public lands serves the public in many ways. The network of roads in the roaded portions of our public lands is already excessive and unmanageable. The U.S. Forest Service road maintenance program costs American taxpayers hundreds of millions of dollars per year and currently suffers a debit of hundreds of millions of dollars. U.S. Forest Service annual reports for every year since 1996 reveal further costs to the taxpayer in the form of heavily subsidized logging, mining, and grazing of our public lands all of which fail to return even the cost of administration. Yet these industries enjoy a second round of subsidies in the form of roads built across our public lands primarily to support extraction of natural resources with recreational access an afterthought often used [as] an excuse to perpetuate already heavily subsidized industrial use of our public lands. (Individual, Kennewick, WA - #A23359.75600)

There are already more roads on the national forest system than can be cared for.

The Department is concerned about building new roads in inventoried roadless areas, when there presently exists a backlog of about \$8.4 billion in deferred maintenance and reconstruction on the more than 386,000-miles of roads in the Forest Transportation System. The agency estimates that at least 60,000 miles of additional unauthorized roads exist across National Forest System lands. The agency receives less than 20% of the funds needed annually to maintain the existing road infrastructure. As funding needs remain unmet, the cost of fixing deteriorating roads increases exponentially every year. Failure to maintain existing roads can also lead to erosion and water quality degradation and other environmental problems and potential threats to human safety. It makes little fiscal or environmental sense to build additional roads in inventoried roadless areas that have irretrievable values at risk when the agency is stragglng to maintain its existing extensive road system. (Organization, Denver, CO - #A12008.17100)

National forests in Colorado have a multi-million dollar backlog in road maintenance. Where the agency cannot keep its current "assets" in good repair, it makes little sense to permit new road construction in the most remote areas, where road construction is the most expensive. (Organization, Boulder, CO - #A13463.17240)

IN SENSITIVE AREAS

All sensitive areas must be off limits to roads. Some areas (e.g. riparian areas, unstable slopes, and sensitive and degraded watersheds) are simply unsuitable for roads. The needs of disturbance-sensitive species must inform road construction, maintenance and use. (Organization, Arcata, CA - #A1778.45100)

NEAR WILDERNESS AREAS

Roadways near wilderness areas (BWCA) effectively reduce the size of the wilderness even if the roads don't enter the BWCA because they allow faster entry into wilderness which already suffers from heavy use. (Individual, Clear Lake, IA - #A8886.90000)

ONCE INVENTORIED AREAS ARE MAPPED ACCURATELY

Once inventoried roadless areas are mapped accurately, with those areas with roads deleted from the inventory, permanent roads should be prohibited. (Individual, Longview, WA - #A18940.90130)

UNTIL NEW FOREST PLANS ARE IN PLACE

There are over 60,000 of the acres in the GMNF that demand protection. There is a need to be a moratorium on any road building or resource extraction in these areas until the new forest plan is re-written. (Business, Bristol, VT - #A8734.12440)

UNTIL THE AGENCY IS ABLE TO BETTER MANAGE THE EXISTING ROAD NETWORK

At the very least, we should continue a moratorium on all new roads until we do a better job of managing the Forest Service's existing road network. (Individual, Arlington, MA - #A7703.12440)

*Allow Trail Construction***961. Public Concern: The Forest Service should construct more recreational trails.**

Encourage and build more recreational trails. Trails provide natural barriers and they provide a mechanism to get at a problem area quickly. (Individual, Fraser, CO - #A30203.30000)

962. Public Concern: The Forest Service should allow trail construction.**RATHER THAN ROAD CONSTRUCTION**

The best and only acceptable compromise are trails—NOT ROADS! Perhaps, provisions can be allowed for ATVs and horse trails; but nothing more; and, the law does not need to be interpreted for more. (Individual, Geneva, NE - #A15512.90410)

LESS THAN SIX FEET WIDE

Access can be attained with trails less than six feet wide. (Individual, Ketchikan, AK - #A13522.90510)

963. Public Concern: The Forest Service should turn unneeded roads into less damaging trails.

I am writing to urge your support of the protection of roadless areas in our National Forests. From personal experience, there are very few areas in Virginia's National Forests that are not crisscrossed by dirt roads, which specifically erode sediment into streams, badly damaging them as native brook trout habitat. It is a rare mountain hollow in Virginia's National Forests that does not have a dirt road running along next to the stream. Please help protect the remaining roadless areas in my state and turn the unneeded roads into less damaging trails. (Individual, Richmond, VA - #A888.10111)

964. Public Concern: The Forest Service should reroute “problem” trails rather than close them.

With education, local OHV enthusiast partners can identify and help correct problematic routes. To encourage users to be “part of the solution” the Forest Service should be creative in its remedy for troubled areas or trails in roadless and unroaded areas. If it is not possible to “fix” a trail/area problem, then rerouting should be considered a preferred alternative to simply closing the route or area. (Individual, Victoria, KS - #A2874.90000)

965. Public Concern: The Forest Service should establish connector trails.**TO AVOID DEAD-END TRAILS**

Connector trails should be constructed to avoid dead-end trails. These systems could provide recreation opportunities for a variety of skill levels. The document and alternative formulation should evaluate all of these sorts of opportunities. (Organization, Helena, MT - #A13226.91211)

966. Public Concern: The Forest Service should construct hiking paths and trail shelters.**RATHER THAN ROADS**

It is critical that we prevent more logging roads into our national and state forests and wilderness areas. Our populace is already jammed into overdeveloped urban infrastructures that have decimated local wildlife and fauna. Our national forests need to be preserved for future generations and the existing ecological balances left alone. Road building will lead inexorably to logging and mining these areas. Instead work on developing hiking paths and trail shelters for easier exploration of these wild areas. (Individual, Fort Wayne, IN - #A479.10111)

967. Public Concern: The Forest Service should allow trail users to construct trails.**BECAUSE THE FOREST SERVICE IS UNABLE TO CONSTRUCT THEM EFFICIENTLY**

The USFS should stay away from the trail making business. They don’t make good trails and their cost is prohibitive. There is no reason trails should be expensive to make—it’s the process that’s the problem. Let the people that use them make them—they know what they want and they’ll do it for 1/10th the price. (Individual, Palmer Lake, CO - #A23361.90420)

968. Public Concern: The Forest Service should work with off-road vehicle users in developing and maintaining trails.**TO ENSURE ENVIRONMENTALLY RESPONSIBLE USAGE AND RIDER SAFETY AND SATISFACTION**

Working with OHV enthusiasts the Forest Service can develop long, well-marked, challenging, and aesthetically rewarding trail systems that will hedge route proliferation and trespassing. These trails can be managed and maintained to ensure environmental responsibility as well as rider safety and satisfaction. (Individual, Lawrenceville, GA - #A6172.30200)

Road/Trail Maintenance/Reconstruction

Summary

General Comments – One general comment regarding road/trail maintenance/reconstruction is that the Forest Service should establish a uniform checklist and a clearly defined process to govern road and trail maintenance. According to one Organization, this would allow consistent, scientific direction that could be followed by all partners such as local governments, tribes, communities and forest planning officials.

Funding – A number of respondents say the Forest Service should provide adequate funding for road maintenance; some suggest this could be accomplished by using national highway gas tax funds. Others assert that the Forest Service should eliminate all road maintenance backlogs—by reprioritizing funding or by considering cost-saving measures for maintenance. Some respondents ask the Forest Service to justify its claim that there is an \$8.6 billion road maintenance backlog, while others suggest that the Agency tie adequate road maintenance funding to best management practices for timber removal, and that it seek funding for trail maintenance from states.

Road Maintenance/Reconstruction – General comments regarding road maintenance/reconstruction include the request that the Forest Service provide new direction for road maintenance in the Forest Service Manual; that it clarify what road restoration activities will be allowed under the Roadless Area Conservation Rule for roads significantly damaged by natural hazards; that it address road maintenance needs in the Tongass National Forest; and that it sign unmaintained roads indicating user liability. Beyond these more general comments, a number of respondents urge the Forest Service to maintain existing roads—by rerouting roads that are causing damage, by waterproofing needed roads, or by bringing roads up to standard. Some suggest that the Forest Service allow off-highway clubs to maintain roads that counties and states cannot, and that it assist Permit Holders in road maintenance.

Trail Maintenance/Reconstruction – A few respondents offer comment specifically on trail maintenance/reconstruction. Some suggest that the Forest Service should maintain all existing trails in the trail inventory. According to one individual, there should be an on-going trail maintenance program rather than the hit-and-miss funding that seems to have occurred in the past. An Organization suggests that the Agency clear trails early in the year “to ensure maximum availability and reduction of diversion damage caused by routing around obstacles.”

Road/Trail Maintenance/Reconstruction General

969. Public Concern: The Forest Service should establish a uniform checklist and a clearly defined process to govern road and trail maintenance.

ABATE of Illinois believes that trail, road, and cross-country health of the forest should be based on standard criteria using a uniform checklist and a clearly defined process that would minimize personal interpretation.

This, along with directives to provide for all types of recreation, would allow strong leadership from local forest planning officials, local governments, communities, tribes and organizations in the design of the forest as well as the application of scientific criteria. (Organization, Naperville, IL - #A20342.13110)

Funding

970. Public Concern: The Forest Service should provide adequate funding for road maintenance.

We strongly feel that the first priority should be given to maintaining existing roads, together with adequate funding for all associated costs connected with allowing access to these roads, such as clean up of illegal dumping and adjacent off road vehicle damage, as well as actual road maintenance and repair.

We are strongly opposed to the building of any new roads in currently roadless areas. Any new road building should be focused in areas previously accessed for logging, etc. As you know, the existing undisturbed forested land that is still available represents only a fragment of what once was. (Individual, Selma, OR - #A1594.45500)

BY USING NATIONAL HIGHWAY GAS TAX FUNDS

I support the proposed use of some National Highway gas tax funds to maintain and upgrade the forest roads. Primary paved existing roads should be brought up to minimum safety standards based upon the road, number of vehicles, terrain, etc. If a condition of receiving the funds is that they can only be used to bring all forest roads up to “common public highway standards”, then I oppose the receipt of the funds. I believe this requirement could be used as a way to remove significant roads from the overall system as many of them can’t meet the national standards due to narrow width, etc. (Individual, North Bend, WA - #A27321.17110)

971. Public Concern: The Forest Service should eliminate all road maintenance backlogs.**BY REPRIORITIZING FUNDING**

The Forest Service should require sufficient maintenance of existing roads and reprioritize funding until all maintenance backlogs are eliminated. New direction for proper maintenance of roads should be detailed in the Forest Service Manual. New roads, both within inventoried roadless areas and in other portions of the national forests, will be needed in the future to accommodate management activities and the needs of society. When carefully designed and maintained on a forest-by-forest level, the benefits of roads will far exceed costs to both the natural resources and the public. (Professional Society, Anchorage, AK - #A21707.17240)

BY CONSIDERING COST-SAVING MEASURES FOR MAINTENANCE

Reducing and eventually eliminating the \$8.4 billion debt accrued for national forest road repair should be a major consideration. If the Roadless Rule is amended, the Forest Service might consider cost-saving measures for maintenance such as closing unneeded non-system roads that may exist in the Roadless area in favor of constructing new roads deemed necessary and approved, e.g., for firefighting especially near home sites, fuel removal, and insect control. Also, the Forest Service might consider an exemption for realigning or reconstructing necessary roads in roadless areas if the outcome is less damaging to the environment in the long run. (Federal Agency, Washington, DC - #A28843.17240)

972. Public Concern: The Forest Service should tie adequate road maintenance funding to best management practices for timber removal.

Continue to practice stringent road building standards to maintain wildlife corridors, high quality fish and wildlife habitat and the biodiversity of the forests. The current funding of immediate road maintenance needs identified for repairs is a step in good faith, but annual funding earmarked to road maintenance is an essential component for best management practices. Provide funding that is linked to any timber sale plan to safeguard stricter logging standards set for road building. (Individual, Pelican, AK - #A26552.75600)

973. Public Concern: The Forest Service should justify its claim that there is an \$8.6 billion road maintenance backlog.

I find the claim of an \$8.6 billion road maintenance backlog to be beyond belief. (Individual, Fruitdale, SD - #A7638.12200)

The analysis needs to rationally explain, inventory, verify and document the so-called “eight billion dollar” road maintenance backlog and the so-called network of “ghost roads.” (Association, Salem, OR - #A21754.17240)

974. Public Concern: The Forest Service should seek funding for trail maintenance from states.

If more money is needed to maintain the existing trail system we suggest that you check with the various states affected by your proposal to see if trail maintenance funds are available. The off-road trail fund in Wisconsin has a very good level of funding for such purposes. Closing OHV and ATV trails because of

lack of funding for roads in an inappropriate response to a different problem. (Organization, Portage, WI - #A27773.17100)

Road Maintenance/Reconstruction

975. Public Concern: The Forest Service should provide new direction for road maintenance.

IN THE FOREST SERVICE MANUAL

The Forest Service should require sufficient maintenance of existing roads and reprioritize funding until all maintenance backlogs are eliminated. New direction for proper maintenance of roads should be detailed in the Forest Service Manual. New roads, both within inventoried roadless areas and in other portions of the national forests, will be needed in the future to accommodate management activities and the needs of society. When carefully designed and maintained on a forest-by-forest level, the benefits of roads will far exceed costs to both the natural resources and the public. (Professional Society, Anchorage, AK - #A21707.17240)

976. Public Concern: The Forest Service should clarify what road restoration activities will be allowed under the Roadless Area Conservation Rule.

FOR ROADS SIGNIFICANTLY DAMAGED BY NATURAL HAZARDS

We noted that certain provisions and maps of the proposed rule were vague and required clarification. As an example, it was unclear in the definitions of **road maintenance** and **road reconstruction** if a road significantly damaged by a natural hazard such as an avalanche may be fully restored. Based upon the proposed rule's definitions, it appeared that only minor restoration might be permitted. The permissible activities allowed that are greater than "minor restoration" yet less than "reconstruction" were not clear. (Elected Official, Bridgeport, CA - #A18107.90210)

977. Public Concern: The Forest Service should address road maintenance needs in the Tongass National Forest.

Maintain or eliminate and rehabilitate existing roads: The Forest Service should be focusing future management activities on maintaining the existing road system on the Tongass. Many of these road systems are in desperate need of attention. The countless miles of eroding roadbeds and hundreds of washed out culverts and bridges are causing lasting damaging impacts to our anadromous fish streams. As commercial fishing is the number 1 private employer in the region, I believe Forest Service efforts should focus on undoing the harm done to the resource on which this important industry depends. I don't believe the Forest Service should proceed with any road building at all. Instead roads that are unused or beyond hope of repair should be eliminated and rehabilitated. There is a sufficient backlog of road maintenance and rehab needs on the Forest to keep Forest Engineers busy into the foreseeable future. (Individual, Tenakee Springs, AK - #A1758.90210)

According to a Forest Service report, a serious problem exists with roaded crossing over Tongass fish streams. It revealed the failure of road culverts to allow the passage of juvenile fish (nearly 80% on the trout streams surveyed). The Forest Service is unable to maintain the thousands of miles of roads it has already allowed to be cut through the Tongass. It would make no sense to build more roads until the existing ones can be maintained or removed.

We request that St. James Bay and Pt. Couverden near Juneau receive protection if the Tongass is considered in the roadless policy. (Business, Juneau, AK - #A28683.45621)

978. Public Concern: The Forest Service should sign unmaintained roads indicating user liability.

I suggest as a compromise that road closures be prohibited but stop road maintenance. The roads will soon become impassable anyway, even if their users are allowed to roll off rocks etc. The "Road Closed" sign, which is really a bow to some insurance, a matter of liability, should be replaced by a sign laying liability squarely on the shoulders of the user. We are not children that have to be protected from their own actions. WE will find a way to get unstuck. (An afterthought: if driving over a middle strip of high dry grass represents a real fire danger, some roads may have to be closed after all. In that case it should be seasonal.) (Individual, No Address - #A5286.90000)

*Allow Road Maintenance/Reconstruction***979. Public Concern: The Forest Service should maintain existing roads.****BY REROUTING ROADS THAT ARE CAUSING DAMAGE**

Existing roads should be maintained to minimize impacts to watersheds. I would suggest that existing roads, where problems exist, that the first option is to reroute, repair, and or resolve the problems as the first priority. I would suggest that these roads be closed only AFTER all other means have been tried to resolve the problems. The roads should be reviewed on an individual basis by the local people. (Individual, Boise, ID - #A5362.90120)

BY WATERPROOFING NEEDED ROADS

Set a schedule to "waterproof" existing needed roads. (Professional Society, Saint Leonard, MD - #A9040.90120)

BY BRINGING ROADS UP TO STANDARD

When reconstructing roads as part of new timber sales make sure they are brought up to standard. (Professional Society, Saint Leonard, MD - #A9040.90120)

You have invited public comment on the proposal to maintain and upgrade current Forest Service roads. As you pointed out in your May 16, 2000, statement to the Senate Subcommittee on Energy and Natural Resources, forest roads, especially when poorly maintained, can have adverse impacts on watersheds. Few marks on the land are more lasting than roads, and many roads in the national forests do not meet current standards for safety and environmental protection. Many of the classified roads have not been properly maintained, and other roads are neither classified nor maintained. Some of them are simply cleared caterpillar tracks into logging areas. (Organization, Deerfield, IL - #A19049.50000)

980. Public Concern: The Forest Service should maintain roads that charge special use fees.

Where residents pay special uses fees for roads, the maintenance should be the responsibility of the Forest Service. (Individual, Marion, NC - #A4691.17120)

981. Public Concern: The Forest Service should allow off-highway clubs to maintain roads that counties and states cannot.**BECAUSE TOO MUCH LAND AND ROADS HAVE BEEN TAKEN FROM THE PEOPLE**

There are many off highway clubs that would maintain roads that county and states can't, just for the fun of using. There's just been too much land and roads taken from the people. (Individual, No Address - #A742.45524)

982. Public Concern: The Forest Service should assist Permit Holders in road maintenance.

I think Permit Holders should have FS assistance, in maintaining roads and bridges where the Forest Service dictates the road and bridge design and requires upkeep for FS fire fighting equipment. (Individual, Marion, NC - #A4691.30200)

Allow Trail Maintenance/Reconstruction

983. Public Concern: The Forest Service should maintain all existing trails in the Forest Service trail inventory.

Maintain all existing trails on the forest service trail inventory. (Organization, Helena, MT - #A13226.45400)

AS PART OF A CONSERVATION PROCESS

Part of the “conservation” process can and should be an intensive, on-going trail maintenance program rather than the hit-and-miss funding that line item has received in the past. Statewide OHV programs have certainly proved they can provide a large measure of that stewardship. These programs are currently under-utilized due to political grandstanding and obstructionism by supporters of the Clinton land grabbers. The rule must be significantly revised to address recreation access and recognize all of the potential contributors to partnerships for forest health maintenance. (Individual, Bozeman, MT - #A19102.90410)

984. Public Concern: The Forest Service should clear trails early in the year.

TO ENSURE MAXIMUM ACCESS AND REDUCTION OF DAMAGE

Trails should be cleared early in the year to ensure maximum availability and reduction of diversion damage caused by routing around obstacles. (Organization, Helena, MT - #A13226.90411)

Road/Trail Closure/Obliteration/Restoration

Summary

General Comments – Comments regarding road/trail closure/obliteration/restoration include the suggestion that the Forest Service close all user-created routes until site-specific analysis can be completed to determine what status they should have; that it obliterate non-system roads and trails after they are adequately mapped and to avoid unintentional trespassing; that it work with off-road vehicle groups to avoid unnecessary road or trail closures; and that it provide adequate signs to indicate that a road or trail has been closed.

Funding – According to one individual, the Forest Service should not close roads that it does not have the funding to maintain. This person remarks, “Closures simply shouldn’t be an option for a lack of financial resources necessary to regulate proper use of the roads.”

Road Closure/Obliteration/Restoration – Respondents offer several different remarks regarding road closure/obliteration/restoration. One business asks the Forest Service to clarify the evaluation process for closing unclassified roads. Others say there should be public participation for the local communities to provide input before choosing which roads to close or obliterate. One association asserts that the Forest Service should not include roads associated with mining activities in the backlog of roads needing to be reclaimed as those are already mandated by other laws that the permittee is accountable for. Additionally, one elected official questions the adequacy of the statement made in the Advance Notice of Proposed Rulemaking

that the existing road system “was largely funded and constructed to develop areas for timber harvesting and the development of other resources.” According to this respondent, the Forest Service should recognize that, absent recreational needs, roads built for timber removal could be closed after logging, inasmuch as roads built solely for timber removal do not require the high construction standards necessary for roads which serve recreational purposes.

Beyond these general remarks, some respondents assert that the Forest Service should decommission existing roads. One individual believe that the goal should be to remove as many roads as possible. Another suggests eliminating from the travel plan all roads that are not currently shown on maps. An Organization suggests that the Forest Service clearly state in the Roadless Area Conservation Rule that any road constructed in compliance with the exceptions must be closed and rehabilitated as soon as possible.

Some respondents assert that the Forest Service should not decommission existing roads because access to large areas disperses impact. In particular, states one individual, roads which are main arteries to other areas should not be decommissioned. Moreover, say others, the Forest Service should not use the fact that roads are not maintained properly as an excuse to decommission them because “primitive tracks are more fun to drive than the high-speed routes.”

Road/Trail Closure/Obliteration/Restoration General

985. Public Concern: The Forest Service should close all user-created routes.

UNTIL SITE-SPECIFIC ANALYSIS CAN BE COMPLETED TO DETERMINE WHAT STATUS THEY SHOULD HAVE

Further, all illegally-created unclassified routes in roadless areas must be closed until site-specific analysis can be completed to determine whether to remove or decommission the travelway, or to open and classify the travelway as a motorized route or non-motorized trail. 36 CFR 261.10(a) states that “constructing, placing, or maintaining any kind of road, trail . . . on National Forest System land or facilities without a special-use authorization, contract, or approved operating plan” is prohibited. In addition, illegally-created unclassified routes should not be allowed to remain open while that site specific analysis takes place since they were created illegally and are likely to be causing “adverse environmental impact” (NEPA 40 CFR 1506.1 (a)(1)). (Organization, Missoula, MT - #A21359.90420)

986. Public Concern: The Forest Service should obliterate non-system roads and trails.

AFTER THEY ARE ADEQUATELY MAPPED

Forest plans should address those activities not already regulated by the existing roadless rule, especially off-road vehicles. These should not be allowed cross-country access in roadless areas. In many cases, trails should also be closed to motorized vehicle use. Non-system roads should be mapped and obliterated. (Individual, Victor, ID - #A20625.90110)

TO AVOID UNINTENTIONAL TRESPASSING

To avoid unintentional trespass in the long run, it is necessary to obliterate all evidence of routes no longer open to OHV recreation. Additionally, it may be helpful to reroute those trails remaining open, to avoid intersections with the closed routes. (Individual, Arroyo Grande, CA - #A19060.90410)

987. Public Concern: The Forest Service should work with off-road vehicle groups.

TO AVOID UNNECESSARY ROAD OR TRAIL CLOSURES

Solutions to problems must be worked out jointly enabling land managers and all interested parties to understand each other's concerns and needs. Joint, multiple meetings would be most advantageous to all concerned. We do not want to see any loss of roads or trails. Land managers have a viable and willing volunteer working force at their disposal—Off-highway Vehicle Users! With Adopt-a-Road programs, Cooperative Management Agreements and Memorandums of Understanding we can, and have accomplished a great deal. As an example: GPSing, rebuilding trails, erecting fences, putting up signs, constructing water bars, water crossings and maintaining roads and trails. (Organization, Bullhead City, AZ - #A12066.15123)

988. Public Concern: The Forest Service should provide adequate signs to indicate that a road or trail has been closed.

If it is necessary to close a route, managers must help motorized recreationists avoid the prohibited trail. In the short-run, signs and notes maps can help users avoid areas newly closed to them. To avoid unintentional trespass in the long-run, it is necessary to obliterate all evidence of routes no longer open to OHV recreation. Additionally, it may be helpful to reroute those trails remaining open, to avoid intersections with the closed routes. (Individual, Victoria, KS - #A2874.90000)

SIGNS SHOULD STATE A LEGITIMATE REASON FOR THE CLOSURE

Utilize consistent trail signing and marking so that the public is not confused. Trails closed unless otherwise marked open are not reasonable. Trails, when closed, should be signed with an official, legitimate reason. (Organization, Helena, MT - #A13226.91110)

Funding

989. Public Concern: The Forest Service should not close roads that it does not have the funding to maintain.

Closures simply shouldn't be an option for a lack of financial resources necessary to regulate proper use of the roads. (Individual, Lake Havasu City, AZ - #A735.17100)

Road Closure/Obliteration/Restoration

990. Public Concern: The Forest Service should clarify the evaluation process for closing unclassified roads.

There is a confusing and at times conflicting issue that the FEIS identifies: Forest Service "classified", system roads vs. "unclassified", non-system roads. Classified, system roads may consist of 385,000 miles, but there are at least 2 to 3 times that many unclassified roads. On the INF there may be one classified road that has been constructed within the IRAs, but there are hundreds of miles of unclassified roads in IRAs. As best as the reader of the FEIS can tell from the maps provided, some of these roads are in areas identified as unroaded portions of IRAs. While the document boasts that "no roads or trails are going to be closed because of these prohibitions" for system, classified roads, that is not the case for non-system, unclassified roads. The document neglects to disclose that since there are many more miles of unclassified roads than classified, that while no roads or trails shall be closed immediately upon signing of this proposed rule, anytime a cause arises (washout, something as simple as a fallen tree, etc.), an unclassified road in an IRA will be evaluated using the criteria set forth in the rule. The criteria prohibit, but are not limited to, reconstruction that increases a road's capacity, service level, or original design function. There is no information provided as to how the baseline data are going to be obtained, how evaluations will occur, and how decisions will be implemented. (Business, Mammoth Lakes, CA - #A30296.45200)

991. Public Concern: The Forest Service should consider public comment before closing roads.

I feel that before any roads either classified or unclassified are closed there should be a period of comment for the local people to air their views and then the decision should be made based on the facts that are presented at these hearings. There have been too many roads closed that would better serve the sportsman if they were left open, and there would be very little adverse impact on the ecosystem if they were left open. Lets get the people who actually use the land involved instead of just the politicians. (Individual, Riverton, WY - #A4722.90120)

The obliteration of roads during “rehabilitation” must be based on local needs and input. (Individual, Oroville, CA - #A17888.15111)

992. Public Concern: The Forest Service should not include roads associated with mining activities in the backlog of roads needing to be reclaimed.**DUE TO THE REQUIREMENTS FOR RECLAMATION UNDER FEDERAL AND STATE REGULATION**

Principle nine, “Competing Values and Limited Resources,” is very important in our view. Because (as we discuss in more detail in Attachments 4 and 5) mining activities on National Forest lands are required to be reclaimed pursuant to federal and state regulation, the burden of constructing, monitoring, and reclaiming roads on such mining operations is carried by the mine operator. The backlog of roads needing to be reclaimed in the nation’s forests, which was cited in the original proposal to justify the Roadless Rule, see, e.g., 66 Fed. Reg. at 3245-46, should not have included roads associated with coal or hard rock mining activities in light of the requirements for reclamation under applicable federal and state requirements as well as the need for the mine operator to post a financial warranty to guarantee reclamation in the event the operator is unable to complete the necessary reclamation task. As such, Forest Service funds need not be used for such roaded activities. Any new Roadless Rule should clearly and distinctly recognize this fact. Any new Rule should also recognize that, to the extent authorized by statute, the Forest Service can (and does) broker consensual agreements among diverse groups regarding mining on National Forest lands. (Association, Washington, DC - #A19636.65320)

Mining on National Forest lands requires compliance with all federal environmental protection statutes such as the Clean Air Act, the Clean Water Act, and the National Environmental Policy Act. In addition, however, coal-mining operations on National Forests lands must also meet the specific mining and reclamation requirements set forth in the Surface Mining Control and Reclamation Act of 1977 (“SMCRA”) and its implementing regulations.

SMCRA, itself, contains specific mining and reclamation performance requirements for roads, and SMCRA’s implementing regulations include extraordinarily detailed environmental protection performance and design standards for roads. Also, unless the Forest Service requests otherwise, coalmine roads on National Forest lands are not open to the public. Furthermore, costs of construction, reconstruction, maintenance, and reclamation of these roads are borne by the mine operator. Thus, from a Forest Service budget perspective, these roads do not add to the backlog of maintenance costs currently faced by the Agency. (Association, Washington, DC - #A19636.65370)

993. Public Concern: The Forest Service should recognize that, absent recreational needs, roads built for timber removal could be closed after logging.**BECAUSE ROADS BUILT SOLELY FOR LOGGING DO NOT REQUIRE THE HIGH CONSTRUCTION STANDARDS NECESSARY FOR ROADS WHICH SERVE RECREATIONAL PURPOSES**

We note that in the Advance Notice of Proposed Rulemaking the statement that the existing road system on National Forest System lands “was largely funded and constructed to develop areas for timber harvesting and the development of other resources” (63 F.R. 4350-01, p.1). However, it is worth noting that these roads were most often built to a higher standard than necessary solely for timber harvesting.

As a result, the local counties' timber receipts were reduced while the Forest Service used these timber receipts to subsidize the other forest uses. To a large extent these forest roads were built to higher standards solely to accommodate recreational uses. Absent these recreational needs the roads would have or could have been closed after logging. (Elected Official, Roseburg, OR - #A11811.90000)

994. Public Concern: The Forest Service should clarify whether certain roads will be closed due to their roadless designation.

THE ROAD NEAR SOUTHERN ARIZONA'S PENA BLANCA LAKE

A small "roadless" dot near Southern Arizona's Pena Blanca Lake looked as though it covered a road below the dam that's popular with birders. When I asked the main Coronado National Forest office, they didn't even know there was a road there. Then I was told it did not impact the road. The Nogales office of the same forest said it thought that road would be closed because it was in a "designated roadless" area. Which is it? I would think Southern Arizona's birders need an answer before they can even submit a comment. (Individual, Tucson, AZ - #A5278.45100)

995. Public Concern: The Forest Service should reconsider decisions that turned specific existing roads into trails.

TRAIL 67

The nameless road to Walker has recently been designated a trail (Trail 67) by the Forest Service. Motorized travel is now prohibited. Hikers, mountain bikers and horses are allowed. This surely must be some kind of joke. First, that road (Trail 67) crosses my property and other private property, just a few hundred feet south of the northern end of the road. The Forest Service has never discussed this with me or any other property owners that I know of. What is even worse is the trail is blocked by a sturdy Forest Service barbed wire fence and locked gate. One certainly wonders how the hikers, mountain bikers and horses are to get to the trail. The Forest Service has indicated that the road may be used for emergencies, but any other motorized travel will result in a citation. I wonder how the Forest Service thinks someone in an emergency is going to get through the fence and locked gate. (Individual, Phoenix, AZ - #A29149.15111)

Allow Road Closure/Obliteration/Restoration

996. Public Concern: The Forest Service should decommission existing roads.

This is a precious resource that we should take extraordinary precautions to preserve, and unless absolutely compelling need arises, we must maintain the status quo. The goal should be to remove roads whenever possible, in an attempt to reclaim some of this precious heritage. (Individual, Santa Barbara, CA - #A504.90310)

Roadless Areas should be kept as is. Many spurs of logging roads ought to be decommissioned to increase wildlife corridors. This decommissioning process would employ locals, and would reduce the ecosystem [damage] done by constructing the roads in the first place. (Individual, Olympia, WA - #A614.90310)

The forest service has more roads that it can possibly maintain. If anything they should be spending their time closing roads not building them. Roads are a proven detriment to fish and wildlife; erosion from poorly maintained roads is one of the worst legacies the forest service has left us with. Will that situation be improved if we build more roads? (Individual, Amasa, MI - #A793.90310)

Gate and close more of the existing roads. (Individual, Corbett, OR - #A11196.90310)

997. Public Concern: The Forest Service should eliminate from the travel plan roads that are not currently shown on maps.

There are also many roads that are not currently shown on the maps and I would encourage these be considered for elimination in the travel plan. These roads have been created at an alarming rate in the past few years by all-terrain vehicles. (Individual, Helena, MT - #A5394.10155)

998. Public Concern: The Forest Service should clearly state in the Roadless Area Conservation Rule that any road constructed in compliance with the exceptions must be closed and rehabilitated as soon as possible.

As the rule currently stands, we request that clarifying language be added to the rule that states that any road constructed in compliance with the exceptions must be, as soon as practicable, closed, ripped, recontoured and rehabilitated. In addition, roads built in compliance with the exceptions shall not be used to preclude a roadless area from consideration for Wilderness designation or other protective management prescription. (Organization, Missoula, MT - #A21359.90130)

*Do Not Allow/Restrict Road Closure/Obliteration/Restoration***999. Public Concern: The Forest Service should not decommission existing roads.**

This is our land so leave the roads in for us to enjoy it. Closing roads off because of the man-hating Green movement is equal to socialism. This is America our tax dollars pay to maintain the forest and to use it. Leave all the roads open. (Individual, Houghton, MI - #A70.90320)

While I'm not in favor of building new roads without a complete and thorough review, existing roads should be kept open and monitored. DO NOT CLOSE ROADS. (Individual, Lake Havasu City, AZ - #A735.90320)

ROADS THAT ARE MAIN ARTERIES TO OTHER AREAS

While it is important to allow equal access to our national heritage of the land, I feel it is equally important to consider the whole value of our lands. I have hunted, fished and camped on many tracks of national lands and can say without any reservation that I will return. The best example is the track of national forest in the Little Belt Mountains of Montana. There were many acres that were accessible only by primitive methods of beast and or human power. But to get to these were well maintained gravel roads that were used as jump-off points into those roadless areas. I would support a policy similar to this. One that has a main artery that allows access to those jump-off points to our national heritage—the land. (Individual, Santa Maria, CA - #A3981.91110)

BECAUSE ACCESS TO LARGE AREAS DISPERSES IMPACT

Not all roads need to be maintained, and different road classifications can easily be instituted. Roads should never be closed, except for temporary management purposes. Common sense suggests that allowing access to the largest area possible spreads people out and creates the least amount of impact on any one area. (Individual, Loveland, CO - #A7090.15168)

IN ASSOCIATION WITH OTHER ACTIONS

Trail closures should not be associated with other actions including timber sales, mining, and livestock grazing. Corrective action should be taken where trail closures in the past have resulted from these sorts of past actions. Loss of motorized trails as a result of past timber sales should be mitigated by connecting old and new travel ways to create a loop system. (Organization, Helena, MT - #A13226.91211)

1000. Public Concern: The Forest Service should not use the fact that roads are not maintained properly as an excuse to decommission them.

As for the argument that many of these roads are not maintained properly or that there isn't the funding for maintaining roads just doesn't hold water with me. I have been a user of many "back country roads" in Colorado since the early 70s. There has been little to no maintenance done on these roads during that time and the areas have not suffered from it. (Individual, Boulder, CO - #A4480.45500)

BECAUSE PRIMITIVE TRACKS ARE MORE FUN TO DRIVE THAN HIGH-SPEED ROUTES

However, please don't forget that driving on the national forests is one of the most popular of recreation activities. This doesn't required high road standards. In fact, primitive tracks are more fun to drive than the high-speed routes. Don't assume a road should be obliterated just because it isn't high standard. Many of these routes require little maintenance and are causing no significant resource damage. Find out what the user public thinks before embarking on any more road obliteration initiatives. (Individual, Boise, ID - #A5165.90000)

1001. Public Concern: The Forest Service should remove all gates on federal land.

Take out all Forest Service gates. (Individual, No Address - #A18775.90100)

1002. Public Concern: The Forest Service should not obliterate bridges.

WHERE ROADS ARE ALREADY PRESENT

No more roads, and don't tear down bridges with roads already there. (Individual, Wapiti, WY - A7385.90130)

Natural Resources General

Summary

General Comments – Management of natural resources is a topic of comment to a number of respondents. Numerous individuals urge the Forest Service to responsibly manage natural resources—as an impartial advocate for the public good; to protect areas not yet damaged; to preserve resources fundamental to our survival, such as water and air; and to sustain the population and ecological balance of the planet. On a similar note, a number of respondents urge the Forest Service to make sound resource management decisions based on science, on expert opinion, on new technology, and on best management practices. Some individuals suggest specifically that the Forest Service should promote future sustainable yields in management of roadless areas—by implementing sustainable management practices; by defining areas where sustained yield will be the management objective; by harvesting areas that have already been cultivated; or by shifting to forestry practices outlined by the Pacific Northwest Research Station.

One of the most common assertions is that the Forest Service should seek to prevent further degradation of roadless areas and natural resources. Respondents suggest that further degradation can be prevented by encouraging conservation and recycling, and by developing alternative forms of energy. A number of individuals remark that there is no justification for natural resource development in roadless areas anyway inasmuch as these areas account for very little of the nation's timber, oil, and gas resources. Further, assert some, allowing resource uses only sets the precedent for more commodity activities.

One association is concerned that the Roadless Area Conservation Rule would make it difficult to meet resource requirements for the future. According to this respondent the present and future

national consumption need far out strips what the national forests can supply, a product they are suppose to supply. This person believes the Forest Service can meet the challenge but not without professional active management of all lands.

Adequacy of Analysis – One organization suggests the Forest Service evaluate the cumulative impacts of road closures on such things as fire and timber management and firewood gathering. According to another respondent, the Agency should determine when land use activities are approaching the management threshold in forest plans in order to ensure resource sustainability and maintenance of land management continuity.

Funding – An individual suggests the Forest Service fund the development of better technology in order to aid in resource conservation.

Natural Resource Management – Some respondents comment that, in general, natural resource management should be allowed. A few respondents assert that resource management activities should be carried out with temporary roads which are closed and revegetated following completion of work. According to others, the Forest Service should allow regulated removal of forest products which does not require road building or inflict environmental damage, such as ginseng and morel harvest. Respondents who state that natural resource management should be allowed, however, direct their comments to specific activities; these comments will be summarized in the sections to follow.

Of those respondents who address natural resource management, a number believe that it should be prohibited or restricted. Respondents state that the Forest Service should prohibit active management in roadless areas—because of public support for the Roadless Area Conservation Rule; because commodity use and exploration and wilderness preservation are mutually exclusive; because of the need to act for the long term; and because of the intrinsic value of forests. Some individuals suggest, moreover, that commodity production is not the best use of public lands. One individual believes that society has decided that these lands should be used to preserve and recreate on, not as a commodity resource. Finally, some say that the Forest Service should encourage the development of environmentally sound alternatives to logging and mining, and should close land previously opened to commercial interests.

Natural Resources Management General

1003. Public Concern: The Forest Service should responsibly manage natural resources.

AS AN IMPARTIAL ADVOCATE FOR THE PUBLIC GOOD

The role of the government should be as a dispassionate and impartial advocate for the public good. Exploitation for the enrichment of individuals or corporations should not be permitted. As much as possible the role of the government in the management of these resources should be shielded from the transitory political whims of unscrupulous politicians. (Individual, No Address - #A460.12100)

TO PROTECT AREAS NOT YET DAMAGED

As a former employee of the Idaho State Department of Lands, I am well aware of the need to maintain already constructed roads, but it is up to the government to protect the areas of the United States not yet damaged by the incursions of the timber and mining industry. (Individual, Bismarck, ND - #A139.12100)

TO PRESERVE RESOURCES FUNDAMENTAL TO OUR SURVIVAL

These concerns have resulted in federal legislation like the Clean Water and Air Acts, the Endangered Species Act, now the Roadless Rule because local and state entities tend to deplete resources for their own specific economic needs, ignoring the long-term and cumulative impacts to the environment as a whole. Resources such as forests, water, and air cross local and state boundaries and overuse by one entity usually negatively impacts citizens in another area. Since these resources are fundamental to the survival of us all, they have become and should continue to be regulated by the federal government. (Individual, Klamath Falls, OR - #A1035.12100)

TO SUSTAIN THE POPULATION AND ECOLOGICAL BALANCE OF THE PLANET

I am not opposed to use of our natural resources for the public good. But this should be done without any more damage to the natural environment that is left on this planet. The days of unabated clear-cut logging, strip mining, irresponsible drilling, and the use of dangerous chemicals to extract resources from the land are OVER and people still doing any of these things need to be prosecuted and removed from that industry. The ecosystem cannot take anymore and still sustain the population and ecological balance of the planet. (Individual, Bonita Springs, FL - #A1718.65000)

BY MANAGING NON-WILDERNESS LANDS WITH VARYING DEGREES OF INTENSITY, DEPENDING ON RESOURCE POTENTIAL

Non-wilderness lands should be managed with varying degrees of intensity depending on timber growing potential and other non-timber uses and values. (Individual, Evergreen, CO - #A19178.65200)

1004. Public Concern: The Forest Service should make sound resource management decisions.

BASED ON SCIENCE

In this community, fear of wildfire is understandably great. It is also manipulated by industry to whip people into a frenzy of believing wildfire is best avoided by logging. Again, I believe the Forest Service must implement science-based fire management plans (which I believe they are doing) and offer educational outreach on this topic to counter the hysteria that industry promulgates. A significant part of such education should be the urging of communities and individual homeowners to take responsibility for protecting themselves against wildfire. (Individual, Portola, CA - #A695.30000)

How should inventoried roadless areas be managed to provide for healthy forests, including protection from severe wildfires and the buildup of hazardous fuels as well as to provide for the detection and prevention of insect and disease outbreaks?

Use common sense. We should continue to address these issues with science, speed, and efficient decision-making processes. People want Roadless areas protected, but if you need to build a road to solve a problem that, unchecked, might destroy the whole area, then people will want you to do that. There's enough flexibility built into Roadless to address these issues with the best solutions available. (Individual, Meridian, ID - #A1683.30000)

BASED ON EXPERT OPINION

This is a decision that needs to be made by experts in maintaining wilderness areas, and not by foresters eager to harvest public land. Nor by corporations eager to spend tax dollars to assist in making money for their personal gain, and not by politicians looking for payoffs from corporate coffers for their election campaigns. The January 12th rule as documented contains exceptions and clarifications for this question. (Individual, Portland, OR - #A3660.30000)

BASED ON NEW TECHNOLOGY

The IRAs should be protected with as much priority as they are now. New technologies, methods, and science should continually be applied to improve the protection. Public-awareness of the issues and problems is the best tool we have to keeping and improving the health of our forests. Ultimately, every decision regarding development and usage of our forests is based on that awareness. (Individual, No Address - #A594.30100)

Where logging is allowed, it should be done with Best Available Technology minimize the impact of such cutting. People who log in a destructive way (generating water pollution, poorly constructed roads, failure to follow aesthetic guidelines for ridge cutting, etc.) should be thoroughly punished and prevented from making a living this way.

There is good logging and bad logging. Logging that permanently scars a mountain is BAD logging. Take a look at Cheat Mountain in West Virginia; it is all cut to pieces from logging in the first half of this century. No regard was given to the lasting damage that was done removing spruce logs from the area. The folks that did that logging did not really know any better. The better class of loggers today DO know how to do a minimum impact job in the woods. Best practices should be more than “suggested,” especially on Federal lands. (Individual, Covington, VA - #A5294.65280)

BASED ON BEST MANAGEMENT PRACTICES

Any ‘management’ should be based on best forestry practices as determined by science and not economics. (Individual, Tucson, AZ - #A872.30100)

1005. Public Concern: The Forest Service should promote future sustainable yields in management of roadless areas.

BY IMPLEMENTING SUSTAINABLE MANAGEMENT PRACTICES

There is plenty of information that already exists on how to sustainably manage forests (for example, the Forest Stewardship Council certification program.) I would encourage you to explore these resources for ideas on how to better manage the areas of our forests that remain open to the harvesting of natural resources. Implementing sustainable management practices is a win-win situation—it will benefit both industry and the people of the United States. (Individual, Detroit, MI - #A1429.65280)

BY DEFINING AREAS WHERE SUSTAINED YIELD WILL BE THE MANAGEMENT OBJECTIVE

Define areas where sustained yield will be the management objective. (Individual, Kalispell, MT - #A3380.65270)

BY HARVESTING AREAS THAT HAVE ALREADY BEEN CULTIVATED

Sustainability means logging areas that have already been cultivated. We do not need to log every last stand of old growth. Let’s leave some of our forests pristine for future generations. These forests belong to all of us, not just powerful timber and mining interests. (Individual, Portland, OR - #A1489.65220)

BY SHIFTING TO FORESTRY PRACTICES OUTLINED BY THE PACIFIC NORTHWEST RESEARCH STATION

The Forest Service already manages a huge matrix of forest roads and second growth forests. These forests should be used to continue to produce the types of wood and forest products that our country depends on. Also, the Forest Service should shift to sustainable alternative forestry such as has been outlined by your Pacific Northwest Research Station. (Individual, Olympia, WA - #A580.65230)

1006. Public Concern: The Forest Service should prevent further degradation of roadless areas and natural resources.

Roads bring in people to use up the nonrenewable resources in ways that destroy the earth, such as logging, mining, building malls and developments. There should be areas where these things can be strictly kept out. (Individual, Berkeley, CA - #A497.65000)

This rule is not extreme - 70% of our national forests have already been roaded, logged, mined, and otherwise exploited for the short-term profits of the logging, mining, and fossil fuel industries, with taxpayers footing the bill for the road constructions. (Individual, Salt Lake City, UT - #A1325.65000)

The appropriate role of local forest planning as required by NFMA is to safeguard the treasures of natural-world’s resources from creeping, universal, ocean-to-ocean-Canadian-border-to-Mexican-border industrialization. (Individual, No Address - #A536.65000)

BY ENCOURAGING CONSERVATION AND RECYCLING

Enough is enough, if we need resources, let's conserve, it's the only sustainable way to do things, and it will have to be done sooner or later, may as well do it before destroying the environment and losing our 'national treasure' or whatever term is used by politicians. (Individual, Santa Rosa, CA - #A4421.65000)

Why can't the government concentrate on getting more recycled materials to the public and stop allowing the continuous harvesting of the virgin forests? (Individual, Byron, CA - #A1311.65200)

I beg you to support recycling. Construction materials, which are made of recycled materials, are available and could replace much of the lumber we now use. (Individual, Castroville, CA - #A4167.65290)

I drove through Northern and Central California and Southern Oregon and witnessed the clear-cutting that the logging industry does to the hillsides and mountainsides of forests. Despite the claim that "they will grow back" the areas are still bare because baby trees need larger trees to shade them and retain the soil so they can get a healthy start. So yes, once they are gone, they are gone forever. I see no need to strip what is left of our forests to satisfy the insatiable demands of indulgent consumers. What this country needs to do is plan for recycling and put it into effect, everywhere. There are many alternatives to destroying our forests and the ecological balance they provide. Let the public outcry be heard before it is too late to save the planet. (Individual, Cowan, TN - #A4177.65290)

I have seen devastating clear-cuts from the air over the Pacific Northwest, in the Inland Passage of Alaska, and in Idaho and Montana. The remaining forests need to be logged sustainably, which can be done if we cut back on logging and reuse/recycle, and conserve paper and wood products. For example, I am reusing an envelope to send this letter. The envelope may look tacky, but not as bad as a clear-cut. (Individual, Davis, CA - #A5154.65270)

BY DEVELOPING ALTERNATIVE FORMS OF ENERGY

I strongly support research and development of alternative forms of energy. Solar and thermal energy seem to be likely candidates. Technology in hybrid cars also seems to be a much better alternative to exploiting our wild lands. (Individual, No Address - #A4431.65000)

Obviously our current energy supply is a finite system, and we need to develop alternatives. Let's not destroy the little that we have left because we do not want the responsibility of changing our ways . . . (Individual, Normal, IL - #A328.65300)

Take for example drilling for oil in the Artic National Wildlife Refuge. The fact is we need to develop alternate types of energy, not drill in the last wild places. Once the oil is gone there, then what? This is the same for old growth forests. Loggers cry they need to log this last small % of old growth that is left. Why? Once they finish logging it at the end of five years time, then they are right back where they started, with no old growth forests to log! So then what do they do? Now is the time for miners and loggers to adjust to a new way to support themselves, before the old growth forest is gone. Now is the time to make our sustainable forests even better. Now is the time for Americans to look to the future and face the reality of finding different ways of life from logging, fishing, mining and drilling. (Individual, Port Angeles, WA - #A3672.65230)

Oil and gas resources are very limited in roadless areas. Based on an analysis by the US Geological Service, six of the states' roadless areas hold only 0.4% of the nations oil reserves, thereby demonstrating that the full costs of drilling outweighs the benefits. Hurting our protected land now for any "quick fix" would only hurt the nation more in the long run. Instead, conservation and alternative fuel sources, such as gas/electric hybrids and the like, should be emphasized. (Individual, No Address - #A928.65300)

If we use current technology wisely we will never have to cut another tree or drill another hole in the ground to obtain energy. Hydrogen, as an energy carrier can supply all of the energy we need without pollution and the environmental hazards of using oil, coal or natural gas. Let's stop the insanity and convert now. (Individual, Vestal, NY - #A3913.65300)

The current administration is beholden to big oil, the forest industry and the mining industry for their election. Only about six percent of the US timber comes from our national forest. The forest industry is determined to get the rest. And why must we pump the last barrel of oil when the handwriting is on the wall concerning our future energy sources. Worldwide the fastest growing source of energy for electricity production is wind. At Arlington, Wyoming stand 133 wind turbines and they currently produce enough electricity to supply most of western Wyoming. There are thousands of sites for wind farms in Wyoming and the nation. With only 66 turbines the wind farm at Arlington can supply the needs of Cheyenne, our largest city. Antelope and cattle graze beneath the turbines. The turbines are big and do not spin at speeds that will kill birds. In fact, the Arlington turbines have not killed any birds. This summer BMW and Honda introduce their hydrogen-powered cars. The exhaust is water. Wind and sun produced electricity can produce hydrogen from water in the process of electrolysis. The large envelope passive solar home of Vincent and Joyce Sindt in west Laramie, one of the coldest towns in the US, used \$26 in backup electricity and two cords of wood in heating the home for two years. In Japan and at other locations, solaria on the south sides of some homes supply all of the heat needed by the homes. On the edges of the window glass through a reverse meter into the power grid and the homeowners collects a fee for the electricity the home produces. In many climates solaria and windy ridges can be our power plants. We can save the Arctic Wildlife Reserve, the intact national forests and watch atmospheric carbon dioxide return to the level that sustains our stable climatic condition. Save our roadless areas. (Professional Society, Laramie, WY - #A6282.65300)

1007. Public Concern: The Forest Service should provide national oversight of forest management.

IN DECIDING WHERE TIMBER SALES AND OTHER COMMERCIAL OPERATIONS CAN TAKE PLACE

I believe that local districts should be involved in protection and management, but that there needs to be significant national oversight in deciding where timber sales and other commercial interests can take place. I believe this is too political and economic of an issue to be decided locally. (Individual, Fairhaven, MA - #A19657.13130)

1008. Public Concern: The Forest Service should consider that roadless areas account for very little of the nation's timber, oil, and gas resources.

Roadless areas provide less than .2% of the nation's timber supply and less than .4% of the nation's oil resources and .6% of natural gas resources. The rule has no impact on access to inholdings and no impact on the large areas of the National Forest that are already roaded. The rule will only protect the remaining 31% of the National Forests, which have been preserved thus far because of topography, lack of economic resources, recreational benefits, and wildlife and watershed values. These forests comprising 31% of the National Forest should be preserved for future generations. (Individual, Seattle, WA - #A8230.10150)

Protecting roadless areas will not have a significant impact on the nation's energy supplies. Roadless areas in the Rocky Mountains are not a major source of oil and gas; these areas contain only four-tenths of one percent of America's oil resources and six-tenths of one percent of America's gas resources. (Individual, The Plains, VA - #A6201.65000)

Roadless areas provide less than two-tenths of one percent of the U.S. timber supply, four-tenths of one percent of the U.S. oil resources and six-tenths of one percent of U.S. gas resources. (Individual, Valley, WA - #A6278.65241)

The national forests provide only 5% of our timber and less than 5% of that comes from the proposed roadless areas. The Roadless Rule affects less than one-quarter of 1% of the nation's timber supply. (Individual, Wasco, CA - #A1663.65241)

The commodity values in roadless areas are not significant. Roadless areas provide less than two-tenths of one percent of the nation's timber supply, and commercial logging of roadless areas would require large taxpayer subsidies. Similarly, roadless areas in the Rocky Mountains contain only four-tenths of one percent of the nation's oil resources and six-tenths of one percent of U.S. gas resources. (Individual, Markleeville, CA - #A1067.45100)

To answer this question, I would like to quote previous Forest Service Chief Mike Dombeck from his January 5, 2001 speech "Roadless Area Conservation: An investment for Future Generations": "We presently supply less than 4 percent of the nation's timber from all of our national forestlands combined. Of that modest 4 percent only a tiny fraction - 6 percent - will be affected by roadless area conservation. That's one quarter of 1 percent. Similarly, National Forests supply less than 4 tenths of one percent of the nation's oil and gas, and far less from roadless areas. Is it worth one-quarter of 1 percent of our nation's timber supply, or a fraction of a fraction of our oil and gas to protect 58.5 million acres of wild and unfragmented land in perpetuity?" (Individual, Laramie, WY - #A1.45100)

1009. Public Concern: The Forest Service should recognize that allowing active management sets the precedent for more resource removal.

In a country that is based strongly on capitalism, a movement to build roads and allow logging and other industries that take resources from these forests could very easily turn into a stepping stone for other industries to move into such areas. History has proven that wealthy corporations and industries tend to get their way over a long period of time of pushing an issue with their money. This issue should have nothing to do with money. (Individual, No Address - #A30028.15000)

1010. Public Concern: The Forest Service should support legislation that regulates natural resource consumption.

People need to realize that resources are precious, and the only way to do this is through laws that limit their consumption. (Individual, No Address - #A6795.65000)

1011. Public Concern: The Forest Service should reach decisions on development proposals in a timely manner.

Lander County would encourage the Forest Service to expedite all development proposals along the timeframes needed to push through the rule. The evaluation of the rule under the NEPA process showed that the Forest Service is capable of completing an EIS within a year. We hope that all current and future mining, timber and other resource development are afforded the same swift and decisive action. (Elected Official, Battle Mountain, NV - #A27730.14420)

1012. Public Concern: The Forest Service should limit active management while accommodating reasonable local practices.

The appropriate role of the local forest-planning unit, such as yourself, is to adhere to the national rules IN SO FAR AS POSSIBLE. While you must work hard to avoid any piece-meal, local changes that could have long range damaging effects, you also have to do what is necessary to accommodate some local quirk. For example, while no new roads should be built into these areas, if they already have an old logging rail line that the snowmobilers have been using for decades, you should not try to close it. Rather, you might want to clean it up a little so that it becomes a more effective firebreak, but not enough to encourage anyone with a 4 x 4 PU to go roaring down it. In other words, limit development as much as possible but accommodate reasonable local practices. (Individual, Hudsonville, MI - #A4928.15111)

1013. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule will make it difficult to meet resource requirements for the future.

The rule is the result of a well orchestrated but ill-conceived effort by preservationist groups to dictate land use allocations of unfamiliar real estate. It not only is a mockery of the basic premise of N.E.P.A, it violates the concepts inherent in the Forest and Rangeland Renewable Resources Planning Act. (i.e. “the nation maintains a conservation posture that will meet the requirement of our people in perpetuity.”) Conservation is in opposition to preservation. The U.S. population is predicted to double by the year 2050 and our national forests are expected to provide raw material for the populace. The forests can meet this challenge but not without professional management, unmanaged lands will produce nothing for future generations except major fuel bodies to create conflagrations such as are occurring now. (Association, Eureka, CA - #A17718.10141)

1014. Public Concern: The Forest Service should monitor resource use.

Resource extraction should be monitored to have the least impact—such as buffer zones next to rivers and lakes. A team approach to resource extraction such as wildlife biologists having critical in-put and power over industry would be a start. I keep hearing “sound science”, but it seems the scientists are always hushed when industry wants their way on our public lands. (Individual, Tustin, MI - #A5276.14500)

MAINTAIN ACCESS SO THE PUBLIC CAN MONITOR RESOURCE MANAGEMENT

The USFS published a recreation agenda in 2000. It is almost never mentioned. It is like the agenda does not exist. We feel as motorized recreational users of the forests that this must have been printed to pacify us and nothing is really going to change. One thing about rules like the Clinton-Gore roadless rule is, if you lock people out, they can not see how their natural resources are being mismanaged. (Organization, Okanogan, WA - #A6026.65000)

1015. Public Concern: The Forest Service should develop a national roadless rule.**BECAUSE IT WILL STIMULATE NEW INDUSTRY INNOVATIONS**

I believe conservation is ultimately the best approach to take, protecting natural resources can stimulate new innovations in industries that otherwise would damage or destroy environments. (Individual, No Address - #A8998.10110)

*Adequacy of Analysis***1016. Public Concern: The Forest Service should evaluate the cumulative impacts of road closures.****ON FIRE AND TIMBER MANAGEMENT, AND FIREWOOD GATHERING**

The environmental document must evaluate the impact that the proposed motorized road and trail closures will have on fire management, home heating, and timber management. The environmental document must also include an analysis of the benefits to the public from the gathering of deadfall for firewood from each of the roads and trails proposed for closure. These analyses are especially significant following a devastating fire season and a period of rising energy costs. The closure of roads and trails is occurring at a large scale throughout the national forests. Therefore, the environmental document must evaluate the cumulative impacts of motorized road and trail closures on forest fire management, timber management, and firewood gathering. (Organization, Helena, MT - #A13226.65290)

1017. Public Concern: The Forest Service should determine when land use activities are approaching a management threshold.

A THRESHOLD ESTABLISHED IN THE FOREST PLAN TO ENSURE RESOURCE SUSTAINABILITY AND MAINTENANCE OF LAND MANAGEMENT CONTINUITY

Further, we are opposed to providing “opportunities for the involvement of others, mainly the general public, in monitoring and evaluation” activities. We do not object to promoting and seeking stronger coordination with other federal agencies, state, local and tribal governments, in fact we encourage it as a means of streamlining the planning process. However, the FS is overstepping reasonableness by depending upon those without express technical expertise in the issues, i.e., scientific and academic communities and “other interested parties,” to conduct monitoring activities that are the responsibility of the FS. Asking the public and academia to participate in monitoring procedures will merely invite controversy and increased polarization. We recognize that the FS is attempting to offer added opportunities for involvement in managing the NFS, but active participation by these entities will complicate and delay the process. We urge that the FS adopt the means for determining when land use activities are approaching the management threshold established in the plan to ensure resource sustainability and land management continuity are maintained. As such, integrated monitoring must be done on all resource activities to get a true picture of actual cumulative effects. It is crucial for the FS to avoid responding to new development proposals with knee-jerk reactions to halt all activity pending completion of a new environmental impact statement. With improved monitoring activities, the FS will improve its resource database and should not be taken by surprise. (Business, Denver, CO - #A25688.65300)

Funding

1018. Public Concern: The Forest Service should fund the development of better technology.

TO AID IN RESOURCE CONSERVATION

Please spend the money on better technology, not more drilling. There must be a way to build more efficient engines and not promote SUVs for everyday city driving. I find it hard to believe in today’s day and time, with human cloning being a possibility, that we cannot do this. It is sad that we are going to totally deplete our planet of its resources and animals all in the name of money. Haven’t we done enough? How greedy do we have to get? (Individual, Houston, TX - #A10360.50100)

Allow Active Natural Resource Management

1019. Public Concern: The Forest Service should construct temporary roads for resource management activities.

Helicopter, cable or forwarder removal of timber is not feasible or practical in the vast majority of cases where timber needs to be removed, temporary roads and skid trails should be allowed so that the Forest Service can prudently manage the resources under their jurisdiction. After the work is completed, the temporary roads and skid trails should be closed and planted to minimize erosion and enhance wildlife habitat. (Organization, Edgefield, SC - #A4829.90120)

Inventoried roadless areas are unique only in that they were inventoried during the wilderness study era. I do not believe that all Forest Service land needs to have a permanent road system but I do believe that it is a crying shame to allow resources to go to waste due to the lack of management (wood fiber to burn or rot due to disease). The practice of constructing temporary roads for management activities and putting them to bed after it is used is a much-underused practice. (Individual, Dayton, WY - #A5074.90121)

1020. Public Concern: The Forest Service should allow regulated removal of forest products.**WHICH DOES NOT REQUIRE ROAD BUILDING OR INFLICT ENVIRONMENTAL DAMAGE, SUCH AS GINSENG AND MOREL HARVEST**

Allow recreational activities and regulated harvesting of forest products that do not require road building or inflict major damage on the environment. Example, ginseng permits, morel permits, harvesting of seeds for propagation of native plants, etc. (Individual, No Address - #A23569.90100)

*Do Not Allow/Restrict Active Natural Resource Management***1021. Public Concern: The Forest Service should prohibit resource removal in roadless areas.**

Protecting roadless areas in our national forests is so basic an idea. There was ample scientific, moral and environmental reason for the rule to be passed in the first place. Lets not buckle now to industry after much hard work has already been done. It's on your conscience. What kind of country we leave for our children. Please do the right thing. (Individual, Kittery, ME - #A4852.10111)

Please respect the voice of the people, not the voice of industry. Roadless lands are the few lands left in America where human development does not dominate the landscape. The value of these lands for wildlife, natural processes, ourselves and our children are immeasurable. In an increasingly developed world, roadless areas will only become more and more important to our well being and that of the planet. (Individual, Missoula, MT - #A5313.10111)

BECAUSE OF OVERWHELMING PUBLIC SUPPORT FOR THE ROADLESS AREA CONSERVATION RULE

I was greatly relieved when the Roadless Area Conservation Rule was established, and very frustrated to hear that it's now in jeopardy. I believe it was strongly supported by a wide variety of people, and that support has not changed. Perhaps the current administration believes that circumstances have changed that necessitate alterations. But circumstances certainly haven't changed enough to make it a good idea to open the last of America's wild national forests to drilling, mining and logging. Please weigh carefully the overwhelming support for the protections that were put in place in January, and resist the temptation to yield to industry pressures. The decision is a critical one. (Individual, Westford, MA - #A366.10110)

We and millions of other Americans want a stop put to the destruction of our remaining natural areas, and we have demonstrated that desire time and time again. I hope the responses the Forest Service receives from individual American citizens about this unnecessary and redundant public comment period convince the Forest Service that we are serious—protect the roadless areas from any further development and exploitation. (Individual, Macomb, IL - #A95.10111)

Please, please preserve the Forest Service's Roadless Area Conservation Rule as it now stands. The roadless area conservation rule represents the desires of the American people, and to alter it in order to please a small number of business elites would be criminal. (Individual, Davis, CA - #A170.10111)

BECAUSE INDUSTRIAL EXPLORATION AND WILDERNESS PRESERVATION ARE MUTUALLY EXCLUSIVE

Please support the Forest Service's Roadless Area Conservation Rule. No amendments, alterations, or exceptions of this policy should be allowed.

Surely you are aware that this policy, as it now stands, is the result of more than 600 public hearings and 1.6 million public comments, 95% of which support the strongest protection. The wishes of the American people to protect our natural resources must not be ignored in favor of corporate profits or government alliances.

In the words of the Heritage Forest campaign, the rule represents a balanced approach to forest conservation, saving the last 30% of America's wild national forests from logging mining, and drilling—activities already allowed on most national forest lands. Industrial exploration and wilderness preservation are mutually exclusive goals; therefore, we must protect our national forests and conservation spaces from industry exploitation. To alter or dismiss the Roadless Area Conservation Rule would be to allow, indeed to encourage, the very exploitation that Americans have unequivocally shown they do not desire. Furthermore, the Roadless Area Conservation Rule already adequately addresses issues of fire management, forest health, access, and local input. (Individual, Conyers, GA - #A342.10150)

BECAUSE OF THE NEED TO ACT FOR THE LONG TERM

It is a great privilege to live in Oregon, where undeveloped public lands are so easily accessible. The forests near the Columbia River Gorge, on Mount Hood, in the Gifford Pinchot, the Cascade Mountains, the Deschutes, Fremont or Malheur National Forests, the Eagle Cap wilderness of the Wallowas and the botanically rich Siskiyou, are extraordinary places that deserve complete protection. As an avid hiker and one who studies the workings of ecosystems, I have come to learn both the biological and aesthetic importance of these places. To sacrifice our few remaining National Forest roadless areas for limited financial gain is a loss that can never be restored. I strongly urge the Bush administration to act for the long term and preserve these areas for future generations and the health of the entire world. (Individual, Portland, OR - #A3679.10110)

The roadless rule while being an irritation to some, that has brought lawsuits and criticism is one of the best things to occur in most of our lifetimes in regard to public land. With the rule we can proudly speak of preservation for future generations to come, something often spoken, then thrown by the wayside. A roadless rule is not a bad thing. Where enforcement of vehicle bans have taken place, the hunting community for example, complained about it. Later they found that the hunting experience was enhanced by it. I believe the roadless rule will be appreciated by many over time. Even many who don't see it that way now. (Individual, Coulterville, IL - #A114.10111)

BECAUSE OF THE INTRINSIC VALUE OF FORESTS

The most important value of a forest, the one that should be protected above all else, is its value as the living embodiment of millions of years of evolutionary development which has resulted in a healthy, functional community of plants, animals, predators, and prey which is sustained by its efficient, and often beautiful, use of the energy it receives from the sun. The profusion of plants, funguses, insects, and higher animals have all found a place in this community where they can be nourished by the flow of energy from plant to grazer to carnivore, and by so doing, thrive and perpetuate their kind. That it all works out, and works out in such varied and fascinating abundance is miraculous. If we, as a people, cannot honor and protect a portion of something as wondrous as a forest, with all its teeming life, if we can value it only for the monetary gain to be obtained from removing some of its parts, then we, as a people, have failed to mature beyond the frontier mentality of heedless exploitation, and have failed to become responsible caretakers of a precious gift which we do not yet even fully understand. There is much yet to be learned from forests, and it would be a tragedy if they were all converted to sterile tree farms as has been done on industry owned lands.

This should not be construed as advocating that all national forest land should be set aside. What it does advocate is that some part of every forest type should not be exploited, and that the inventoried roadless areas should be included in that part. (Individual, Dallas, OR - #A3697.10110)

BY ADDING A SUPPLEMENTAL PROHIBITION TO THE EXISTING ROADLESS AREA CONSERVATION RULE

Mining, grazing, logging and all on-road and off-road vehicle use should be prohibited in these areas. As previously stated, it would be neater to prohibit this by adding the supplemental prohibition to the existing rule, rather than wait for plan revisions across the country. (The Chattahoochee has been working on its revision for better than six years now, and appears to need another two years before completion.) As exists today, traditional access to roadless areas by hunters, hikers, fishermen should continue to be expressly allowed. (Individual, Atlanta, GA - #A26430.90000)

1022. Public Concern: The Forest Service should not use maintenance of private property access as an excuse to allow resource removal.

Limited access to property by those who own property in roadless areas is not the problem!! This is a subterfuge for allowing access to any and all that wish to exploit the area. (Individual, No Address - #A1728.40000)

1023. Public Concern: The Forest Service should recognize that commodity production is not the best use of public lands.

Production of forest commodities is no longer the highest and best use of our public lands. We have collectively decided as a society that we wish to preserve wildlife habitat and dispersed recreational opportunities. This is best done by leaving all the remaining roadless areas roadless, and by restoring other public lands with significant habitat potential to the best condition possible. (Individual, Williams, OR - #A1911.65230)

DUE TO THE HARSH CONDITIONS IN MANY ROADLESS AREAS

One point that must be addressed is that roadless areas cannot be viewed as the only areas that have resources. Yet, the questions about roadless areas you have asked us to answer lead one to infer that only in roadless areas do we find any resources.

Such a view is ludicrous and, in fact, the opposite of the truth. Less than 10% of the lower 48 states is anything resembling a wild or unroaded condition. National Forest roadless areas comprise an even smaller percentage. These areas are the least desirable from the standpoint of commodity production because of their lack of commodity resources, their remoteness, harsh environments and other factors.

To suggest that local economies or the nation need to extract commodities from these areas is ridiculous. Even if these areas held important commodities, the mere fact that these areas comprise a small percentage of the land base indicates that those commodities would be gone in a flash. Any economy dependent on commodity extraction from roadless areas is doomed to failure. (Organization, Moscow, ID - #A22654.65000)

1024. Public Concern: The Forest Service should prohibit the removal of forest products.**NATURAL MATERIALS**

Those activities that inherently damage the natural environment of a roadless area should be prohibited in roadless areas. These include the use of motorized equipment and vehicles and the gathering or removal of naturally occurring materials. (Individual, Denver, CO - #A17164.90110)

SECONDARY FOREST PRODUCTS

Activities that should be expressly prohibited are the use of off-road vehicles in roadless areas, the harvesting of secondary forest products including but not limited to mushrooms and mining of any sort. (Individual, Salem, OR - #A13948.91221)

1025. Public Concern: The Forest Service should replace logging and mining with environmentally sound alternatives.

The Initiative is badly flawed in that there is no provision to replace the demand for these activities with acceptable alternatives. Logging and mining cannot simply be prohibited unless the demand is reduced or replaced with an (hopefully environmentally friendly) alternative. Otherwise, logging and mining will go off-shore to countries with lower environmental standards than ours. The Earth will suffer even greater loss, in the long run. (Individual, Sumter, SC - #A6210.50400)

1026. Public Concern: The Forest Service should close land previously opened to commercial interests.

BECAUSE IT IS TIME TO STOP DESTROYING OUR NATURAL RESOURCES

In addition, I feel that land that has already been opened to business interests be closed to them. We have consistently been destroying our natural resources in all areas and it is time that it is stopped. The waste in this country is shameful and a whole different attitude toward our environment and resources needs to be fostered. (Individual, Chicago, IL - #A4063.90110)

1027. Public Concern: The Forest Service should prohibit gardening of vegetation for commercial purposes.

The following activities should be completely prohibited in roadless areas: . . . gardening of vegetation for commercial purposes . . . (Individual, Port Angeles, WA - #A6179.90110)

Timber Removal

Summary

General Comments – A number of respondents assert that there is no justification for removing timber in roadless areas. Some state that timber companies already have an adequate timber supply, while others maintain that the Roadless Area Conservation Rule would decrease timber removal on federal lands by only two percent. The reason the Rule would have so little effect on overall timber production, people assert, is that most roadless areas are unsuitable for timber production—they are steep, remote, and the trees have little commercial value.

Some respondents also question the Forest Service’s management of timber. One Organization urges the Agency to recognize the conflict of interest in its management of timber whereby, this organization asserts, Forest Service employees are encouraged to approve timber sales whether they are in the best interests of the public or the environment or not. Another individual suggests that because roadless areas are difficult to access and expensive to harvest, the reason the government probably wants to keep these lands in the timber base is that growth on these lands offsets harvesting on other land. By keeping these lands in production, it allows the over cutting of suitable timber base lands. Further, some ask the Forest Service to explain why it is preparing and implementing timber removal projects in roadless areas given its expressed commitment to conserving wild forests.

Additionally, people suggest the Forest Service monitor timber removal, replant even-age management areas in order to avoid harvesting other areas, and encourage the development of alternatives to wood.

Other respondents do not question the justifiability of removing timber. They suggest that the Forest Service should collaborate with timber companies in the use of sustainable timber practices, and should consider public comment prior to timber sales. According to one individual, timber sales should be announced far enough in advance to allow for early public input, and then find a way not to have the sales held up by public outcry and lawsuits at the last minute.

Adequacy of Analysis – Respondents representing various interests suggest that further analysis is needed related to timber removal. One organization suggests the Forest Service analyze the impacts of removing land from sustained yield management. This respondent remarks, “We want to know the volume of timber that will be removed from sustained yield management, its market

value, the allowable sale quantity, and the potential jobs and income that might have been created if the lands had been managed under the sustained yield, multiple use mandate.” Another group suggests that “inasmuch as some options have been precluded by the roadless rule, during the evaluation of roadless areas it is no longer relevant to look at timber harvest potential during roadless evaluation.” According to one business, the Agency should analyze the impact of timber sales on lands adjacent to roadless areas, “as these sales have increased fire risk, resource damage and changed wildlife patterns on roaded and unroaded National Forest lands.” Finally, one individual asserts that the Agency should require logging companies to perform environmental impact studies in order to prevent environmental damage.

Funding – A few individuals comment that the Forest Service should not charge a fee for dead timber gathering permits and should not sell fiber.

Timber Removal – A number of respondents believe that the Forest Service should permit timber removal in roadless areas—because it would require more acres elsewhere to replace the potential timber volume in these areas; because of the centrality of wood products to our culture; and to sustain turkey farms. Others suggest that timber harvest only be allowed as part of ecological restoration efforts; as long as the Forest Service replaces each harvested tree with five planted trees; or as long as it is not commercialized.

People also suggest various methods by which timber removal ought to be accomplished. Suggestions include harvesting along roads, with temporary logging railroads, by helicopter, by horse, and by elephant. Some suggest the Forest Service focus on harvesting saw logs and small trees, harvesting small diameter timber from roaded areas, selective timber removal, or salvage timber sales. Several respondents suggest a number of specific areas where they say timber removal ought to be allowed, including specific states, counties, and forests, as well as private lands and areas that are already accessible by existing roads.

Some suggest the Forest Service consider a categorical exclusion for some routine activities, such as timber removal. One respondent urges the Agency to implement existing forest plans in order to meet harvest levels adopted during the forest planning process. Others remark that, in general, the Agency should support a sustainable timber industry—by supporting sustainable timber removal practices; by managing second growth in the Tongass National Forest; and by removing restrictions and limitations lobbied by special interests. Some suggest the Agency should allow timber removal on other forest lands to replace lost timber volumes due to roadless designations. Finally, a few individuals recommend that the Forest Service should not place restrictions on timber removal on privately owned forest lands adjacent to state and national forests—inasmuch as, one person argues, the Agency’s refusal to thin National Forest System lands will result in more wildfires—and should enlist the public to help clear and thin the forests in order to promote community and cultural involvement.

Other respondents urge the Forest Service to prohibit timber removal in roadless areas. Some mention particular methods of harvesting they say should not be allowed, such as helicopter logging, salvage logging, and even-age management. Others suggest specific places where they say it should be prohibited, including areas containing less than 50 percent suitable timber base. Another individual suggests that the Forest Service should prohibit timber companies from harvesting virgin timber on National Forest System lands. Finally, some assert that the Agency should stop preparing timber sales in the Tongass National Forest which are in violation of the Rule, and should adjust the annual sale quantity downward for national forests in general—to

prevent further biological and recreational problems in roaded areas, and to reflect the interests of special interests and small scale gatherers. (See also Chapter 6: Protecting Forests (Question 3): Timber Harvest.)

Timber Removal General

1028. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule.

TO PROVIDE FORESTRY PROFESSIONALS WITH ADEQUATE TIMBER REMOVAL OPTIONS

By maintaining the roadless plan as we currently see it, you give forestry professionals across the nation a little working room. As you know, we forestry professionals exist in front of society's critical eye, which in turn makes professional public forest management very challenging. The roadless plan removes the "old growth debate" from its primacy, allowing us, the public foresters, the time and energy to develop management schemes for public natural resources that sustains them and sustains humanity.

Our job is only getting more difficult as the US population increases and per capita consumption does as well. Creative forestry is the only way to keep forests managed by professional foresters, and the roadless plan fits the bill. It is creative enough to have substantial public support from across the spectrum. (Individual, Corvallis, OR - #A27066.65230)

1029. Public Concern: The Forest Service should consider that keeping roadless areas in the timberland base allows the over-cutting of more productive land.

For growing timber, Forest Service lands are generally less productive than private land and roadless areas are the least productive of the FS land. Generally roadless lands are very difficult to access and road building would be very expensive. The big reason the government wants to keep these lands in the timberland base is that growth on these lands offsets harvesting on other land. By keeping these lands in the formula for determining how much wood can be cut, it allows the over cutting of better land. (Individual, Merion Station, PA - #A17478.65260)

1030. Public Concern: The Forest Service should consider that timber companies have an adequate timber supply.

THEIR LARGEST CONCERNS ARE FOREIGN COMPETITION AND A GLUTTED MARKET

I have worked for Pyramid Mountain Lumber in Seeley Lake, MT for 21 years. In that time I have heard endless complaints about how lack of available timber would cause the mill to close. The fact is however, that we have always been able to adequately source our mill and we continue to do so. The biggest enemy of the timber industry is foreign competition and a glutted market. (Individual, Condon, MT - #A22480.65210)

1031. Public Concern: The Forest Service should collaborate with timber companies.

IN THE USE OF SUSTAINABLE TIMBER PRACTICES

Locally, Hayward Lumber Company is providing leadership in the use of certified "green wood" and sustainable timber practices. I encourage you to contact Steve Brauneis with Hayward's Strategic Environmental Planning Division to learn more about their ideas and practices. (Business, Monterey, CA - #A7031.15152)

1032. Public Concern: The Forest Service should consider that if it allows timber removal in roadless areas only by skid roads, it will not allow timber removal for long.

DUE TO THE ENVIRONMENTAL DAMAGE CAUSED BY SKID ROADS

The only other way to log in roadless areas would be to use long skid roads (“non-road roads” according to the DEIS). Skid roads usually cause much more environmental damage than do properly constructed roads, so skid roads will likely cause more damage than road building. Due to that increased damage from skid roads, it is unlikely that the Forest Service would allow that for very long. Thus the Forest Service is being disingenuous by saying that logging will continue to the extent indicated in the IRAs. (Union, No Address - #A28881.65220)

1033. Public Concern: The Forest Service should consider public comment prior to timber sales.

Timber sale planning should be announced far enough in advance to allow for early comment, and not have the sales held up by public outcry and lawsuits at the last minute. (Individual, Payette, ID - #A1049.90512)

1034. Public Concern: The Forest Service should consider that most roadless areas are unsuitable for timber removal.

BECAUSE THEY ARE STEEP, REMOTE, AND THE TREES HAVE LITTLE COMMERCIAL VALUE

All lands suitable for logging are already roaded. Presently unroaded lands are the marginal areas without suitable trees for logging and/or lands unsuitable for logging due to terrain, and susceptibility to erosion. (Individual, Bozeman, MT - #A961.65261)

The BOTTOMLINE is that the roadless areas are not good timberlands or, at least, it is NOT COST-EFFECTIVE to timber them. They are either too steep or too remote, or both. If that were not so, they obviously would already have been timbered. Thus, timbering them now would not be in the best interests of the taxpayers. (Individual, Birmingham, AL - #A4991.65262)

I feel that the areas that are still roadless today are roadless for a reason. They are either too remote or too steep or have climatic/elevation features resulting in forests that are too slow growing to produce valuable timber. For the most part, the timber in these remaining roadless areas has too little commercial value to make it worth the costs associated with logging it, particularly the cost of building roads to reach the timber. These areas should be left alone for the wildlife that depends on these ecosystems. If thinning or insect/fire salvage is considered necessary, it should be done by helicopter only. (Individual, Missoula, MT - #A1695.65280)

Montana Logging Association representative Patrick Heffernan admitted that inventoried roadless areas were not the issue for their members. Forest Planners on the Flathead National Forest told me that they would not turn to the roadless areas for timber harvest for another 20-30 years in any event. What is the rush? What is the real issue here? It is not local input. The inventoried roadless areas in Montana are quite often mostly unsuitable for timber harvest by the agencies’ own analysis during the Reagan years. You may have made some of those determinations yourself on forests in our region. There has been plenty of input. Lets settle on the national rule published on 1/12/2001. (Organization, Missoula, MT - #A26424.10150)

1035. Public Concern: The Forest Service should acknowledge that the Roadless Area Conservation Rule would decrease timber removal on federal lands by only two percent.

This rule affects 58.5 million acres of federal forestlands, which amount to 2% of the US land base and 31% of the Forest Service land base. Implementation of the Roadless Rule would decrease the timber harvest on federal lands by only 2%. (Elected Official, Nevada City, CA - #A12058.65200)

1036. Public Concern: The Forest Service should replant clear-cut areas.

TO AVOID HARVESTING OTHER AREAS

Yes, timber sales do support our library here in Jefferson County, WA. But we do not need to invade the remains of the Okanagon National Forest to pay for libraries. Why not replant the clearcuts? Then the lumber companies can restabilize and reuse those old roads. (Individual, Port Townsend, WA - #A4965.10111)

1037. Public Concern: The Forest Service should monitor timber removal.

Use GPS and frequent audits to enforce any timber sales to eliminate over-cutting.

Post cameras at access points to photograph vehicles entering and leaving to discourage timber theft as well as illegal use of our forests. (Individual, Olympia, WA - #A441.65200)

1038. Public Concern: The Forest Service should encourage the development of alternatives to wood.

We must research and develop other sources of building materials. (Individual, Oakland, CA - #A3602.65290)

Why this country does not take advantage of industrial hemp is a mystery. We could save so many forests by using industrial hemp for our paper products only. Let the paper mills retool and use hemp. It grows quickly and cheaply. If hemp were used for just our newspapers and toilet paper alone many trees could be saved. Please take the use of industrial hemp under serious consideration. Nobody gets "high" on this. (Individual, North Hampton, MA - #A4309.65290)

There are alternatives to logging, both for forests and for loggers. In terms of wood products there are renewable pulp sources that will not affect the old growth and substantial returning growth already present in our forests; there are building materials that are more durable and more energy efficient than wood—let us make use of them. The logging industry has a right to its incomes, but when an industry becomes unviable, say as coal mining and its dependent steel production did in the eastern U.S. at mid-century, it's time to move on. (Individual, South Lake Tahoe, CA - #A5107.65290)

Instead of logging, why not investigate an alternative for wood, perhaps bamboo? Or a composite so wood waste can be utilized? How about retro planning already planned developments so that more people can live in areas that have already been established? Invest that money to make them attractive. I am mortified that anyone can determine the last vestiges of pristine wilderness are not valuable enough to preserve. This in itself is a sign that my tax dollars are not going towards education. Please do the right thing and preserve the Forest Service's Roadless Area Conservation Rule as it stands now. (Individual, Kenmore, WA - #A4061.65290)

There is a growing market for the use of building products and "lumber" made from recycled plastic containers, such as 2-liter soda bottles and milk bottles. Please consider that we must save what little is left, and make re-use of what we already used. (Individual, San Diego, CA - #A85.50000)

1039. Public Concern: The Forest Service should recognize the conflict of interest involved in its management of timber.

“The appropriate role of local forest planning” is to recognize that there is an overwhelming conflict of economic interest—where forest service employees are mandated to “get out the cut” to maintain their jobs—even though most timber sales are not in the public interest, are below-cost timber sales, and do damage to important wildlife habitat and fisheries. (Organization, Sheridan, WY - #A17593.12200)

1040. Public Concern: The Forest Service should explain why it is preparing and implementing timber removal projects in roadless areas.**GIVEN ITS EXPRESSED COMMITMENT TO CONSERVING WILD FORESTS**

Logging projects on roadless areas in the Sierra Nevada threaten botanically significant areas, imperiled fish and wildlife, and scenic and recreation values. It is fair to ask then, why—as the Service expresses [its] commitment to conserving wild forests the agency is preparing and implementing logging projects in roadless areas? (Individual, Mountain View, CA - #A13532.50000)

*Adequacy of Analysis***1041. Public Concern: The Forest Service should analyze the impacts of removing land from sustained yield management.**

We want to know the volume of timber that will be removed from sustained yield management, its market value, the allowable sale quantity, and the potential jobs and income that might have been created if the lands had been managed under the sustained yield, multiple use mandate. (Organization, Missoula, MT - #A28141.65200)

1042. Public Concern: The Forest Service should not evaluate timber removal during roadless evaluation

Inasmuch as some options have been precluded by the roadless rule, during the evaluation of roadless areas it is no longer relevant to look at timber harvest potential during roadless evaluation. (Civic Group, Roanoke, VA - #A1713.45521)

1043. Public Concern: The Forest Service should analyze the impact of timber sales on lands adjacent to roadless areas.

The impacts of the timber sale programs on lands adjacent to roadless areas must be analyzed, as these sales have increased fire risk, resource damage and changed wildlife patterns on roaded and unroaded National Forest lands. (Business, Spokane, WA - #A22047.65200)

1044. Public Concern: The Forest Service should require logging companies to perform environmental impact studies.**TO PREVENT ENVIRONMENTAL DAMAGE**

Have logging companies perform environmental impact studies and require interventions like developers have. If they cause run-off make certain they build adequate traps to prevent stream damage. There is a logging company on the west coast, I believe Northern California, that is practicing environmentally sensitive logging. It can be done. (Individual, No Address - #A25892.65280)

*Funding***1045. Public Concern: The Forest Service should not charge a fee for dead timber gathering permits.**

How about not charging for permits for dead wood gathering? (Individual, No Address - #A5360.30200)

1046. Public Concern: The Forest Service should not sell fiber.**CHIP THE BRUSH AND LEAVE IT ON THE FOREST**

Chip the brush and leave it there. No selling of fiber. (Individual, Redway, CA - #A7008.30540)

*Allow Timber Removal***1047. Public Concern: The Forest Service should permit timber removal in roadless areas.****BECAUSE IT WOULD REQUIRE MORE ACRES ELSEWHERE TO REPLACE THE TIMBER VOLUME**

In his 13 October 1999 announcement of this initiative, President Clinton noted, “Only five percent of our country’s timber comes from the national forests. Less than five percent of the national forests’ timber is now being cut in roadless areas. We can easily adjust our federal timber program to replace five percent of five percent, but we can never replace what we might destroy if we don’t protect these 40 million acres.”

There are at least three problems with this statement. First, timber production on 40 million acres of land that has been tied up in a litigation and studies for several decades, where, in fact, timber production has largely been prohibited pending decisions on the future of those lands, is simply not relevant to this debate. What is relevant is not that “five percent of five percent” of the Nation’s timber supply has somehow managed to trickle off those lands but, rather, the fact (according to Forest Service data) that forty-six percent of the entire softwood growing stock timber inventory of the United States is on National Forest lands. It is also relevant that many acres of those lands are among the most productive timberlands on earth and it would require many more acres elsewhere to replace the timber that might have been harvested from them. *Even more important is that this replacement would have to be not only for the timber standing on those lands today, but also for all of the timber that might grow there in the future.* (Organization, Orono, ME - #A17644.65210)

BECAUSE OF THE CENTRALITY OF WOOD PRODUCTS TO OUR CULTURE

What about trees and wood? Wood products are something that are used in everyone’s life, every day—the house you live in, paper, telephone poles, power poles, bridges, etc. The government couldn’t operate without paper, nor could the banks or schools. If it hadn’t been for wood to build the ships used to discover America, we probably wouldn’t be here today. The wagon they used to pioneer the great country and the railroads that take the trains from coast to coast used wood. As you drive down the highway, look at the guardrails that keep you from plunging over a cliff or into a river and the fences that keep the livestock off the roads. I think that everyone just takes all these things for granted and doesn’t realize how important wood is to everyone. How about all the jobs that the wood products industry create? For example, the child that starts school uses wooden pencils and paper they draw on. There are thousands of uses of wood if you open your eyes and look around. (Individual, Bonner, MT - #A958.65240)

TO SUSTAIN TURKEY FARMS

This also gives the turkey farmers a problem because the loggers will not be able to chop down wood or even get the dead and dried-out wood from the trees on the mountain to make the sawdust for the turkey farmers, and sawdust also makes nutri-mulch, one of the best fertilizers. (Individual, Chester, UT - #A22041.90510)

This issue also affects turkey farmers. Sanpete County is a county of turkey farming. All of the turkey farmers depend on the logging of our dead trees on our mountains for sawdust. (Individual, Moroni, UT - #A22043.90510)

AS PART OF ECOLOGICAL RESTORATION EFFORTS

If merchantable timber can be extracted as part of ecological restoration efforts, this should be allowed, but determination of what constitutes “ecological restoration” should not be at the discretion of USFS

silviculturists. It should be decided by ecologists from outside the agency. (Individual, Corvallis, OR - #A650.65220)

There are a few instances where chain saws might legitimately be used to move the vegetation towards ecological sustainability. When the USFS recognizes this situation, say so. A chainsaw is not needed on every acre. Nature seems to be doing pretty well . . . without our “help.” (Individual, Grangeville, ID - #A830.65260)

AS LONG AS THE FOREST SERVICE REPLACES EACH HARVESTED TREE WITH FIVE PLANTED TREES

I really do not have a problem with logging if the government replaces each tree with five more. If they do not wish to do this, then tough. (Individual, No Address - #A10440.90520)

AS LONG AS IT IS NOT COMMERCIALIZED

We must not allow timber harvesters to become commercialized—small loggers in Vermont are able to support their families without intruding into the Green Mt. National Forests. (Individual, Shelburne, VT - #A8102.90520)

1048. Public Concern: The Forest Service should permit timber removal by various methods.

Please consider my viewpoints on the roadless issue to be against closing any more Forest Service roads. I also do not believe that logging is that detrimental to the forest if done properly and managed well. (Individual, No Address - #A724.90510)

Forests are a resource that should be utilized. It makes little sense to me to leave past areas off limits to efficient logging opportunists. (Individual, Phillips, WI - #A801.90510)

WITH ROADS

Timber in national forests should be recognized and treated as an important national asset. The Forest Service should return to a program of sustainable harvesting for the benefit of the whole (lumber-using) country and as one way to reduce wildfire hazards. Harvesting timber without building roads would be much more expensive and would reduce the ability to clear brush and slash as an economical part of harvesting contracts. (Individual, Twain Harte, CA - #A1043.90510)

THROUGH A HARVESTING SYSTEM THAT DOES NOT REQUIRE ADDITIONAL ROADS

Something that is desperately needed is a long reaching (miles) and economically feasible logging system that will permit removal of timber without additional roads. (Individual, Ellensburg, WA - #A17772.65220)

THROUGH THE CONSTRUCTION OF TEMPORARY LOGGING RAILROADS

All of the arguments regarding logging roads only list two alternatives—roads for trucks or not logging. There is a third way, used for many years by loggers but now mostly ignored: temporary logging RAILROADS!

For over a hundred years loggers in all parts of the U.S. and Canada used these, and a few even survive. In the steam era they even gave rise to a number of unique locomotive types, including three types of geared steam. Diesel locomotives were also found suitable.

Advantages of logging railroads:

- 1 Narrower right-of-way: 1 track vs. 2 lanes plus, pull offs.
- 2 Reduced grades: this requirement of steel wheels on steel rail often will require trestles yet these are easily constructed of material at hand—logs—and as they only need carry a single track they can be far cheaper than an equivalent truck trestle. This need for trestles often means point-to-point distances are greatly reduced from that needed for roads as track jumps across narrow valleys rather than winding down one side and up the other
3. Reduced dust clouds and erosion: both unavoidable where heavy trucks constantly tear up dirt roads.

4. Greatly reduced air pollution from hydrocarbons, meaning diesel exhaust. A single 1500 HP locomotive diesel easily does the work of 50 trucks of then times the horsepower and putting out 100 times as much exhaust. Also, the reduced grades of a railroad means power needs to move a given load are less, and locos do not have to pour out huge carbonous clouds as they claw up grades as trucks do as they climb out of valleys [that] railroads jump across.

5. Limited access: only rail equipment can use a railroad while any car, truck, bus, motorcycle, etc. can use a road.

6. Recoverable assets and reclamation: when a logging railroad is no longer needed, the rails and ties are picked up and reused. Little damage has been done to the land and vegetation quickly recovers.

7. Safety: a couple of radio-dispatched trains are far less likely to have accidents compared to dozens of trucks challenging each other at blind curves, narrow no-passing areas, etc. Also, [there is] far less danger of fire from a handful of diesel locomotives on a dedicated track to dozens of tracks which often run through dry brush, etc.

8. Tax saving: logging companies have always built their own railroads—no reason for taxpayers to foot the bill as they do for roads (see 5 above).

Conclusion: logging railroads are a sound compromise in that they allow logging yet with little of the damage and taxpayer cost of logging roads. Both sides will strongly oppose this idea, which means it is a good compromise, (if you cannot get both sides to agree to a compromise, find one both hate—just never favor one side over other—the first rule of an arbitration). (Individual, Burkeville, VA - #A23064.90412)

BY HELICOPTER

If economical, some limited helicopter logging could be done. (Individual, Missoula, MT - #A113.90516)

If and when necessary, non-clear-cut logging could be allowed using horse or helicopter. (Individual, Bozeman, MT - #A285.90523)

BY HORSE

You could consider logging if they wanted to bring it out by horse. (Individual, No Address - #A781.90520)

BY ELEPHANT

I favor new technologies or old technologies that work. In Indonesia they use elephants because they're easy on the fragile soil and because they can selectively cut trees and easily get them out of the cut area—that's the kind of logging I agree with. (Individual, Palmer Lake, CO - #A23361.90510)

HARVEST SAW LOGS AND SMALL TREES

The USFS should focus on caring for the Roaded areas - harvesting some saw logs and many more small trees. That is what we do on the 2,800 Double Arrow Ranch with 370 homes. (Individual, Seeley Lake, MT - #A5799.30100)

HARVEST SMALL-DIAMETER TIMBER FROM ROADED AREAS

The Forest Service must advance small diameter timber utilization from roaded areas. (Individual, Cleveland, OH - #A26411.65220)

SELECTIVE TIMBER REMOVAL

Woodlots/woodlands have to be managed: Good management practices require that you have roads into the woodlands. For example in our part of the country (NH) hemlock trees often develop rotten heartwood when they get up to 15+ inches in diameter. It's foolish to just let them stand there and rot till they fall. There are many trees that just need to be harvested and thinned out so that better quality timber can grow. Access needs to be available so that collections of underbrush and downed limbs etc. can be chipped or removed for fire protection. You need roads for these chores. (Individual, Keene, NH - #A3648.65200)

Keeping in mind that during the 1940s, the private timber companies opposed the cutting of timber on public lands, I think that these policies should be revived.

Timber cutting should be done only for the following:

- a) To thin trees to reduce wild fire danger
- b) Christmas trees
- c) Firewood for public use.
- d) When trees are so old that they are about to die, then it's OK to cut some of them that are deemed surplus for wildlife use (e.g. termites/birds, etc). (Individual, Olympia, WA - #A441.65200)

SALVAGE TIMBER REMOVAL

I support a policy that allows those same emergency fire roads to be used for a limited time only (perhaps a limit of two years past the fire season) as avenues for salvage logging. There's no point in wasting timber that has already burnt. As the situation in Yellowstone today shows, burnt trees that have dried and toppled only turn to matchsticks, increasing fire danger with no significant improvement to forest health in a dry climate (no humus formed for hundreds of years!). I support limited and selective logging of burned areas - no clear cutting, always using best practices, and all other current regulations should be followed without exception. (Individual, West Yellowstone, MT - #A1045.31120)

In those cases where such devastation does occur, consideration should be given to the appropriate recovery of damaged timber resources for both the utilization of such timber for the building needs of our nation and to prevent the spread of disease and destruction of healthy stands of timber. (Organization, Washington, DC - #A5069.31120)

1049. Public Concern: The Forest Service should permit timber removal in certain areas.

IN WISCONSIN

I am opposed to any policy that would restrict the construction of roads and the use of motorized vehicles in National Forest land, thereby ending timber production on these lands. Any such policy would have a negative effect on our economy and residents of Wisconsin who we represent. (Elected Official, State of Wisconsin - #A30167.90100)

IN SIERRA COUNTY

Timber harvests (fuel wood gathering and timber operations) have been a vital part of Sierra County's customs and cultures and economy. The impact of the Roadless Area Initiative has yet to be determined, but its impact on future fuel wood gathering and any timber production could be significant. This is because it could lock up almost all of the forests, resulting in less than 20% left for multiple use and future timber production in Sierra County. (Manager, Sierra County, NM - #A22059.65230)

IN ROADED AREAS OF THE TONGASS NATIONAL FOREST

Another major issue examined during the TLMP revision process was the issue of falldown, or the failure of remotely sensed data to adequately portray timber and landscape condition. The reality is that the Tongass does not have the extensive timber resources it was once thought to have. The forest wide average timber per acre is not 25 mbf/acre. Harvest between 1955 and 1990 averaged about 41 mbf/acre (USDA Forest Service, 1991). This high-grading makes it very difficult now to plan large timber sales that are economical. Removal of remaining old growth stands has serious implications for species viability. The Forest Service should now turn its attention to sustainable harvesting from roaded areas for locally owned small operators (Individual, Sitka, AK - #A15506.45623)

The logging industry was not kind to its workers or the environment. It saddens and frustrates me that our congressmen continue to scream loudly for jobs in the timber industry when the industry left its employees high and dry before the 50-year contracts ever ended. The two mills' bad treatment of their

workers is well documented. The industry couldn't compete with lower priced Canadian wood for pulp but the misinformation about why the mills were going down the tubes continues to abound.

It also seems that people have forgotten that Alaska Pulp and Ketchikan Pulp Co. had illegally divided up the forest between themselves, violated antitrust laws, forced small companies out of business, and perpetrated some of the worst logging practices in the history of logging. However, if the industry wants to continue to pursue clear-cut logging in the Tongass forest it still can. The Forest Service needs to hold the industry to logging in the areas where roads already exist and not allow them into pristine wilderness where the recreation, fish, and wildlife values are so important. (Individual, Juneau, AK - #A10588.45623)

I am particularly concerned that the Tongass roadless area receive full protection for their identified roadless areas.

I have lived in the Tongass for three decades and value the wildlands, wilderness, and the natural living resources of the area. I include old growth and uneven-aged forests among the living resources as well as the wildlife, fish, and understory plants. Chief Bosworth, if you lived here or visited our wild areas, you would recognize that the ecosystem is still intact, thanks to the cessation of industrial-scale logging when the two pulp mills closed.

The greatest good in the long-range scheme of life is to leave this magnificent forest. We can not improve upon it by building roads and cutting trees. There is ample inventory of timber adjacent to the existing roads to support reasonable harvesting far into the future, without entering the unroaded areas.

My family and I use the Tongass for subsistence activities, recreation and rejuvenation. We use a boat or kayaks to reach many places within the Sitka area. We share the areas with friends and visitors; none of them say they think the forest should be clearcut to satisfy a political agenda. (Individual, Sitka, AK - #A17360.45623)

IN THE ROGUE RIVER/SISKIYOU NATIONAL FOREST

The Rogue River/Siskiyou National Forest covers some 1.750 million acres. For comparison, the State of Oregon manages some 18,073 acres in southwest Oregon. In 1999, the state sold 6.1 mmbf under sustainable forestry practices. The 466 employees of the Rogue River/Siskiyou National Forest, with an annual payroll of approximately \$38.45 million, are either incompetent or the NWFP is broken! The Clinton Administration Northwest Forest Plan (NWFP) **promised** an annual allowable harvest on the Rogue River/Siskiyou National Forest of 50 million board feet (mmbf). In Fiscal Year (FY) 2000, the total harvest on the Rogue River/Siskiyou National Forest was **less than one 1 million board feet**. (Association, Medford, OR - #A17183.65263)

ON PRIVATE LANDS

Out west I have seen huge areas of clear cut. The "seed trees" left on a national forest in which I camped in S. Wyoming were sitting there useless. No seedlings in sight and the cut over was old.

Silviculture can and should be done by private property owners. Our national forests and BLM lands need to be preserved and restored for native habitat and clean water. (Individual, Bradenton, FL - #A12811.30700)

We have millions of acres of forests in this country, and the only significant resources that can be extracted from them are wood and wood pulp. These materials can be produced at very competitive cost from private forests where the trees are replanted, in other words, sustainably. (Individual, Northridge, CA - #A12738.65240)

ONLY IN AREAS THAT ARE ALREADY ACCESSIBLE BY EXISTING ROADS

I understand this is a tough decision for the FS to make since the mandate of the FS is to manage its lands for many uses including timber harvest. However, I believe the FS should focus on managing timber stands for harvest only on NF lands that are already accessible by existing roads. Why destroy a pristine ecosystem for timber that will only build a handful of houses and take a century to recover? (Individual, Washington, DC - #A5223.75510)

We need to continue logging, but I encourage you to support further logging and road building in areas already “defiled.” (Individual, Salem, OR - #A452.65200)

1050. Public Concern: The Forest Service should consider a categorical exclusion for some routine activities.

SUCH AS TIMBER REMOVAL

I think the Forest Service is spending too much of it’s limited manpower and budget on what I consider frivolous appeals and lawsuits that really have very little merit. For example, almost all of the eastern United States has been clear-cut or high-graded numerous times with no permanent damage as can be seen by the fact that we now have numerous wilderness areas in these same cutover areas. Why doesn’t the Forest Service use that fact alone as basis for proposing that more routine activities that have been occurring for years be categorically excluded from a NEPA decision? (Individual, Russellville, AR - #A3484.45500)

1051. Public Concern: The Forest Service should implement existing forest plans.

TO MEET HARVEST LEVELS ADOPTED DURING THE FOREST PLANNING PROCESS

Notwithstanding the current programmed sale levels are significantly lower than the harvest levels adopted during the LRMP process, the Forest Service is not able to meet these lowered programmed sale levels even with increased funding and staffing. It is our position that the public would be better served and the Forest Service’s time and money better spent if it shifted its attention to implementing the existing forest plans and removing the institutional impediments that preclude effective implementation. (Elected Official, Roseburg, OR - #A11811.65263)

1052. Public Concern: The Forest Service should support a sustainable timber industry.

BY SUPPORTING SUSTAINABLE TIMBER REMOVAL PRACTICES

If the industry learned to operate by cutting less than what it grows, cutting lower quality trees leaving established “legacy” trees to continue their population and to support other life dependent upon them, cutting in harvest cycles of several decades taking only 1/3 of the trees of designated allotments, and maintaining trees of all sizes and ages within each allotment, maybe we could see a sustainable timber industry. This industry would not be dependent upon new roads in areas of the forest which are now currently in natural states, but would be able to operate on private land and within existing timber allotments. This practice could also allow a healthy forest to consistently exist within the allotment. As it stands now, when timber interests harvest trees they leave the landscape barren and nearly useless after a few harvests. (Individual, Carbondale, CO - #A17312.65220)

BY MANAGING SECOND GROWTH IN THE TONGASS NATIONAL FOREST

Manage second growth for a sustainable future timber industry: Forest Service timber management efforts should focus on the vast tracts of second growth now available on the Tongass. With 70% of the healthiest old growth stands now harvested, it is time to look at what is happening in those clear cuts. The future of the Tongass timber industry lies in the effective management of second growth stands- NOT in the continued assault on old growth. Pre-commercial and commercial thinning efforts need to be stepped up a hundred-fold in the Tongass. The careful grooming of our second growth will ensure a sustainable timber economy over the long haul. Anything else is short sighted and a recipe for environmental as well as economic disaster for the region. (Individual, Tenakee Springs, AK - #A1758.65280)

BY REMOVING RESTRICTIONS AND LIMITATIONS

It has been harped upon for decades that federal timber sales in Montana are money-losing propositions. This is because of the hoops that companies must jump through to obtain permission for their operations. A federal timber sale could exist alongside a state or private logging operation, with the same quality of

trees, and lose money while the state or private unit would be profitable, all because of excessive restriction and limitations lobbied for by environmentalists. (Individual, East Helena, MT - #A20422.15121)

1053. Public Concern: The Forest Service should allow timber removal on other forest lands to replace lost timber volumes due to roadless designations.

Any roadless review program should examine revising the timber harvest levels to meet the multiple use objectives. With the disparity between growth and harvest, the opportunities to harvest are graphically illustrated in the DEIS (page 3-112) wherein it noted that net annual growth on the NFS in 1997 was 20.5 billion board feet. This growth and yield indicates that there are options to reduce development pressure on the roadless areas by increasing the harvest levels on the remaining lands or to spread the impacts across a large land base. (Elected Official, Roseburg, OR - #A11811.65263)

IN OREGON

The analysis assumes that timber harvest reductions resulting from the prohibition proposed would not be replaced with timber volume from other NFS lands (DEIS 3-11), however since the same attributes and amenities that are allegedly benefited by the proposed action are also found in land management prescriptions already in place on other NFS lands, we recommend reexamining these other land allocations and prescriptions to determine if they can be eliminated or otherwise modified to replace the lost timber volumes. This is particularly relevant on the Oregon forests where the majority of NFS lands are now managed for biodiversity, endangered species, recreation, and other non-timber values. (Elected Official, Roseburg, OR - #A11811.65263)

1054. Public Concern: The Forest Service should not place restrictions on timber removal on privately owned forest lands adjacent to state and national forests.

BECAUSE THE FOREST SERVICE'S REFUSAL TO THIN NATIONAL FOREST SYSTEM LANDS WILL RESULT IN MORE WILDFIRES

Privately owned forestlands adjacent to State and National Forests should not have restrictions that prevent timber harvest. Wildfires will continue to burn the forest as USDA Forest Service refuses to thin National Forest or allow commercial logging and road building in 49.2 million acres of roadless national forest, with limited exceptions for public safety and national security. (Individual, Jefferson, OR - #A775.30700)

1055. Public Concern: The Forest Service should enlist the public to help clear and thin the forests.

AS IT PROMOTES COMMUNITY AND CULTURAL INVOLVEMENT

I believe public participation into helping with the clearing and thinning should be the ultimate tool as it always has been around here. It promotes community and the culture that existed until recently that is strong and involved in the forest as a cultural reality. (Individual, No Address - #A5360.30100)

1056. Public Concern: The Forest Service should allow wood gathering in roadless areas.

Forest gathering is fun. (I have often gone into the forest for wood and collected pinion, gone fishing and had a picnic.) Being in the forest is calming. Gathering is good exercise. Gathering allows you to do something important while you are scouting for the hunt or just visiting. (Individual, No Address - #A5360.65290)

Do Not Allow/Restrict Timber Removal

1057. Public Concern: The Forest Service should prohibit timber removal in roadless areas.

The following activity should be expressly prohibited in the roadless areas: Logging by any means. Mechanical thinning is not to be included in this restriction, but any tree cut must remain on site, soil shall not be compacted by vehicles, and distribution of remaining trees shall follow patterns natural to the area. (Individual, Dallas, OR - #A3697.90100)

DURING THE ANPR COMMENT PERIOD

SWAN opposes the initiation and implementation of logging projects within roadless areas during this time of comment. This is unconscionable. More than a million people commented and raised their collective voice that these areas should be protected. Now, the President has unilaterally changed the policy giving the National Forests to scurry into roadless areas out west during this period of “administrative limbo.” While SWAN does not work in Alaska and California, we, as American citizens, are harmed as well. (Organization, Plymouth, MN - #A7116.15112)

1058. Public Concern: The Forest Service should prohibit all timber removal methods.

HELICOPTER LOGGING

The alternative use of helicopters is not that desirable because of the dangers a crash can cause to the forest especially fire. (Individual, No Address - #A31.90526)

Next thing I hear is that some companies plan to bypass the regulations by using helicopters to bring in their equipment and labor force—and to haul their “products” out. What kind of a game is this? (Individual, Monrovia, CA - #A190.90526)

SALVAGE LOGGING

We urge the agency to approve a plan that: Prohibits not just “commercial logging” but also any other removal of living or dead trees from roadless areas. (Organization, Missoula, MT - #A17234.90520)

CLEAR CUTTING

Logging should be limited to traditional non-mechanized clearing and single tree extraction. Clear cutting should be banned throughout the entire national forest system. (Individual, Winchester, VA - #A378.90520)

I support prohibition of large-scale clear-cut logging and large-scale mining. Decisions on small logging and mining operations, as well as off-road vehicle use, should be made on a forest-by-forest basis, after a planning process that involves a nationwide public comment opportunity. (Individual, Sitka, AK - #A698.90520)

Clear cutting takes away the cones/re-growth and causes all kinds of damage that loggers don’t pay for or clean up after. (Take a look at clear-cut areas with no re-growth—have loggers take care of the land, as a farmer/rancher takes care of his). (Individual, Bozeman, MT - #A665.90523)

Clear cuts should be ended as a primitive form of management with gross ecosystem impacts. (Individual, Boise, ID - #A64.90523)

1059. Public Concern: The Forest Service should prohibit timber removal in certain areas.

IN WASHINGTON STATE

We live in Washington State, at the foot of Mt. Rainer, on the northwest corner of the National Park. Surrounding the mountain inside of the Park is a VIRGIN, TEMPERATE, INLAND RAINFOREST, with well over 200 inches of annual rainfall. We live on our own privately owned lands in the middle of timber company holdings, just a few miles from the entrance to the park. There are about 50 people that live in our unincorporated area of Fairfax. We see the atrocities that are inflicted on the forests during clear-cutting and spraying of poisons. We are first-hand witnesses to this destruction, because we see it everyday. Our VIRGIN TEMPERATE, INLAND RAINFOREST in the park is being affected by industry logging RIGHT UP TO ITS BORDER in three separate sections on the north side. We barely have one mile of Forest Service lands as a buffer for the park in many places. Clear-cutting was drastically escalated before the Salmon Plan kicked in. They logged all of our seven-mile INLAND, TEMPERATE, RAINFOREST valley in just a few short years. (We have only a few sections that are public-owned 'islands' of land in our valley, and the oldest tree farm is just 28 years old.) This hurt our local loggers, because that much area could have provided work for a decade for just locals, but they called in crews from all around to log faster. They are logging huge areas of 20-30 year-old trees for chip-wood that could be made from many other types of wood. This is ridiculous! They have also built about 2-3 miles of new road on every square mile up here while they could, before the salmon sanctions started. Hundreds of permits went out before the plan kicked in. (Organization, South Prairie, WA - #A28978.65200)

IN AREAS CONTAINING LESS THAN 50 PERCENT SUITABLE TIMBER BASE

No IRA should be allocated to developmental uses if the land has only "poor" timber site or productivity, even if it's currently stocked with mature timber. Only "fair to good" site or productivity should be considered for allocation to developmental uses in an IRA. Timber sites with "poor" productivity will be too costly to manage for timber and the "wildness" tradeoff will be too high.

An IRA should not be considered for development unless it contains at least 50% or more suitable timber land. If it contains less than 50%, it will probably be uneconomical and the "wildness" tradeoff will be too high. An IRA land area should also have at least 50% or higher productive soils to be considered for development. Less than 50% will be too costly to manage for development. (Individual, Libby, MT - #A2301.65260)

IN THE SKYKIOMISH WILD COUNTRY

I would especially oppose any logging in the Skykiomish Wild Country near INDEX. (Individual, Seattle, WA - #A41071.90520)

1060. Public Concern: The Forest Service should prohibit timber companies from harvesting virgin timber on National Forest System lands.

Large timber companies that want big virgin wood should learn to grow it on their own property. (Individual, Amasa, MI - #A793.45626)

1061. Public Concern: The Forest Service should stop preparing timber sales in the Tongass National Forest.

WHICH ARE IN VIOLATION OF THE ROADLESS AREA CONSERVATION RULE

The Roadless Area Conservation Rule should be retained and implemented as is. The Bush administration needs to do all that it can to ensure protection of America's remaining roadless areas. In particular, the Forest Service should stop preparing timber sales in the Tongass National Forest that are in violation of the Roadless Area Conservation Rule. (Individual, Napa, CA - #A1037.10150)

ON PRINCE OF WALES AND GRAVINA ISLANDS

The Forest Service should stop timber sales in the Tongass National Forest that violate the Roadless Area Rule. Some sales proposed for wild places like Prince of Wales Island's last roadless areas, and Gravina Island, should be the first to be called off. (Individual, San Francisco, CA - #A17368.12440)

1062. Public Concern: The Forest Service should adjust the annual sale quantity downward.**TO PREVENT FURTHER BIOLOGICAL AND RECREATIONAL PROBLEMS IN ROADED AREAS**

The Forest Service typically employs timber targets for National Forests. As roadless lands in the Forest Service timber base are conserved under a roadless area protection policy, the roadless lands will be removed from the timber base. This will impact the timber sale program of the National Forests.

Siskiyou Project recommends that the annual sale quantity be adjusted to a lower harvest amount. The only other alternative is to shift this timber burden to the roaded portions of the National Forest System. This approach is not sustainable. The roaded portions of our National Forests require restoration and recovery from damaging activities. To expect more harvest from this land based on a "rob Peter to pay Paul" approach that will further compound biological and recreational problems on the roaded parts of the National Forest system. (Organization, Cave Junction, OR - #A17235.65230)

TO REFLECT THE INTERESTS OF SPECIAL INTEREST GROUPS AND SMALL SCALE GATHERERS

The old way did not work, in many ways; the rape and management of the forests has been poor in many ways. First, before and after the turn of the century (late 1800s and early 1900s was a period of wanton rape all over the country). Then there was a period of heavy use, then a period where roadless areas were designated as a reaction to the incredible big scale logging and rape of the forest. Then the miserable policy of the "Smokey the Bear" system devastated the natural ability of the forest to take care of itself. Then the poorly directed environmentalists continue the dysfunction by insisting that we do nothing to the forests. All the while we ignore the culturally and historically valid systems that have validity of carefully tending the forest by using and protecting this treasure. The loggers have some place here and I would rather have the forest logged than burned up. The methods of logging have to be seriously looked at and scaled down to reflect the interest of the enviros and the needs of the smaller scale gatherers. (Individual, No Address - #A5360.30100)

1063. Public Concern: The Forest Service should prohibit wood gathering in roadless areas.**UNLESS THE AREA IS A BUFFER ZONE**

In order for the process to reach its full environmental and scientific potential human activities within those designated areas should be kept to an absolute minimum.

The following activity shall be expressly prohibited: Collecting firewood, with the exemption of those areas considered buffer zones for the protection of human settlements. (Individual, No Address - #A26840.90000)

Mining, Oil, and Gas Development**Summary**

General Comments – Most general comments regarding mining, oil, and gas development deal with mining leases and management related to mineral exploration in general. One Organization is concerned mineral rights are not "held hostage" within roadless areas and believes the exception for existing leases in the current Roadless Rule is a fair and reasonable and goes on to recommend that the Forest Service revise management of mining leases in inventoried roadless areas such as to discourage further mineral exploration. Another suggests the Agency should hold companies responsible for environmental damage.

Others assert that the Forest Service should not implement the Roadless Area Conservation Rule because it will make mineral exploration less feasible because of increased permitting costs and mitigations measures. This respondent goes on to cite numerous legal and statutory references to assert that, in fact, the surface Mining Control and Reclamation Act of 1977 obviates the need to apply the Rule to mining; hence the Forest Service should exclude mining lease renewal and modification from application of the Rule.

One elected official advises the Forest Service to address short-term safety issues regarding mining activities while the Rule is undergoing review. “While the Roadless Area Rule has been enjoined,” writes this respondent, “the effects of the roadless boundary are being felt on the daily operations of the mines. For example, two of the mines are now drilling methane ventilation holes from the surface in order to protect worker safety. However, even though they hold existing coal leases, the roadless area issue is slowing down the approval of the drilling program. It is critical that the Forest Service address these short-term safety impacts that can’t wait to be resolved until a revision of the Forest Management Plan is completed.”

Adequacy of Analysis – A number of respondents offer suggestions regarding the analysis of mining impacts. To begin with, some suggest the Forest Service should analyze oil and gas resource potential in roadless areas, specifically through a public lands inventory of hydrocarbon potential. According to some, the Agency should assess the amount of oil reserves that lie under National Forest System lands, while others say it should assess the percentage of coal that comes from these lands. On a similar note, some recommend the Agency assess the impact of the Roadless Area Conservation Rule on energy potential.

One county commissioner calls on the Forest Service to provide a legal review to determine whether the Rule can prohibit access to mining claims. Others suggest the Agency obtain input from the Bureau of Land Management regarding leasing areas included in the roadless inventory. One association asks the Agency specifically to justify its claim that inventoried roadless areas would be among the last areas entered for exploration and development. They do not believe this is clear in the final rule and distrust the Agency’s motives.

Organizations comment in particular about monitoring of mining activities. According to one, the Forest Service should improve post-plan monitoring of oil and gas developments; this should include, this respondent goes on, development of an inventory of resource data. This same organization encourages the Agency to prepare a reasonably foreseeable development scenario for analysis of effects of oil and gas development, one which analyzes the net effect of long-term surface disturbance rather than the number of wells to be drilled.

Mining, Oil, and Gas Development –The most common remark made on this topic is that the Forest Service should ensure access for mining—as required by law (see also Chapter 2: Other Legal Concerns: Federal Laws, Acts, and Policies: *Mining Laws General, Mining Law of 1872, and Mining and Mineral Policy Act*) and by the Forest Service Manual and regulations. Others assert that the Forest Service should specifically allow mineral, oil, and gas exploration and extraction in roadless areas—to help lower the costs of fuel in the United States and to help maintain the supply of hardrock minerals critical for defense technologies. One individual adds, however, that continued exploration and extraction should only be allowed if companies agree to clean up existing super-fund sites. Likewise, some say it should only be allowed by certain methods, such as slant drilling or other techniques which do not disturb the surface, or by manual means.

A number of respondents suggest specific states or areas in which mining exploration and extraction, they say, should be allowed to continue, as well as certain mining operations they say should continue. Additionally, a few respondents ask the Forest Service to clarify that mining leases issued by the Bureau of Land Management will not be affected by the Roadless Area Conservation Rule. Finally, one utility group asks the Forest Service to exempt geothermal leases from the Rule, including new geothermal resource areas identified by the Bureau of Land Management.

Although those who state that mining exploration and extraction should be allowed to continue typically write more detailed responses on behalf of their position, others assert that mineral exploration and extraction should be restricted. In particular, a number of individuals and Organizations state that it should be prohibited altogether in roadless areas. People also identify certain mining methods they say should not be allowed, including acid mine draining, gold mining techniques, and recreational mining. Additionally, respondents identify specific states and areas where they say mineral exploration should be prohibited. One individual asks the Forest Service to revoke inactive mining claims. Finally, although the issue of drilling in the Alaska National Arctic Wildlife Refuge does not arise in the Advance Notice of Proposed Rulemaking, several respondents urge the Forest Service to oppose it.

Mining, Oil, and Gas Development General

1064. Public Concern: The Forest Service should revise management of mining leases in inventoried roadless areas.

As a general matter, roadless areas must not be “held hostage” to mineral rights within their borders. The exception for existing leases in the current Roadless Rule is a fair and reasonable compromise. Further, we recognize certain limitations in addressing private mineral rights on national forests, but recommend that, at a minimum, the following principles be included in the final roadless area policy. First, no new mineral leases should be offered in inventoried roadless areas. Second, existing leases in inventoried roadless areas should be allowed to expire whenever possible. In addition, existing leases within roadless areas should not be subject to communitization agreements unless all leases covered by the agreement are located entirely within the roadless area. Finally, the Forest Service should consider “mineral withdrawals” for roadless areas in special circumstances. Such circumstances might include a perceived threat to a certain roadless area or areas. (Organization, Charlottesville, VA - #A25689.65340)

1065. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule.

BECAUSE IT WILL MAKE MINERAL EXPLORATION LESS FEASIBLE

Just as the clear leasing exception of [section] 294.12(b)(7) has been muddied by the FEIS, however, here too in the case of locatable hard rock minerals (such as gold, silver, platinum, and palladium), the access protections for mining claimants are inadequate. Exploration for and development of locatable minerals will still face significant adverse impacts under the *application* of the Roadless Rule due to increases in permitting costs and mitigation measures. In other words, road construction in inventoried roadless areas, even if allowed, will be subjected to more stringent regulatory requirements by the mere fact of location within a roadless conservation area, notwithstanding that the areas are open to multiple use, including mineral entry, as specified by Congress. For example, the FEIS explained: For both locatable and leasable minerals, there may also be impacts associated with potential increases in the costs of permitting and environmental mitigation of activities within inventoried roadless areas. This could affect future exploration and development for leasable and locatable minerals. Most proposed activities, particularly if they are proposed within inventoried roadless areas, are already subject to intense scrutiny through preparation of environmental impact statements. However, it is possible that in

some cases, the requirements for environmental analysis may increase, mitigation requirements may increase, and the processing times may increase. Over the long term higher costs and longer processing times might cause some portion of the mineral resources in inventoried roadless areas to become uneconomic. If that occurred, the level of development would be reduced

FEIS, Vol. 1 at 3-316 - 3-317. See also FEIS, Vol. 1 at 3-321 (“Exploration and development of locatable minerals could be affected if costs are increased because of additional environmental mitigation and/or delays.” (discussing social effects of the preferred alternative).

Indeed, all indications point to heightened environmental regulatory standards in roadless areas. Thus, under its “Roads Policy” (published in the Federal Register on the same day as the Roadless Rule), the Forest Service provides that a full-blown environmental impact statement will be required for any road construction or reconstruction in roadless areas.

There is no such *per se* rule in the current system, nor is there a need for one. Such decisions have been made on a case-by-case basis and a less onerous “environmental assessment” is often sufficient.

This is particularly the case with regard to hard rock minerals, because (like the mining of leasable minerals) mining of locatable minerals on National Forest lands is subjected to detailed environmental protection requirements contained in the Forest Service’s own regulations at 36 C.F.R. Part 228, Subpart A. These rules contain specific requirements for the construction, maintenance, and reclamation of roads. And, of course, mining of locatable minerals on Forest Service lands is also subject to all federal environmental protection statutes. (Association, Washington, DC - #A19636.65320)

BECAUSE IT WILL MAKE MINERAL EXPLORATION IMPOSSIBLE

Although mineral location technically can continue in these areas, the very classification makes it almost impossible to explore and develop a mine. (Individual, Elko, NV - #A13510.75530)

1066. Public Concern: The Forest Service should recognize that the Surface Mining Control and Reclamation Act of 1977 obviates the need to apply the Roadless Area Conservation Rule to coal mining.

Not only do SMCRA’s stringent mining and reclamation statutory provisions and implementing regulations obviate the need for applying the Roadless Rule to coal mining on National Forest lands, but also SMCRA *precludes* the application of the Rule to such coal mining. Here, we reference the Federal lands program mandated by SMCRA [section] 523 (30 U.S.C. [section] 1273), and especially SMCRA’s statutory provisions for designating areas unsuitable for coal mining. *Id.* [section] 522, 30 U.S.C. [section] 1272. This long-standing all-encompassing program, discussed more fully below, constitutes the *exclusive* statutory scheme for “roadless” designations of coal mining on National Forest lands. Indeed, the Federal lands program mandated by section 523 of SMCRA and especially SMCRA’s section 522 statutory provisions for designating areas unsuitable for coal mining should have weighed heavily in the cumulative impacts assessment contained in the Roadless Rule FEIS. However, it was ignored.

The term “Federal lands” includes National Forest lands. SMCRA [section] 701(4), 30 U.S.C. [section] 1291 (4). The term “surface coal mining and reclamation operations” includes surface impacts incident to both surface and underground coal mining. SMCRA [section] 701(28), 30 U.S.C. [section] 1291(28). And it is the Secretary of the Interior who awards leases of coal on federal lands (with the consent of the Secretary of Agriculture for coal underlying the surface of National Forest lands). 30 U.S.C. [section] 201(a). See also 43 C.F.R. [sections] 3400.3-1 and 3400.3-3.

Further, SMCRA [section] 522 establishes procedures and requirements for designating areas unsuitable for surface coal mining. 30 U.S.C. [section] 1272. All federal lands, including National Forest lands, are covered by this statutory scheme.

Thus, under SMCRA, Congress established, with some exceptions, a *per se* category of unsuitability for coal mining on National Forest lands.

This act cannot supersede the clear, subsequent pronouncement of congressional intent articulated in [SMCRA] [section] 552...” *Texaco, Inc. et al. v. Andrus*, No. 79-2488 (D.D.C., Aug. 15, 1980), appeal dismissed (D.C. Cir. Oct. 21, 1982). This statement applies just as equally to all of the statutory authorities cited by the Forest Service in support of the Roadless Rule; and, therefore, SMCRA

constitutes the *exclusive* statutory scheme for “roadless” designations of coal mining operations on Forest Service lands. To implement SMCRA [section] 523, OSM has promulgated regulations in Subchapter D of Chapter VII, Title 30 C.F.R.; and to implement SMCRA [section] 522, OSM has promulgated regulations in Subchapter F of the same Chapter VII. These regulations include and incorporate provisions for designating areas unsuitable for surface coal mining. It is in the Interior Department, Bureau of Land Management’s (“BLM”) coal management regulations, however, that the Federal lands review required by SMCRA [section] 522(b) and the *per se* unsuitability category for coal mining in the National Forests mandated by SMCRA [section] 522(e) are addressed and implemented. See 43 C.F.R. Subpart 3461 - “Federal Lands Review; Unsuitability for Mining.” Briefly stated, here is how this regulatory scheme works.

The Federal lands review is carried out “principally through lands use assessments by the surface management agency.” 43 C.F.R. [section] 3461.0-6. This, of course, would mean the Forest Service on National Forest lands. During the course of such land use assessments, the surface management agency (i.e., the Forest Service on National Forest lands) would be required to apply each of 20 unsuitability criteria specified in 43 C.F.R. [section] 3461.5, the first of which is based on SMCRA [section] 522(e) and provides for blanket unsuitability of all National Forest lands. (Association, Washington, DC - #A19636.65310)

1067. Public Concern: The Forest Service should exclude mining lease renewal and modification from application of a roadless designation.

The preamble . . . specifically stated that “Existing coal leases are not subject to the prohibitions.” It would appear, however, that even in the case of what sounds like a clear, unambiguous directive for existing coal leases, the devil is in the details. Thus, the FEIS stated in its description of the Rule:

When existing leases expire, any *renewal* would have to be considered in light of the prohibition... In addition, this would apply to any *modification* of existing leases. Prohibition of road construction or reconstruction in inventoried roadless areas may influence reanalysis of lands available for lease when land management plans are revised or amended.

FEIS, Vol 1 at 3-259. This FEIS explanation of how the subsection (b)(7) exception would be applied presents real problems because: (1) existing mine plans rely on future reserves, and if such reserves are not available are routinely *renewed* for 10 year terms after an initial lease term of 20 years as long as there is production from the lease (see 30 U.S.C. [section] 207); and (2) furthermore, *modifications* of existing leases commonly occur in order to make “logical mining units” to increase efficiency, to avoid bypass of federal coal reserves, and for other reasons.

Application of the subsection (b)(7) exception in the manner described by the FEIS would be unworkable. In order for a federal coal lease to be issued, a mineable reserve will have had to be proven through an exploration (usually through drilling) process regulated pursuant to strict state and federal regulation. See, e.g., the Bureau of Land Management’s Coal Management Rules at 43 C.F.R. Group 3400. It is simply unreasonable that such a process (often involving a two-or-three-decade time frame) should arbitrarily be derailed by a roadless designation pursuant to the Roadless Rule. This problem must be resolved in any new rulemaking.

This problem must be resolved in any new rulemaking. If the Forest Service insists on including mining within the ambit of a new rule, then as long as federal coal lessees are in full compliance with the terms of the lease, any subsequent renewal or modification should be excluded from application of a roadless designation.

The Companies are concerned that what appeared clear has now become quite opaque. Coal production from *existing* leases may well be in jeopardy. Furthermore, and importantly, because the Forest Service determined that “baseline information for existing leases is not necessary” its estimates of impacts of the Roadless Rule are tainted. (Association, Washington, DC - #A19636.65310)

1068. Public Concern: The Forest Service should recognize that oil and gas leasing is not a project-level decision requiring additional National Environmental Policy Act analysis.

We object to the view that oil and gas leasing is a project-level decision requiring additional NEPA analysis. Although we recognize a lease conveys specific rights subject to terms and conditions of the lease, it must be duly noted that decisions regarding lease terms and conditions are predicated upon the analysis performed in conjunction with the land and resource management plan and decisions regarding land use allocations. As such these decisions are relatively broad in nature, while proposals to drill are project related and site-specific. For example, a separate NEPA decision is required to approve a project proposal on a lease, such as a well, while the leasing decision can be made more broadly through the planning process. This leasing procedure was upheld in *Wyoming Outdoor Council v. USDA Forest Service*. (Business, Denver, CO - #A25688.65310)

1069. Public Concern: The Forest Service should address short-term safety issues regarding mining activities.

UNTIL THE ROADLESS AREA CONSERVATION RULE IS FINALIZED

The one concern is that the Forest Management Planning process takes a significant amount of time. While the Roadless Area Rule has been enjoined, the effects of the roadless boundary are being felt on the daily operations of the mines. For example, two of the mines are now drilling methane ventilation holes from the surface in order to protect worker safety. However, even though they hold existing coal leases, the roadless area issue is slowing down the approval of the drilling program. It is critical that the Forest Service address these short-term safety impacts that can't wait to be resolved until a revision of the Forest Management Plan is completed. (Elected Official, Delta, CO - #A15550.90711)

1070. Public Concern: The Forest Service should not subject existing mining leases to communalization agreements.

Existing leases within roadless areas should not be subject to communalization agreements unless all leases covered by the agreement are located entirely within the roadless area. (Organization, Charlottesville, VA - #A15659.90720)

1071. Public Concern: The Forest Service should hold companies responsible for environmental damage from oil and gas development.

I believe oil and gas companies should be held accountable and legally responsible for RCRA, NEPA, and CERCLA violations. (Individual, Longmont, CO - #A7449.75600)

1072. Public Concern: The Forest Service should recognize the efforts of the mining industry to preserve the environment and beauty of the grasslands.

The oil and gas industry in North Dakota has operated on the grasslands for nearly 50 years. Our industry and the FS are proud of the ability to develop those lands while preserving the environment and the beauty of the grasslands. The Roadless Initiative gives no consideration to that history. (Business, Bismarck, ND - #A19269.65330)

Adequacy of Analysis

1073. Public Concern: The Forest Service should improve post-plan monitoring of oil and gas developments.

INCLUDE DEVELOPMENT OF AN INVENTORY OF RESOURCE DATA

PLA supports improved post-plan monitoring by the FS. Current monitoring activities have been ineffective and have not been used to determine the effectiveness of planning decisions. While we fully support improved monitoring requirements, we strongly object to the proposal to require a project

proponent to pay for monitoring of site-specific projects. Post-plan monitoring and evaluation is a function of the revised planning process and is the sole responsibility of the FS. Language should be included which requires that all monitoring and evaluations to be made be based upon the best available scientific information, techniques and methods. Also, any decisions based upon this information must be statistically significant in order to justify any change in management. . . . To ensure the oil and gas program is not suspended due to perceptions that cumulative effects exceed acceptable levels, it is critical for the FS to routinely monitor activities. It is of particular importance for monitoring to be done on areas of heightened activities on at least an annual basis. Annual monitoring of activities in these areas will give the FS the opportunity to acquire critical information useful for daily and long-term management flexibility. With advance knowledge of when thresholds are being approached, it will be possible for the FS and project proponents to develop acceptable measures to mitigate or reduce potential effects to an acceptable level. Similarly, the effectiveness of mitigation measures can be tested.

In order for this concept to work, the FS must develop a system for tracking monitoring efforts and results. In addition, a quality control process needs to be put in place to ensure that resource management objectives are clearly stated and measurable. Measurable management thresholds, which when reached require a review of existing management practices, must also be identified. An extremely important element of the monitoring effort is an inventory of resource data. Components of this database, many of which must be reflected on maps, would include: Identification of the area of concern and its ongoing uses.

An inventory of all resource activities, including oil and gas wells, fields, roads, pipelines, recreation, grazing, wildlife habitat manipulation, etc., on state and federal lands.

A yearly survey of companies regarding their future activity plans (the FS must devise a method for protecting proprietary data) so that timely development will be permitted.

A record of current surface disturbance and post-development reclamation for all resource uses (this concept ties in with the "net effects" concept).

A record of new activities that will occur over the long term to help in determining net effects of activities (we recommend the FS use completion reports as the basis for such information).

Archeology and TandE species surveys.

Review mitigation measures to determine their effectiveness.

Review the effectiveness of plan decisions and the accuracy of the NEPA impact analysis.

We also recommend the FS enter into a memorandum of understanding with other federal and state agencies with administrative or management responsibilities in the areas of concern to facilitate collection of the needed resource data. Industry may be able to provide some of the data discussed above.

The overall goal of our net effects and monitoring strategies is to:

Provide an element of flexibility in planning for the oil and gas program on federal lands,

Eliminate the need for repetitive NEPA documentation for exploration and development activities,

Provide incentives for mitigation and swift reclamation of dry holes, temporary access roads and well pads, and create a system for resource management planning, which can serve as a tool for industry, organizations and government agencies in the pursuit of their interests and missions. Increase the FS efficiency and data exchange with other surface management agencies. (Business, Denver, CO - #A25688.65300)

1074. Public Concern: The Forest Service should prepare a reasonably foreseeable development scenario for analysis of effects of oil and gas development.

WHICH ANALYZES THE NET EFFECT OF LONG-TERM SURFACE DISTURBANCE RATHER THAN THE NUMBER OF WELLS TO BE DRILLED

In order to maintain flexibility in the planning documents, PLA recommends that the FS utilize the following approach when conducting its analysis on the potential effects of oil and gas development:

NET EFFECTS OF REASONABLY FORESEEABLE DEVELOPMENT

During the land use planning process, the FS must predict the post-lease impacts that could occur from oil and gas development by preparing a reasonably foreseeable development (RFD) scenario. This forecast is normally based upon local geologic trends, currently proposed and historical activity within the planning area. As part of the RFD scenario, the FS typically quantifies the number of **wells** it anticipates will be drilled in the planning area over the life of the plan. The FS also estimates the average surface disturbance associated with wells in the area. This is accomplished by calculating average acreage disturbance figures for well pads, access roads, pipelines, facilities, etc.

This information is then used as the basis for determining environmental consequences of oil and gas exploration and development activities in accordance with each management alternative analyzed. It should be noted that while the number of wells drilled can vary by management alternative, the projected level of disturbance associated with the average well remains the same under this approach. Currently, the FS uses as its baseline for determining environmental consequences of each alternative the number of wells which could be drilled, both exploration and development, rather than net acreage disturbed by oil and gas operations. As such, the FS often fails to consider that once a well is plugged, reclaimed and abandoned, it has no adverse effect on the environment. For example, if the FS predicts 10 wells may be drilled with 5 acres disturbance each, up to 50 acres could be disturbed. We propose, however, if 5 of the 10 wells are dry and subsequently reclaimed, they should not be counted as part of the acceptable level of **long-term** impacts established in the analysis because they were short-term disturbances. Hence, industry should be given the opportunity to drill additional wells, provided they would not result in more than 25 acres of additional surface disturbance or would not exceed an acceptable level of surface impact as determined in the land management plan or post-plan monitoring. Moreover, if 10 additional wells could be drilled without exceeding the established threshold of surface disturbance, they should be allowed since they would fall within the acceptable range established during planning. The key element which must be considered in determining what level of oil and gas activity will be allowed over the life of the plan is **not** the number of wells which could be drilled, but rather the **net effect** of surface disturbance and activities.

This **net effect** approach is consistent with the newly adopted ecosystem management strategy because it relies on scientific data to establish suitable levels and patterns of use. The **net effect** approach will also have the added benefit of facilitating better land use planning and encouraging multiple-use activities, including oil and gas leasing, exploration and development, on federal lands. (Business, CO - #A25688.65300)

1075. Public Concern: The Forest Service should obtain input from the Bureau of Land Management regarding leasing areas included in the roadless inventory.

With regard to minerals, which of course, are of great interest to Oxbow Mining, the USDS should obtain input from the BLM as it makes decisions relating to unprotected resources. In our area of interest the USDA would discover that by a decision effective October 21, 1973 the Department of the Interior through the BLM established the Paonia-Somerset Known Coal Leasing Area. Subsequently, as a result of the Federal Coal Leasing Amendments Act, which was adopted in 1976, these previously designated KCLAs were reclassified as Known Recoverable Coal Resource Areas. These are designated areas that the Bureau of Land Management has deemed after extensive study to have valuable coal resources and potential coal bed methane resources as well. I am confident similar studies have been done by the USGS or the BLM with respect to oil and gas resources. If such an analysis had been done by the USDS in our areas, then it would appear to me that it would have resulted in exclusion of the 160 acres that have been included in the roadless area but also are in conflict with a federal coal lease, for after all coal resources of this value are most certainly limited resources which should be protected for development. (Association, Denver, CO - #A29223.65320)

1076. Public Concern: The Forest Service should address the amount of oil reserves which lie under National Forest System lands.

Currently, 67% of the known oil reserves in the U.S. lie under federal lands. However, access to those lands has decreased by 60% in the past ten years. The nation's dependency on foreign oil has increased to 56% on a daily basis and is expected to climb for the foreseeable future. Responsible access to oil and gas reserves is critical to our nation's energy supply; moreover, the proposals fail to consider the 21

trillion cubic feet (TCF) of natural gas that underlie available FS lands, as noted in the recent National Petroleum Council Study. (Business, Bismarck, ND - #A19269.65330)

1077. Public Concern: The Forest Service should use accurate data to estimate the percentage of coal that comes from National Forest System lands.

This extraordinary analytical gap was addressed directly by the Department of Energy (“DOE”). As noted in the preamble to the Roadless Rule, following publication of the FEIS in November 2000, DOE provided information on affected coal resources to the Forest Service. The DOE analysis shows that the Roadless Rule, likely, will affect three existing coalmines in Western Colorado sterilizing at least 250 million tons of high quality, low sulfur coal. As a frame of reference, this lost coal in Western Colorado alone (which, of course, would be produced over a period of years) represents almost 25% of last year’s *total* national coal production of 1.1. billion tons.

In addition, the significance of National Forest lands as a source of high quality, low sulfur coal was downplayed by the Forest Service. The preamble to the Roadless Rule stated that the “FEIS described the coal production from [National Forest] lands as accounting for about 7% of *national production* in 1999.” However, as shown in recent National Mining Association (“NMA”) testimony to the Congress:

This statement implies that tightening up access simply will not have much impact on energy production from National Forest Service land. However, last year the Black Thunder Mine in Wyoming alone produced over 60 million tons of coal, which represents over 5% of national production by itself. The Black Thunder Mine is located in the Powder River Basin of Wyoming and is located on the Thunder Basin National Grasslands, which is managed by the National Forest Service. In speaking with Forest Service personnel, it was learned that they do not have a good method of estimating coal production from National Forest Service lands. A quick survey of some of the producers on the Thunder Basin National Grasslands revealed that these few mines in Wyoming accounted for 8-10% of national coal production. This completely ignores coal production from National Forest Service lands in Colorado and Utah. If accurate data were used, *the percentage of national coal production from National Forest Service Lands could very likely be 15-20%, which is a very significant percentage.* (Association, Washington, DC - #A19636.65330)

1078. Public Concern: The Forest Service should analyze oil and gas resource potential in roadless areas.

The Colorado Oil and Gas Association (“COGA”) is a member organization representing the majority of oil and gas producers in Colorado, as well as allied service, supply, gathering and processing, transmission, gas distribution and power generation sectors. Colorado Oil and Gas Association is strongly opposed to the proposed prohibition of road construction on 58 million acres of “inventoried” roadless areas, including 4.4 million acres in Colorado, as well as the mandate to local forest supervisors to manage smaller parcels for “roadless values.”

Prohibition of road construction on nearly one-third of the national forest system is tantamount to an abandonment of the statutory multiple use mandate applicable to these lands. With respect to oil and gas exploration and development, it is essentially the same as new wilderness designation. The nation can ill afford to lock up huge areas of the public land base with no regard to the potential for impairing our ability to supply the energy necessary for our citizens and the economy. The EIS’s qualitative discussion about “increased exploration costs” resulting from the roadless proposal is disingenuous to say the least. Prohibition of lease road construction will preclude development of public oil and gas resources.

The EIS has no quantitative analysis of the oil and gas resource potential that would be foregone. COGA members have been unable to obtain timely, detailed mapping information in order to assess impacts of the proposal on existing lease development. In at least one case, however, the proposal would preclude additional drilling on a portion of a producing federal gas unit that has generated over 62 billion cubic feet of gas. Federal gas royalties attributable to the portion of the unit that would be off-limits exceed \$2.3 million. This, despite the fact that there are two wells with existing lease roads in the heart of the proposed roadless acreage. (Business, Denver, CO - #A27325.65320)

THROUGH A PUBLIC LANDS INVENTORY OF HYDROCARBON POTENTIAL

The roadless area proposal is an example of irresponsible, negative action by the government that would foreclose access to the gas resource base without knowledge of its size and potential. It would represent one arm of the government acting at cross-purposes with clear public policy goals expressed by another arm of the government.

COGA asserts that the roadless area proposal should be withdrawn unless and until a public lands inventory of hydrocarbon potential has been completed and incorporated into the analysis, including the impact access restrictions. (Business, Denver, CO - #A27325.65320)

1079. Public Concern: The Forest Service should accurately assess the impact of the Roadless Area Conservation Rule on energy potential.

ON THE LITTLE MISSOURI NATIONAL GRASSLAND

The Forest Service actually represented to the public that the roadless regulation would not interfere with energy production. 66 Fed. Reg. 3244, 3249, 3261 (2001) (less than 1 million acres of high potential land affected). In response to a letter sent by the Western North Dakota counties, the Forest Service did not identify the roadless rule as having any effect on leasing but that about 72,890 acres were “not available” due to management direction or other administrative decisions. Letter of Frederick Norbury to Constance Brooks, April 25, 2001. These statements cannot be reconciled with other Forest Service documents that at least half of the 182,000 acres that the Forest Service classified as high potential, would be closed or restricted to energy development, Vol. 17, 1950-3/Minerals/5903.pdf. The Forest Service decided in December 2000 to impose no exception for oil and gas development on the basis that it was not a “widespread” problem. This conclusion certainly contradicts the Administration’s energy direction and policy and suggests that earlier assurances that the roadless rule had minimal impact on production were mistaken. All of these acreage figures do not address the other 36,000 acres of designated roadless conservation areas.

It is likely that the Forest Service has understated the energy potential on the Little Missouri National Grassland, especially since virtually all of the roadless areas have been under lease at some time, and much of the area is still under lease. (Organization, Denver, CO - #A21358.10135)

IN WYOMING

We are concerned that the geological analysis underlying these rules, which will have a profound effect on the State of Wyoming, is inadequate. Due to the extremely large area of coverage (continental scale) of this document, it must cover areas of tremendous diversity and differences. To lump natural resource issues in Wyoming with the same issues in Arizona or Alabama necessarily results in a superficial analysis, which cannot be accurate and detailed. As a result, we cannot have sufficient understanding of specific issues for any area of the county, much less Wyoming. For example, Wyoming has substantial platinum and palladium resources that could be put off limits but the proposed rules, yet the document does not mention the resource, much less evaluate the impact of shortages of these vital metals on the national economy. (State Agency, Cheyenne, WY - #A22609.65000)

1080. Public Concern: The Forest Service should address the overall process of mineral exploration.

THROUGH DETAILED STUDIES ADDRESSING MINERAL POTENTIAL IN ROADLESS AREAS

I strongly urge the Forest Service to give full consideration to the overall process of mineral exploration and development as it applies to access. Complete detailed studies addressing mineral potential and necessary access are imperative and essential to developing balanced national forest plans that include domestic mineral development. (Individual, Reno, NV - #A21755.65320)

1081. Public Concern: The Forest Service should provide a legal review to determine whether the Roadless Area Conservation Rule can prohibit access to mining claims.

Prior to adoption of the proposed action, we suggest that a legal review be conducted to determine if administrative action of this nature can prohibit access to mining claims on the NFS lands. (Elected Official, Roseburg, OR - #A11811.65310)

1082. Public Concern: The Forest Service should justify its claim that inventoried roadless areas would be among the last areas entered for exploration and development.

To point out one more important error in the Forest Service's underlying analysis of impacts on coal mining production and reserves, in the face of the aforementioned DOE comments and those of NMA and others (including the Companies), the Forest Service replied in the preamble" . . . even if resources do underlie inventoried roadless areas, they would be among the last areas entered for exploration and development . . ." This assertion is not supported in the administrative record of the Roadless Rule.

Indeed, to the contrary, and by way of example, coal reserves underlying inventoried roadless areas adjacent to Arch's West Elk Mine in Colorado would be among the *first* areas entered into for exploration and development (not the last) in the next phase of that mine Indeed, Arch is currently experiencing some Roadless Rule-based resistance from Forest Service officials regarding the need to enter into those areas, as is discussed further in Section VIII.2 of these comments. (Association, Washington, DC - #A19636.65330)

Allow Mining, Oil, and Gas Development

1083. Public Concern: The Forest Service should ensure access for mining.

Despite the fact that Roadless Area rule has been enjoined, and has not been implemented, there is still a proposed stipulation to the Lease Modification that "road building prohibition will apply to this lease modification." The environmental community has used the fact this area has been designated as an IRA (although enjoined) to block the ability of the operator to access the surface for activities necessary to produce from the mining lease. (Business, Wright, WY - #A23085.45500)

Access for the exploration of locatable minerals pursuant to the General Mining Law of 1872 is not prohibited by this rule. Nor is reasonable access for the development of valid claims pursuant to the General Mining Law of 1872 prohibited. In some cases, access other than roads may be adequate for mineral activities. This access may include, but not limited to, helicopter, road construction or reconstruction, or non-motorized transport. Determination of access requirements for exploration or development of locatable minerals is governed by the provisions of 36 CFR part 228. (Individual, Cottage Grove, OR - #A27337.40000)

AS REQUIRED BY LAW

We argue that the proposed rule takes away the public right of access to minerals on public lands. Any review of statutory and judicial case law proves that the Forest Service does not have authority to promulgate rules or regulations that prevent access to public lands for prospecting, locating and developing mineral resources. From the 1872 Mining Law, to the Organic Administration Act of 1897, to the Multiple-Use and Sustained-Yield Act, Congress has maintained that nothing shall be construed so as to offset the use or administration of mineral resources of national forest lands. By enacting the proposed rule, the Forest Service oversteps its authority by denying public access to designated mining areas. (Association, Pocatello, ID - #A20842.65320)

AS REQUIRED BY THE FOREST SERVICE MANUAL AND REGULATIONS

Forest Service Manual and Regulations Specifically Acknowledge Right of Access.

The Forest Service Manual Chapter on Mining Claims (Chapter 2810) specifically acknowledges right of access to a mining claim: The right of reasonable access for purposes of prospecting, locating and mining is provided by statute. Such access must be in accordance with the rules and regulations of the Forest Service. However, the rules and regulations may not be applied so as to prevent lawful mineral activities or to cause undue hardship on bona fide prospectors and miners. Forest Service regulations also emphasize protection of miner's right to access. (See 36 CFR 228.1—mining laws confer a statutory right of entry and 36 CFR 261.1(4)(b)—regulatory prohibitions shall not preclude activities authorized under the Mining Law). (Business or Association, Washington, DC - #A29622.65320)

EXCEPT IN WILDERNESS AREAS

NWMA would add that permitting aerial access only or precluding surface occupancy can only legally be applied by the Forest Service in designated Wilderness Areas, and then, only in certain circumstances.

The Wilderness Act of 1964 specifically states that “in any case where valid mining claims or other valid occupancies are wholly within a designated national forest wilderness area, the Secretary of the Agriculture shall . . . permit ingress and egress to [claims] by means which have been or are being customarily enjoyed with respect to other such areas similarly situated.” (Association, Spokane, WA - #A17351.65320)

1084. Public Concern: The Forest Service should allow mineral, oil, and gas exploration and extraction in roadless areas.

On the national level the Department of Energy study, “Undiscovered Natural Gas and Petroleum Resources Beneath Inventoried Roadless and Special Designated areas on Forest service Lands analysis and Results”, shows that of the 208 oil and gas lays examined, 116 are affected by the roadless rule. It is estimated that 11.3 trillion cubic feet of natural gas would be unavailable for exploration and development activities. In Montana, the Rocky Mountain Division of the Lewis and Clark National Forest has been estimated to contain a minimum of 1 tcf of gas. The Beaverhead and Deerlodge National Forests also are gas potential areas. The Missouri Breaks National Monument has estimated reserves of 1 bcf of natural gas. The Breaks are BLM lands, but this monument added to the Roadless Initiative, the recently adopted transportation rule, roads manual, as well as Forest Service planning regulations that fail to integrate oil and gas resources in land use considerations, create an inextricably linked agenda aimed at precluding multiple-use activities on federal public lands.

MPA is encouraged by the Energy Policy put forward by the Administration. We hope the balanced approach to all energy resources in that document can guide the Forest Service and the BLM in their land use planning, including any plans for unroaded and roadless areas. With that guidance for energy resources, MPA believes existing planning processes are adequate to protect wildlife, watershed and recreational amenities on the National Forest system (NFS) while preserving multiple-use. (Business, Helena, MT - #A29111.50200)

Locking up the natural resources as de facto wilderness is wrong. Exploration for the extraction of oil, gas, coal, and minerals should be allowed in the forests. (Individual, Miami, AZ - #A880.90100)

Existing mining activities, if following environmental regulations should be permitted continuing the scope of present activities. (Individual, Painted Post, NY - #A357.90000)

I believe it would be in the best interest of the country to exempt oil and gas exploration and production from any future rule(s) that would, in any way, limit the building of roads in National Forests. Our critical reserves of oil and gas must not be locked away administratively. (Individual, Denver, CO - #A4566.90710)

TO HELP LOWER THE COSTS OF FUEL IN THE UNITED STATES

If there is oil there we can use to help lower the costs of fuel in the US why not tap into it? In this day and age there are ways to do this without destroying the area and it would have to be carefully planned. (Individual, No Address - #A4764.90710)

BECAUSE HARDROCK MINERALS ARE CRITICAL COMPONENTS FOR DEFENSE TECHNOLOGIES

Hard-rock minerals produced from National Forest lands comprise critical facets of many of the nation's most advanced and vital commercial and defense technologies. (Association, Washington, DC - #A19636.65340)

ONLY IF COMPANIES AGREE TO CLEAN UP EXISTING SUPER-FUND SITES

As for mining interests that want to continue poking holes in the ground like the thousands that surround the town I live in, I can only lend my support to their cause if they will take care, out of their own pockets, of all the super fund sites caused by the previous rapers. The cleanup of these mining sites is coming out of the pockets of the taxpayer. Let those that stand to profit from a relaxed administration's "guarding" of the public trust start with Leadville, Colorado and proceed with all the other messes created by their industry and then once that task is accomplished I will lend my support to their ways. They too want it all without any accountability. By any measure, they are unreasonable. (Individual, Crested Butte, CO - #A30745.65370)

1085. Public Concern: The Forest Service should allow mineral, oil, and gas exploration and extraction by various methods.**BY SLANT DRILLING OR OTHER TECHNIQUES WHICH DO NOT DISTURB THE SURFACE**

The roadless areas should be withdrawn from mining and mineral leasing, except in cases where areas can be leased for oil and gas production using a no surface occupancy (NSO) stipulation which would allow for extraction by slant drilling or other techniques which don't disturb the surface of the land inside the roadless area. I think slant drilling is a viable technology that could open up some areas to mineral production without having to build new roads. (Individual, Vail, CO - #A5371.90721)

BY MANUAL MEANS ONLY

Mining should be restricted to manual means only. (Individual, Cleveland, SC - #A21250.90720)

1086. Public Concern: The Forest Service should allow mineral, oil, and gas exploration and extraction in certain areas.**IN THE ROCKY MOUNTAINS**

The National Petroleum Council's December 1999 report to the Secretary of Energy found that significant access restrictions already restrict or preclude development of some 137 trillion cubic feet (TCF) of known natural gas reserves in the Rocky Mountains, twice as much as is unavailable off the coastal U.S. How can the domestic petroleum industry find and develop the resources to satisfy the NPC's identified need for an additional 7 TCF of annual gas production by 2010 if we continue to lock-up the public lands essential to meeting that demand? (Business, Denver, CO - #A27325.65320)

IN THE ROCKY MOUNTAIN STATES

The National Petroleum Council's study, "Natural Gas, Meeting the Challenges of the Nation's Growing natural Gas Demand," has projected that 460 trillion cubic feet (TCF) of natural gas remain within the Rocky Mountain States. The FS controls approximately 8 percent of the 288 TCF occurring on federal lands. Up to (21 TCF) of natural gas is projected to underlie these lands. Of additional concern, another 2 percent of the land base is estimated by the NPC to be threatened by potential new wilderness designations. Nowhere in any of the roadless documents has the FS given any consideration of this vast resource nor the consequences the roadless initiative will have upon industry's ability to explore for and develop this clean fuel source.

The Department of Energy Study, Undiscovered Natural Gas and Petroleum Resources beneath Inventoried Roadless and special Designated Areas on Forest Service lands analysis and Results

examined 208 oil and gas plays. Of those 208 plays, 116 are affected by the roadless rule. It is estimated that 11.3 trillion cubic feet of natural gas would be unavailable for exploration and development activities. While the nine largest plays in the study make up around 14% of the roadless areas, these areas represent (83%) of the gas resource contained in the inventoried roadless areas. PLA was involved in helping develop the parameters of this study, and despite criticism by those opposed to energy exploration and development in these areas, the study agencies to reduce impediments to energy development and to take actions of expedite energy-related projects, it is important for the Forest Service to reconsider its roadless program and its impact on the energy resource availability. (Business, Denver, CO - #A29112.65330)

IN COLORADO AND UTAH

Allow for the development/designation of coal/energy producing regions within the national forests, particularly in Colorado and Utah. (Business, Wright, WY - #A23085.90710)

IN UTAH

In 1991, PacifiCorp submitted a Lease by Application (“LBA”) in the North Trail Mountain/Cottonwood Creek Area of the Forest that contains 75 million tons of recoverable coal. This coal lease tract is now held by the State of Utah because of the 1998 coal land exchange (“1998 Exchange”) between the State and Federal Government resulting from the establishment of the Staircase-Escalante National Monument (“Monument”). See Utah Schools and Lands Exchange Act of 1998, Pub. L.No. 105-335, 112 Stat. 3139 (Oct. 31, 1998). As much as 25 percent of the state and federal coal leases held by PacifiCorp are in inventoried roadless areas, including the area of the LBA, a substantial reserve of coal mine operator. This outcome could occur despite significant industry interest in exploring around these areas on the Wasatch Plateau for more economically recoverable coal deposits. New leasing and Plateau for more economically recoverable coal deposits. New leasing and exploration, however, would require surface access roads to determine quality, quantity, geology, and engineering conditions and to control, minimize, and mitigate any damages from mining-induced subsidence.

PacifiCorps’s current lease development activities and future leasing opportunities could also be significantly impaired by the Roadless Rule on its 1998 Exchange.

PacifiCorp is concerned that the delay and expense resulting from the requirement for EIS preparation to conduct any exploration that might be allowed in roadless area, as well as forest plan amendments and revisions precipitated by the Roadless Rule will impose substantial costs and delays in data acquisition. As a result, significant amounts of economically recoverable coal may be bypassed.

Application of the Roadless Rule to the areas covered by the LBA and the Mill Fork lease resulting in the bypassing of these two significant reserves is contrary to the purpose and intent of establishment of the Monument and the 1998 Exchange.

PacifiCorp is grateful that the Forest Service in its Roadless Rule acknowledged that the reserves granted to Utah in the 1998 Exchange “would be considered outstanding rights,” FEIS, Vol. 1 at 3-258, and, thus, the construction of portal and transportation facilities necessary for the development of these resources, “as an outstanding right . . . would be excepted from the prohibition alternatives,” FEIS, Vol. 1 at 3-260. See also 66 Fed.Reg. at 3265 (access to Utah state-owned coal would be guaranteed based on existing rights). *But, the mere designation* of the areas within which Utah was granted coal reserves and within which PacifiCorp plans to conduct lease development activities thwarts the intent of Congress and denies Utah and its lessees the full benefit of the bargain struck in the 1998 Exchange.

It was understood by the parties to the 1998 Exchange that the resources granted to the State of Utah could be developed subjected only to generally applicable environmental laws without any special encumbrances on the development of the coal resources. (Association, Washington, DC - #A19636.65330)

The Roadless Rule does not purport to repeal any of the multiple-uses on the lands involved, but it very well might have that effect. For example, in Utah, some of the “inventoried” tracts of land are over the Central Utah coal reserves. These coal seams may only be mined by underground techniques, so there is no danger of the effects of surface mining. Yet, in order to offer these tracts up for leasing, and then lay out the necessary mining sequence plans, and thereby obtain the necessary financing for the operations,

test core sampling holes must be drilled from the surface. This requires a road to the drill sites. This road could be reclaimed immediately after use. But the Roadless Rule does not even allow for temporary roads. If time had been taken to examine these and other issues, perhaps a carefully written local stipulation could have been crafted for these coal areas.

Similarly with the general mining laws of the nation. Because general prospecting for minerals is not prohibited by the Roadless Rule (and if otherwise allowed by forest plan revisions), any person who discovers valuable mining resource because of the inability to build a road. The Roadless Rule therefore has the effect of closing the areas to future mineral prospecting, leasing and mining. The state demonstrated in its comments of July 17, 2000 that there are areas with such resources which are known today. (State Agency, Salt Lake City, UT - #A20742.65320)

IN THE NATIONAL MONUMENT IN UTAH

Why don't you open the national monument in Utah to the huge supply of clean-burning coal locked up by Clinton. . . . Open up our national forests and monuments to the much needed raw materials they contain. (Individual, Oceanside, CA - #A27306.90100)

IN THE MANTI LASAL NATIONAL FOREST

Historic activities, such as coal mining on the LaSal National Forest, should expressly and presumptively be allowed. The Roadless Area FEIS clearly noted that local economies are highly dependent on these activities. It also correctly notes that the economies of these rural communities are highly inelastic. (Business, Wright, WY - #A23085.90710)

IN MONTANA

Part of the Forest Planning process involves making inventories of the mineral resources in roadless areas. These inventories show substantial regions of high mineral potential in the roadless lands of Montana's National Forest. Was the gathering of these inventories a mere empty exercise? What provision will be made to provide future access to these areas of high mineral potential? (Organization, Missoula, MT - #A28141.65320)

IN NORTH DAKOTA

In North Dakota the roadless conservation areas have been under *de facto* wilderness management since the late 1990s. The Forest Service has not approved or offered for sale any leases located in these roadless areas. *See e.g.* DPG FEIS, App. C. 127, 132. The Forest Service has objected to and threatened counties who proposed road rehabilitation and construction. These two policies combined to delay and interfere with energy development. The roadless administrative record (RAR) states that at least half of 182,000 acres classified as high oil and gas production potential will be closed to energy development or greatly restricted. RAR, Vol. 17 1950-3/Minerals/5903.pdf. The impact of roadless designation on county governments, revenues, access, and local industries is significant. See HAND comments on economic costs of proposed wilderness. The comments were written before the spike in oil prices and the increased demand for energy. The Department of Energy (DOE) sharply criticized the roadless rule for its effects on energy development. However, the DOE report addresses potential production in the Rocky Mountain Front and ignores North Dakota, which actually produces half of the oil and gas produced in the National Forest System. The Forest Service internally admits that the roadless designations interfere with likely development in these areas. The cost in terms of state revenue, county revenues and national energy policy has been largely unquantified. These areas were entirely leased in 1987 but the low development management prescription has actively discouraged drilling and production. By 2001, many of the leases were not extended or renewed. The Forest Service FEIS admits that they declined to renew or issue leases due to "management policy." DPG FEIS, App. C 134. Given the lack of wilderness qualities, the comparative value of the land for energy production and continued agriculture use greatly outweigh the other uses. (Organization, Denver, CO - #A21358.65300)

IN THE DAKOTA PRAIRIE GRASSLANDS

The Dakota Prairie Grasslands are a vital component of North Dakota's economy. They provide 27% of the state's oil production and contain 30% of the state's producing wells, providing nearly 1,000 jobs. The oil industry's activities on the grasslands bring in nearly \$15 million per year in tax revenues and

only temporarily disturb a very small portion, less than one-half of one percent of the grassland's surface area.

The oil and gas industry in North Dakota has explored in and drilled upon the grasslands for nearly 50 years and has restored over 500 wells and 480 miles of roads, or 45% of all roads constructed by the industry.

The oil and gas industry and other users, including wildlife, can co-exist in the Dakota Prairie Grasslands because reclamation is fast, effective, and very successful. That may not be true in National Forests in other states where reclamation can be more of a challenge.

The Tesoro Refinery in Mandan receives 36% of its supply from the grasslands, the Roadless Initiative places the future of the refinery at risk because it eliminates potential new wells and pipeline rights of way. The future of the refinery is vital to the State and local economies, as well as the national interests in continuing to meet the demand for gasoline and other refined crude oil products. (Business, Bismarck, ND - #A19269.65330)

IN ALASKA

New roads may be required for the development, under strict guidelines, of a sound National Energy Policy. A group of Americans would deny oil exploration in Alaska, when such action would cause little change to this area (affecting only a very small amount of land) and would be of great benefit for this country. (Individual, Albuquerque, NM - #A5739.65300)

IN THE ABSAROKA-BEARTOOTH WILDERNESS

In considering the designation of the Absaroka-Beartooth Wilderness in 1978, Congress specifically drew the boundaries to exclude the Stillwater deposit. Through the Roadless Rule, however, the Forest Service could well thwart by regulation that carefully considered legislative decision. Congress had extensive mineral information in making its determination to designate that Wilderness.

As we have discussed previously, *application* of the Roadless Rule directly contravenes express congressional intent to allow unimpeded development of the important Stillwater mineral resources. (Association, Washington, DC - #A19636.65310)

IN BIG SPRINGS AND JERRIT CANYON

Under the January 12 rule, exploration and development activities will be significantly reduced or eliminated in the "roadless area" between Big Springs and Jerritt Canyon. The delay of years and the EIS expense of hundreds of thousands to a million dollars or more will be prohibitive to almost any exploration project. There is a significant potential for the loss of an otherwise economic resource and the associated loss of local jobs. Thus, the important value of economic well being for nearby communities must be considered.

Thus, the January 12 Rule must be modified to ensure that reasonable road access is preserved in roadless areas in order to explore for and develop locatable mineral resources pursuant to the 1872 Mining Law and the intent of Congress in designating wilderness area boundaries, and to maintain local economic vitality. (Association, Spokane, WA - #A17351.65320)

BY MINING OPERATIONS CONTROLLED BY THE STILLWATER MINING COMPANY

Two significant portions of the Stillwater platinum/palladium ore deposit fall within inventoried roadless areas in both the Custer and Gallatin National Forests, comprising an estimated 25 percent of the deposit. Effective future operation of the Stillwater Mine will require new roads in these areas. Roads will be required for the construction of ventilation shafts and emergency escape ways vital to ensure mine safety. Helicopters or other alternative transportation methods will not be adequate and, even where such alternatives could be used, significant increased costs would be imposed on Stillwater. Thus, the Roadless Rule threatens significant harm to the operation of this unique and important mine. (Association, Washington, DC - #A19636.65320)

The January 12 rule seriously affects not only ongoing and planned development and production activities of SMC (Stillwater Mining Company) but also future mineral exploration activities of SMC and other companies. Significant areas of the SMC mining claim group along the complex are adversely

affected. Roads will be required to construct additional ventilation shafts and escape ways to maintain safe operation of the mine. Delays in approval of surface activities necessary for underground operations will increase the cost to the company and may reduce the amount of economic reserves. Bypassed mineralized areas may be lost. Expensive changes in mining methodology may be required. In addition, the January 12 Rule illegally threatens to halt further exploration activities in the Stillwater complex. (Association, Spokane, WA - #A17351.65330)

BY MINING OPERATIONS CONTROLLED BY BURLINGTON RESOURCES OIL AND GAS COMPANY L.P.

Burlington Resources Oil and Gas Company L.P. (BR) is filing these comments to reiterate our specific concerns with respect to possible implications of any proposed Forest Service (FS) Roadless Area policy on any BR mineral or leasehold acreage owned or to be acquired by BR and to seek clarification that our acreage will be exempted from any new restrictions on access to it. (Business, Midland, TX - #A22626.91110)

1087. Public Concern: The Forest Service should clarify that mining leases issued by the Bureau of Land Management will not be affected by the Roadless Area Conservation Rule.

Clarify that coal lease renewals and Logical Mining Units, issued by the Bureau of Land Management, have valid existing rights, and that the roadless area prohibitions will not apply to these administrative functions. (Business, Wright, WY - #A23085.65310)

IN GUNNISON COUNTY

The land area of Gunnison County includes 86% public lands of which a significant portion is currently designated as either wilderness or roadless. Although we highly value our wilderness and roadless areas, as they to play an important role in our economic well being, the proposed rulemaking needs to identify a careful mechanism to support present operations like the existing coal mines which are particularly impacted by this rulemaking. (Elected Official, Gunnison, CO - #A22061.10112)

1088. Public Concern: The Forest Service should exempt geothermal leases from the Roadless Area Conservation Rule.

INCLUDING NEW GEOTHERMAL RESOURCE AREAS IDENTIFIED BY THE BUREAU OF LAND MANAGEMENT

On behalf of Mammoth-Pacific LP, I am writing to provide comments on Phase II of the U.S. Forest Service's roadless initiative. Specifically, we request that geothermal leases be specifically exempted from the initiative.

Located in Mono County, California, Mammoth Pacific facilities generate up to 40 megawatts of renewable, environmentally sound electricity, which can power approximately 40,000 homes. This electricity, which is generated by using the earth's natural heat, displaces the need to use fossil fuels for power generation, and has no combustion emissions. For natural gas, that is a reduction of over two billion cubic feet per year and over one hundred thousand tons of carbon dioxide per year. In addition, with an annual payroll of over \$1.4 million, Mammoth Pacific plays an important role as a local employer and as one of the largest property tax payers in Mono County. The G3 facility, located on public land, also paid \$1 million in royalties to the Minerals Management Service in 2000 for electricity sales.

Mammoth Pacific has obtained and currently maintains geothermal steam leases on U.S. Forest Service lands, some of which are in areas included in the roadless initiative. Although we strongly support your efforts to protect our natural resources, we believe that this initiative may have the unintended consequence of restricting these leases and these leases of other geothermal resource areas.

As Congress and the Administration look for environmentally sound solutions to our energy crisis in California and elsewhere, efforts to restrict existing geothermal leases is inconsistent with laws and public policies specifically aimed at diversifying our nation's energy production sources and reducing our nation's dependence on fossil fuels. Geothermal energy is an environmentally sound alternative source of energy that has no significant impact on the environment.

Furthermore, if the roadless initiative impairs the lessor's rights to develop the geothermal resources that occupy the lease to any extent, it takes value from the lease—a lease that the lessor has tried in good faith to maintain and enhance under the terms of its lease(s).

For these reasons, we believe that existing geothermal leases should be specifically exempted in the roadless initiative.

In addition, we understand that the Bureau of Land Management (BLM) has been directed by the Administration to review and update its knowledge of geothermal resource areas with the intent of possibly adding new lease areas. If the roadless initiative includes new geothermal resource areas identified by the BLM, these areas should also be exempt. (Organization, Mammoth Lakes, CA - #A17659.91710)

Do Not Allow/Restrict Mining, Oil, and Gas Development

1089. Public Concern: The Forest Service should not allow mineral exploration in roadless areas.

New mining/drilling activity should be prohibited. (Individual, Painted Post, NY - #A357.90000)

I urge you to uphold President Clinton's ban on road building and logging in our national forests. But the ban should do more: it should also prohibit all extractive activities, including mining, and oil and gas pumping. It should prohibit all power vehicles. And it should apply to all our forests—from the smallest to that great national treasure, the Tongass. (Individual, Candler, NC - #A160.90110)

Mining, oil and mineral exploration should be prohibited. (Individual, No Address - #A565.90720)

Mining has the potential to impact all of the ecological and amenity values of roadless areas that the Forest Service is committed to protecting in this process—from water quality to solitude. Mining access roads are as destructive as logging roads and are often driven deep into the most remote roadless area watersheds. Mine sites can become permanent scars on the land.

Speculators use the Mining Law to file nuisance claims or to mine the pockets of investors and citizens of the United States. While these activities can seriously degrade the ecological, recreational, and aesthetic values of roadless areas and can cost the public millions of dollars, they seldom produce minerals that benefit the public. Many impacts from mining are wholly unnecessary for the reason that they either take place on mining claims that do not support the discovery of a valuable mineral deposit, and are therefore, not valid, or are associated with access to mining operations on invalid claims. According to the Department of Interior, "Rights to mine under the general mining laws are derivative [of] a discovery of a valuable mineral deposit and absent such a discovery denial of a plan of operations is entirely appropriate." Recreational miners, while failing to meet the requirements of the 1872 Mining Law, are granted the privileges to impact sensitive riparian areas and ecologically valuable low gradient stream reaches beyond those accorded any other use of the national forests.

Specific examples of the impacts of mining on roadless areas can be found in the North and South Kalmiopsis roadless areas comprising approximately 190,000 acres adjacent to the Kalmiopsis Wilderness on the Siskiyou National Forest in southwest Oregon. (Organization, Cave Junction, OR - #A17235.90720)

There is an exquisite stream in Siskiyou, Rough and Ready Creek, that harbors along its banks a number of rare and fragile plant species that don't exist anywhere else; and there is a miner claiming over 4000 acres along and around that creek who is attempting to force the federal government to let him mine and remove rock and ore samples in whatever way he chooses, or else pay him \$600,000,000. The operation he has in mind for his Nicore mine is unlikely to come close to paying that kind of money, and it would destroy the Rough and Ready area. I don't believe the Rule would be enough to make him give up completely, but it would help enormously in protecting Rough and Ready and other such pristine places from being devastated by unimpeded mining activity. (Individual, Medford, OR - #A15234.10110)

1090. Public Concern: The Forest Service should not allow mineral exploration by various methods.**ACID MINE DRAINING**

If land is being cleared for mining, one of the most significant negative impacts is acid mine drainage. This can lead to extensive damage to soil and potable water supplies. (Individual, East Aurora, NY - #A6187.65360)

GOLD MINING TECHNIQUES

Mining activities, especially new techniques used to mine gold, can be extremely destructive to the environment and pose serious threats to public health including contamination of groundwater and drinking water supplies. While not explicitly mandated as a "multiple use" of the forest, mining law authorizes and even encourages mineral development in the national forests. Unfortunately, many of the most remote and pristine areas of our forests are vulnerable to mineral development, including many inventoried roadless areas. (Organization, Charlottesville, VA - #A15659.90120)

RECREATIONAL MINING

There will no doubt be applications for so called "recreational mining." It too should be prohibited; recreational mining for gold or other precious metals with a dredge produces large amounts of dirt that destroys spawning beds for salmon and other fish. It also destroys habitat for the aquatic macro invertebrates on which fish feed. (Individual, Salem, OR - #A13948.90720)

1091. Public Concern: The Forest Service should not allow mineral exploration in certain areas.**IN THE TONGASS NATIONAL FOREST**

I strongly oppose allowing oil drilling in Alaska's Tongass and other previously protected areas of our national forests. I understand that the benefits from drilling the known sources in this area would be minimal and short lived. (Individual, Danville, VA - #A1158.90720)

IN THE HUMBOLDT-TOIYABE NATIONAL FOREST

A ban on mineral exploration road building is essential if roadless areas on the Humboldt-Toiyabe National Forest in Nevada are to be protected. For example, between 1985 and 1997, approximately 350,000 acres of Forest Service roadless areas were lost, primarily to mining and exploration. This number is based on the following: Of the total area of areas identified in the Humboldt and Toiyabe Forest Plans in 1985, approximately 350,000 acres no longer qualified as roadless in the GIS inventory completed in support of forest plan revision in 1997. Based on local forest watch groups' experience, most of the land, except in the Schell Creek Range, was roaded by mining or exploration projects.

Currently, there are various exploration projects ongoing in roadless areas in Nevada. These include: Arc Dome south, the Toiyabe Crest, Bunker Hill, Georges Canyon, land directly adjacent to the Alta Toiyabe Wilderness, and Mahala Creek in the Independence Range. Because only a few percentage of these exploration activities lead to full-scale mining operations, the Forest Service should protect these roadless areas by requiring exploration without road building. Mining in the above mentioned areas should not be permitted. (Organization, Portland, OR - #A12004.90720)

IN THE SOUTHERN APPALACHIANS

Two recent examples from the Southern Appalachians illustrate the very real threat to roadless areas from mining activity and mining rights in the forest.

In Laurel Fork of the George Washington National Forest, a private oil and gas company was poised to exercise its lease rights in this magnificent and pristine roadless area. With a proposed pipeline along its borders and active leases beneath its surface, Laurel Fork was only spared by legal intervention and a negotiated settlement whereby the gas company agreed to relinquish its surface rights in Laurel Fork. The Forest Service has since amended its forest plan to preclude new oil and gas leases in the area.

The Devil's Fork Area of the Jefferson National Forest is another roadless area whose status is threatened by mining pressure. Due to private mineral rights in Devil's Fork, the Forest Service has

apparently removed Devil's Fork from the roadless area inventory. The area is clearly deserving of roadless status but for the existing mineral leases and rights associated with those leases. (Individual, Asheville, NC - #A22623.90720)

IN NORTH DAKOTA

With the overwhelming majority of the Little Missouri National Grasslands leased for oil and gas development I believe it is safe to conclude the Grasslands have been used in an exploitative manner. As mentioned earlier in North Dakota more than half of the roadless areas on the Little Missouri National Grasslands have disappeared in the last 30 years. In large measure this is the result of exploitative oil and gas development. Where we once had close to 450,000 acres of roadless areas, areas contain undeveloped oil and gas leases. Given this it is almost a forgone conclusion that oil and gas development will occur in many of these areas. Because of this leasing I believe the acreage of unroaded roadless areas may decline in North Dakota between this generation and the next more-so than many realized. I daresay few areas in the United States have born the brunt of declines as great as these.

In addition, new technologies, tax credits and development incentives serve to increase the extent of oil and gas development on the landscape, as well as the longevity and permanence of individual oil and well fields. The current administration is also forwarding policies that expedite oil and gas industry, such things harbor a downside in terms of landscape conservation. What might have once been on the landscape for 10 years or not at all, may now be there for 30 years or more. (Individual, Bismarck, ND - #A29119.65340)

IN THE GEORGE WASHINGTON AND JEFFERSON NATIONAL FORESTS

Two recent examples illustrate the very real threat to roadless areas from mining activity and mining rights in the forest. In the Laurel Fork Area of the George Washington National Forest, a private oil and gas company was poised to exercise its lease rights in this magnificent and pristine roadless area. With a proposed pipeline along its borders and active leases beneath its surface, Laurel Fork was only spared by legal intervention and a negotiated settlement whereby the gas company agreed to relinquish its surface rights in Laurel Fork. The Forest Service has since amended its forest plan to preclude new oil and gas leases in the area.

The Devil's Fork Area of the Jefferson National Forest is another roadless area whose status is threatened by mining pressure. Due to private mineral rights in Devil's Fork, the Forest Service has apparently removed Devil's Fork from the roadless area inventory. The area deserves roadless status but for the existing mineral leases and the rights associated with those leases. (Organization, Charlottesville, VA - #A25689.65340)

1092. Public Concern: The Forest Service should prohibit mining activities in roadless areas.

DUE TO THE ASBESTOS FIBERS CARRIED BY MINERS INTO HOMES AND TOWNS

The Seattle Post-Intelligencer has reported in a series of articles of the damage to human life by asbestos fibers carried by miners and the wind from tailings into northwest Montana homes and lives. This has been repeated where historic asbestos has been mined or, inadvertently, disturbed when other minerals were stripped from the earth (where associated with asbestos). You know these stories, this history and the terrible disease unleashed. (Individual, Mercer Island, WA - #A27540.65360)

1093. Public Concern: The Forest Service should revoke inactive mining claims.

Access to private lands in these areas - particularly mining claims that are nothing more than recreation cabins for snowmobiling, hunting, etc. should be disallowed and claims revoked. (Individual, Missoula, MT - #A6141.90110)

1094. Public Concern: The Forest Service should prohibit drilling in the National Forest System.

Please keep the national forest system as it is, do not open it up because of pressure from other groups or the government. Positively do not open it up to drilling of any kind. (Individual, Orwell, OH - #A11129.10150)

IN THE NEW YORK NATIONAL FINGERLAKES FOREST REGION

The Roadless Area Conservation Rule should be retained and implemented as is. The Bush administration needs to do all that it can to ensure protection of America's few remaining roadless areas. . . . Preparations should . . . stop for drilling (vertical or slant drilling) in the New York National Fingerlakes Forest region. (Individual, Rochester, NY - #A8831.10150)

1095. Public Concern: The Forest Service should oppose oil drilling in the Alaska National Arctic Wildlife Refuge.

We do have some other deep concerns.

Simply put they are:

That this roadless issue will be sacrificed to the passage of drilling in ANWR. We can only hope that you will make a supreme effort to not let this happen. (Association, Cody, WY- #A19163.16100)

BECAUSE IT WILL NOT PROVIDE LONG-TERM BENEFITS

I wish that you would not drill for oil in ANWAR in northern Alaska. Please. It won't do any good. Well, perhaps temporarily but not long term, and long term solutions are what you really should be seeking out and using. Think solar, waterpower, or windmills. (Individual, No Address - #A4548.65300)

I know out of doing a lot of research that drilling for oil in the Arctic is only going to give us a major disaster and you would not get enough to make a difference. (Individual, Spokane, WA - #A21843.50000)

I just don't see why Bush wants to ruin some of our precious wildlife reserve when we can get oil from other places or use more of an environmentally friendly form of energy. Please consider what I have said because if Bush allows this drilling to begin, then it is only a matter of time before it occurs in other places. I would like to be able to show my kids someday open green spaces with wildlife, not just cement streets and polluted air. (Individual, La Crosse, WI - #A1385.70300)

Grazing

Summary:

General Comments –Several individuals ask the Forest Service to address how grazing in roadless areas will be handled in the future, and to address the impact of roadless designations on rangeland health and management. One individual urges the Agency to insist that ranchers accept the risk that their herds will be subject to natural predators by not demanding that predators be destroyed or relocated. Another individual suggests that grazing rights should not automatically go to the same rancher every decade.

Funding – One individual suggests that the Forest Service should sell unneeded grazing land to people who hold leases.

Grazing – Some respondents urge the Forest Service to allow grazing in roadless areas. According to one individual private properties and communities could benefit by grazing on forest grounds to keep fuels from building up. Others suggest that the Roadless Area Conservation Rule should make it clear that grazing is a permissible use within these areas.

Respondents believe that the Forest Service should protect access to livestock and range facilities. One individual remarks that there needs to be access to livestock and associated activities such as delivering salt and water, mending fences and taking trailers to sick or injured stock.

A number of respondents state that grazing should be restricted. Several individuals request that the Forest Service prohibit grazing on all National Forest System lands. They believe it degrades the environment and has little fiscal pay off. Others say that it should be regulated in roadless areas, particularly in riparian areas and recreational campsites.

Grazing General

1096. Public Concern: The Forest Service should address how grazing in roadless areas will be handled in the future.

Other concerns related to this issue are the lack of information regarding the specifics regarding how grazing on current roadless areas will be handled in the future—will it be allowed; if not, how will it be prevented; if only reduced, by how much? (Individual, No Address - #A448.65120)

1097. Public Concern: The Forest Service should insist that ranchers accept the risk that their herds will be subject to natural predators.

BY NOT DEMANDING THAT PREDATORS BE DESTROYED OR RELOCATED

I think that if the government does lease out my forests to ranchers to graze their cattle on, there should be a clause in which they accept that because they are allowing their domesticated animals into the wilderness unsupervised, there will be consequences of their action. They will not demand that wolves, coyotes, cougars, bears, or any other natural predators that kill their livestock be terminated or relocated. They will accept these losses as part of the price for being allowed to graze their privately owned stock on public land. National Forests are meant to preserve our rare animals as well, and predators shouldn't be punished for doing what they were born to do. (Individual, San Diego, CA - #A4694.15160)

1098. Public Concern: The Forest Service should analyze the impact of roadless designations on rangeland health and management.

IN THE NATIONAL GRASSLANDS

The Forest Service should allow local and forest level decisionmaking for rangeland health in addition to forest health. This means that Roadless values should be analyzed as to their purpose and practicality as to range conditions on the national grasslands. It appears that many of the proposed Roadless areas on our national grasslands and national forests have been proposed without a thorough analysis of the impact on rangeland health and management. This analysis must include the impact of Roadless designations on adjacent private rangelands and their management. (Individual, Buffalo, WY - #A29885.60600)

1099. Public Concern: The Forest Service should ensure that grazing rights do not automatically go to the same rancher every decade.

If you want to make some changes, work on grazing rights. The fees for grazing rights should be competitive, and should NOT automatically go to the same rancher decade after decade. In many areas they should be curtailed, and eventually eliminated. (Individual, No Address - #A8932.65110)

Funding

1100. Public Concern: The Forest Service should sell unneeded grazing land.

TO PEOPLE WHO HOLD LEASES

Grazing land that is not needed should be sold to lease holders. So should forests if there are buyers. (Individual, Union City, MI - #A6855.30100)

Allow Grazing

1101. Public Concern: The Forest Service should allow grazing in roadless areas.

I would urge the Forest Service to keep under review the 58.5 million acres of roadless areas. My urging comes with a keen interest that current use of those roadless areas by ranching interests be considered a part of future use of roadless lands in National Forests. (Individual, Saint Ignatius, MT - #A7484.10110)

TO PREVENT FUELS FROM ACCUMULATING

Private properties and communities could benefit greatly by more grazing on forest grounds to keep fuels from building too heavily. (Individual, Ruby Valley, NV - #A15251.35000)

BY INCLUDING SPECIFIC STATEMENTS TO THAT EFFECT IN THE ROADLESS AREA CONSERVATION RULE

We note that in the Wilderness Acts, Congress specifically addressed grazing usage within the wilderness in order to clearly state that grazing was a permissible use within these areas. It stated that grazing was a permissible use within these areas. To avoid any confusion that grazing is a priority use within the roadless and unroaded areas, we suggest that similar statements be included in the proposed rule. (Elected Official, Roseburg, OR - #A11811.65110)

We note that in the Wilderness Acts, Congress specifically addressed grazing usage within the wilderness in order to clearly state that grazing was a permissible use within these areas. To avoid any confusion that grazing is a priority use within the roadless and unroaded areas, we suggest that similar statements be included in the proposed rules. (County Attorney, Grant County, OR - #A17667.90610)

IN NORTH DAKOTA

The Final EIS indicates in the response to comments volume (Volume 3), that local managers will have the option to disallow grazing and other uses in inventoried roadless and unroaded areas if deemed necessary to protect their roadless characteristics. Based on this, it is erroneous to assume that grazing will not be affected by the roadless designation.

This plan does not recognize the fact that North Dakota's National Grasslands consist of intermingled private, state and federal land. Seriously curtailing grazing on the federal portion of this system will put more pressure on the private lands. The result will be a negative impact on an ecosystem we have worked on improving for 70 years. (Elected Official, Watford City, ND - #A27737.65100)

1102. Public Concern: The Forest Service should protect access to livestock and range facilities.

We need **ACCESS TO LIVESTOCK AND RANGE FACILITIES**. Ranchers need roads and trails to move camps, to mend fences on grazing permits, to deliver salt and water to animals, and to get trailers in to sick or injured stock. (Individual, West Point, UT - #A5415.90610)

Fencing around the units in the Manti Canyon is very critical. Fences keep the cattle in the units that they are allowed to graze in. Without fences, the cattle would be scattered all over the mountainside. The different fences surrounding the units consist of electric, barbed wire and log. With harsh winters and other elements, the fences need to be fixed every year before and during the grazing period. Roads are critical for access to get to the fence lines. It would be impossible to carry all the equipment, fencing

tools and other supplies by horse or foot. The use of vehicles and ATVs reduces the hours spent on fixing the fences and it also makes the work easier. Along with fencing, proper nutrition is needed for the cattle.

Salt is needed for proper healthy nutrition for the cattle. The salt also gives the cattle bloat protection. Salt is only able to be packed by horses when the amounts are small and it's a short distance to travel. Because the salt bags weigh 50 to 100 pounds each it is more economical and [less] time consuming to haul salt with a motorized vehicle. We wouldn't be able to provide the proper nutrition to those animals very economically with the roads closed. The salt licks are also used by the deer, elk, and even smaller animals. They are provided good nutrition from the salt licks. (Individual, Manti, UT - #A20336.90100)

Do Not Allow/Restrict Grazing

1103. Public Concern: The Forest Service should regulate grazing in roadless areas.

Grazing. I feel at times needs to be more regulated than it is, because I have seen areas of the forest which I felt were terribly overgrazed, even in wetter years. (Individual, Powell, WY - #A19223.65110)

IN RIPARIAN AREAS AND RECREATIONAL CAMPSITES

Cattle should not have any access to riparian zones, and, should be excluded from using recreational campsites. Preferably, all foraging in roadless areas would be reserved for only wildlife and big game species. (Individual, Geneva, NE - #A15512.90110)

1104. Public Concern: The Forest Service should not allow grazing on National Forest System lands.

Grazing should be banned. (Individual, Chico, CA - #A1040.90000)

BECAUSE OF ENVIRONMENTAL DAMAGE

Keep cattle out of the areas in the Western states, because they are nothing but hooved locusts. They eat all of the best forage and leave very little nutritious forage for wildlife, plus they destroy the streams. (Individual, Ogden, UT - #A1166.90000)

I am opposed to allowing livestock to graze on national forest or other federally owned lands. The programs degrade the environment and do not generate enough money to pay for them. (Individual, Waco, TX - #A3956.90620)

1105. Public Concern: The Forest Service should restrict off-road vehicle use by ranchers on National Forest System lands.

FOR THE PURPOSE OF MONITORING LIVESTOCK

What about the cattleman? Most of them nowadays ride ATVs to keep track of their cows to monitor where the cows are. Will they be forced to ride ATVs in the woods? Like most dirt bikes have torn up our trails that are slowly being closed to the public? (Individual, Forest Ranch, CA - #A5944.65140)

Utility Corridors

Summary

General Comments – One individual requests that the Forest Service consult with the Federal Energy Regulatory Commission and the Federal Communications Commission regarding the effects of the proposed regulation on public utilities that have rights-of-way (ROWs) which cross the National Forest System, or which may need to cross the NFS in the future. This person believes these corridors should be counted as existing roads.

Utilities – Those who assert that utility development should be allowed to continue write primarily about the need to maintain access to utilities. One individual believes that the Forest Service should allow power line construction in roadless areas. Several utility groups assert specifically that the Forest Service should allow them to have continued access to their facilities. To that end, individuals and city agencies ask the Forest Service to maintain existing roads in order to allow local governments access to their water systems.

Other respondents request that the Forest Service restrict or prohibit utility development in roadless areas. They suggest that the Agency prohibit power-lines and pipelines, wireless telecommunications facilities, and hydroelectric facilities; prohibit maintenance of existing dams; prohibit water extraction; and limit water withdrawal that threatens to lower the water table.

Utilities General

1106. Public Concern: The Forest Service should consult with the Federal Energy Regulatory Commission and the Federal Communications Commission regarding the effects of proposed regulation on public utilities.

TO ENSURE ACKNOWLEDGEMENT OF EXISTING RIGHTS-OF-WAY

The Federal Energy Regulatory Commission (FERC), and the Federal Communications Commission (FCC), must be consulted regarding the effect of the proposed regulation on Public Utilities that have rights-of-way (ROWs) which cross the National Forest System, or which may need to cross the NFS in the future.

All utility rights-of-way, and proposed rights-of-way, must be acknowledged to be existing roads. These ROWs are vital to rural economies. The USDA has a mandate to improve rural economies, and this mandate applies to the USDA Forest Service as well. (Individual, Anchorage, AK - #A11831.91710)

Allow Utilities

1107. Public Concern: The Forest Service should allow power line construction in roadless areas.

I don't think an occasional power line or other man made structure decreases my outdoor experience. (Individual, Palmer Lake, CO - #A23361.90100)

1108. Public Concern: The Forest Service should allow access to power lines and hydroelectric facilities.

THROUGH THE CONSTRUCTION OF TEMPORARY ROADS

Roadless area rules must allow for access to facilities within the forest that may not presently have defined roads, but for which periodic repair work may require the temporary establishment of an access road. For example, SCE owns numerous power lines that traverse forest lands and many hydroelectric facilities are located on forest property. These facilities may not require permanent roads. However, occasional access may necessitate the creation of a temporary road or pathway. (Organization, Rosemead, CA - #A22624.91110)

FACILITIES CONTROLLED BY THE TENNESSEE VALLEY AUTHORITY

The Tennessee Valley Authority has a significant number of electric transmission lines already erected on Forest Service lands in a number of National Forests in seven states that TVA serves. In order to maintain the easements, perform emergency repair and routine maintenance TVA needs to be able to

utilize existing access roads or as some roads are reclaimed by the Forest Service, extend limited lengths of new roads through the edge of some areas being considered for "Roadless Area" designation.

It would be in the Forest Service's local management interest and TVA's interest to be able to work together to meet the objectives and needs at the local forest level, yet preclude general public access and utilization of any road access agreed to by the two agencies. TVA has been working with the local forest managers to close some roads and to a limited extent assist in maintenance of others. In the mountainous, rolling, or wetlands of some of the forests there is no other way to maintain access to existing lines and structures. Failure to maintain the structures or lines would result in significant portions of the service area being uncertain of reliable power and jeopardize several interconnections on the national power grid. (Organization, Chattanooga, TN - #A3339.91710)

1109. Public Concern: The Forest Service should maintain existing roads.

TO ALLOW LOCAL GOVERNMENTS ACCESS TO THEIR WATER SYSTEMS

Roads are also necessary to repair and maintain city water supplies. (Individual, Fountain Green, UT - #A20620.51000)

In the West, much of our local watershed is in our national forests. It is imperative that roads be maintained, and access be allowed to these vital areas. Our very lives depend on it. (Individual, Manti, UT - #A29868.51000)

If a road were washed out on public lands, local governments would have unnecessary costs and red tape to follow to get a road repaired to access their water system. (Individual, Manti, UT - #A25532.91710)

RAYWOOD FLAT AREA

The Raywood Flat and the Banning Canyon roads in the counties of Riverside and San Bernardino, California, are used to access and service an approximately 14 mile long water conveyance system that provides water to residents of Banning Bench and the City and also provides the hydro power for the Southern California Edison ("SCE") San Gorgonio #1 and #2 hydroelectric project. The system includes two diversion dams, two powerhouses, water tanks, and a long water flume conveyance system. Historical records indicate that the original flume was constructed of wood around 1877 to provide water to the early settlers in the region, and that the current concrete flume was constructed around 1910 to provide water and generate hydroelectric power. The system is referred to by the Federal Energy Regulatory Commission (FERC) as "Project 344," and SCE holds a FERC license to operate it for power generation.

Some 75 years ago, the State of California adjudicated the right of the Banning Heights Mutual Water Company ("BHMWC") and the City to divert and use the water that generates power for Project 344. The adjudicated right to divert water that BHMWC and the City hold to is very significant indeed: approximately 9,500 acre/feet per year from the whitewater River. Banning Bench, a community of some 600 residents served by BHMWC, has been almost entirely dependent on this water supply for nearly a century. Use of this water by the residents of the City (pop. 26,000) goes back at least that far. Moreover, for more than a century, the City, SCE, and BHMWC have used the roads in this area to operate, maintain and repair the flume system.

Designating Raywood Flat Area A and Area B as a Roadless Area, would seriously endanger BHMWC's and the City's water supply by not allowing for the road maintenance and repairs that are periodically needed in order to enable BHMWC, the City, and SCE to have access to Project 344. Including these areas in the Roadless Area designation would only lead to inevitable problems, as the Forest Service will most likely maintain that special permission is thereafter required to repair and maintain the existing roads, and the City will out of necessity, respond by asserting its various rights to this essential right-of-way as were granted by 19th Century Federal Law. The upshot will be costly and potentially cause long delays for essential repairs to the diversion dams and water conveyance system that our community depends on. (Manager, City of Banning, CA - #A20958.51210)

The Raywood Flat Road and Banning Canyon Road are shown on existing Forestry maps to be partially excluded from the proposed Roadless Area, but this is not enough. All of the roads along with the entire water conveyance system need to be excluded from the Roadless Area, starting from the Banning Heights Water Tank at Pine Powerhouse all the way up to the Diversion Dam at the East Fork of the Whitewater River. The best approach is simply not to include in the Roadless Area any of the Sections of land that contain any roads or improvements on them or provide access to portions of the water conveyance system.

Once put in place, it will be hard to work around a Roadless Area or to change that designation. Areas must not be made roadless where existing roads in those areas are regularly used to operate, maintain, and repair a water system that has been relied upon by our community for nearly a century. Ours is a growing city, and the importance of this water source for our community is only going to increase as that growth occurs. (Manager, City of Banning, CA - #A20958.45610)

This letter is sent to you to address the matter of the proposed Roadless designation in the Raywood Flat Area AandB (#61 and #62). The Raywood Flat Rd. and the Banning Canyon Rd. in Riverside and San Bernardino County California, helps service a hydroelectric project with 2 diversion dams, 2 power houses, water tanks, and long water conveyance system which provides water to Banning Heights Mutual Water Co. for the Banning Bench, a small community of approximately 500 residents.

Banning Heights and its predecessors have owned the water rights that serve as the basis for the Federal Energy Regulatory Commission (FERC) project for more than 80 years. The Banning Bench has been primarily dependent on this supply for their water. The hydro project has used the existing forestry roads in this area to maintain the entire system for at least 80 years. (Individual, Banning, CA - #A17655.91610)

1110. Public Concern: The Forest Service should allow motorized vehicles in roadless areas.

TO MAINTAIN WATER SYSTEM STRUCTURES

In other areas of national forests we are aware of many situations where access has been denied to municipalities and irrigation companies to maintain water system structures in wilderness and roadless areas even though water permits and roads were established long ago. These systems cannot be maintained without the use of motorized equipment and road access. (Professional Society, No Address - #A27584.65000)

Do Not Allow/Restrict Utilities

1111. Public Concern: The Forest Service should prohibit power-lines and pipelines in roadless areas.

I guess roads are something that ought to be prohibited if we're going to call an area roadless. I'm not sure how far I'd go beyond that - perhaps I'd include power-lines and pipelines as prohibited—large, linear structures that have a function similar to roads (and often require roads for construction and servicing anyway). (Individual, Jackson, WY - #A10527.90110)

1112. Public Concern: The Forest Service should prohibit the construction of wireless telecommunications facilities.

The following activities should be expressly prohibited in existing roadless areas: logging (except where scientific evidence proves that it is essential to the health of the forest), mineral extraction, construction of power lines, and the construction of wireless telecommunications facilities. (Organization, Washington D.C. - #A22098.90110)

1113. Public Concern: The Forest Service should prohibit hydroelectric facilities in roadless areas.

Activities that should be prohibited include: construction roads, snowmobiles, operating personal watercraft (jet skis) and off-highway vehicles, harvesting timber commercially, mining, exploring for oil and gas, and developing hydroelectric facilities. (Individual, Eureka, MT - #A10594.90110)

1114. Public Concern: The Forest Service should not allow maintenance of existing dams.

There should be overarching federal guidelines that apply to all roadless areas, including . . . no maintenance of existing dams. (Individual, Dutch John, UT - #A25600.13130)

1115. Public Concern: The Forest Service should prohibit water extraction from roadless areas.

Water extraction from roadless areas should be prohibited. Water extraction from aquifers underlying roadless areas should be strictly limited. Use only the natural outflows from roadless areas. (Individual, Durham, NH - #A8746.90110)

1116. Public Concern: The Forest Service should limit water withdrawal that threatens to lower the water table.

. . . limit water withdrawals that threaten to lower the water table (Individual, Cleveland, OH - #A26411.90000)

Other Natural Resource Concerns

Summary

Respondents offer various comments relating to management of natural resources which do not fall under the topics covered in the above sections. A few individuals ask the Forest Service to recognize the possible medicinal values available in forest products, while an agriculture association suggests that the Agency should recognize that the most effective use of grasslands is food production. Others suggest that certain activities be prohibited in roadless areas, including construction of commercial facilities, dumping of waste materials, nuclear testing and waste storage, and eco-terrorism.

1117. Public Concern: The Forest Service should recognize the possible medicinal values available in forest products.

Today, medicine has discovered that some of the best cures come from nature. Where will we be without cures for illnesses if our resources for curing them are gone? (Individual, Columbus, OH - #A4376.65290)

Social and economic values are immensely enhanced by and near such climax forests. . . . Such forests provide an immensely valuable scientific laboratory where discoveries of nature's processes lead to enhancements to civilization such as new medicines. (Individual, Salem, NH - #A8263.70000)

1118. Public Concern: The Forest Service should revise the leasing process.**TO ALLOW MORE EQUITABLE EXPENSE SHARING**

The entire leasing process must be revised to allow more equitable expense sharing between private industry and US citizens. The USFS was not established as a welfare assistance program. (Individual, Kemmerer, WY - #A8383.17130)

1119. Public Concern: The Forest Service should prohibit various activities in roadless areas.

CONSTRUCTION OF COMMERCIAL FACILITIES

The following activities should be completely prohibited in roadless areas: . . . construction of commercial facilities such as lodges, ski resorts, guide stations, hotels, radio and television towers as well as cellular telephone broadcast facilities . . . (Individual, Port Angeles, WA - #A6179.90110)

DUMPING OF WASTE MATERIALS

Dumping of waste other than natural waste should be prohibited. (Individual, Lacey, WA - #A17762.90000)

I think pollution and anti-dumping laws of public lands should be strengthened and enforced. IRAs should above all else be clean. (Individual, Palmer Lake, CO - #A23361.90000)

NUCLEAR TESTING, POWER GENERATION, AND ECO-TERRORISM

Nuclear testing and power generation should not be done in IRAs.

Eco-terrorism should not be tolerated in IRAs. (Individual, Palmer Lake, CO - #A23361.90110)

NUCLEAR WASTE STORAGE

Activities prohibited: Nuclear waste storage. (Individual, No Address - #A28602.90110)

1120. Public Concern: The Forest Service should recognize that the most effective use of grasslands is food production.

As we view this plan, the most effective usage of the grasslands is food production. (Association, Watford City, ND - #A29131.65000)

Recreation General

Summary

General Comments – People offer a number of general comments regarding recreation management. Some respondents assert that the Forest Service should take its responsibility to provide recreation opportunities to the public more seriously. One Permit Holder states that, per the National Forest Management Act, the Agency has a statutory duty to provide outdoor recreation opportunities. Others assert that the Agency’s goal must be to provide the maximum amount of recreational opportunities, as long as they do not cause significant, irreversible harm to the environment. To that end, people urge the Forest Service to devote more attention to recreation planning and, in so doing, to consider various recreational values—such as non-wilderness, semi-primitive, motorized, and non-motorized values, and the value of dispersed recreation.

Some ask the Forest Service to allow management activities designed to reduce fuel loading and wildfire risk because of the impacts of fire on recreational opportunities. Others urge the Agency to forego implementation of the Roadless Area Conservation Rule because, they say, it does not adequately consider recreation, or because it will be overly restrictive toward recreation uses. Likewise, one Organization urges the Forest Service to manage for multiple use in order to promote recreational diversity. Another suggests that the Agency prepare a winter recreation use plan as part of the forest planning process in order to develop a system of land use allocations.

Respondents also comment on recreation management vis-à-vis wilderness management, particularly in relation to dispersed recreation. According to some, the Forest Service should manage roadless areas to reduce recreation pressures on designated wilderness areas—by providing non-motorized recreational opportunities, or by allowing a wider variety of activities, including motorized activities. On a similar note, some advocate opening non-wilderness areas, including roadless areas, to dispersed recreation.

Adequacy of Analysis – A few individuals suggest that the Forest Service should acquire data on the increasing recreational use of National Forest System lands and that it should, likewise, evaluate recreation potential in roadless areas. One individual adds that such evaluations must utilize accurate maps indicating cultural improvements, as well as topographic features on a small drainage-by-drainage basis. A business asks the Agency to evaluate seasonal suitability for various activities, including motorized and non-motorized recreation.

Funding – Some urge the Forest Service to request adequate funding for recreational programs, in particular so that these facilities can be maintained without visitor fees. Others suggest that money allocated for roads or for timber sales be used instead to fund recreational facilities.

Recreation Access – A number of respondents assert that the Forest Service should not restrict recreation access to National Forest System lands. Some say specifically that the Agency should ensure no net loss to public land and public access—that for every acre marked as ‘Closed,’ an equal acre be marked as ‘Open Access.’ Likewise, one Organization urges the Forest Service to ensure equal access among different user groups.

Some suggest that access be allotted according to use demands. For example, several propose allocating land acreage proportionally based on numbers of users for each activity. Others suggest granting proportional access among user groups based on their respective needs for

solitude; this would mean allocating more land area for non-motorized users, suggest some individuals. Finally, one individual requests that the Forest Service take into consideration the available opportunities for activities on other public lands when making allocation decisions.

Other respondents, however, maintain that there is currently sufficient access and that implementation of the Roadless Area Conservation Rule would have no effect on access. These comments appear in the previous section on travel management.

User Conflicts – The topic of user conflicts arises occasionally in comments directed to recreation management. Some respondents suggest that the Forest Service can alleviate the crowding that leads to conflicts by making more land available for recreation. Another individual asserts that crowding can be alleviated by implementing the Roadless Area Conservation Rule. This person remarks that these areas are already over-crowded by so many different users, and would appreciate the prohibition of a few uses, such as motorized vehicles.

Others believe the Forest Service can alleviate conflicts by designating separate areas for competing uses—such as for motorized and non-motorized uses, or for different types of motorized uses. Another individual suggests allowing activities according to the landscape’s ability to tolerate them, and then prioritizing uses according to the percentage of the public that participates in that activity.

Recreation Management General

1121. Public Concern: The Forest Service should take a leadership position in managing National Forest System lands.

BECAUSE IT HAS A STATUTORY DUTY TO PROVIDE OUTDOOR RECREATION OPPORTUNITIES TO THE PUBLIC UNDER THE NATIONAL FOREST MANAGEMENT ACT

The agency needs to take a leadership position in managing the forests. The Forest Service has tremendous expertise in managing natural resources, and it has a duty to apply that expertise. In the past couple years, the agency has explored various roles for itself in forest management, including those of “convenor” or “facilitator.” From the ski industry’s perspective, it is crucial that the Forest Service take a leadership role in decision-making on the management of the forests, whether it be at a planning or site-specific project level. The agency is not merely a participant in the process, it has a statutory duty to provide outdoor recreation opportunities to the public under NFMA [National Forest Management Act], the Multiple-Use Sustained Yield Act, and the National Forest Ski Area Permit Act. We appreciate the difficult position that the agency is in and the fact that the results of its decision-making are not always popular. As we witness a tremendous increase in involvement from other agencies with little or no recreation experience in approval processes, however, the leadership of the Forest Service becomes paramount. (Permit Holder, No Address - #A5285.12120)

1122. Public Concern: The Forest Service should acknowledge that its goal is to provide the maximum amount of recreational opportunities.

AS LONG AS THEY DO NOT CAUSE SIGNIFICANT, IRREVERSIBLE HARM

Make it plain from the start that the goal of the Forest Service is to provide the maximum amount of recreational opportunities as long as they do not cause SIGNIFICANT IRREVERSIBLE HARM. Baseless emotional arguments will not be considered. An example being that it is often stated that deer, elk, and bears shy away from roads and need pristine wilderness to survive. Now we know that this is a baseless argument because too many deer, elk, and bears have ended up in unlucky motorists’ grilles, and the highest concentrations of these animals are not in the pristine wilderness areas, but instead in the bottoms near the roads. (Individual, Kalispell, MT - #A19138.15160)

1123. Public Concern: The Forest Service should consider various recreational values.**NON-WILDERNESS, SEMI-PRIMITIVE, MOTORIZED, AND NON-MOTORIZED**

Non-wilderness, semi-primitive, motorized and non-motorized recreation values must be considered as important from an economic and social standpoint. Semi-primitive both motorized and non-motorized recreation adherents are typically non-communicative and seldom heard from. They do, however, represent a large percentage of forest users, thus should be provided for. (Individual, Manhattan, MT - #A21848.45100)

THE VALUE OF DISPERSED RECREATION

I find value in all of the roadless areas characteristics but what truly sets inventoried roadless areas apart from other specially managed lands is the opportunity for dispersed recreation. For me, this means an opportunity to enjoy the great outdoors with family and friends. Our roadless areas must be managed to preserve and promote dispersed recreation opportunities. (Individual, Lawrenceville, GA - #A6172.45100)

I find value in all of the roadless areas characteristics but what truly sets inventoried roadless areas apart from other specially means an opportunity to enjoy the great outdoors with family and friends. Our roadless areas must be managed to preserve and promote dispersed recreation opportunities. (Individual, Stinson Beach, CA - #A28654.45100)

1124. Public Concern: The Forest Service should devote more attention to recreation planning.**ESPECIALLY IN THE TONGASS NATIONAL FOREST**

I believe that the Forest service needs to devote much more attention to recreation planning, especially in the Tongass. In the future we face a great danger of loving our forests (and associated waters) to death, and losing wilderness. This problem will require difficult policy decisions such as capacity analyses, allocations between private and commercially operated recreation visits, design and location of infrastructure, and prevention of 'theme parks' that diminish and obscure the lessons of naturally functioning ecosystems. (Individual, Sitka, AK - #A15506.90000)

1125. Public Concern: The Forest Service should manage roadless areas for primitive recreation.

We need wilderness as places of solitude in an over-crowded world. Only government can provide this unusual "service" by setting aside a relatively small portion of the public domain for "primitive" recreation. (Individual, Harrison Township, MI - #A8378.25300)

1126. Public Concern: The Forest Service should manage to reduce fuel loading and wildfire risk.**BECAUSE OF ITS DEVASTATING IMPACTS ON RECREATIONAL OPPORTUNITIES**

Allow vegetative management activities that are designed to reduce fuel loading and wildfire intensities. Catastrophic wildfires can have significant environmental consequences as well as devastating effects on recreational opportunities. With this in mind, it is important that the agencies be encouraged and allowed to treat fuels to reduce the risk of wildfire within these designated areas. (Organization, Salt Lake City, UT - #A12009.30500)

1127. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule.**BECAUSE IT DOES NOT ADEQUATELY CONSIDER RECREATION**

Please accept my comments on the roadless initiative as proposed by the Clinton Administration. I object to just about all aspects of the initiative as presented as is currently being considered for implementation. The issue was railroaded through the public comment process, our comments were discouraged, belittled or ignored. The inventory of roadless areas includes many areas that include roads and ORV [Off Road Vehicle] trails, yet are inventoried as "roadless." The whole plan is nothing more than an attempt to lock up more public land. If it truly was an attempt to better manage the public land, serious consideration would have been given to recreation that includes ORVs and mountain bikes. These forms of recreation would have been addressed not just mentioned. (Individual, Everett, WA - #A744.12220)

BECAUSE IT WILL BE OVERLY RESTRICTIVE TOWARD RECREATION USES

I am writing to support the decision the Forest Service's Roadless Area Conservation Rule. The roadless initiative put forth by the Clinton administration is overly restrictive toward recreation uses and doesn't represent the interests of the people who actually go to the National Forests. (Individual, Fort Collins, CO - #A970.10130)

Please STOP the Forest Service's Roadless Area Conservation Rule as published in the Federal Register on January 12, 2001. Allowing the Roadless Area Conservation Rule to stand would cause irreparable harm to the millions of people who depend on our forests for resources and recreation. (Individual, Albuquerque, NM - #A10497.10130)

As an ORV person, I'm 180 [degrees] away from the citizen who wants Forest land totally closed to humans. I think that's unrealistic and unfair.

I think there's enough land to go around for all users, or non-users, to use and enjoy. Whether it's ORV parks (snow mobiles included), hiking trails, whatever, the users (sometimes in organized clubs) are currently responsible for the area's upkeep. Let's keep it that way. (Individual, Asheville, NC - #A15196.10130)

1128. Public Concern: The Forest Service should manage roadless areas to reduce recreation pressures on designated wilderness areas.**BY PROVIDING NON-MOTORIZED RECREATIONAL OPPORTUNITIES**

As a wilderness manager, I know that the designated wilderness areas are being "loved to death." Though the surveys all show that roughly 85 percent of those who come to public lands are seeking peaceful (non-motorized) contact with nature related outdoor recreation experiences, they too often find that the 75 percent of the public land which is not protected as wilderness is invaded by the ugly technological externalities of noise, speed, fumes, roads, dust . . . etc. The small percentage who wish to use public lands for motorized recreation are increasingly dominating the non-wilderness portions of America's public lands, rendering them useless as sanctuaries for the many citizens who desperately need a vacation away from city noises. The result is that far too many citizens must seek peace and solitude in designated wilderness! This should not be! (Individual, Murphys, CA - #A15706.25350)

BY PROVIDING FOR A WIDER VARIETY OF ACTIVITIES, INCLUDING MOTORIZED

Managing roadless units as roadless can be an exciting challenge, providing a tremendous variety of opportunities not available in wilderness. You can harden sites to accommodate uses. You can prescribe fire for hazard reduction or wildlife habitat improvement. You can build trails specifically designated to accommodate a variety of uses, from 4-wheelers to rock climbers. You can provide permanent improvement such as corrals or hitch racks for pack and saddle stock. You can spray herbicides for weed control or insecticides for control of insect outbreaks. Creative management of roadless lands can reduce

recreation pressures on our true wilderness units by providing attractive alternatives. The possibilities are limitless. (Organization, No Address - #A8227.25360)

1129. Public Concern: The Forest Service should manage for multiple use.

TO PROMOTE RECREATIONAL DIVERSITY

Multiple-use management goals are the only goals that will “best meet the needs” of the public and provide for equal program delivery to all citizens including motorized visitors. All of us have a responsibility to accept and promote diversity of recreation on our public lands. Diversity of recreation opportunities can only be accomplished through management for multiple-uses and reasonable coexistence among visitors. (Organization, Helena, MT - #A20619.50200)

1130. Public Concern: The Forest Service should open non-wilderness areas to dispersed recreation.

Some of our public land should be managed as Wilderness, but certainly not all of our roadless areas. Areas not yet designated by Congress, should be open to dispersed recreation, including significant portions for motorized recreation. Roadless area conservation will protect the same characteristics that make these areas special and worthy of Wilderness consideration but it will do so without eliminating access. (Individual, Canyon Lake, TX - #A3666.25220)

INCLUDING ROADLESS AREAS

I find value in all of the roadless areas characteristics but what truly sets inventoried roadless areas apart from other specially managed lands is the opportunity for dispersed recreation. For me, this means an opportunity to enjoy the great outdoors with family and friends. Our roadless areas must be managed to preserve and promote dispersed recreation opportunities. The demand for motorized and other dispersed recreation is growing. At the same time, the supply of roadless lands available for multiple-use activities continues to decline because of special designation and development. Clearly, there is a need for lands managed as roadless to provide dispersed recreation opportunities. (Individual, Victoria, KS - #A2874.91110)

I am pleased that the Roadless Area Conservation Rule recognizes the special values associated with roadless areas for both motorized and non-motorized recreationists. I agree with the Forest Service that dispersed recreation opportunities are among the characteristics of roadless areas and that they should be protected for future generations; and I am opposed to any action that might weaken this protection. (Individual, Canyon Lake, TX - #A3666.91110)

1131. Public Concern: The Forest Service should encourage recreational development of private lands.

TO ENHANCE RECREATION OPPORTUNITIES ON PUBLIC LANDS

They should have a reasonable right to access their lands and they should be able to manage their lands as necessary. In some cases, development of private land may serve to enhance the recreation experiences on the public lands. The agencies should be encouraged to work collaboratively with private landowners in the planning for these designated areas. (Organization, Salt Lake City, UT - #A12009.40000)

1132. Public Concern: The Forest Service should emulate the Ten Lakes Roadless Area management.

The Ten Lakes Roadless Area (designation in S-393) is an example of roadless management to be emulated. Snowmobiling is prevalent with no effect on soil and water. Cross-country skiing is permitted. With hardened trails and minimal shelters it could become a unique use recreation area. (Association, Eureka, MT - #A17718.91110)

1133. Public Concern: The Forest Service should prepare a Winter Recreation Use Plan as part of the forest planning process.**TO DEVELOP A SYSTEM OF LAND USE ALLOCATIONS**

We have a suggestion to help the Forest Service shape the future of managing roadless areas and alleviating some of the tension that is occurring between various winter recreation activists such as snow cat skiing, snowmobiling and backcountry skiing. This is that the Forest Service prepare a Winter Recreation Use Plan as part of the forest planning process. The primary approach for this plan should be a system of land allocation whereby areas are established and managed for each of these uses. That is, separate areas for motorized and non-motorized users, snow cat skiing and snowmobiling etc. The roadless area protection presents an opportunity to do this as some roadless areas have low value for Wilderness designation and could be set aside for these other uses. (Permit Holder, McCall, ID - #A15317.91210)

*Adequacy of Analysis***1134. Public Concern: The Forest Service should acquire data on the increasing recreational use of National Forest System lands.**

The Forest Service must have data on the increasing recreational use of the lands it manages. The demand for recreational lands is virtually exploding. In the Chattahoochee National Forest, cars are parked at trailheads every day of the year. On weekends, it's hard to find a parking space. On the Nantahala River in North Carolina, every pull-out along the river has one or two cars parked in it. Even the western national forests are seeing increased use. I have visited and hiked and fished in several western national forests, and I always see people, even in the most remote areas. These data on recreational use should be used and considered in all Forest Service decision-making processes. (Individual, Conyers, GA - #A13536.90000)

1135. Public Concern: The Forest Service should evaluate recreation potential in roadless areas.**BY USING ACCURATE MAPS**

Recreation potential evaluation must utilize accurate maps indicating cultural improvements as well as topographic features on a small drainage-by-drainage basis. The existing forest planning procedure is quite capable of this necessarily intensive inventory and analysis. (Individual, Evergreen, CO - #A19178.90000)

1136. Public Concern: The Forest Service should provide an evaluation of seasonal suitability for various activities.**INCLUDING MOTORIZED AND NON-MOTORIZED RECREATION**

This list might include: An evaluation of seasonal suitability for various activities, including motorized and non-motorized recreation. (Business, Lewiston, ID - #A7991.90000)

*Funding***1137. Public Concern: The Forest Service should request adequate funding for recreational programs.**

Please ask for funds to adequately support the Forest Service recreation and trail programs. For many years the Forest Service has said they support recreation but they have NOT asked for the appropriated monies to do so. "ON the ground monies" have decreased for the last 3 years, while money for various plans have increased! Please ASK for more money for field level staff and projects. (Individual, Los Altos, CA - #A27264.17100)

IN ORDER TO MAINTAIN RECREATIONAL FACILITIES WITHOUT VISITOR FEES

I also urge your support for increasing the Forest Service recreation budgets, and to maintain our National Forests and campgrounds without visitor fees. (Elected Official, Salem, OR - #A23671.90000)

1138. Public Concern: The Forest Service should use money allocated for roads to fund recreational facilities.

By keeping the current roadless rule, it is also my hope that this will make more funds available nationally to improve hiking trails and to maintain existing roads on forest lands for the motorized public. The lack of funds to maintain the existing infrastructure on public lands has reached a crisis point. In our area, the Forest Service is unable to keep up with the needs of the recreating public. Campgrounds are full, parking lots are inadequate at trailheads, and trails and roads are not being maintained. In my opinion, recreation has become the national agenda for the Forest Service, not building roads that subsidize the logging industry. (Elected Official, Hailey, ID - #A4888.91110)

1139. Public Concern: The Forest Service should use funds from timber sales to build new recreational facilities.

I suggest that timber sales be used to generate the funds to build new campgrounds and new access roads to trailheads or picnic areas.

If more such trailheads were created, it would help disperse the crowds. The forest service needs to be partnering with the lumber industry to expand the recreation opportunities. (Individual, Bozeman, MT - #A59.17130)

Recreation Access

1140. Public Concern: The Forest Service should not restrict recreation access to National Forest System lands.

As the USFS evaluates roadless areas it should consider the public's right to access and recreate on public land . . . if the land is locked up then some jobs will be lost in policing/maintenance/upkeep and new road building, just to name a few. (Individual, Ogden, UT - #A590.90110)

The public should have access to public lands. Access to public lands should be guaranteed. (Individual, No Address - #A931.91110)

There are too few areas where people can camp, hike, fish, hunt, or just get away from other people and enjoy solitude. We need more access to wilderness areas where reservations are not required months in advance, or by permit only. It is getting to the point now where you can achieve the same outdoor experience in your suburban backyard, as you can in the public parks and campgrounds. (Individual, Renton, WA - #A3967.91110)

BY ENSURING NO NET LOSS TO PUBLIC LAND AND PUBLIC ACCESS

I'm seriously opposed to removing millions of areas of land from public use by randomly calling a road a "non-road" and refusing to maintain or clear perfectly good roads and these other bogus political moves.

We need NO NET LOSS to public land. No NET LOSS to access! If anything, there should be an INCREASE in public land and access to provide quality experiences to a growing population. (Individual, Cincinnati, OH - #A4027.90100)

I strongly ask that a full revision of the rule and ask that for every acre marked as 'Closed,' an equal acre be marked as 'Open Access.' (Individual, Healdsburg, CA - #A6217.10120)

1141. Public Concern: The Forest Service should allow access to roadless areas by local citizens.**AS THE ONLY EXCEPTION TO ACCESS RESTRICTIONS**

The ONLY exemption [to restrictions on access to roadless areas] that I believe could be considered would be to provide LIMITED access if local populations were not able to otherwise enjoy their own wilderness areas. This access should strictly forbid any possibility of allowing any vehicles off the access area into the wilderness . . . not just snowmobiles and all wheel terrain vehicles. I do believe citizens in local areas should have the ability to enjoy their wilderness . . . but it MUST remain a wilderness . . . for them and their children's enjoyment, for the health of the environment, and for the life of the animals that live there. (Individual, College Park, MD - #A4380.90100)

1142. Public Concern: The Forest Service should ensure equal access among different user groups.

Management of our National Forest to maximize wild game populations at the expense of other uses does not meet the requirements of multiple-use laws and policies. We support hunting but why is hunting's impact on wildlife acceptable and non-destructive viewing by motorized visitors not acceptable? We are concerned that the areas of the National Forest which were designated for multiple-use management are not being managed for multiple-use. The document should carefully evaluate if the objectives of multiple-use laws and policies are being met by the proposed action. National Forest management decisions must not tend to eliminate access and recreation opportunity for one class of forest visitor and favor access and opportunity for another class of forest visitor. Past travel plan and rulemaking actions have effectively done this. The goal of public land management must be to require sharing of our resources with all users and uses. The document must evaluate the cumulative effects of travel plan and other forest actions on multiple-use and motorized visitors. (Organization, Helena, MT - #A13226.50200)

1143. Public Concern: The Forest Service should allocate land acreage proportionally based on numbers of users for each activity.

We have wilderness areas. We have roadless areas. We have remotely roaded areas. We have moderately roaded areas. We have heavily roaded areas. We have a variety of road types, from paved to native substrate. On top of all this we have a multitude of uses. There should be something out there for everybody. Lets not just manage the entire forest for the majority. Lets manage the majority of the forest for the majority of the people and the minority of the forest for the minority of the people. (Individual, No Address - #A27068.15165)

BALANCED WITH A NEED AND COST/BENEFIT ANALYSIS

The Forest Service must take an inventory of the desired uses and determine the reasonable division of resources needed to meet those uses to a satisfactory degree. Final decisions should be based upon: the level of demand for certain uses, the amount and type of land required for meeting that demand, the relative societal costs and benefits of each type of use, and the ability of other land ownerships to meet the demands within a specific region. (Association, Minneapolis, MN - #A19249.13230)

1144. Public Concern: The Forest Service should grant proportional access among user groups based on need for solitude.**ALLOCATE MORE LAND AREA FOR NON-MOTORIZED USERS**

Generally, solitude and quiet are two of the highest values sought by non-motorized recreationists and those desiring wilderness, primitive, and semi-primitive experiences. On the other hand, solitude and quiet are generally lower on the list of experiences desired by those seeking more developed-type recreation experiences and by motorized users, usually falling below social experiences with his/her companions and thrill-seeking. Therefore, the seekers of wilderness, primitive and semi-primitive recreation experiences require larger, more dispersed areas than do motorized recreationists, even though

the motorized recreationist can cover many times more ground in a day than can his non-motorized counterpart. (Individual, Dillon, MT - #A28767.70320)

Another misconception is the idea that people are being excluded from public lands if they can't drive to their destination. On the Medicine Bow National Forest, there are nearly no areas left which are more than 1/2 mile from a road. I would say that those of us that want quiet, non-motorized access are the ones that have been excluded! (Individual, No Address - #A27082.75800)

1145. Public Concern: The Forest Service should take into consideration the available opportunities for activities on other public lands when making allocation decisions.

Can't we categorize the outdoor activities, for example: Conservation/no human use, hiking, fishing, hunting, ATV, automobile four wheel drive, etc., and set aside ideal locations that suit each specific activity. Each federal forest would need to be analyzed on a state-to-state basis. For example being from Wisconsin there are plenty of state fishing lakes available so none of the federal land would need to be set aside for fishing in Wisconsin. I fail to see why this has to be an all or none situation. Compromise and do what's right for all Americans. (Individual, Burlington, WI - #A14172.15111)

User Conflicts

1146. Public Concern: The Forest Service should designate separate areas for competing uses.

TO MINIMIZE USER CONFLICTS

We have to share, and we have to be smart about our environment. I believe that we also have to be considerate of others who don't take the same approach to enjoying our forests; however, I also believe that the majority should rule when it comes to recreation. Designating areas for specific activities, with areas based on percentage of use, is a good way to keep opposing enthusiasts apart. For example, I'm finding that it keeps snowmobilers and cross-country skiers satisfied for the most part in places like Mt. St. Helens and Newberry Caulderra. Only when the skier ventures onto the snowmobilers' trails, which they are allowed to do, is there a problem. The only way to manage this is on a local level. (Individual, Eagle Creek, OR - #A29956.15160)

If you close all the unofficial routes, and define an area as "roadless" even though it really isn't, you will stir up a hornet's nest. If you work with OHV groups and leave them a place to play, you will be able to save the places that really should be saved with a minimum of conflict. I think there is room for everyone. (Individual, Sandia Park, NM - #A26171.15160)

The citizens of the United States own the Forest and should be able to enjoy them. There could be areas where certain activities could be designated so different groups could utilize the forest without competing with each other.

Designate areas so the competing groups can all have an area to enjoy. (Individual, No Address - #A457.25300)

FOR NON-MOTORIZED AND MOTORIZED USES

First, it is important to say that I am a backpacker AND a motorcyclist. However, on the issue of use of the forest, I must strongly suggest that the two uses (hiking and off-road vehicle use) cannot co-exist. They simply must be separated by significant distances to assure a true outdoor, wilderness experience for the non-motorized. The noise of motors carries many miles in the outdoors. I do not go into the woods to hear what I can hear from an office parking lot or mall alongside a freeway. If the uses are not kept separate, I simply lose my right to enjoy many miles of our national forests. There has long been

the concept that the rights of some end where they encroach on the rights of others. That concept must be applied here.

Please notice that I am not suggesting there cannot be two uses; however, those who suggest co-use plans simply are deaf or riding noisy machines. In many places, the use of 4-8 mile buffer zones (noise can carry that far) may not be practical. In those cases, the whole area must be given up to motorized traffic or that traffic must be banned; there is no other real choice. In areas where there are no roads, we do not need roads; these are the last few, precious gems of our national heritage. Do not give them away to those who pass through so quickly, they don't see more than a freeway rider anywhere in the country. (Individual, Richmond, KY - #A4606.91221)

FOR DIFFERENT MOTORIZED USES

The AMA promotes the development and maintenance of multiple use trails. These trails provide the widest variety of recreational opportunities. However, in some cases it may be prudent to restrict trail/area access to specific types of OHVs. For example, a relatively low powered single track OHV may be less disruptive, and therefore require less route maintenance, than larger more powerful two track vehicles. (Organization, Pickerington, OH - #A3645.90420)

THAT ALLOW MOTORIZED USERS TO VIEW NON-MOTORIZED AREAS

Align non-motorized area boundaries so that they do not encroach or eliminate trails located at the edge of the boundaries. Provide for motorized trails and vista points on the boundaries outside of the non-motorized areas so the motorized visitors can view those areas. (Organization, Helena, MT - #A13226.91110)

BY ADJUSTING ROADLESS AREA BOUNDARY LINES

I find the WI roadless areas to have small 'core' areas due to the fact that 95% of Roadless areas is surrounded by roads and by the fact that most of the roadless areas are very small and even smaller by Western standards. Small adjacent roadless areas divided by town roads is not Wilderness. Selecting a USFS tract of land by road density does not allow up front weighting for other resource characteristics. In Wisconsin, winter snowmobile Trail use on the 1984 RARE II roadless lands is real significant, but is not fairly considered under current USFS Roadless.

Just moving a roadless boundary 1000 ft from a Class A road to the edge of a winter snowmobile trail would offer conflict resolution! Trying to keep a snowmobile trail between Wilderness and Wild Rivers is a challenge that few planners want to solve.

As you know, Snowmobiling lasts about 100 days per year in Northern Wisconsin on all USFS lands. The season is enjoyably repeated year after year by 600 Wisconsin Snowmobile Clubs and other sledders.

Wisconsin does not need a whole lot of 2nd rate Wilderness based upon the current carryover Roadless inventory land selection. (Individual, Thiensville, WI - #A28617.45611)

1147. Public Concern: The Forest Service should not confuse use conflicts with user conflicts.

There is a huge distinction between the "use conflict" addressed in the Nixon and Carter executive orders and the "user conflict" wording in the administrative guidebook. I have Sierra Club documents that encourage "citizens" to actively promote "user conflict" (in quotes, no less) in order to browbeat land managers into closing an area to motorized recreation. That's garbage.

Genuine use conflict occurs when physically-incompatible activities—for example, mining and grazing, or logging and downhill skiing—are simultaneously desired on the same parcel. But skiers having a hissy fit because there's an active timber sale or mining operation within the viewshed is merely a conflict generated because a "user" has a bad attitude. Where is the spirit of multiple use and reasonable compromise for these whiners? It's nonexistent—they don't care if anyone else is happy or angry, so why accommodate them at all? Two way street, dudes. (Individual, Whitefish, MT - #A13242.15161)

1148. Public Concern: The Forest Service should allow activities according to the landscape's ability to tolerate them.

Different landscapes are equipped to handle different activities. I think that all users must be prioritized by the percentage of the American public that participates in that activity. For example, I'm sure more people hiked in the National Parks last year than snowmobiled. If the activity is hindering an ecosystem's ability to manage itself, such as the snowmobiling in Yellowstone is resulting in de facto bison population control, then that activity should be prohibited. Specific activities should not be allowed that disrupt those functions that make an ecosystem function properly. Some systems are perfect only for hiking, where others can tolerate a much wider use of visitor activities like camping, bicycling, and rappelling. But again, if an activity is found to damage the system, it should be prohibited. If that activity ends up being prohibited on all public lands, so be it. We cannot allow our public lands to be damaged by special interest groups. These lands belong to everyone, including generations to come. (Individual, No Address - #A29243.90000)

1149. Public Concern: The Forest Service should alleviate crowding.

BY MAKING MORE LAND AVAILABLE FOR RECREATION

The population of the United States is continuing to increase. This places additional pressures on the public lands available for recreation in local parks, state parks, national parks and the national forests. In many areas public lands are being so over utilized that it is degrading the quality of the recreational experience for visitors and causing those in charge of managing the facilities to consider limiting access. This is not in the best interest of the American public or the recreational lands currently in use. The Forest Service should be playing a key role in assuring that there are sufficient public lands available to the public to ensure that the recreational needs appropriate to the National Forests are met, now and in the future. Limiting the public access to millions of acres of public lands will only place an additional burden on the land that is currently accessible, and potentially deny access to some in the future if access quotas are deemed necessary.

As the demand for public access to public lands continues to increase, which it will continue to do as the U.S. population continues to increase, the Forest Service should plan for increased public use of Forest Service land, and how to best provide for the additional public access necessary to prevent additional damage from over use to the areas already utilized. More people will be coming for recreational opportunities in the national forests. That fact is inevitable. The Forest Service should be planning for that and making the land available to the U.S. citizens who are the true owners of the property. (Individual, Crystal River, FL - #A6257.91110)

As a Westerner, a rancher, and an avid public lands user—I have a concern. All the campgrounds are full, the trails are crowded, hunting season is a 3-Ring Circus. We have an increasing population and yet our recreational opportunities (public land) have not increased (at least not as fast). Used to be you could drive to wild areas for a family picnic. Now all the roads are more used and the land they access is more abused. The only way to get to pristine land is to hike and all the trails are crowded with others trying to find pristine wilderness. The congestion is itself destroying the land's pristine quality.

So two things, I believe, need to be done:

1 Keep Roadless areas—Roadless!

2 Provide more land to a burgeoning population! (Individual, Pritchett, CO - #A15216.10111)

BY IMPLEMENTING THE ROADLESS AREA CONSERVATION RULE

I'm writing to ask you to please keep the Roadless Area Conservation Rule just as it is. We need the Federal protection for the last beautiful, pristine areas of our public lands, and there are so few roadless areas left as it is. Everywhere I go in the mountains I find miles and miles of roads and ATV/motorcycle trails before I can get to quieter trails which don't allow motorized travel. There are now so many people who seek out and visit these places of solitude for good fishing, hunting, spectacular hiking, backpacking and climbing, that already many of these areas seem pretty crowded. (Individual, Bozeman, MT - #A8756.10150)

Motorized Recreation

Summary

General Comments – General comments on motorized recreation focus on the appropriate use of motorized vehicles and the adequacy of signs. According to some individuals, the Forest Service should require local forest managers to determine the appropriate use of motorized vehicles based on science rather than socio-economic factors. Some suggest the Agency implement rules on proper and responsible motorized use. One Organization requests that the Forest Service create a standard signing convention to avoid user confusion regarding seasonal motor vehicle restrictions.

Adequacy of Analysis – Several Organizations ask the Forest Service to more adequately analyze recreation management specifically with respect to motorized recreation. One group requests that the Agency evaluate the type of motorized experiences desired by users, commenting that environmental documentation must evaluate the type and quality of experiences that motorized visitors enjoy and want maintained in the area. Others assert that the Agency has not given adequate attention to the growing demand for motorized recreation opportunities, and so suggest evaluating the available mileage of off-road vehicle trails versus the available mileage of non-motorized trails and cross-country opportunities. Likewise, one individual requests that the Agency address the current level of motorized recreation on classified and unclassified roads within roadless areas in order to assess the costs of closing these areas and concentrating use in other areas.

Education – Some individuals suggest that the Forest Service educate the public about responsible motorized recreation. They believe that education is key to the success of this type of recreation and point out that people have to be educated to drive a car, why not require the same type of program for off road vehicles, snowmobiles, water crafts, etc.

Cumulative Impacts on Motorized Recreationists – Some respondents assert that the Forest Service should address the cumulative impacts of the Roadless Area Conservation Rule and other management proposals on motorized recreationists. According to one organization, it would be fair to analyze all impacts of all recreational activities, nonmotorized and motorized alike and then do a cumulative impact assessment before making decisions on what will be allowed and what won't be allowed. Other respondents suggest that the impacts to be evaluated include the impacts of all past motorized closures and road and trail obliterations; impacts of motorized closures as a result of wildfire; and impacts associated with environmental justice.

Suggestions for alleviating these impacts include developing a management alternative which incorporates all existing motorized roads and trails and restricts motorized travel to those travelways; closing certain areas to prevent user-created trails while allowing use of existing motorized routes; and reclassifying roadways to restricted-width or unrestricted-width motorized trails to provide motorized recreation opportunities, and then removing these roads from the roads inventory.

Motorized Recreation –A number of respondents urge the Forest Service to allow motorized recreation. One Organization suggests that in order to preserve motorized access, the Forest Service should develop a comprehensive inventory of all existing motorized routes. Some suggest the Agency should designate land specifically for motorized and mechanized access in areas where environmental damage will be minimal. Others suggest that the Forest Service

specifically allow motorized vehicles in roadless areas—motorcycles, six- or eight-wheeled vehicles, and battery-operated vehicles for the handicapped. One individual points out that there is a substantial number of citizens who enjoy this type of recreation, and while setting aside wilderness areas is appropriate, the Agency must take into account the number of people that would like to have equal opportunity to enjoy the rest of the national forests. One respondent suggests the Forest Service enhance opportunities for motorized recreation by including “roads and trails systems with loops, destinations such as lakes, mines, scenic overlooks, and interconnections to other forests and regional trails.” Finally, some suggest that the Forest Service should not use disturbance of wildlife as a reason to deny motorized access, since studies have shown that hikers disturb wildlife more than motorized visitors. A few individuals urge the Forest Service to allow airplanes in roadless areas by maintaining primitive backcountry airstrips and airstrips at ranger stations.

Other respondents believe that motorized recreation should be restricted or prohibited, particularly in roadless areas. One individual lists reasons such as air pollution, noise pollution, and environmentally destructive. These respondents assert that this type of recreation ruins the wilderness experience for everyone. People suggest specifically prohibiting two-cycle engines, gasoline, diesel, and alcohol engines, and vehicles that require more than a single track. Respondents say these prohibitions are necessary to eliminate user created trails and to alleviate the vandalism and crime, animal harassment, and increased wildfire danger which, they claim, follow from motorized activity. A few individuals also suggest prohibiting helicopters, airplanes, and powerboats in roadless areas.

Motorized Recreation General

1150. Public Concern: The Forest Service should require local forest managers to determine the appropriate use of motorized vehicles.

BASED ON SCIENCE RATHER THAN SOCIO-ECONOMIC FACTORS

Absolutely no motorized vehicles, I don't care to have local managers decide this and other activities based on “socio-economic” factors, rather on science. (Individual, Missoula, MT - #A4935.91221)

1151. Public Concern: The Forest Service should implement rules on proper and responsible motorized use.

TO ALLOW ACCESS TO PRIVATE AND PUBLIC LANDS

Rules on proper and responsible motorized vehicles on Forest Service lands should be implemented to allow access to private and public properties within inventoried roadless areas. (Individual, Ephraim, UT - #A11576.91211)

1152. Public Concern: The Forest Service should create a standard signing convention.

TO AVOID CONFUSION REGARDING SEASONAL MOTOR VEHICLE RESTRICTIONS

There needs to a standard signing convention that is easier to understand. For example, there are often misunderstandings about seasonal motor vehicle restrictions due to the “No” symbol with the actual closure period shown below in small text that is often not seen or understood. In this case, the road or trail is open except during the period shown below but it is often misinterpreted as closed. (Organization, Helena, MT - #A13226.15163)

Adequacy of Analysis

1153. Public Concern: The Forest Service should evaluate the type of motorized experiences desired by users.

The motorized roads and trails that would be closed under the Roadless Rule are, for the most part, primitive roads and trails that provide the ideal experience sought by motorized visitors. The environmental document must adequately evaluate the type and quality of experiences that motorized visitors enjoy and want maintained in the area. (Organization, Helena, MT - #A13226.91211)

1154. Public Concern: The Forest Service should evaluate the available mileage of off-road vehicle trails versus the available mileage of non-motorized trails and cross-country opportunities.

The document and decision must adequately address the need for motorized access and recreation in the National Forest and adequately allow for mitigation necessary to offset the trend of past closures. The cumulative effect of this trend has created an allocation of recreation opportunities in the National Forest strongly in favor of non-motorized interests. The process must evaluate and identify how many miles of OHV trails are available to motorized recreationists in the National Forest versus the miles of trails and cross-country travel opportunities available to non-motorized visitors. (Organization, Great Falls, MT - #A15315.45500)

Identify and compare the acreage available for use by motorized vs. non-motorized visitors. For example, this comparison should report the area available for motorized visitors as the number of feet of trails times a width of 4 feet divided by 43,560 square feet per acre versus all of the acreage in the national forest available to non-motorized visitors. (Organization, Helena, MT - #A13226.15168)

1155. Public Concern: The Forest Service should address the current level of motorized recreation on classified and unclassified roads within roadless areas.

IN ORDER TO ASSESS THE COSTS OF CLOSING THESE AREAS AND CONCENTRATING USE IN OTHER AREAS

The reevaluation must clearly show the current level of motorized recreation on classified and unclassified roads within the so-called roadless areas. The costs of closing these areas and concentrating use in other areas must be addressed. (Individual, Alturas, CA - #A28581.45500)

1156. Public Concern: The Forest Service should include accurate emissions readings in EISs.

Use fair guidelines in the EIS and require accurate emissions readings to be included in the EIS. (Individual, Lennon, MI - #A5999.15169)

Education

1157. Public Concern: The Forest Service should educate the public.

ABOUT RESPONSIBLE MOTORIZED RECREATION

Education is key to the success of every program. We must communicate to everyone the need for people to stay on roads and trails. How to ride safely. How to respect others and the environment. We give driver's education to all those who wish to drive a car, but we do not mandate any education for four-wheelers, snowmobiles, water crafts or mountain accessible vehicles. Maybe it could be part of the syllabus taught in schools. (Individual, Spring City, UT - #A25950.15163)

Cumulative Impacts on Motorized Recreationists

1158. Public Concern: The Forest Service should evaluate the cumulative impacts to motorized users of reduced motorized access.

Motorized recreationists gave up cross-country travel opportunities as part of the Three-State OHV Record of Decision. This lost opportunity included instances such as retrieval of big game and trail bike riding where cross-country travel was generally acceptable. If the concern over the creation of motorized trails by cross-country travel is environmentally unacceptable, then it should also be applied equally to cross-country hiking and mountain climbing. Cross-country hiking and mountain climbing also create trails that provide visible evidence on the landscape of mankind's existence. For that matter, non-motorized trails and motorized trails are often equal in visual and resource impact. Why are non-motorized trails acceptable and motorized trails not acceptable? This position is commonly used to eliminate motorized recreation opportunities and demonstrates that the impacts of non-motorized recreation opportunities are not evaluated with the same criteria used to justify elimination of motorized recreation opportunities. The document must evaluate the cumulative impact associated with the loss of motorized cross-country travel opportunities. The formulation of alternatives must include new motorized recreation opportunities to mitigate the loss of motorized cross-country recreation opportunities. (Organization, Helena, MT - #A13226.91211)

The loss of motorized recreation and access opportunities due to area closure with motorized travel restricted to designated routes compared to existing conditions must be adequately addressed in the document and factored into the decision. The proposed area closure action without closing of any existing roads and trails is a significant loss of recreation and access opportunities to motorized visitors. The lack of adequate consideration of area closure impacts on motorized visitors in the project area combined with the same lack of analysis in all travel plan documents has produced a significant cumulative impact that must be adequately evaluated and corrective measures must be implemented. (Organization, Helena, MT - #A13226.10141)

The environmental document must consider the following visitor profiles in addition to OHV enthusiasts as motorized visitors who use primitive roads and trails in the forest. People out for weekend drives, sightseers, picnickers, campers, hunters, fishermen, snowmobile enthusiasts, woodcutters, wildlife viewing, berry and mushroom pickers, equestrians, mountain bikers, and physically challenged visitors who must use wheeled vehicles to visit our public lands. The cumulative impact of all statewide-motorized closures on all of these visitors must be included in the environmental document. A statewide analysis is required because cumulative effects are forcing motorized visitors to travel farther and farther to fewer and fewer places to find motorized access and recreation opportunities. (Organization, Helena, MT - #A13226.70100)

IN CONJUNCTION WITH OTHER MANAGEMENT PROPOSALS

The environmental document must evaluate how all of the policy proposals over the past year have overwhelmed the public. There is no way that the public could have evaluated and commented on each proposed action. The cumulative impact of an overwhelming number of proposals is decision-making that does not provide for the needs of the public. These proposals include ICBEMP (inter-agency), 3-States (Montana, North and South Dakota) OHV Strategy, National BLM OHV Strategy, USFS Roadless, USFS Roads Policy, USFS Strategic Plan, North Belts Travel Plan, Clancy-Unionville Travel Plan, Whitetail/Pipestone Travel Plan, North Divide Travel Plan, South Divide Travel Plan, Blackfoot Travel Plan, South Belts Travel Plan, Lewis and Clark National Forest Travel Plan update, Montana State Trail Plan PEIS, Montana State Trail Grant Program PEIS, Grizzly Bear Recovery Plan, Post-fire Weed Mitigation EIS, Fire Salvage EIS, and other local travel plan actions in each National Forest. Motorized visitors have had to devote the majority of their available energy and time addressing local and national level travel plan actions. The combination of all of these actions has created a cumulative effect on motorized visitors by consuming their time, money, and quality of life. Very few motorized recreationists are paid to be involved in the protection of their interests. Additionally, this cumulative effect has led to the loss of opportunity for motorized recreationists to further the awareness and

education of all motorized visitors in areas such as proper riding ethics, safety, and environmental protection. This cumulative effect has also reduced the opportunity for motorized recreationists to improve and maintain existing motorized opportunities. This includes reduced maintenance of trailheads and trails and reduced ability to undertake mitigation projects to protect the environment and public safety. All of these cumulative effects must be addressed in the document and decision. (Organization, Helena, MT - #A13226.16000)

INCLUDE THE IMPACTS OF ALL PAST MOTORIZED CLOSURES AND ROAD AND TRAIL OBLITERATIONS

Timber sales have included many motorized closures as associated actions. Many timber sales with motorized closures were done without adequately addressing the impact on motorized visitors. Many of these motorized closures were done as a concession to those opposed to the timber sales and without input from motorized recreationists. Many of the closures and obliterations included historic travel ways used for exploration, mining, and travel in the early days. The environmental document must evaluate all past motorized closures and road and trail obliterations done as part of timber sales and the cumulative impact of those closures on motorized access and recreation. Furthermore, closures from past timber sales should be mitigated by connecting old and new travel ways to create a looped motorized trail system. (Organization, Helena, MT - #A13226.65200)

INCLUDE IMPACTS OF MOTORIZED CLOSURES AS A RESULT OF WILDFIRE

The fires of 2000 have required a significant number of motorized closures and these cumulative impacts have not been considered. All of these cumulative impacts on motorized visitors must be adequately addressed and provided for in the environmental document and decision-making. (Organization, Helena, MT - #A13226.30400)

INCLUDE IMPACTS ASSOCIATED WITH ENVIRONMENTAL JUSTICE

There is no comparable national recreation trail for motorized visitors equivalent to the Continental Divide Trail (CDT), Pacific Crest Trail, National Recreation Trail (NRT) and other national non-motorized trails that travel a long distance and interconnect with other forests. If motorized recreationists had national trails, they would see considerably more use. Non-motorized recreationists have considerably more national trail recreation opportunities than motorized recreationists. The document needs to evaluate the cumulative impacts and environmental justice issues surrounding the lack of national motorized trails on motorized recreationists and then identify and implement measures necessary to mitigate these impacts on motorized recreationists. (Organization, Great Falls, MT - #A15315.15160)

INCLUDE NEGATIVE ECONOMIC IMPACTS

The environmental document must evaluate the social and economic impact to motorized recreationists of not having motorized recreational opportunities in the nearby forests. These impacts include the cost of having to travel farther and farther in search of fewer and fewer motorized recreational opportunities in times of increasing travel costs. A 200-mile roundtrip costs at least \$70 and that cost will continue to increase substantially in the future. The document must evaluate the economic cost of fewer motorized recreation opportunities on motorized recreationists. The document must evaluate the cumulative effect of all management decisions that contribute to these social and economic impacts on motorized recreationists. (Organization, Helena, MT - #A13226.75400)

1159. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule.

BECAUSE IT UNFAIRLY IMPACTS MOTORIZED USERS

The proposed Roadless Rule selected by the Forest Service would eventually close the majority of existing roads and trails to motorized recreation. This preferred alternative forces motorized visitors and recreationists to start with the worst case scenario and then struggle to add routes currently in use back into the process at a late stage using the public comment. This course of action places an enormous burden on motorized visitors just to maintain the status quo. This process is providing preferential treatment for non-motorized visitors who do not have to identify routes and challenge the process to protect their recreation opportunities. We do not understand why the roadless rule process has been

devised to put motorized visitors at a disadvantage. We request that this procedure be evaluated and corrected. (Organization, Helena, MT - #A13226.10130)

BECAUSE ROADLESS STATUS WILL TRUMP EXISTING FOREST DESIGNATIONS

While the DEIS indicated that recreation use will not be adversely affected, we note that since some of the inventoried roadless areas were classified in the land and resource management plan as semi-primitive motorized recreation, and wildlife emphasis, a prohibition on roads and reconstruction would preclude meeting these management objectives. (Elected Official, Roseburg, OR - #A11811.25300)

1160. Public Concern: The Forest Service should develop a management alternative which incorporates all existing motorized roads and trails and restricts motorized travel to those travelways.

TO AVOID CONTRIBUTING TO FURTHER CUMULATIVE IMPACTS ON MOTORIZED RECREATIONISTS

A reasonable rulemaking alternative is needed in order to avoid contributing to the significant cumulative impacts that motorized recreationists have experienced. A reasonable alternative would incorporate all existing motorized roads and trails and restrict motorized travel to those travel ways. The Forest Service must adequately evaluate a reasonable alternative in the environmental document and decision-making. In order to avoid contributing to further cumulative impacts, we request that an alternative based on incorporating all existing motorized roads and trails and restricting motorized travel to those travel ways be included in the evaluation and selected by the decision-makers. (Organization, Helena, MT - #A13226.45400)

1161. Public Concern: The Forest Service should close certain areas to prevent user-created trails while allowing use of existing motorized routes.

BECAUSE THE CUMULATIVE IMPACTS OF THE TRAVEL PLAN AND THE RULEMAKING PROCESS ON MOTORIZED RECREATIONISTS HAVE BEEN SIGNIFICANT

Most of the primitive motorized roads and trails in roadless areas are not new or "user created" travelways. These roads and trails have existed for many years. The public has relied on them for access to the forest for many years and for many purposes. This pattern of use is well established. A reasonable alternative would use area closure to prevent the creation of unwanted trails by visitors and, at the same time, allow the public to use all of the existing motorized routes. Too many decisions have been enacted without the development of this reasonable alternative. The cumulative impact of the travel plan and rulemaking process on motorized access and recreation opportunities has been significant. We request that this reasonable alternative be included in the environmental document as the preferred alternative. (Organization, Helena, MT - #A13226.45514)

1162. Public Concern: The Forest Service should reclassify roadways to restricted-width or unrestricted-width motorized trails.

TO AVOID CONTRIBUTING TO THE CUMULATIVE IMPACTS ON MOTORIZED RECREATION

The environmental document must accurately address the significant negative impacts associated with disturbing existing stable roadways in order to obliterate the existing roadbed. A more viable alternative would be to reclassify the road to either restricted-width or unrestricted-width motorized trail. The preferred alternative should make practical use of this management tool and the benefits that it provides including reduced sedimentation impact, reduced fisheries impact, reduced noxious weed impact, much less construction cost, reduced road inventory, reduced road maintenance and increased opportunities for motorized recreationists. Reclassifying roadways to restricted- or unrestricted-width motorized trail also avoids contributing to cumulative impacts on motorized recreationists. (Organization, Helena, MT - #A13226.45500)

The Forest Service's current management directive is to aggressively decommission non-beneficial or unclassified roads, reduce the existing backlog on road maintenance and reconstruction, and reduce the

resource impacts of the current roads network. The Forest Service in the Roadless Rule EIS reported that the backlog of forest road maintenance was about \$8.4 billion. This estimate includes many primitive roads and trails that motorized recreationists would prefer not to have improved. The challenge of these types of primitive roads and trails is just what most motorized recreationists are looking for. Therefore, this maintenance effort is overstated and a more reasonable alternative would be to incorporate reasonable mitigation measures and convert roads to unrestricted-width or restricted-width trails to provide motorized recreation opportunities and then remove these roads from the roads inventory. (Organization, Helena, MT - #A13226.45500)

Allow Motorized Recreation

1163. Public Concern: The Forest Service should develop a comprehensive inventory of all existing motorized routes.

TO ASSIST IN PRESERVING MOTORIZED ACCESS

A fair process would start with a comprehensive inventory of all existing motorized routes. Then, in order to avoid further cumulative loss and significant impact on motorized access and recreation opportunities, the Roadless Rule process must include a preferred alternative based on preserving all existing motorized routes. Any significant negative impact associated with a specific motorized route would be the basis for an evaluation to close or keep that route open. The cumulative loss of motorized recreation and access opportunities in the national forests has been significant. In order to avoid further cumulative impacts, the closure of an existing motorized route would be offset by the creation of a new motorized route. (Organization, Helena, MT - #A13226.91211)

1164. Public Concern: The Forest Service should designate land for motorized and mechanized access.

I would favor some designation other than wilderness for many of these lands, so as to permit limited motorized or mechanical access where appropriate, on existing trails. Four wheelers should be limited to forest roads. Trail bikes and mountain bikes only, on trails. (Individual, Manhattan, MT - #A671.25360)

WHERE ENVIRONMENTAL DAMAGE WILL BE MINIMAL

I personally feel strongly about public access to national parks/forests employing motorized vehicles. There is an increasing trend for ATVs, off-road vehicles and snowmobiles to wreck the nature of wildness for people and wildlife. I would like to see "quiet" traditional uses upheld such as snowshoing, cross-country skiing, canoeing, hiking, biking etc. Having said this I know that there is a responsibility to provide for these other activities in areas less prone to impacting values. Sort of what happens when a city finally decides upon the location for an airport. In the case of dirt bikers-maybe a dune area inland of a beach where annual storms "clean the slate" (Oregon) or alkali playa, subject to inundation (Nevada), can be designated use areas. (Individual, Craig, AK - #A778.90100)

1165. Public Concern: The Forest Service should allow motorized vehicles in roadless areas.

MOTORCYCLES

While our wilderness areas must be preserved, there must be balanced use for the benefit of all citizens. Motorcyclists are a substantial group within this country and have an equal right to use public lands as hikers, boaters, etc. (Individual, Darien, CT - #A595.91221)

SIX OR EIGHT WHEELED VEHICLES

Also permit ATV 6 or 8 wheelers allowed, NO 4 WHEELED. (Individual, Strongsville, OH - #A11136.91221)

BATTERY-OPERATED VEHICLES FOR THE HANDICAPPED

No motorized vehicles allowed, except for battery operated ones for the handicapped. (Individual, Coeur d'Alene, ID - #A4798.91221)

TO ACCESS AND MAINTAIN GRAZING AREAS

Roadless area protection should not be carried out in a manner as would require any cutbacks in domestic livestock grazing, or the curtailment of the use of any motorized equipment which has been traditionally used in the area to access or maintain grazing improvements or supervise livestock operations. For example, if a rancher needs to use ATVs for access, that should be permitted, as the economics of ranching operations in today's world may not always make horse or foot access practical. (Individual, Vail, CO - #A5371.90100)

TO CARRY OUT BIG GAME FOR PROCESSING

Allow only ATVs to bring big game, such as deer, to be processed. (Individual, Erie, PA - #A7326.91211)

DEPENDING ON THE TERRAIN IN THE AREA

The type of vehicle most suited to the terrain must be considered. Steep side hills should be accessed only by single-track vehicles (motorcycles and scooters) whereas more gentle areas may accommodate 3 and 4-wheeled ATVs. ATVs must not be allowed on single-track trails. The upcoming OHV Plan should be utilized to help address this issue and guide the overall Forest Plan. (Individual, Evergreen, CO - #A19178.91211)

AS REQUIRED BY THE NATIONAL ENVIRONMENTAL POLICY ACT

The significant closing of motorized routes in the project area does not meet the basic requirement of the NEPA act of 1969 as stated in "Sec. 101 (b) (5) achieve a balance between population and resource use which will permit high standards of living and a wide sharing of life's amenities." A wide sharing of life's amenities must include recognizing and meeting the need for motorized access and recreation opportunities in the project area. We do not understand why this area and many others in the National Forest cannot be shared with all forest visitors. We meet so few hikers on the roads and trails that we use and we just don't understand the problem. Is it reasonable to excessively accommodate forest visitors that are not moderately tolerant and sharing? The evaluation in the environmental document, the decision-making and the current allocation of motorized versus non-motorized recreation and access opportunities in the National Forest must provide for an equal and wide sharing of life's amenities with motorized visitors. (Organization, Helena, MT - #A13226.20203)

1166. Public Concern: The Forest Service should enhance opportunities for motorized recreation.

The second principle of rulemaking actions should be to enhance the level of opportunities for motorized visitors in order to be responsive to the needs of the public. Enhancement could include roads and trails systems with loops, destinations such as lakes, mines, scenic overlooks, and inter-connections to other forests and regional trails. The document must develop alternatives that enhance opportunities for motorized recreationists and the decision-making must enact them. (Organization, Helena, MT - #A13226.91211)

1167. Public Concern: The Forest Service should revise Management Areas 11 and 12 to allow motorized recreation.

Please change the Forest Service's MAs 11 and 12 to allow motorized recreation to continue. (Individual, Superior, MT - #A6008.91211)

1168. Public Concern: The Forest Service should not use disturbance of wildlife as a reason to deny motorized access.**BECAUSE STUDIES HAVE SHOWN THAT HIKERS DISTURB WILDLIFE MORE THAN MOTORIZED VISITORS**

A study of National Park elk habituated to human activity and not hunted were still more sensitive to persons afoot than vehicles (Shultz, R.D. and James A. Bailey "Responses of National Park Elk to Human Activity", Journal of Wildlife Management, v42, 1975). Therefore, hikers disturb elk more than motor vehicles and "disturbance of wildlife" must not be used as a reason to justify motorized recreation and access closures. Additionally, when there are concerns with wildlife disturbance, restrictions on hikers should be given a greater emphasis than restrictions on motorized visitors. A study of the heart rate of elk found that humans walking between 20 to 300 meters from the elk caused them to flee immediately 41% of the time while an OHV passing within 15 to 400 meters of the elk caused them to flee 8% of the time (Ward, Lorin A., Jerry J. Cupal, "Telemetered Heart Rate of Three Elk as Affected by Activity and Human Disturbance" Planning for Trailbike Recreation, U.S. Department of the Interior Heritage Conservation and Recreation Service, 1976). Therefore, hikers disturb elk more than motor vehicles and "disturbance of wildlife" must not be used as a reason to justify motorized recreation and access closures. Additionally, when there are concerns with wildlife disturbance, restrictions on hikers should be given a greater emphasis than restrictions on motorized visitors. (Organization, Helena, MT - #A13226.53300)

A study of mule deer found that 80% fled in reaction to encounters with persons afoot while only 24% fled due to encounters with snowmobiles (David J. Freddy, Whitcomb M. Bronaugh, Martin C. Fowler, "Responses of Mule Deer to Persons Afoot and Snowmobiles", Wildlife Society Bulletin, 1986). Therefore, hikers disturb elk more than motor vehicles and "disturbance of wildlife" must not be used as a reason to justify motorized recreation and access closures. Additionally, when there are concerns with wildlife disturbance, restrictions on hikers should be given a greater emphasis than restrictions on motorized visitors. (Organization, Helena, MT - #A13226.53300)

1169. Public Concern: The Forest Service should allow airplanes in roadless areas.**THOSE THAT CAN LAND ON WATER**

All motor vehicles should be prohibited except airplanes that can land on lakes. (Individual, Prescott, AZ - #A21064.90110)

BY MAINTAINING PRIMITIVE BACKCOUNTRY AIRSTRIPS

I strongly endorse retaining roadless area access via existing and historical primitive backcountry airstrips.

The small aircraft capable of operating from these strips have minimal to no adverse effect upon the areas. In addition, the aficionados of "bush flying" that use the strips typically perform all the requisite minimal, low-impact maintenance required to keep the strips useable by light aircraft, and absorb related costs themselves.

In addition to offering recreational access for hiking, camping, and fishing (while reducing land vehicle impact) these strips can, on occasion, be useful for medi-vac and fire fighting purposes, and can possibly serve as emergency landing fields for aircraft traversing the area. (Individual, Longmont, CO - #A27112.90100)

BY MAINTAINING AIRSTRIPS AT RANGER STATIONS

Existing airstrips at ranger stations (Bob Marshal Wilderness) should be maintained and emergency evacuation by helicopter should be permitted. Float-planes should be limited to emergency and occasional access for rangers. (Individual, Missoula, MT - #A30559.90000)

1170. Public Concern: The Forest Service should allow competitive motorized events in roadless areas.

Competitive, motorized group events should be expressly allowed. (Individual, Greeley, CO - #A28995.91210)

Do Not Allow/Restrict Motorized Recreation

1171. Public Concern: The Forest Service should prohibit motorized vehicles in roadless areas.

Specific activities that should be expressly prohibited in roadless areas would include operating motorized vehicles, especially snowmobiles and dirt bikes, and ATVs. These machines are extremely polluting, destructive to the ecology of the area, and drive away animals, as well as destroying the wilderness experience for non-motorized users for miles in every direction. (Individual, No Address - #A470.91221)

I am writing to express my opinion concerning roadless area conservation, in particular the use of off-road recreational vehicles. I feel the U.S. Forest service has an obligation to maintain existing roads as well as ensuring access to private property located adjacent to federal lands. I do not however, feel that it is the U.S. Forest Service's obligation to maintain and monitor roads for recreational vehicle use. I am a four-wheel enthusiast myself, and realize the impact that my vehicle has to wildlife and terrain. It is my opinion that there should be no use of these vehicles on federal lands for recreational purposes, due to the dangers that overuse can present. I can tell you from experience that it doesn't take long for these vehicles to start eroding the top-soil, the national parks are sanctuaries for the common man. They are a place where we can take our families to show them the wonders of nature, and the great land that is America. I feel that off-road vehicle use would be a distraction to those not in participation. Once again, it is my opinion that the U.S. Forest Service should reject all recreational off-road vehicle use in our national parks and forest areas. (Individual, Houston, TX - #A519.91221)

Roadless areas should be protected from destructive vehicle use. Vehicle use should not be allowed except by Forest Service employees in pursuit of their duties or emergency personnel. Off road vehicles, including the ATV and Snowmobiles are not environmentally friendly and they should not be allowed. Currently there are thousands of miles of ghost roads, illegal roads created by logging trucks, off road vehicles and ATVs, within the boundaries of our National Forests. (Individual, Coulterville, IL - #A114.90000)

All motorized activity should be prohibited in roadless areas—no motorcycles, cars, ATVs, or snowmobiles. (Individual, Bozeman, MT - #A624.91221)

TWO-CYCLE ENGINES

No two-cycle engine vehicles. (Individual, No Address - #A491.91221)

GASOLINE, DIESEL, AND ALCOHOL ENGINES

NO gasoline engines at all for anybody, for any reason. None. Only firefighting equipment may use engines. No one should be allowed to use a gas, diesel, etc. engine for ANY reason otherwise. Simple and effective. Try it, you'll like it. No concrete! No permanent building of any kind, period, except fire towers. No offices. No houses, no yards, no fences, no maintained trail, no footbridges, no shelters that are permanent. (Individual, Jackson, MI - #A7273.90000)

NO gas, diesel, alcohol, etc, engines. (Individual, Jackson, MI - #A7273.90110)

VEHICLES THAT REQUIRE MORE THAN A SINGLE TRACK

All activities that require a road (anything wider than a single track) like ATVs, and four wheeling should be prohibited. (Individual, Woodland Park, CO - #A14027.90110)

ON NEW BUT CLOSED ROADS

The use and availability of open roads to the public should be a local issue with a few guidelines, i.e. Quads (dirt motor bikes and motorcycles), snowmobiles should be prohibited on new, but closed roads. (Individual, Olympia, WA - #A20848.90000)

TO ELIMINATE USER CREATED TRAILS

I believe that the Roadless Area Conservation Rule would be improved by adding firm measures to curb the problems caused by motor vehicles that cut new paths on the terrain when they drive beyond authorized travel ways. This is a rapidly expanding problem in Nevada and Eastern California. (Individual, Carson City, NV - #A11788.91221)

DUE TO INCREASED VANDALISM AND CRIME

The problem we are now coming to grips with is ATVs and snowmobiles in the winter. With those modes of travel it is easier to litter and dispose of unwanted trash, appliances, hazardous waste and not be detected for some time. Summer, spring, fall, and winter present all the challenges one can imagine, wild parties in the Wilderness Areas, poaching, you can even catch disposable diapers and spare tires, even used appliances. Garbage and trash are being tossed in our waterways. (Individual, Morrisville, VT - #A7953.90110)

A final and often overlooked impact is serious crime; virtually all felonies that have occurred on the ANST (Appalachian National Scenic Trail) are within an easy walk of a motorized route. As you know, enforcement is difficult, and the problem is exacerbated where roads cross or are in the vicinity of the trail. (Organization, Harpers Ferry, WV - #A21737.90110)

DUE TO ANIMAL HARRASSMENT

Game animals are being harassed by adolescents on motorbikes and ATVs. We also have a small percentage of adults doing the same. The big problem everywhere is the manpower shortage. I would strongly urge you not to open any more access until such time as we have adequate manpower to police the areas once the door is open. (Individual, Morrisville, VT - #A7953.90110)

DUE TO INCREASED WILDFIRE DANGER

Just the rash of forest fires we are now experiencing should be warning enough. The weather of late has been too extreme. I have driven on the highways we now have and witnessed cigarettes being tossed from moving vehicles, along with cigars. (Individual, Morrisville, VT - #A7953.90110)

1172. Public Concern: The Forest Service should prohibit helicopters and airplanes in roadless areas.

The following activities should be completely prohibited in roadless areas: . . . close overflight by helicopter or airplane guide server. (Individual, Port Angeles, WA - #A6179.90110)

Helicopters should not be permitted to land or to fly below 2,000 AGL over roadless areas. (Individual, West Glacier, MT - #A5946.90110)

1173. Public Concern: The Forest Service should prohibit powerboats in roadless areas.

NOT allowed; Roads, logging, mining, summer homes, resorts, and NO OFF ROAD VEHICLES, SNOWMOBILES, POWER BOATS, LOW FLYING AIRCRAFT, or hunting, except for the enlightened wildlife management. (Individual, San Jose, CA - #A6276.90110)

No outboard motors on lakes, and no motor vehicles on land, snowmobiles, ATVs, motorcycles, etc. (Individual, Caledonia, WI - #A7531.90110)

Other

1174. Public Concern: The Forest Service should seize vehicles that violate regulations in wilderness areas.

Protect only wilderness areas and allow the seizure of vehicles that violate wilderness areas. (Individual, Sparks, NV - #A4805.91211)

1175. Public Concern: The Forest Service should prohibit the development of recreational vehicle parks.

We do not need RV Parks. (Individual, Hobbs, NM - #A11008.90920)

1176. Public Concern: The Forest Service should clarify how roadless area designation would impact backcountry airstrips.

It is unclear how the roadless initiative might impact backcountry airstrips. These airstrips may be located in areas designated as roadless. We support backcountry airstrips as a valuable transportation resource that is of low environmental impact. (State Agency, Sacramento, CA - #A28870.16110)

Motorized Recreation – Off-Road Vehicles

Summary

General Comments – One Organization suggests that the Forest Service should use Executive Order 11909 as a management tool to govern management of off-road vehicles. They believe this is a powerful management tool that the Forest Service can use to maintain resources while providing diverse OHV recreational opportunities.

Funding – According to an Organization, federal and state agencies must evaluate why the OHV gas tax system does not function to serve the needs of OHV recreationists. Then a plan should be developed and implemented that will use OHV gas tax monies to address the needs of OHV recreationists. Another respondent writes that there should be no off-road vehicles in roadless areas, that there should be other places for them to ride.

Off-Road Vehicles – Some respondents assert that the Forest Service should allow off-road vehicle use in roadless areas. According to one individual, user conflicts seem to be the major issue facing all of the recreational uses and hopes that the Roadless Rule will not ban OHV/ORV use in these areas. This person believes there is minimal environmental damage.

Others state that the Forest Service should prohibit off-road vehicles in roadless areas. One respondent concludes, due to the damage caused by off-highway vehicles to soil, vegetation, water quality, wildlife, and solitude, all off road vehicles should be banned from inventoried roadless areas.” A few individuals suggest restricting this activity by requiring off-road vehicle users to have permits. Rather than close the forest roads, offers one respondent, permits should be required areas for such activities as hunting, which would require a training session about respecting the land and the Forest Service would be able the one abusing the system.

Off-Road Vehicles General

1177. Public Concern: The Forest Service should use Executive Order 11909 as a management tool to govern management of off-road vehicles.

TO MAINTAIN RESOURCES WHILE PROVIDING DIVERSE OFF-ROAD VEHICLE RECREATIONAL OPPORTUNITIES

Executive Order 11909, signed by President Jimmy Carter on May 24, 1977, authorizes public land managers to close routes or areas negatively impacted “to the type of off-road vehicle causing such effects, until such time as he (the administrator) determines that such adverse effects have been eliminated and that measures have been implemented to prevent future recurrence.” The Executive Order is a powerful management tool that the Forest Service can use to maintain resources while providing diverse OHV recreational opportunities. (Organization, Pickerington, OH - #A3645.90420)

Funding

1178. Public Concern: The Forest Service should develop a plan to use gas tax money to address the needs of off-highway vehicle recreationists.

Fuel Used for off-road recreation in Montana is estimated at 20,199,323 gallons per year (Report ORNL/TM-1999/100, Federal Highway Administration). The State of Montana allows a refund of \$0.2775 per gallon for off-road fuel use to account for the value of improvements and programs that purchasers of OHV gas do not receive through the federal highway program (<http://www.mdt.state.mt.us/administration/gastaxrefund.html>). Therefore, about \$5,605,312 is paid by off-road recreationists in fuel tax each year and should be available to support OHV recreation. This amount of annual funding would be sufficient to address all OHV mitigation, maintenance and educational projects necessary to protect the environment and meet motorized recreationists’ needs. However, very little of this money is returned to OHV recreation. Therefore, OHV recreationists have a substantial funding mechanism in place in the form of gas tax, yet very little of this tax is returned to OHV projects.

Federal and state agencies must evaluate why the OHV gas tax system does not function to serve the needs of OHV recreationists. Then a plan should be developed and implemented that will use OHV gas tax monies to address the needs of OHV recreationists. The document must evaluate justice issues surrounding the use of OHV gas tax monies for purposes not related to OHV recreation. The document must evaluate the cumulative effects on motorized recreationists of diverting OHV gas tax monies including the impacts associated with the lack of maintenance, the backlog of maintenance, the lack of mitigation projects, the lack of education and management programs, and the resulting loss of OHV opportunities and reduced quality of life for OHV recreationists. (Organization, Helena, MT - #A13226.17110)

1179. Public Concern: The Forest Service should use funds to enforce the exclusion of off-road vehicles from nondesignated areas.

Ban off road vehicles. Make areas for these vehicles. Then use funds to enforce their exclusion from the rest of the forest. (Individual, Ellijay, GA - #A8020.91221)

Allow Off-Road Vehicles

1180. Public Concern: The Forest Service should allow off-road vehicle use in roadless areas.

BECAUSE BOTH USER CONFLICTS AND ENVIRONMENTAL DAMAGE ARE MINIMAL

User conflicts seem to be the major issue facing all of the recreational uses. I hope that the roadless initiative will not ban OHV/ORV use in these areas. I feel that the conflicts are minimal as well as the environmental damage. Local clubs and groups can correct this damage. I feel that the wilderness groups are extreme in their demand that public lands should exclude everyone but backpackers. The philosophy of OHV groups and wilderness groups are mutually exclusive. The myth of a wilderness paradise where man lives in harmony with nature is a strong theme in wilderness groups. Such a state never existed, nature is cruel, hard and we don't do to well on our own in nature. Thanks to technology we do not freeze in the dark with a bacterial infection. I too am conflicted.

On the one hand I want to conserve the natural beauty of our forestlands and on the other I want to enjoy the recreational activities, somehow a balance can be achieved. (Individual, Denver, CO - #A841.91211)

Many activities are viewed as dangerous to the land, yet are not. It seems people believe words over reality. Reality is that OHVs, like trail motorcycles and mountain bikes do little if any damage to the land, yet we like to BELIEVE they do. Again visiting the land in question is the only way to view what is REALLY going on. (Individual, Humboldt, TN - #A464.90000)

ALLOW OFF-ROAD VEHICLES NOT LICENSED FOR THE STREET

Allow use of specific roads for OHVs that are not licensed for the street in order to develop a system that ties OHV trails together. (Organization, Helena, MT - #A13226.91211)

IN CALIFORNIA

I hope and plead that you will keep access the same as it has been in the past. I live in California and hope off-road access will remain available in areas like Pismo Beach and Gorman and be reopened in other available areas while access in areas like Yosemite shall remain by foot and horseback. (Individual, Santa Barbara, CA - #A21204.90100)

Do Not Allow/Restrict Off-Road Vehicles

1181. Public Concern: The Forest Service should restrict off-road vehicle use.

BY REQUIRING OFF-ROAD VEHICLE USERS TO HAVE PERMITS

I love the forests and as an off road biker and 4-wheeler I respect the environment. By taking my kids deep into the forests I am able to teach them a loving respect for nature as well. If the public is denied easy access to the wilderness then less of our next generation will know why we want to protect the forest. Rather than close the forests roads, require permits to access these areas like hunting, which requires a training session on respect for the land and a visible number to identify the unlawful. It is a few who have disrespect who are ruining it for thousands. The forest service needs to do a better job of patrolling areas to keep the big wheeler mud rukklers from tearing up roads and wetlands. (Individual, No Address - #A296.90000)

Any activities which are in keeping with the goals of preservation should be permitted. ORV/OHV use may be compatible in some circumstances, but motorized vehicles should be permitted only where access is specifically granted. (Individual, Denton, TX - #A156.90110)

1182. Public Concern: The Forest Service should prohibit off-road vehicles in inventoried roadless areas.

I believe the existing Roadless Area Conservation Rule (regardless of the legally flawed decision of Judge Lodge's ruling) should be selected and implemented, with one change. I believe that, due to the damage caused by off-highway vehicles to soil, vegetation, water quality, wildlife, and solitude, that they should be banned from ALL inventoried roadless areas. (Individual, Idaho Falls, ID - #A11733.10150)

IN THE SHAWNEE NATIONAL FOREST

No off-road vehicles . . . in Shawnee National Forest. (Individual, Glencoe, IL - #A21487.90110)

Motorized Recreation – Snowmobiles**Summary**

Adequacy of Analysis – One individual suggests the Forest Service could better manage winter motorized recreation by more adequately evaluating the number of user days for snowmobiling.

Snowmobiles – Of those who specifically address snowmobiling, most say the activity should be allowed in roadless areas. One individual remarks that snowmobiling is his passion and is concerned that they are seeing more and more areas closed off to this sport. Several respondents add that they do not cause damage to the soil, create trails and their tracks melt away. They do not see an adverse impact to the environment. Others do not believe that the Forest Service should not allow snowmobiles in roadless areas. These respondents feel that air and noise pollution ruin their backcountry experience.

*Adequacy of Analysis***1183. Public Concern: The Forest Service should reevaluate the number of user days for snowmobiling.****IN WISCONSIN**

Note that both US Forests in Wisconsin are in the snow-belt and have had 60+ to 100 days of excellent snow trail conditions over the past 30 years. The Southern end of Wisconsin has few snow-trail user days. I do feel that the US Forest Service in Wisconsin does a marginal job at counting/measuring user days for snowmobiling family recreation. Snowmobilers want to keep the trails that exist today, however USFS documentation on winter snowmobiling use is weak and misleading.

I have personally ridden all the Wisconsin winter snowmobile trails in Jan and Feb 2001 that are currently within the USFS roadless inventoried lands. These trails tend to connect smaller communities via remote forest winter trails that have considerable use, especially on three-day weekends. (Individual, Thiensville, WI - #A28617.91213)

*Allow Snowmobiles***1184. Public Concern: The Forest Service should allow snowmobiles in roadless areas.**

Change MAs 11 and 12 to allow snowmobiling to continue in areas where it already is. Snowmobiles should not be kicked out of an area just because it is considered a roadless area. Motorized recreation should continue in these areas. (Individual, Superior, MT - #A3723.91211)

As a SNOWMOBILE rider, I do resent the fact that those “spandex lovers” are working very hard to make snowmobiles extinct. We spend \$9.4 billion every year for our sport . . . cross country skiers are CHEAP . . . I have actually been asked to give them HOT WATER so they can make tea while they sit in the cafe and drink it without buying even a doughnut! Snowmobiles have the LEAST IMPACT ON THE GROUND of all motorized vehicles . . . we watch bobcats and birds and rabbits every time we go out for a ride . . . they don’t even care if we are there! They are too busy doing their own survival thing. (Individual, Mazama, WA - #A757.91213)

I am writing this because my father just informed me that the lawmakers are meeting again to discuss whether or not to make more laws restricting our wilderness area. I am strongly opposed to this. I am 27 years old and have snowmobiled with my father for more than 20 years now. We live in California. Snowmobiling is my passion, it is my escape from the world. My father has always raised me to be kind and responsible with nature, not to be foolish. In the last few years we have seen some of our favorite places to visit be deemed ‘off-limits.’ I don’t understand why We never hurt anything. Our snowmobiles never even touch the soil.

I think that the government has done more than enough to restrict the much sought after nature destinations that people like me deserve to experience. (Individual, Hayward, CA - #A5339.91213)

BECAUSE THEY DO NOT CREATE ROADS AND TRAILS AND THEIR TRACKS MELT AWAY IN THE SPRING

Snowmobiles have been the bugaboo of environmentalists in the Greater Yellowstone region for the past few years, but I believe the controversy is merely a question of management. Roadless areas should be open to a wide array of recreation users - including hikers, mountain bikers, horseback riders, llama outfitters, skiers, and, yes, snowmobilers. Over-the-snow vehicles do not create roads and trails; their tracks melt away in the spring. (Individual, West Yellowstone, MT - #A1045.90100)

IN THE HIAWATHA NATIONAL FOREST

I spend a lot of time in Hiawatha National Forest and I can tell you we are not hurting the environment with the current status.

Hiawatha National Forest is extremely important to my livelihood. My wife and I own a small resort on the edge of the forest. The forest allows people to come to our area 2 months a year for the various recreational activities. Spring, summer, and fall require automobile traffic on the forest roads. Winter time traffic consists of snowmobile traffic. Snowmobiling has allowed Michigan’s Upper Peninsula to become a true winter wonderland. We actually need to open more seasonal roads for groomed snowmobile trails. The safety of snowmobilers rests in developing additional groomed trails. Additional trails do not require additional roads, just grooming more existing forest roads. (Individual, Christmas, MI - #A6694.45611)

Do Not Allow/Restrict Snowmobiles

1185. Public Concern: The Forest Service should not allow snowmobiles in roadless areas.

Last winter I attempted to enjoy a nice winter camping trip in the Snoqualmie-Mt. Baker NF and was treated to an endless procession of snowmobiles. What enabled us to get away from the carbon monoxide and hellish roar of horribly inefficient 2-stroke engines? Skiing far off of the National Forest roads. (Individual, Redwood City, CA - #A1221.91221)

Non-Motorized Recreation

Summary

General Comments – According to some respondents, the Forest Service should acknowledge that there is very little demand for non-motorized recreation opportunities. One Organization states, “The opportunity to provide for the nation’s pedestrian recreation—how much of a need is

there vs. how much of an opportunity already exists; i.e. Designated Wilderness Areas managed by the U.S. Forest Service comprise 18% of the total National Forest System. However, only 4.25% of all forest visitors access Wilderness areas for their recreational pleasures. Based upon agency statistics it would appear as if the need for pedestrian recreation opportunities is low.” A county commissioner adds that, according to recent studies, “road usage is the predominate recreational use, and even wilderness use is limited to those areas close to roads.”

Non-Motorized Recreation – Some individuals state that the Forest Service should allow non-motorized activities in roadless areas. One respondent remarks, “Any non-motorized activity should be allowed in roadless areas, as it is hard to imagine an activity of this sort that would be very harmful.” Another person suggests that the Roadless Area Conservation Rule would discourage hiking, and so should not be implemented.

On the other hand, one individual suggests that jogging be prohibited in roadless areas. Another person writes, “Whereas there are great quantities of public lands currently closed to motorized recreation and these lands are severely under-utilized because of lack of non-motorized recreationists, I hereby propose that there is a freeze imposed on any new classification of non-motorized public lands.”

Non-motorized Recreation General

1186. Public Concern: The Forest Service should acknowledge that the need for non-motorized recreation opportunities is low.

The opportunity to provide for the nation’s pedestrian recreation—how much of a need is there vs. how much of an opportunity already exists; i.e. Designated Wilderness Areas managed by the U.S. Forest Service comprise 18% of the total National Forest System. However, only 4.25% of all forest visitors access Wilderness areas for their recreational pleasures. Based upon agency statistics it would appear as if the need for pedestrian recreation opportunities is low. (Organization, Basalt, CO - #A10621.45100)

NON-MOTORIZED RECREATION DOES NOT DEPEND ON LARGE UNROADED AREAS

It is important that when examining the roadless issue, that the facts be closely analyzed. For example a clear misconception is that roadless demand is increasing, when in fact there is not only no scientific support for this position, but the scientific data available indicates just the opposite.

While the DEIS (3-120) noted that:

“Recreation use data has never been collected specifically for inventoried roadless and other unroaded areas. As a result, estimates of environmental consequences based on use cannot be made with any degree of precision.”

A review of the Forest Service’s own research reveals . . . numerous reports on the recreational use of the roadless areas. Most notable are the recent monitoring reports and studies of unroaded recreation usage that indicate that the recreation use of the unroaded areas is not dependent upon large areas of unroaded lands. Rather, these recent studies indicate that road usage is the predominate recreational use, and even wilderness use is limited to those areas close to roads. (Elected Official, Roseburg, OR - #A11811.45100)

Allow Non-motorized Recreation

1187. Public Concern: The Forest Service should allow non-motorized activities in roadless areas.

Any non-motorized activity should be allowed in roadless areas, as it is hard to imagine an activity of this sort that would be very harmful. Other activities should be examined individually to determine their affect with respect to the goal of the roadless area. (Individual, Tucson, AZ - #A4938.90413)

1188. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule.

BECAUSE IT WILL DISCOURAGE HIKING

This roadless rule will do more harm than good. Many laws like it have been twisted and manipulated therefore working against what it is to protect. I think that this will make hiking more restricted considering there have been people arrested and charged for picking up rocks they were charged with “removing archaeological resources” from Lake Oroville CA. This case was dismissed but many are not. The roadless rule will inevitably make hiking a thing of the past along with other activities that the every day person enjoys. I don’t like the fact that even now I could be arrested for picking up rocks or finding a coin on the ground. I would like to request that the roadless rule not be put in effect. (Individual, No Address - #A7149.10130)

1189. Public Concern: The Forest Service should allow non-motorized, backcountry recreation.

FOR INDIVIDUALS AND GROUPS OF LESS THAN 12 PEOPLE

Activities that should be allowed are non-motorized, backcountry recreation for individuals and small groups (less than 12 people). (Individual, Waterbury, VT - #A15433.90100)

Do Not Allow/Restrict Non-motorized Recreation

1190. Public Concern: The Forest Service should prohibit non-motorized recreation in roadless areas.

JOGGING

No . . . jogging . . . or other activity that could fragment these last stretches of unbroken forests, disturb their inhabitants, or weaken their capacity to support diverse wildlife. (Individual, Olympia, WA - #A16987.90110)

1191. Public Concern: The Forest Service should impose a freeze on any new classification of public land as non-motorized.

BECAUSE LARGE AREAS OF PUBLIC LAND CURRENTLY CLOSED TO MOTORIZED RECREATION ARE SEVERELY UNDERUSED

Whereas, there are great quantities of public lands currently closed to motorized recreation and these lands are severely under-utilized because of lack of non-motorized recreationists, I hereby propose that there is a freeze imposed on any new classification of non-motorized public lands. (Individual, Clancy, MT - #A6721.45500)

Mechanized Recreation

Summary

A number of mountain bikers state that mechanized recreation should be allowed in roadless areas because, they maintain, the sport is growing in popularity does not interfere with pedestrian recreationists. One person who claims not to be a fan of mountain biking acknowledges that “in general they do not require roads, are quieter, and you can’t penetrate a wilderness nearly so far on a bicycle as on a machine, and you can’t haul nearly so much litter with you.” Others, however, assert that mountain biking can damage the environment and so “should be prevented in erosion-prone areas.”

Allow Mechanized Recreation

1192. Public Concern: The Forest Service should allow mountain biking in roadless areas.

Mountain bikes should be allowed in any and all roadless areas. I ride a great deal and seldom see a hiker any great distance from the parking lot. On days when I do trails work I rarely see a hiker but see lots of mountain bikers. (Individual, Crestline, CA - #A123.91210)

I think a special exception should be made for non-motorized travel, specifically MOUNTAIN BIKING, but also including horses and hikers etc. This land is our heritage we should be allowed to have access to it. And what better way than to ride a bike to see it? It is non-polluting and easy on the land. (Individual, No Address - #A850.91210)

I'm an avid mountain biker. I also am a member of an outdoor club. (The Warriors Society), that has hikers as well as mountain bikers included in the membership. The Warriors Society does almost all the trail maintenance in the Trabuco district of the Cleveland national Forest. I am most concerned that "Roadless" is a prelude to excluding mountain bikers from using OUR wild areas. It has been drawn to my attention that Mountain Biking is constantly under fire from all sides. The only people that want it excluded are the ones who have never participated in the sport and therefore see no need for it.

What is going to be an allowable activity in the "roadless areas." If roadless means that two years after passage, the Government or other influence is going to ban Mountain biking I'm very much against "Roadless." Taking the Government's word that they will never turn this into a ban is NOT an option, so you can put me down as against "Roadless." (Individual, Anaheim, CA - #A337.91214)

I am no fan of mountain bikes, but in general they [do not] require roads, are quieter, and you can't penetrate a wilderness nearly so far on a bicycle as on a machine, and you can't haul nearly so much litter with you. (Individual, No Address - #A470.91214)

IN THE CLEVELAND NATIONAL FOREST

I am very much personally concerned with any changes that affect trail access to the Santa Ana Mountains. I am a frequent trail user and ardent environmental conservationist. I served for five years as a Park Ranger Reserve for Orange County, a volunteer position. I am also an avid mountain biker and choose that as my primary means to access the Santa Ana Mountains. Those who mountain bike in this area are among the most responsible trail users, generally doing more to maintain trails and wilderness than to harm it. We tend to be the more experienced and older mountain bikers. (I am 47 years old).

I urge that any changes made to designations in the Cleveland National Forest specifically permit mountain biking on all multi-purpose trails. I would support any efforts made to ban road building or any access of motorized vehicles where they are not currently permitted. (I am also a motorcyclist, but have no desire to expand access beyond what is currently available. (Individual, Trabuco Canyon, CA - #A26030.91214)

Do Not Allow/Restrict Mechanized Recreation

1193. Public Concern: The Forest Service should restrict mountain biking.

IN EROSION-PRONE AREAS

Mountain biking should be prevented in erosion-prone areas. (Individual, Chapel Hill, NC - #A8742.90110)

Local forester input would be very useful on this subject, prohibitions should be established that would best protect depending on the potential risk of damage to a particular area, i.e. no fishing in endangered

species areas, fire bans in dry areas, no bikes in erosion prone areas, etc. (Individual, No Address - #A8998.90000)

Ski Area Development

Summary

General Comments – General comments on ski area development are somewhat varied. One Permit Holder recommends that the Forest Service employ a panel advisory committee to review ski area requests for expansion. Another remarks that “the Forest Service has already decided that ski area operations are consistent with roadless area protection and management,” and suggests that the Agency should use explicit language in its documents to clarify its position. One respondent requests that the Forest Service specifically address ski ways, ski runs, and ski trails and the use of snowcats or other off-highway vehicles in inventoried roadless areas adjacent to ski areas. Some comment on the potential effects of a national roadless rule and request that the Agency not implement any rule that would alter current ski area special use permit rights. Finally, one respondent requests that alpine skiing be allowed in roadless areas adjacent to existing ski areas.

Ski Area Development – A number of respondent who specifically address ski area expansion, assert that it should be allowed. These respondents state that there is a growing demand for outdoor recreation and that ski area operations can be compatible with roadless protection. According to one business, “Resorts that obtain approval should be able to make improvements outside of permitted boundaries if no road construction is needed or if roads already exist in roaded portions of IRAs.” Respondents also list a number of specific areas where they say ski area expansion should be allowed.

Other respondents state that the Forest Service should not allow ski area expansion outside of current ski area permit boundaries. One respondent concludes, “Skiing is not an activity that has increased in number in the past years and I believe the number of resorts now available for this purpose is quite adequate.” Others suggest that the Forest Service should review ski use permits and manage such areas in a more restrictive manner.

Ski Area Development General

1194. Public Concern: The Forest Service should review ski area requests for expansion.

WITH A PANEL ADVISORY COMMITTEE

In order to maintain economic vitality, which in turn fosters good stewardship in the forests, we must not neglect the resorts’ ability to seek additional opportunity. This opportunity could come in many forms—improving facilities in the existing permit area, allowing for the careful expansion into areas adjacent to the existing permit area, as well as reviewing the possibility for additional terrain being added which may bear the IRA roaded construction/maintenance allowed classification. All of these potential uses would require the careful review of the Forest Supervisor as well as the District Ranger to ensure the compatibility with the environmental considerations. Again, I would propose a review that took on a panel advisory committee’s recommendations as further evidence of a complete and thorough review process. (Business, Twin Bridges, CA - #A8808.90810)

1195. Public Concern: The Forest Service should use specific language to clarify its position on ski area operations.

The Forest Service has already decided that ski area operations are consistent with roadless area protection and management. However, this conclusion is founded upon inquiries with knowledgeable agency personnel and a close reading of the final rule, the preamble, and other agency documents. Instead, explicit language is essential to clarify Forest Service intent. (Permit Holder, Avon, CO - #A28852.10120)

1196. Public Concern: The Forest Service should address ski ways, ski runs, and ski trails and the use of snowcats or other off-highway vehicles in inventoried roadless areas adjacent to ski areas.

Forest Service Roadless Area Conservation Final Rule Questions and Answers at 10. The preamble to the Final Rule also stated that timber cutting and removal would be allowed for “authorized activities such as ski runs and utility corridors.” 66 Fed. Reg. 9, p. 3,258. Nor are ski runs, ski trails, and ski ways at four-season resorts considered “roads” under the Final Rules. The Final Rule would narrowly prohibit road construction and reconstruction; it carefully defines “roads” as a “motor vehicle travelway over 50 inches wide, unless designated and managed as a trail.” Final Rule [section] 294.11. Ski runs, ski trails, and ski ways appear to be exempt “trails.” And nothing in the Final Rule was intended to affect the use of snowcats, snowmobiles, or other off-highway vehicles in inventoried roadless areas adjacent to ski areas.

A representative of Vail Resorts spoke by telephone on December 1 and 8, 2000 with [the] Project Director of the Forest Service Roadless Project [who] confirmed that: ski ways, ski runs, and ski trails do not constitute roads under the proposed rules; the construction and use of ski ways, ski runs, and ski trails in inventoried roadless areas would not be affected by the proposed rules; and the proposed rules do not affect the use of snowcats or other off-highway vehicles in inventoried roadless areas adjacent to ski areas. (Permit Holder, Avon, CO - #A28852.45200)

1197. Public Concern: The Forest Service should not implement a national roadless rule that would alter current ski area special use permit rights.

The SUPs held by MMSA are in essence agreements or contracts between MMSA and the Forest Service. The issuance, making, and entering into of SUPs are a product of, and are consistent with, the Forest Plan then in effect (identified herein as the Plan), and the management prescriptions contained therein. This entire process is being circumvented, and the rights vested in special use permittees such as MMSA are being affected and obviated in the event the Roadless Initiative is adopted. (Permit Holder, Mammoth Lakes, CA - #A21901.75320)

1198. Public Concern: The Forest Service should allow alpine skiing in roadless areas adjacent to existing ski areas.

If roadless area designations are to be applied to parcels of land that are adjacent to existing ski areas or permit boundaries, the applicable Forest Plan should not expressly prohibit use of the area for alpine skiing for those parcels. (Permit Holder, Stateline, NV - #A21708.91213)

*Allow Ski Area Development***1199. Public Concern: The Forest Service should permit ski area expansion.**

Please open up more roads, so we can go on scenic drives into the forest. Also, allow some ski areas to expand their skiing terrain. (Individual, Bozeman, MT - #A1511.90100)

It is the ski industry’s view that parcels adjacent to existing developed recreation sites should not be designated “roadless”, as they may have some, but not all, of the characteristics commonly associated with roadless areas. If such adjacent parcels are designated as roadless, forest planning guidance or

directives should clarify that for planning purposes, it should be assumed that ski area operations can be compatible with roadless management. Even the agency's Final Environmental Impact Statement (FEIS) in Roadless Area Conservation, issued in November, 2000, acknowledged that "new ski areas, or expansion of existing ski areas outside existing special permit boundaries, in inventoried roadless areas may not be subject to the prohibitions, it would depend on the type of project and method of construction." FEIS Volume 3, Response to Comments, Page 115. Ski area operations can be compatible with roadless protection and should not be expressly prohibited. (Permit Holder, No Address - #A5285.90810)

The agency should recognize the unique role of ski areas in its decision-making on roadless protection. Resorts need flexibility is particularly necessary in the context of roadless protection and is justified on many levels: (1) we currently accommodate over 30 million skier visits on less than one-tenth of one percent of NFS lands; (2) Recreation visits on the national forests are expected to increase in the future as a result of demographic and population shifts, and as quality of life becomes a high priority for the public. Ski areas experienced a record season in 2000/2001 with over 57.3 million skier visits; (3) In addition to increased quantitative demands for recreation, there is now increased public demand for diversified and year-round recreational activities at ski resorts, as well as new and varied terrain, better and faster circulation, and reliable and consistent snow conditions. Ski areas must have the flexibility to make improvements to address these emerging trends. (4) By necessity, resort improvements must be adjacent to or connected to existing improvements. Ski areas make significant, long-term capital investments on National Forest land, and are locked in place by virtue of these investments. We do not deal in interchangeable commodities that can be obtained elsewhere on the forest. (5) Ski area roads are essential to the completion of ski area improvement and development projects, as there is no practical or economically feasible substitute for road building in the context of ski area development. (6) When we do construct roads in new areas, their impacts are limited as thorough analysis is conducted, mitigation is performed, the roads are short in length, and they are used for limited or temporary purposes such as construction, maintenance or service, access or emergencies. 7) Finally, resorts are uniquely situated in that we help enhance the public's appreciation for the natural environment and the very values that the agency seeks to protect through roadless management. All of these factors should be taken into account in the agency's analysis of the future course of roadless protection. (Permit Holder, No Address - #A5285.90910)

DUE TO GROWING DEMAND FOR OUTDOOR RECREATION

Nationally, ski area operators accommodate more than 30 million forest visits on less than one-tenth of one percent of the total inventory of NFS lands. U.S. ski areas had a record season in 2000/2001 with over 57.3 million skier visits—both public and private lands. Recreation visits on the national forests are expected to grow as a result of demographic and population shifts, and as quality of life continues to be a high priority for the public. Nationally, ski area capacity will need to expand to accommodate the growing demand for outdoor recreation.

It is important to remember that land suitable for the development of alpine ski and snowboard terrain is limited. Topography, slope gradient requirements, solar and wind exposure, avalanche hazard, fish and wildlife habitat requirements, cultural resources, and vehicular access are just a few of the myriad issues that constrain the suitability of lands for ski area development. As a consequence, ski area operators of the Pacific Northwest support the development of appropriately suited terrain that is contiguous to existing ski areas. Relying upon the USFS policy that gives existing SUP holders the opportunity to expand their operations to meet increasing public need—rather than the conversion of raw land for the development of new ski areas—Pacific Northwest ski area operators have invested hundreds of millions of dollars into existing ski area facilities. Operators have done so with the goal of remaining competitive in local and regional ski markets—both in the short- and long-term. (Permit Holder, Hood River, OR - #A13230.90810)

BECAUSE SKI AREA OPERATIONS CAN BE COMPATIBLE WITH ROADLESS PROTECTION

It is the ski industry's view that parcels adjacent to existing developed recreation sites should not be designated "roadless," as they may have some, but not all, of the characteristics commonly associated with roadless areas. If such adjacent parcels are designated as roadless, forest planning guidance or

directives should clarify that for planning purposes, it should be assumed that ski area operations could be compatible with roadless management. Even the agency's Final Environmental Impact Statement (FEIS) on Roadless Area Conservation, issued in November 2000, acknowledged that "new ski areas, or expansions of existing ski areas outside existing special use permit boundaries, in inventoried roadless areas may or may not be subject to the prohibitions; it would depend on the type of project and method of construction." (FEIS Volume 3, Response to Comments, Page 115) Ski area operations can be compatible with roadless protection and should not be expressly prohibited. (Permit Holder, Hood River, OR - #A13230.90810)

The right to enjoy one's own property within a Roadless designation area must be preserved. Going beyond that, even if property is not currently owned by an individual, the access to that land must be made available to the public for their use. The Forest Supervisor and District Ranger must be given the ability to review proposals which may allow public use of areas marked for IRA with potential new road construction. You must incorporate into the Roadless document that if potential use of the land is not outside of acceptable environmental concerns, then the land shall be given the opportunity to further enhance the benefit to the general public. A case in point could be the ability for a resort such as ours to utilize such land to improve the public's interaction with the environment. As is mentioned in the Forest Service FEIS on Roadless Area Conservation, "**New ski areas, or the expansions of existing ski areas outside existing special use permit boundaries, in inventoried roadless area may or may not be subject to the prohibitions; it would depend on the type of project and method of construction.**" In essence, ski area operations can be compatible with roadless protection thus enabling improved access to public land. (Business, Twin Bridges, CA - #A8808.40000)

EXPANSIONS THAT DO NOT REQUIRE ROAD CONSTRUCTION

Another point that needs clarification is the expansion of resorts and recreation facilities outside of special use permit boundaries and into IRAs. While the proposed rule deals with the construction and reconstruction of roads in the IRAs, it leads one to believe that expansion and construction not requiring roads will be prohibited. This should simply not be the case. Resorts that obtain approval should be able to make improvements outside of permitted boundaries if no road construction is needed or if roads already exist in roaded portions of IRAs. The proposed rule should be modified to clearly state that the policy pertains only to road construction or reconstruction and that ski area expansion outside of permit boundaries into IRAs could be authorized if there is no road construction needed. (Business, Mammoth Lakes, CA - #A30296.90810)

1200. Public Concern: The Forest Service should permit ski area expansion in certain areas.

IN THE EASTERN SIERRA

The FEIS states that the opportunities for future developed recreation would decline if the preferred alternative is selected. There is some discussion that additional impacts will occur at existing developed and road dependent recreation facilities, but there is no disclosure as to what the impacts will be, how the Forest Service plans to deal with increased use at existing facilities, what type of expansions of existing facilities will be authorized, and so on. This is of particular interest to DCC, since the FEIS states that no additional expansion of ski areas shall be allowed outside of existing permitted boundaries. In the case of the Eastern Sierra, communities have been developing in anticipation of Forest Plan decisions being enacted. As stated in the FEIS, demand is increasing for dispersed activities, but it is also increasing for developed and road dependent recreation. If there is no opportunity for expansion of facilities, the opportunity to manage developed recreation sites will diminish. The INF planning process took this future-planning element into consideration and provided the flexibility that was needed. (Business, Mammoth Lakes, CA - #A30296.90100)

IN THE GRANITE MOUNTAIN/SLAB BUTTE AREA OF THE PAYETTE NATIONAL FOREST

It has long been our position that a tract of land on the Payette N.F. needs to be recognized as having potential for ski area development. We would like to take this opportunity to again suggest that a portion

of the Granite Mountain/Slab Butte area be recognized in the forest plan for this purpose. Ski area operations can be compatible with roadless protection. (Permit Holder, McCall, ID - #A15317.91210)

PELICAN BUTTE

This is difficult for me to assess. I have mainly become familiar with the issues surrounding Pelican Butte, and in accordance with the vast majority of citizens from this county, I believe that there is likely to be little environmental impact on Pelican Butte or the surrounding areas with the proposed development of Pelican Butte into a ski-destination. (Individual, Klamath Falls, OR - #A6931.50000)

In my opinion, the Jeld-Wen corporation's proposal to develop the most environmentally conscientious ski-destination in the history of skiing in the U.S. on Pelican Butte is NOT a major imposition on the wilderness as it only represents 1/10,000th or 0.01% of the total Clinton "Roadless ban." Furthermore, it has been estimated by some biologists that such a development would actually enhance wildlife in the area of Pelican Butte, particularly elk and deer that rely on open meadows for higher quality food. (Individual, Klamath Falls, OR - #A6931.53200)

In a prospective fashion, the Jeld-Wen Corporation, with whom I do not have any financial interest, has already drawn up a very elaborate plan to develop Pelican Butte into the most environmentally conscientious ski-destination in the country. This has been with the input of wildlife biologists, the Forest Service, local citizens, local Indian tribes, and ski-consultants. This has included proposals for underground passage-ways for animals to cross ski-runs, a high gondola which passes over rather than through old-growth forest, the avoidance of ski runs in old growth forest, minimal snow-making near the base of the hill, withholding from ANY hotel development at the base of the hill, and implementing a small sewage treatment plant specifically for the day lodges on the hill in order to prevent any water contamination issues. The net result is that Jeld-Wen has spent up to \$4,000,000 simply developing an environmental impact statement and proposing a plan for the development of Pelican Butte. While some radical environmentalists may contend that there can be no compromise concerning Pelican Butte, we must remember that the ski-destination proposal only includes 3000 acres that only represents 1/10,000th of the "Roadless ban" area. (Individual, Klamath Falls, OR - #A6931.90810)

SIPAPU

An Executive Order on the Roadless Initiative will:

1. Overturn the Public Law 96-550 enacted by the 96th Congress December 1980.
2. Be contrary to the 1986 Carson National Forest Plan concerning Sipapu Ski area.
3. Negate 15 years of work and expense by the Forest Service and Sipapu in developing an EIS for ski area expansion.
4. Be an environmental injustice by creating economic and social hardships on the poorest countries in northern New Mexico.
5. Circumvent the right for appeal.

Public Law 96-550 enacted by the 96th Congress December 1980.

The purpose of the act is very specific with its main points:

1. Designate certain National Forest lands to be included in the National Wilderness Preservation System.
2. Insure certain uses including but not limited to campground and other recreation site development, timber harvesting, intensive range management, mineral development and watershed and vegetation manipulation.
3. Designate certain other National forest system land in NM for further study in furtherance of the purpose of the Wilderness Act.

The land surrounding the ski area was not included as wilderness lands, not included for further study and was included in other lands promptly available for nonwilderness uses.

The EIS for the Carson National Forest Plan, completed in 1986, is in accordance with Public Law 96-550 and designated management area 15 for ski area expansion. (Permit Holder, Vadito, NM - #A28970.45624)

Do Not Allow/Restrict Ski Area Development

1201. Public Concern: The Forest Service should not allow ski area expansion.

I live in Ogden, Utah, and frequently visit the Wasatch-Cache National Forest, with which I know you are familiar. The Ogden Ranger District contains much developed area (Pineview Reservoir, Snowbasin Ski Area), much undeveloped roaded area (Monte Cristo Plateau), and still a fair amount of inventoried roadless area. I am sad to remind you, however, that the nearest roadless area to central Ogden was recently encroached upon by the expansion of Snowbasin into Strawberry Bowl, an expansion that was fraudulently claimed to be necessary for the 2002 Olympics.

Let me repeat: The most recent encroachment into a roadless area near here was made not for the purpose of fire prevention, . . . and not even for the purpose of resource extraction. It was made for the purpose of commercial profit by one of the wealthiest men in Utah, who is attempting to capture a greater share of the nation's stagnating downhill skiing market. He was supported in this attempt by many local elected leaders, who felt that bringing more tourists to Utah might help the local economy. Obviously these local leaders are unconcerned with the fact that an increase in tourism here might lead to a decrease in tourism somewhere else. Meanwhile, polls showed that Ogden's about half in favor of the Snowbasin resort development and half against.

Now another local ski area, Nordic Valley, is proposing to expand onto 2000 acres of inventoried National Forest roadless area.

It is in situations like this that we need to rise above local interests and take a national perspective. The national interest is not served by ski area expansions that merely try to attract tourists to a particular ski area at the expense of others. Also, ski area expansions on public land come at the expense of the American taxpayer, who pay the salaries of the many Forest Service employees who work full time to monitor ski area activities and try to mitigate their environmental damage. And the environmental damage that does occur exacts a price on us all, as watersheds are polluted and more plant and animal species become endangered throughout the United States. (Individual, Ogden, UT - #A30511.15122)

OUTSIDE OF CURRENT SKI AREA PERMIT BOUNDARIES

The Roadless Policy allows ski areas to expand (many significantly) within ski area permit boundaries - only expansions outside of these areas would be curtailed. With skier numbers essentially stagnant for three decades, it makes little sense to permit further expansions into these undisturbed areas, such as at Beaver Creek, Breckenridge and Vail in Colorado, Mammoth Mountain and Heavenly in California, and Snowbird and Snowbasin ski areas in Utah. (Individual, Alta, WY - #A19643.90820)

BECAUSE THERE IS NO NEED FOR EXPANSION

Skiing is not an activity that has increased in number in the past years and I believe the numbers of resorts now available for this purpose is quite adequate. There is no need for expansion. (Individual, Lake Oswego, OR - #A4615.90820)

1202. Public Concern: The Forest Service should not allow ski area expansion in certain areas.

IN CALIFORNIA

Ski area developments should also be banned from roadless areas, such as Sherwin and Mammoth/June Lakes in my home state of California. These developments also degrade the health and beauty of the environment while using the claim of "meeting recreational demand" to hide the real goal of attracting lucrative real estate investments. New ski area construction or expansion should not be given any special exemptions in your final policy. (Individual, Auburn, CA - #A30708.90820)

1203. Public Concern: The Forest Service should review ski use permits and manage such areas in a more restrictive manner.

I want ski resort use permits to be carefully reviewed and managed in a MORE RESTRICTIVE fashion. (Individual, Salt Lake City, UT - #A4902.90110)

The Forest Service has recently expanded the use permits for the Snowbird Resort to add facilities, roads, ski lifts, and other development on a previously roadless area to the south of their previously existing ski runs. This permit and agreement is in place. However, the Forest Service officials here in the Wasatch National Forest can and should take a MUCH HARDER LINE with this development. No further activity on my public land should be allowed until the local Forest Service Administrators completely review all the existing terms and conditions for compliance. (Individual, Salt Lake City, UT - #A4902.90820)

Hunting and Fishing

Summary

General Comments – Some assert that among the values to be considered during roadless area evaluations, hunting and fishing values should be included. Beyond that, most general comments on this topic address management activities which respondents say will enhance hunting and fishing. Several respondents request that the Forest Service protect roadless areas, both to maintain game species habitat and to prevent hunting behavior problems associated with motorized access. One organization states that, according to a study on the topic, “The use of motor vehicles associated with hunting rose to the top of the bad behavior analysis.” Others assert simply that hunting is better in roadless areas. One individual remarks, “Designated roadless areas and other areas with low densities of roads are often attractive to big game for the security they offer and thus make for the best areas to hunt.”

Some believe that the Forest Service should not decommission existing roads because, they say, roaded access is needed for hunting. One individual adds, “I am an outdoorsman and I use the National Forests a lot. It has become very difficult to hunt in many of our forests as it is. A large animal, such as an Elk, is impossible to get out of the woods on foot in many areas.” Likewise, others urge the Forest Service to allow timber removal for habitat management in order to maintain quality hunting and fishing. Finally, one individual suggests that hunting and fishing licenses ought to be issued by the federal government, rather than individual states, to ensure consistency.

Funding – A few individuals assert that the Forest Service should use the fees collected from hunters and anglers to benefit hunters and anglers. One person remarks, “Please respect the fact that hunters and anglers pay money to manage our wildlife and it should benefit them the most.”

Hunting and Fishing – A number of respondents who address hunting and fishing, say it should be allowed in roadless areas. Several ask the Forest Service to keep the “heritage and traditions” associated with hunting and fishing “alive and well for years to come.” Some suggest these activities should be allowed because people depend on the food they obtain from hunting. One person suggests retaining free access for these activities. Others mention specific types of hunting and fishing they say should be allowed to see continue, including mountain lion hunting, commercial fishing, trapping, and sport shooting.

Other respondents believe that the Forest Service should prohibit hunting in roadless areas. “Hunters kill wildlife,” asserts one individual. “This is not conducive to areas functioning as

biological strongholds and wildlife refuges.” Another says, “Bear baiting should not be allowed anywhere, period.”

Some respondents direct their comments specifically to trapping. One individual states, “I would be in favor of having [roadless areas] remain open for all legal purposes, including hunting, fishing, and trapping.” Others who address trapping assert that it is not well regulated and restrictions are poorly enforced. According to one individual, “It is not uncommon in states with regulations and in states with none, for an animal to be left in a trap for weeks because the trapper does not check the trap.” Others concur that trapping is not effective for wildlife management as “it does not ensure stable, healthy wildlife populations.” Rather, “natural ecological factors such as weather and food supply, as well as wild animals’ innate ability to limit their populations through natural means, are sufficient to create a balance between wildlife populations and their habitats.” Some also suggest that hunting with dogs be prohibited because, they say, the dogs are not adequately kept under control.

A few individuals suggest that the Forest Service regulate hunting, particular hunting that damages predator-prey dynamics. One suggestion is to regulate the number of tags sold. Some also suggest closing off-road vehicle trails to hunters and prohibiting fishing in roadless areas containing endangered species.

Hunting and Fishing General

1204. Public Concern: The Forest Service should consider hunting and fishing values.

Fishing and hunting values and traditions are deeply held in the United States and must be considered in decisions that affect the roadless areas in the forests and grasslands - the nation’s best remaining fish and wildlife habitat. (Individual, No Address - #A4553.54100)

1205. Public Concern: The Forest Service should require that hunting and fishing licenses be issued by the federal government.

I think that hunting and fishing licenses should be federal and not state and the same for everyone, like federal parks. (Individual, Danbury, WI - #A7242.91310)

1206. Public Concern: The Forest Service should protect roadless areas.

FOR GAME SPECIES HABITAT

Roadless areas are crucial to protect habitat security and maintain ample hunting opportunity for elk, deer, bighorn sheep, mountain goats and other game.

Loss of roadless areas would cause Montana’s five-week elk season to collapse, as it did on Idaho’s Targhee National Forest, where elk seasons plummeted from 44 to 5 days after intensive logging and road building.

To sustain Montana’s elk hunting traditions, the state of Montana’s 1992 Montana Elk Management Plan pledges that the state will: “promote maintenance of key unroaded areas that provide important elk security and offer backcountry or roadless recreation.” (Organization, Helena, MT - #A21370.53100)

TO PREVENT HUNTING BEHAVIOR PROBLEMS

Montana is a state that prides itself on its wild nature and the opportunities available for hunting on that wild estate. It is wild land resource that has already been reduced by 88% statewide. Today, we seem perched on the brink of degrading the hunt into some form of drive-by-shooting with the excessive road systems that already exists on public lands and now machines ranging beyond the roads themselves.

In 1998 the Montana Fish, Wildlife and Parks Commission convened a Hunter Behavior Advisory Council to: *identify, define and recommend solutions to hunting behavior problems in Montana*. I served on that council. As part of our work we solicited the public's opinions on hunter behavior. Part of that solicitation encouraged people to address any issue they chose. The use of motor vehicles associated with hunting rose to the top of the bad behavior analysis. When this council developed a list of guiding principles conducive to positive hunting behavior and experiences one was:

"Land and wildlife management agencies have a responsibility to provide hunting environments that encourage ethical behavior."

The council further urged Montana Fish, Wildlife and Parks to:

"Encourage federal land managers to address hunter behavior and fair chase considerations in travel management programs."

It would seem that both of these items would be addressed through the adoption of a rule preventing the loss of our last roadless wild lands. I encourage you to avail yourselves of the recommendations of the report. (Organization, Helena, MT - #A2940.53300)

1207. Public Concern: The Forest Service should address the negative effects of roads on game species.

Hunting as a result of road building is improved for a few years. In the long term, hunting success always decreases as a result of roads. Hunting the fringes of our islands provides a refuge for SE Alaska's abundant game species, such as Sitka black-tailed deer, black and brown bears, mountain goats, and moose. (Individual, Juneau, AK - #A23242.53300)

I have been an avid bow-hunter for 18 years, and have bow-hunted for elk, deer, and bear on National Forests and other public lands in WA, NV, ID, MT, and ND. By and large most of the better hunts occurred in areas that were absent of roads. Designated roadless areas and other areas with low densities of roads are often attractive to big game for the security they offer and thus make for the best areas to hunt. I am all in favor of limiting development of new roads, and even more supportive of closing old 'spur' roads that are no longer needed for timber harvest. (Individual, Stanley, NJ - #A4004.90310)

1208. Public Concern: The Forest Service should not decommission existing roads.

BECAUSE ROADED ACCESS IS NEEDED FOR HUNTING

I am an outdoorsman and I use the National Forests a lot. It has become very difficult to hunt in many of our forests as it is. A large animal, such as an Elk, is impossible to get out of the woods on foot in many areas. I don't believe that all of the little logging roads should be open for travel, but a small percentage would make using the forests much more enjoyable. If more forest roads are closed then this will deter a large percentage of current users from going to the out-of-doors. There are already hundreds of thousands of acres of wilderness areas that have no roads. I don't believe we need any further restrictions on the use of "our land." Not everyone can or wants to hike to see the forest. Not everyone wants to ride a horse, rent a horse, or own a horse. Let's be fair to everyone, even the people who own quads, jet skis and trail bikes. (Individual, No Address - #A724.90320)

There are many people who are not hunters that contribute to the overall planning and success of our use of public lands. The anti-hunter groups want to believe that the worst thing that can happen to the forestland is to let hunters use it. These biased opinions are long in rhetoric and short on truth. It is the hunters who generate the most revenue for the continuation of public lands and natural habitat.

I am not asking you to build new roads into our forestlands. What I am asking is for you to not take anything away that is already there. I'm not even asking you to do any upkeep on the trails and roads that have [been] established by the logging industry. What I am asking you to do is to keep the existing, legal roads open for all to enjoy. If there is a logging road that is not designated "just don't keep it up"

let it go back to its natural habitat. I don't mind walking a little for the pure enjoyment of my hunts or camping trips (Individual, Las Cruces, NM - #A5434.91310)

1209. Public Concern: The Forest Service should allow timber removal for habitat management.

TO MAINTAIN QUALITY HUNTING AND FISHING

Our major concern lies with the decisions that affect the White Mountain National Forest that occupies approximately thirteen percent of the State of New Hampshire. We see an annual a loss of about twenty thousand acres of forest and field to development across the State. As this trend continues there is an ever increasing demand for outdoor recreational activities, including hunting and fishing on our public lands. There is a simultaneous effort on the part of some individuals and groups to reduce the opportunity for quality hunting or related wildlife enjoyment by removing the opportunity to manage vegetation in a way that enhances habitat quality for a majority of the game and non-game species found in New Hampshire and in the White Mountains. Over fifty percent of the White Mountain National Forest, under its current management plan, has been withdrawn from vegetative management. The roadless areas designation process has the potential to significantly increase that percentage as part of the current revision process. It is imperative that the ability to manage habitat through the use of commercial timber sales and through non-commercial applications be retained on these lands if the future needs of the wildlife enthusiasts in New Hampshire are to be met. (State Agency, Concord, NH - #A28779.45612)

Funding

1210. Public Concern: The Forest Service should use the fees collected from hunters and anglers to benefit hunters and anglers.

Please respect the fact that hunters and anglers pay money to manage our wildlife and it should benefit them the most. (Individual, Jefferson, OR - #A7985.91310)

In Michigan the DNR just are not getting things done. License fees go up and still nothing. Where are the hunters and fishermen's' funds going?

It should go to help hunters and fishermen. Not to build walkways for the gen. public, and slush funds, and all the other bull. If it gets worse, I will ask sportsmen to boycott License fees for at least one year or more depending on the outcome of the first year. (Individual, Au Gres, MI - #A11048.17120)

Allow Hunting and Fishing

1211. Public Concern: The Forest Service should allow hunting and fishing.

I implore you, as an avid hunter and fisherman, to keep the heritage and traditions of my enjoyments alive and well for years to come. Being in my early twenties and having many years ahead to look forward to enjoying the outdoor sports I love so much, please allow my tax dollars to not be wasted by hindering access to so many acres of land that my children and myself can someday enjoy. (Individual, Hudsonville, MI - #A3931.91310)

I am in favor of allowing hunting and fishing, within state-mandated legal limits, on all federally owned lands, including national parks. (Individual, Waco, TX - #A3956.91310)

Hunters and shooters need a place to go. Do not close off the forest to hunters and vacationers. (Individual, Pinole, CA - #A4189.91110)

I wish to be counted among the hunters and anglers who believe you should scientifically manage all fish and wildlife habitat in the National Forest System as valuable lands that will remain open to HUNTERS, ANGLERS, and other private citizens. I have the hope someday to bring my son to some of these areas that the monies I spent and helped raise through my efforts with Ducks Unlimited and license fees. (Individual, West Salem, WI - #A4957.91110)

We should keep the roads already in place, manage the wildlife as to what is best for all. Hunters and fishermen should be given first and top consideration in this as our dollars provide most of the funding. We also are the people who use and care for the land, waterways, and wildlife the most. (Individual, Hemet, CA - #A4313.15123)

BY MAINTAINING FREE ACCESS

Keep new roads out of prime habitat. Retain free access to hunting land and small lakes. New roads, NO! Keep our waters clean, our lakes free from polluted practices. New roads bring excessive pressure and "dirty" our clean waters. (Individual, Saint Cloud, MN - #A7468.50000)

IN WILDERNESS AREAS

I think that the holding of wilderness lands in the public trust is an excellent idea, providing that it remains open to hunters and fishermen. It is my opinion that these interests have long provided a significant source of conservation revenue and activities should be given access to engage in the pursuit of their passions. (Individual, No Address - #A12665.91310)

BECAUSE PEOPLE DEPEND ON THE FOOD THEY OBTAIN

As a hunter and fisherman I would like you to know that that's how I put food on the table. I don't do it just for fun or for the sport of it like some people I know. I hunt because it's a lot cheaper than buying meat at the store.

If you close down the public lands, where would I go to hunt for food? A lot of people don't have their own land to hunt on so they have to make do with what they have, and if you take that away you will have a lot more car wrecks because there would be no one to hunt the wildlife to keep the population down.

In my opinion and my friends' opinion it would be just stupid to close public land to hunting and fishing. (Individual, Bethlehem, GA - #A7957.91310)

1212. Public Concern: The Forest Service should allow hunting and fishing.

MOUNTAIN LION HUNTING

Hunters/hunting is the #1 proper tool for control of a species and I feel more hunting of Mountain lions should take place. (Individual, East Granby, CT - #A11510.90000)

COMMERCIAL FISHING

As a community that is directly dependent on a commercial fishing economy, a specific activity that should be allowed is commercial fishing in waters adjacent to the IRA. (Organization, Cordova, AK - #A23229.91310)

TRAPPING

With respect to uses of such land, I would be in favor of having it remain open for all legal purposes, including hunting, fishing, and trapping, for example. (Individual, West Swanzey, NH - #A15665.90100)

SPORT SHOOTING

I also believe that forests should be open for sports shooting as well as hunting. (Individual, Lafayette, CO - #A7448.90100)

1213. Public Concern: The Forest Service should manage fish and wildlife habitat as valuable lands that should remain open to hunters and anglers.

Convince the Bush Administration, elected officials and public land managers to scientifically manage all fish and wildlife habitat in the National Forest System, whether roaded or unroaded, as valuable and unique lands that will remain open to hunters, anglers and other public users. Balance accessibility to National Forest lands, with the year round requirements of fish and wildlife (habitat, clean water, food, shelter, open space and disturbance management), while maintaining a functioning forest road system, including keeping roadless areas roadless (with science-based exceptions made for forest health, restoration, and other national needs). (Individual, Lyons, NY - #A1737.50000)

Count me among the hunters and anglers who believe you should scientifically manage all fish and wildlife habitat in the National Forest System as valuable lands that will remain open to hunters, anglers and other private citizens. (Individual, Mosinee, WI - #A5176.53100)

1214. Public Concern: The Forest Service should open closed roads for bear hunters.**IF THEY ARE OPENED FOR DEER HUNTERS**

I think if you are going to open bars on closed roads for deer hunting, you should leave them open for bear hunters also. This could bring a discrimination issue to attention. (Individual, Ronceverte, WV - #A10801.91310)

*Do Not Allow/Restrict Hunting and Fishing***1215. Public Concern: The Forest Service should prohibit hunting in roadless areas.**

Hunters kill wildlife. This is not conducive to areas functioning as biological strongholds and wildlife refuges. Forest Service studies show over 65% of all sensitive species are directly or indirectly affected by roadless areas, including 81% of mammals and 82% of birds. I believe prohibiting hunting in IRAs would affect very few people; during the seven years I worked for the USFS, I rarely met hunters who went very far from a road. (Individual, Vista, CA - #A4838.91320)

Bear baiting should not be allowed anywhere, period. (Individual, Shawnee Mission, KS - #A96.90110)

Prohibit killing animals except in cases of specifically approved, publicly announced efforts to reduce herd size. (Individual, Atlanta, GA - #A873.90110)

WITHIN TWO MILES OF PRIVATE PROPERTY

Hunting should be prohibited for 2 miles around any private residence. Hunting with dogs should be forbidden in any US Forest. (Individual, Marion, NC - #A4691.91320)

BECAUSE IT IS NOT WELL REGULATED AND RESTRICTIONS ARE POORLY ENFORCED

Trapping is largely unregulated, and where restrictions do apply, they are poorly enforced. Most states require that traps be checked every 24 hours, but eight states (Idaho, Montana, Nevada, Oregon, South Dakota, Utah, Washington, and Wyoming) allow a lapse of two or three days; five states (Alabama, Alaska, Kansas, Michigan, and North Dakota) have no trap-check requirements. It is not uncommon in states with regulations and in states with none, for an animal to be left in a trap for weeks because the trapper does not check the trap. (Very few people trap full time, most trap in their spare time). In most cases trappers do not leave identification on their traps, so trappers cannot be traced or fined for neglecting their traps. Many trappers' regulations clearly benefit trappers. It is legal to set traps near schools, neighborhoods, and hiking trails, where they clearly are a safety hazard. In many states it is illegal to disturb a trap in any way, even to release a trapped dog, or cat. Only 15 states require any form

of trapper education. The fur trade has nearly caused the extinction of fishers, martens, and several species of wild cats. (Individual, Topeka, KS - #A12789.90420)

BECAUSE IT IS NOT EFFECTIVE FOR WILDLIFE MANAGEMENT

Trapping Does Not “Help” Wildlife. Supporters often claim trapping can be used for wildlife management and to control disease and “nuisance” wildlife. These claims are false.

Trapping is not wildlife management. It does not ensure stable, healthy wildlife populations. Trappers claim that they are simply “harvesting” those animals that would die anyhow. However, natural ecological factors such as weather and food supply, as well as wild animals’ innate ability to limit their populations through natural means, are sufficient to create a balance between wildlife populations and their habitats. Nonetheless, trappers are permitted in some states to catch species, such as the lynx and river otter, whose populations are low. Moreover, there is some indication that healthy animals—who are more active than diseased or otherwise weak animals—are more likely to be caught by traps. Thus, trapping is harmful to animal populations because it removes healthy animals and leaves behind those who are sick. (Individual, Topeka, KS - #A12789.90420)

1216. Public Concern: The Forest Service should prohibit hunting in roadless areas.

WITH DOGS

All citizens deserve to be able to use roadless areas with out being harassed or endangered by uncontrolled packs of hunting dogs. Bear hunters use radio collars to track dogs and do not accompany them or have control over the behavior of these dogs. We have had our entire poultry flock massacred several years in a row. Our horse has been attacked and injured each year. My child was attacked and injured. Bear hunters have threatened to burn people’s homes if they complain about the trespassing and abuse of their dogs. Bear hunters have threatened our county commissioners if they attempt to curtail the abusive and dangerous activities of the bear hunters. There should be no hunting allowed in the US Forest with dogs. (Individual, Marion, NC - #A4691.91320)

TRAPPING

Please also prohibit all trapping activities in “roadless” areas of those same national forests. You must know that all humane organizations in this country, not to mention some other 89 countries and at least 7 of our States banned the cruel, steel-jawed leg-hold traps. They must no be allowed in our national forests. (Individual, Norfolk, VA - #A6957.90110)

NO trapping or hunting—especially NO steel-jawed traps that have been banned practically worldwide. (Individual, Merritt Island, FL - #A6906.90110)

1217. Public Concern: The Forest Service should prohibit fishing in roadless areas.

IN AREAS WITH ENDANGERED SPECIES

Local forester input would be very useful on this subject, prohibitions should be established that would best protect depending on the potential risk of damage to a particular area, i.e. no fishing in endangered species areas, fire bans in dry areas, no bikes in erosion prone areas, etc. (Individual, No Address - #A8998.90000)

1218. Public Concern: The Forest Service should close off-road vehicle trails to hunters.

Open more trails for ATV users and close these trails to ATV hunters during hunting season. (Individual, Saint Paul, MN - #A10994.90000)

1219. Public Concern: The Forest Service should regulate hunting.**BY REGULATING THE NUMBER OF TAGS SOLD**

Wildlife also needs to be preserved and I think it is possible to manage both with the extinction of none. Hunting laws need to be looked at too. Many times too many tags are sold and at others, not enough of one kind are sold. Money should not be the consideration with the sale of tags. (Individual, Oak City, UT - #A40530.90000)

FOR HUNTING THAT DAMAGES PREDATOR-PREY DYNAMICS

Activities that deplete on wildlife within roadless areas can damage the proper functioning of a forest ecosystem. Activities like hunting wolves from helicopters or cougars with hounds can have extremely detrimental impacts on a system. The noise alone can form an auditory habitat fragmentation, not to mention the impact from the hunting on predator-dependent species and their populations (such as elk populations that explode when wolves are removed). Such activities that damage the predator-prey dynamics of a system shouldn't be allowed in roadless areas. Those areas should truly be reserved areas and all things therein should be protected, not just the trees. (Individual, No Address - #A29243.90110)

Outfitter-Guides**Summary**

A few respondents write that commercial outfitters should be allowed in roadless areas. One Permit Holder requests that the Forest Service implement the Roadless Area Conservation Rule because it will benefit outfitter-guides. According to this respondent, "We have operated under special use permit on the Tongass for nearly 40 years and have experienced a 60% loss of suitable areas to conduct our business as a result of clear-cut logging. Continuing the roadless rule would stabilize this loss for our continued business operation. Another respondent urges the Forest Service to prohibit commercially directed group tours and expeditions. While on person states that it is wrong "that outfitters have the right to charge outrageous fees while using 'Public' lands!"

*Allow Outfitter-Guides***1220. Public Concern: The Forest Service should allow commercial outfitters in roadless areas.**

The Forest Service should consider the following when evaluating roadless areas.

Allowing non-intrusive commercial use (such as outfitting). (Individual, Bozeman, MT - #A3673.91216)

1221. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule.**BECAUSE IT WILL BENEFIT OUTFITTER-GUIDES**

Please do not roll back the National Forest Roadless ruling. We have operated under special use permit on the Tongass for nearly 40 years and have experienced a 60% loss of suitable areas to conduct our business as a result of clear-cut logging.

Continuing the roadless rule would stabilize this loss for our continued business operation. (Permit Holder, Gustavus, AK - #A1716.10150)

Do Not Allow/Restrict Outfitter-Guides

1222. Public Concern: The Forest Service should prohibit commercially directed group tours and expeditions.

Also incompatible with roadless value protection are . . . commercially directed group tours/expeditions. (Individual, Port Angeles, WA - #A6179.91120)

1223. Public Concern: The Forest Service should prohibit outfitters from charging large fees for using public lands.

I strongly object that outfitters have the right to charge outrageous fees while using "Public" lands! (Individual, Bennett, CO - #A11158.91226)

Equestrian Use

Summary

Some respondents commenting on equestrian use, say it should be allowed in roadless areas, both in the form of horseback riding and in the use of pack animals. One recreational non-motorized organization requests that the Forest Service allow users to transport horses to existing trailheads in order to accommodate the "short, single-day rides" enjoyed by most recreational horse trail riders. Other respondents assert that the Forest Service should prohibit equestrian use, both in the form of horseback riding and in the use of pack animals.

Allow Equestrian Use

1224. Public Concern: The Forest Service should allow equestrian use in roadless areas.

HORSEBACK RIDING

I fully support protecting our nation's natural resources. I am an equine trail rider and believe in the "leave-no-trace" philosophy. I also believe I have the right to celebrate this nation's cultural heritage by riding a horse across our public lands and can do it without harm to our environment. (Individual, Long Lane, MO - #A1060.91215)

PACK ANIMALS

Activities that should be allowed: hiking and camping, non-motorized recreation, hunting and fishing, and horse and llama pack trips. (Individual, Rogue River, OR - #A15590.90100)

1225. Public Concern: The Forest Service should allow users to transport horses to existing trailheads.

The American Horse Council submitted comments in the past expressing our concerns that the needs of the recreational horse trail rider have been often ignored in national forests. Issues such as closure of equine trails, adequate parking at trailheads to accommodate horse trailers and safe stabling areas for horses at campgrounds have not always been addressed.

While there is a portion of the horse industry that enjoys lengthy, multiple-day rides, the majority of the recreational horse trail riders participate in relatively short, single-day rides. The type of riding enjoyed by most riders requires facilities for trailer parking and preparation of both horse and rider. Very few riders have the luxury of beginning a trail ride off-site. Most must transport their animals and gear to a trailhead before beginning the actual ride.

These riders are concerned that if the Forest Service (FS) bans new road construction, there may be perfectly legitimate areas where individuals could ride horseback, but they will never have the

opportunity to do so because of the inability to transport their animals to a trailhead. (Organization, Washington, DC - #A23320.91215)

1226. Public Concern: The Forest Service should preserve equestrian access in roadless areas.

THROUGH MAINTENANCE AND MAPPING

Provide maintenance and maps for equestrian trails. (Individual, Sandy, UT - #A11009.91110)

1227. Public Concern: The Forest Service should allow historical and recreational pack and saddle stock use.

AS ALLOWED UNDER THE WILDERNESS ACT

Any new designations must not interfere with the original intent of the Wilderness Act and subsequent laws which include historical and recreational pack and saddle stock use, as public purposes equal in importance to the four public purposes specified in the Wilderness Act. (Individual, Bakersfield, CA - #A15786.20206)

Do Not Allow/Restrict Equestrian Use

1228. Public Concern: The Forest Service should prohibit equestrian use.

HORSEBACK RIDING

Snowmobiles, ATVs, other off-road vehicles, motorized boats, and animal travel including dog sleds and horseback riding should be severely restricted. (Association, Minneapolis, MN - #A19249.90110)

PACK ANIMALS

Commercial logging, mining, oil drilling, ORV use, and pack animals should be banned in all roadless areas. (Individual, No Address - #A12601.90110)

IN THE SHAWNEE NATIONAL FOREST

No . . . equestrian operations in Shawnee National Forest. (Individual, Glencoe, IL - #A21487.90110)

Camping/Shelters/Accommodations/etc.

Summary

General Comments – A few individuals ask the Forest Service to address privatization of forest facilities such as campgrounds, and to reevaluate “the use of private companies on the campgrounds who are charging for the use of public lands.”

Camping/Shelters/Accommodations/etc. – Several respondents state that camping should be allowed in roadless areas; one person suggests expanding the present facilities to alleviate crowding. Some ask the Forest Service to allow the construction and maintenance of Adirondack shelters in roadless areas; to provide shelters for maintenance equipment and survival gear; and to allow the development of small-scale tourist accommodations. Other respondents assert that camping should be restricted. One individual suggests requiring permits for those camping in backcountry areas in order to reduce human-caused wildfire, while another suggests restricting camping in roadless areas to small groups.

Camping/Shelters/Accommodations/etc. General

1229. Public Concern: The Forest Service should address privatization of forest facilities.

CAMPGROUNDS

Other areas of concern to me are the privatization of many of the forest facilities, such as the campgrounds. (Red Creek campground in the Dolly Sods Wilderness—Monongahelia National Forest—West Virginia for example). (Individual, Laurel, MD - #A12185.90910)

1230. Public Concern: The Forest Service should reevaluate the use of campgrounds by private companies.

The Forest Service should reevaluate the use of private companies on the campgrounds who are charging for the use of public lands. (Individual, Klamath Falls, OR - #A21591.15122)

Allow Camping/Shelters/Accommodations/etc.

1231. Public Concern: The Forest Service should allow camping in roadless areas.

Hiking and camping should be allowed in these areas. (Individual, Olympia, WA - #A580.90100)

Allow camping with campsite restrictions at environmentally sensitive areas, where appropriate. (Individual, Bothell, WA - #A5228.90110)

BY EXPANDING FACILITIES

I would add that where camping is permitted that camping should be spread out so that people have a bit of privacy and isolation. Current camping in National Forests is a joke. Being crammed into a small area with other campers is not my idea of camping. (Individual, Palmer Lake, CO - #A23361.90000)

1232. Public Concern: The Forest Service should allow the construction and maintenance of Adirondack shelters in roadless areas.

Amenities such as Adirondack shelters and hardened trails should be allowed. Mechanized equipment and other equipment needed to construct or maintain trails or shelters should be allowed. (Elected Official, Libby, MT - #A18119.90100)

1233. Public Concern: The Forest Service should provide shelters for maintenance equipment and survival gear.

Provide shelters for maintenance equipment and survival gear. (Individual, Del Mar, CA - #A868.91710)

1234. Public Concern: The Forest Service should allow the development of small-scale tourist accommodations.

In response to your question about “specific activities that should be expressly prohibited or expressly allowed for IRAs through Forest plan revisions or amendments”, the group wants to see development of small-scale tourism; small groups of independent travelers coming to Cordova and using existing facilities fits within this picture. Development of destination lodges for 50-100 guests and the accompanying infrastructure—including new roads on public lands—does not. (Organization, Cordova, AK - #A23229.91310)

Do Not Allow/Restrict Camping/Shelters/Accommodations/etc.

1235. Public Concern: The Forest Service should require permits for those camping in backcountry areas.

TO REDUCE HUMAN-CAUSED WILDFIRE

As a precaution against possible human-caused wildfire, permits could be required for back-country camping. (Individual, Fort Collins, CO - #A17987.91110)

1236. Public Concern: The Forest Service should restrict camping in roadless areas.

TO SMALL GROUPS

We feel one specific activity that should be prohibited from inventoried roadless areas would be camping permits allowing large numbers at gatherings. The impact on trees and grounds is astronomical. (Individual, Bayfield, CO - #A13395.90110)

Special Use Permits

Summary

One county commissioner suggests that the Forest Service should address issues related to special use permits—specifically, recreation activities that are proposed, in development, or in place but which are not currently covered in special use permits; and modifications or renewals of special use permits. An elected official asks the Agency to streamline the permit process for state agencies, “especially in instances where a state agency is attempting to gain access in order to carry out salvage logging or urgent forest health activities.”

1237. Public Concern: The Forest Service should address issues related to special use permits.

RECREATION ACTIVITIES THAT ARE PROPOSED, IN DEVELOPMENT, OR IN PLACE BUT WHICH ARE NOT CURRENTLY COVERED IN SPECIAL USE PERMITS

While the DEIS (3-12) indicated that proposed recreation development in inventoried roadless areas would be allowed to continue if special use permits are in place, this is misleading since there are numerous activities that are proposed, in development, or in place, that do not currently have special use permits covering all of the activities or lands. (Elected Official, Roseburg, OR - #A11811.90000)

MODIFICATIONS OR RENEWALS OF SPECIAL USE PERMITS

The DEIS statement ignores that issue that will arise relative to modifications or renewals of the special use permits. We suggest that any rule clearly address this issue. (Elected Official, Roseburg, OR - #A11811.90000)

1238. Public Concern: The Forest Service should streamline the permit process for state agencies.

Streamlining of the permit process is also necessary, especially in instances where a state agency is attempting to gain access in order to carry out salvage logging or urgent forest health activities. Working with state land agencies to come up with “access plans” that could be incorporated into forest plans would be one way to facilitate the process. (Governor, State of Idaho - #A20141.15130)

Other Recreation Concerns

Summary

Respondents suggest a variety of specific activities they say should be prohibited in roadless areas. These include sporting events, fireworks, dog sledding, activities that involve cleated hiking boots, and golf area development. One Organization also suggests that the Forest Service set conservative carrying capacity limits in the Western Sound.

1239. Public Concern: The Forest Service should prohibit various activities in roadless areas.

SPORTING EVENTS

All . . . sporting events should be prohibited in Roadless Areas. (Individual, Philipsburg, MT - #A15223.90100)

FIREWORKS

NO FIREWORKS! (Individual, No Address - #A583.90110)

DOG SLEDS

. . . animal travel including dog sleds . . . should be severely restricted. (Association, Minneapolis, MN - #A19249.90110)

ACTIVITIES THAT INVOLVE CLEATED HIKING BOOTS

Cleated hiking boots . . . should be prohibited. (Individual, Centennial, CO - #A26987.91120)

GOLF AREA DEVELOPMENT

Permanently protect all roadless areas from all environmentally destructive activities, including . . . golf area development. (Individual, Staunton, VA - #A29325.90110)

1240. Public Concern: The Forest Service should set conservative carrying capacity limits in the Western Sound.

With an estimated 600% increase in the number of recreational and sport fishing boats in the Western Sound with the Whittier access road opening, ought to compel the FS to set conservative carrying capacity limits in PWS and to maintain the integrity of roadless areas in this region. Regardless of jurisdiction disputes or pressures from the tourism industry, the FS must comply with laws that mandate assessment of the preferred alternative (such as the Endangered Species Act or ESA). The preferred alternative ought to be a conservative plan; the last thing the Sound and its inhabitants need are to be further stressed by pollution or overuse. (Organization, Anchorage, AK - #A23038.45622)

Designating Areas (*Question 8*)

***Question 8: Designating Areas.* Should inventoried roadless areas selected for future roadless protection through the local forest plan revision process be proposed to Congress for wilderness designation, or should they be maintained under a specific designation for roadless area management under the forest plan?**

This section includes six subsections: Designating Management Categories General, Wilderness Recommendations, Roadless Designation, Inclusion/Exclusion of Specific Areas from a National Roadless Rule, Use of Existing Forest Plan Designations, and Other New Management Categories.

Designating Management Categories General

Summary

The phrasing of Question 8 (above) gives rise to three distinct types of comments. Individuals simply write in a short statement, such as ‘Recommend all roadless areas for wilderness,’ or ‘No more wilderness.’ Others, both those who ask that the Roadless Area Conservation Rule be implemented and those who ask that it not be implemented, challenge the either/or choice implicit in the question. “This [Q8] is not an either/or issue,” begins a typical comment, “and no changes in the Roadless Rule are needed to address it. By law, forest plans must evaluate the wilderness potential of all roadless areas and make recommendations for wilderness designation by Congress. The Rule allows the wilderness recommendation process to continue.” These respondents often continue with suggestions for the preferred management of these areas. The third general type of comment takes the question more broadly and provides suggestions for evaluation criteria and various management designations for these areas. Given that management prescriptions by their very nature prohibit or allow a set of activities, many responses to Question 8 also list the various uses that should be allowed or prohibited under a specific roadless designation.

Among those who state that options presented in Question 8 are too narrow, a number say that allocation decisions should be made on an area-by-area basis. Some assert that these decisions should be based strictly on scientific criteria, with ecotype or ecosystem dynamics as determining factors.

A number of respondents recommend a wider variety of management classifications than simply roadless or recommended wilderness. Some ask state that as long as local forest prescriptions are consistent with a national rule, they should be available for use by local forest planners. Others ask that standard forest planning continue with the widest possible array of prescriptions available, including those that would otherwise be disallowed under the Rule because they allow roadbuilding or timber removal.

Some request that all roadless areas that are currently allocated at the local level to prescriptions that prohibit roadbuilding and timber harvest be removed from the current debate. Others ask that the Forest Service include all inventoried roadless areas under a national rule immediately, regardless of current classification status.

1241. Public Concern: The Forest Service should base management allocations on science.

BY ASSIGNING DIFFERENT MANAGEMENT PRESCRIPTIONS BASED ON ECOTYPE

This brings me to my point of how this forest system should be managed by good science that is checked by both ends of the spectrum, but in such a manner as certain areas are divided for particular uses and studied under a forest time scale (>30yrs) and no changes are made to the management of that study area for at least this duration. This ultimately would require that your agency take charge and designate areas of use/non use. This would be the most difficult step because both polarized groups will never be satisfied with any finalized plan you submit. Observing that the original intent of your department was to manage a national forest preserve, essentially for wood supply and only recently (~20years) has it turned into a recreational area management department, perhaps you should take this time to state your purpose as an organization so that no one will have a misunderstanding as to your role. You must manage the national forest system on a specific area basis too, as the Sitka Spruce in Alaska grow differently than the Douglas Fir of coastal Oregon as do the Pines of the Rocky mountains. Once you have obtained and stated your purpose and started managing forests based in good science then the future of our forests will be secured. (Individual, No Address - #A14.25340)

BY BASING LEVELS OF PROTECTION ON A SCIENTIFIC ENVIRONMENTAL ASSESSMENT

Wilderness or roadless designation and protection should be based on the level of protection needed as shown by scientifically based environmental assessment. (Individual, Tucker, GA - #A4543.25000)

1242. Public Concern: The Forest Service should consider ecosystem dynamics when creating land use designations.

If ecosystem management is not politically passé yet, let's apply it to this situation. In a landscape that is intensively managed for timber extraction (as many National Forests are), roadless areas are most often ecologically unique in that they are in a late seral successional stage (e.g. "old growth. But note the term "successional", implying an inherently dynamic system. In forest ecosystems fire, disease, windstorms, and logging are the main processes which reset the successional clock. So if maintaining late seral islands and corridors within our forests is the ultimate goal, then declaring a certain area roadless only eliminates the human-induced disturbance. And the sense of "permanent protection" such a legal designation implies is at odds with the reality of a dynamic system. One of the other "natural" factors is likely to reset the successional clock. This probability will only be exacerbated in a global warming scenario. A static roadless designation doesn't go far enough toward maintaining a stable percentage of late seral ecosystems. I propose a "dynamic designation". I know this would be an implementation nightmare, especially for a federal agency, but it has a lot of merits for all "stakeholders" concerned. (Individual, McCall, ID - #A25834.50100)

1243. Public Concern: The Forest Service should acknowledge that Question 8 is not an either/or issue, and no changes to the Roadless Area Conservation Rule are needed.

This [Q8] is not an either/or issue, and no changes in the Roadless Rule are needed to address it. By law, forest plans must evaluate the wilderness potential of all roadless areas and make recommendations for wilderness designation by Congress. The Rule allows the wilderness recommendation process to continue. Forest plans also designate roadless areas for continued roadless management, regardless of whether they are recommended for wilderness. The Rule ensures that roadless areas will, at a minimum, be protected from road construction and commercial logging. (Organization, Denver, CO - #A21367.25110)

Forest plans are obligated by law to evaluate wilderness potential of all roadless areas and make recommendations for wilderness designation by Congress. That doesn't change under the Roadless Rule. Forest plans also designate roadless areas for continued roadless management, regardless of wilderness recommendations. (Individual, Ridgway, CO - #A22352.25110)

Existing law requires forest plans to evaluate wilderness potential of national forests and make recommendations to Congress. The Rule did not change that, and no new rulemaking process can override that law. Forest plans should continue to protect the roadless quality of roadless areas pending any Congressional action on wilderness designation, and should take special care not to impair the suitability of such areas for wilderness designation. (Individual, Hyattsville, MD - #A22957.25110)

These designations are not mutually exclusive. The law states that forest plans must evaluate the wilderness potential of all roadless areas and make recommendations for wilderness designation by Congress. The Rule allows the wilderness recommendation process to continue. Forest plans also designate roadless areas for continued roadless management, regardless of whether they are recommended for wilderness and the Rule ensures that roadless areas will, at a minimum, be protected from road construction and commercial logging. (United States Representative, Washington - #A23209.25110)

The areas are roadless and should be managed as such. If some get proposed for wilderness, fine. But roadless is a management designation and whether these lands should be proposed for wilderness is a separate issue. (Individual, Conifer, CO - #A27021.25110)

1244. Public Concern: The Forest Service should consider a full range of management alternatives for roadless areas, not just "roadless" or "recommended wilderness."

Should inventoried roadless areas selected for future roadless protection through the local forest plan revision process be proposed to Congress for wilderness designation, or should they be maintained under a specific designation for roadless area management under the forest plan?

No to both questions. Recommendation for addition to the wilderness system or long-term management as roadless are only two of the broad range of alternatives that should be considered for each unit. (Business, Lewiston, ID - #A7991.25000)

We think both; that is, of those roadless areas selected to remain roadless, some should be recommended for wilderness and some should be put in a management prescription, like semi-primitive non-motorized, to protect them. This also is a decision to be made in the forest planning process. A few areas may warrant proposed wilderness status. Most will be placed in an unroaded prescription. Either way, the public will point the direction for that split. It will then be up to Congress to decide if a recommended wilderness warrants that protection. (Elected Official, Saint Anthony, ID - #A4942.25000)

The FEIS Specialist Report for Wilderness and Special Designated Areas indicates that IRAs have acted as the "reservoir for future wilderness areas" and that because of the proliferation of special designations, such as wilderness, the number of roadless acres is in decline. The report notes that this trend parallels a decrease in the supply of appropriate settings for Primitive, Semi-Primitive Non-Motorized, and Semi-Primitive Motorized recreation opportunities in an "environment of increasing demand." We certainly agree with this assessment and believe that it further illustrates the special value roadless areas have to the American people. Unlike the heavy and contentious restrictions of Wilderness Area designation, roadless area conservation can provide for a wider variety of opportunities while still protecting values associated with wilderness. Americans WANT to "preserve" green space but people also want access to this space for recreation. Roadless area conservation should be viewed, and used, as a way to provide the public with large holdings of high quality, yet non-contentious green space. (Organization, Pickerington, OH - #A3645.50200)

BOTH ROADED AND UNROADED CATEGORIES

For all inventoried roadless areas, forest plan revisions should consider a full range of management alternatives, from active management to wilderness recommendations. If selected in a forest plan revision or amendment to remain roadless, activities that may be permitted should include motorized and non motorized recreation, forest health treatments, watershed improvement activities, wildfire and insect and disease suppression, and some improvements not requiring permanent road access. (Individual, Grants Pass, OR - #A5305.25000)

Roadless lands vary enormously in terms of their terrain, ecologic communities, resources, social setting, and economic importance to surrounding communities. Planners must develop and examine a full range of alternatives for each, from development to potential wilderness. The prescription for every roadless unit should be designed to best fit its unique character.

The one-size-fits-all approach utilized in the initial rule making is unprofessional, as insult to the land, the management professionals responsible for it and the people who rely on it. . . .

Each unit should be addressed individually in forest plans. The highest and best use or land access issues might require roads on some units. On the opposite end of the scale, some units might be best added to the wilderness system, taking on the extensive prohibitions required by that designation. Units to be managed in the long run as roadless, but not wilderness, can support a wide variety of uses, depending on their characteristics and specific resource considerations. (Organization, No Address, #A8227.25000)

UNROADED CATEGORIES ONLY

After deciding which areas should be recommended for wilderness, further evaluation should be done to allocate the remaining areas to appropriate prescriptions. Some of relevant allocation categories include: backcountry recreation, habitat for wildlife requiring unfragmented forest, community water-supply watershed, scenic areas, cultural or historic areas, habitat for rare communities or species, research natural areas, old growth restoration areas.

Inventoried roadless areas that are not recommended for wilderness should be allocated to prescriptions in the forest plan that maintain the roadless characteristics of the area in a manner consistent with the roadless area conservation rule, but that emphasize the special or unique characteristics of the area. While remaining consistent with the roadless area conservation rule direction, a prescription may be applied to a specific area or parts of an inventoried roadless area that recognizes specific additional prohibitions or mandates additional required management activities for that area. We have also noted that some of the allowed exemptions for road construction or timber harvesting may be identified as appropriate for some roadless areas and the area is allocated to an appropriate prescription. We would expect a variety of management emphases for various roadless areas. Thus, we believe it would be inappropriate to specify only one designation for the management of roadless areas that are not allocated to wilderness recommendations. (Civic Group, Roanoke, VA - #A1713.25300)

I think it is important for holistic forest management. Some areas may meet more of the demand for wilderness designation, while others may best achieve USDA goals through roadless area designation. One huge mistake, in my opinion, would be to cram all designated roadless areas into a single legislative box, though I predict that whoever's holding the most power over roadless areas would disagree with me very strongly on this. This is a case where dividing up the pie according to greatest overall need probably makes the most sense, but where petty internal politics could easily derail the whole process. (Individual, New Haven, CT - #A706.25120)

1245. Public Concern: The Forest Service should determine roadless area allocations on a site-specific basis.

I am a forester working in the Adirondack State Park in New York state. The park encompassed approximately 6 million acres, with over 2.6 million owned by the state and many more acres under construction easements. The state owned land has grown considerably since its inception in 1885 when the legislature enacted the law protecting the forest as 'forever wild.' Today, the park is bigger than Yellowstone, Yosemite, and the Grand Canyon combined.

While not all of the park is set aside as wilderness, a considerable chunk of it remains a roadless preserve. Likewise, there are other areas designated for more intensive use, ranging from “wild forest” (less restrictive) to “primitive areas” (more restrictive). Using a single broad brush to create a rule that encompasses millions of acres may not be the best plan. (Individual, Schuyler Falls, NY - #A4779.25000)

1246. Public Concern: The Forest Service should assign land uses that are compatible with uses being implemented by adjoining landowners.

ON THE TONGASS NATIONAL FOREST

Because the Tongass National Forest so dominates the ownership pattern in Southeast Alaska, actions taken in the course of managing it can significantly affect adjacent landowners. As a considerate neighbor, management actions should recognize the following:

Forest Service should give greater consideration to assigning land uses that are compatible with the uses being implemented by adjoining landowners. Native corporations are largely managing their lands for intensive commodity uses. The State of Alaska owns lands dedicated to recreation and community development. The Forest Service should incorporate the needs of those designations into its management of adjacent federal lands.

Sealaska has a common boundary with many areas that are in some type of roadless category. Sealaska is developing, or has developed its adjacent lands. There are opportunities for the Forest Service to participate with Sealaska in a manner that would be advantageous to Tongass NF planning and administration. (Tribal Corporation, Seattle, WA - #A20468.45100)

1247. Public Concern: The Forest Service should remove from debate the roadless areas already designated for continued protection in existing forest plans.

Half the 58 million acres under consideration for permanent roadless status are already designated roadless in existing forest plans and should be removed from policy dispute. Keep the wild areas wild! (Individual, Butte, MT - #A10391.25100)

1248. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule regardless of the current land classification status of roadless areas.

In addition to Roadless Areas recommended for wilderness designation, all Roadless Areas should be managed under the guidelines of the RACR. This does not require additional categorization, it requires implementation. (Organization, Boise, ID - #A20363.25230)

(8. Designating Areas.) The most important action is to protect the unique values and the roadless character of these areas. I’m more concerned that they are given real protection than to argue over what to call them. (Organization, Helena, MT - #A20598.25000)

1249. Public Concern: The Forest Service should apply the same planning process to both roaded and roadless areas.

The inventoried roadless areas are the main areas on which all timber harvesting must necessarily take place because such a small portion of the National Forests in Alaska is roaded. Accordingly, the planning process should apply to both the roadless and roaded areas in exactly the same way and their management should be determined through the same process applied without regard to whether a specific area is roaded or unroaded. The Forest Supervisors have the best local knowledge for each national forest. Consequently, they should be given the responsibility for preparing and approving environmental impact statements for timber sales. (Association, Ketchikan, AK - #A20443.12125)

The planning process should apply to the roadless and roaded areas in exactly the same way and their management determined through the same process applied without regard to whether a specific area is roaded or unroaded. (Individual, Sitka, AK - #A12821.45513)

1250. Public Concern: The Forest Service should make land use designation decisions in a timely manner.

Reach a decision in a timely manner regarding the labeling of lands for specific uses. As you're aware, it's been nearly 40 years since the Wilderness Act and some lands are still in limbo. Get this process finalized and forward recommendations to Congress. There are sufficient federal lands for everyone to get some of what they want. However, the indecision and flux of the last couple of decades has not enhanced the public's view of the job being done by the Forest Service. (Governor, State of Montana - #A17660.14400)

Wilderness Recommendations

Summary

General Comments – A number of respondents note that the local forest planning process must consider additional wilderness recommendations, and assert that a national rule does not change this. Others state that the wilderness consideration process should be modified, and suggest such changes as subjecting all recommendations to a local vote or to a local resident decision-making process of some kind. A few individuals suggest that in limited cases, such as national emergencies or wars, wilderness status should be temporarily revoked for resource use, followed by full land restoration and reinstatement of wilderness status.

Some believe that the Forest Service should reverse its institutional resistance to wilderness designation in order to protect a wider range of ecosystems and meet the changing priorities of the public. Groups also cite the low percentages of capable and available roadless areas that are recommended for wilderness designation in current forest planning efforts as evidence of perceived ongoing internal agency bias against wilderness.

A number of respondents answer Question 8 simply with a statement for or against recommending inventoried roadless areas for wilderness designation versus assigning them to a separate roadless category. Respondents request wilderness designation. Those who request wilderness designation provide a wide range of reasons for their position, including the need to set aside America's few remaining wild places; the need to balance environmental protection with human uses; the need to ensure protection of these areas regardless of political changes in the administration; and the desire to reduce costs of this rulemaking to taxpayers. Some who request additional wilderness designations provide names and descriptions of specific roadless areas they say should be recommended to Congress. (A list of these areas, as well as a list of areas that respondents say should be assigned to a designated roadless category, is found in Appendix F. This appendix also lists specific areas that some respondents ask not to be recommended for wilderness, or ask not to be designated roadless.)

Other respondents do not agree that additional wilderness designations are appropriate. Those who request no additional wilderness designation often state that there is already enough wilderness set aside; that wilderness areas prohibit too many recreational activities, such as mountain biking, snowmobiling, and ATV use; or that wilderness is inherently elitist. Some people propose that if Congress fails to act on wilderness recommendations within a set amount of time, then these areas should be returned to multiple use management.

Wilderness Recommendation Criteria – Comments about the criteria that should be used in the wilderness recommendation process vary. Numerous respondents assert that the Wilderness Act itself, as well as the Forest Service Manual and Handbook, already provide detailed and sufficient guidance in this process. Respondents do, however, enumerate specific characteristics they say should be emphasized or included in the recommendation process. These include expanding the criteria for total acreage to include areas less than 5,000 acres. Others state that acreage alone is less important than proximity to other protected areas, such as existing wilderness areas or National Park Service lands. Still others assert that decisions should be based on whether a given roadless area can function without active management or whether an area is within a complex large enough to sustain the role of natural fire regimes. Some request that the Forest Service ensure that all recommended areas truly have no roads. Finally, some suggest that roadless areas that do not initially meet recommendation criteria should continually be reevaluated to see if conditions have changed which would allow them to be included.

Management of Roadless Areas that Do Not Meet Wilderness Criteria – A number of respondents recognize that not all roadless areas will meet strict wilderness recommendation criteria, and make suggestions about management direction for them. These respondents suggest that all non-qualifying areas should be assigned to a specific roadless category. Others ask that they be assigned to any existing category consistent with a national rule. A number of people ask that any areas that do not meet wilderness criteria be returned to full multiple use management. A few suggest existing management categories that should be assigned to non-qualifying areas, from general forest to backcountry non-motorized.

Relationship Between Roadless and Wilderness Management – Respondents discuss the tradeoffs or connections between roadless area protection and wilderness designation. They say that all roadless areas should be maintained in a condition that will preserve their wilderness characteristics. Some assert that this must be done to maintain the option for Congress to add more areas to the National Wilderness System. Others say that recreational and commodity pressures have become so intense that managing these areas as unroaded is vital. Some ask that the Forest Service bear the burden of proof that roadless areas should be entered.

Others assert that the Agency must maintain the conditions present when the Wilderness Act was passed in 1964 in each roadless area, whether roaded, unroaded, or otherwise modified by human activity. Still others state that inventoried and uninventoried roadless areas should not be managed such as to preserve their wilderness characteristics, saying that amounts to de facto wilderness management. These respondents ask that the Roadless Area Conservation Rule not be implemented. (See also Chapter 2: Other Legal Concerns: Federal Laws, Acts, and Policies: *Wilderness Acts*.)

Wilderness Recommendations General

1251. Public Concern: The Forest Service should make decisions to recommend areas to Congress for wilderness designation through the forest planning process.

The Forest Plan should make the decision whether or not an area should be recommended to Congress for Wilderness designation. (Individual, Grants Pass, OR - #A5305.25200)

The Wilderness Study Area category should be retained. Those designated roadless areas that might qualify for the Wilderness System should be managed as WSAs under management that will not jeopardize their later possible designation by the Congress as Wilderness. Those roadless areas that cannot qualify as WSAs should be managed under the forest plan, with full multiple use values considered. (Individual, Asheville, NC - #A8386.25220)

1252. Public Concern: The Forest Service should designate qualifying areas as wilderness study areas until Congress takes action on them.

Inventoried roadless areas that meet the guidelines for consideration as wilderness areas should be designated as wilderness study areas. Congress would then decide on wilderness designation using the goals for conservation and protection of wild areas as priorities. (Individual, Gallatin Gateway, MT - #A19100.25220)

1253. Public Concern: The Forest Service should reverse its institutional resistance to recommending roadless areas for wilderness designation.

Every roadless area should be carefully considered for possible Wilderness designation, in whole or in part. The special values of these areas flow from their undeveloped condition. The reality of modern life is that there are constant pressures to alter the natural condition of roadless areas for economic gain or convenience. The long term viability of these areas as reservoirs of natural values would be enhanced by a higher level of legal protection than just an administrative rule. Designation as Wilderness Areas is the highest level of legal protection for natural areas that is available in our society and should be pursued for all qualifying areas. In general, Forest planning should favor Wilderness designation of roadless areas. Designation as Wilderness should be recommended except when local planning can clearly demonstrate that this designation would be incompatible with an important natural or social value of a particular area. The "burden of proof" should be to show that the area is not suitable for Wilderness. For thirty years, the Forest Service has insisted on the opposite standard. They have placed the "burden of proof" on those who wish to preserve a roadless area and have been biased in favor of development and intrusive management. It is time to reverse this bias before we lose all our important natural areas. (Individual, Palo Alto, CA - #A15827.25210)

The local forest plan process should re-evaluate Roadless Areas for inclusion in the National Wilderness System and should make new recommendations based on a new evaluation. In the recent forest plan revisions in National Forests of Idaho there has not been an adequate reconsideration of wilderness values and public interests in wilderness designations. The Forest Service is operating under outdated assumptions of public interests and needs in wilderness designations. This should be corrected in future forest plan revisions. (Organization, Boise, ID - #A20363.25230)

Region 2 Has Poor Record for Recommending Wilderness Protection for Roadless Areas.

The failure of Region 2 forest plans to protect roadless areas is further reflected in the Region's failure to recommend roadless acres for wilderness protection in recent forest plan revisions. Frankly, Region 2's record on identifying, protecting, and recommending for wilderness roadless areas during the forest planning process has been abysmal. In the previous four forest plans revised in the last few years in Region 2, the Forest Service identified as roadless a total of 1,387,853 acres on the Black Hills, Rio Grande, Arapaho-Roosevelt, and Routt National Forests. Of this, conservationists recommended 806,430 acres for wilderness, and the agency itself found hundreds of thousands of acres to be "eligible" for wilderness. Yet, the Forest Service recommended only a paltry 8,551 acres for wilderness designation. In other words, Forest Service Region 2 released more than 99.3 % of existing roadless areas to other uses, which include, in some areas: snowmobiling, off-road vehicle travel, logging, roadbuilding, and other uses inconsistent with wilderness.

Even though the Forest Service found more than one-half million acres to have all of the characteristics of wilderness and even to be "available" for wilderness, the Forest Service disregarded its own findings that recreational use of wilderness is increasing and that some existing wilderness areas are already being overused and degraded, by concluding that there is no need for additional wilderness. In addition,

although the agency repeatedly found that recommending existing lower-elevation roadless areas could make important contributions to the protection of under-represented ecosystems in the National Wilderness Preservation System in each of these four Forests, the Forest Service again ignored its own findings and concluded that no additional wilderness was needed. (Organization, Denver, CO - #A21367.25200)

1254. Public Concern: The Forest Service should allow temporary withdrawal of wilderness status for resource commodity use followed by restoration to wilderness condition.

If wilderness holds critical materials and the methods of exploitation is ephemeral there is no reason not to temporarily withdraw the area from wilderness designation and take advantage of it. Once the materials have been exploited it can be returned to its original condition and re-designated wilderness. Civil law fluctuates with the times in every other part of the body politic, why not land-use law? (Individual, No Address - #A8879.25000)

DURING WARTIME

These areas should be proposed for wilderness designation. However, there should be a caveat that these areas may be opened in the future if the American people require the resource for catastrophic events of national significance, like war. This caveat should not include language that would make it easy to renege a wilderness designation, but should make the areas available to the American people in emergency situations only. A recession, poverty, consumer greed, etc. do not qualify as emergency situations that would require opening these areas to harvest. The only situation of national significance that would warrant the removal of a wilderness designation on a roadless area would be war, where the harvestable supplies are required to help sustain the country during the war. There should be another caveat that says that those lands removed during such times of national significance should revert back to wilderness designation regardless of condition once the war ends, or within one year of the end of the war. But, for now, those lands should be proposed for wilderness designation. Perhaps lands that will be maintained in perpetuity as wilderness could be designated as a Wilderness A Area and one of the formerly roadless areas turned wilderness could be designated as a Wilderness B Area. That would distinguish between those lands that are out of reach permanently and those within reach during wartime. This Wilderness B designation shouldn't be a means to harvest timber under the guise of a wilderness designation. It should allow those areas that were roadless to be accessible in the event of war, but at no other time. (Individual, No Address - #A29243.25000)

1255. Public Concern: The Forest Service should allow local communities to decide whether to establish roadless and wilderness areas.

The Forest Service should consider establishing an alternative that would allow local communities to establish or not establish roadless areas and Wilderness with local Forest Officials without any influence from National or Regional Officials inside or outside the agency. (Individual, Alturas, CA - #A28581.13230)

1256. Public Concern: The Forest Service should subject all wilderness recommendations to a binding vote at the county, state, and congressional district level.

"Inventoried roadless areas" should be proposed for Wilderness designation immediately, and designated by hard-release legislation, with conditions. A proposal for wilderness designation will only be forwarded to Congress after forest-wide "ground-truthing" work has been approved by: 1) a vote on the first Tuesday in November in an even-numbered year by all citizens at the county, Congressional district, and state level; 2) any county voting against a wilderness designation shall have no lands within its boundaries designated; 3) any Congressional district voting against wilderness designation will also have no lands designated within that district; and 4) no state in which a majority of citizens votes against additional wilderness designation shall have such designation anywhere in the state.

If a majority of state citizens vote for wilderness, but no county and no Congressional district votes to approve such designation, then no land will be recommended, and “hard-release” legislation will be forwarded to Congress for approval.

If a county votes for approval of lands within its boundaries without approval at the state or Congressional-district level, then the issue may go up for a second vote in the next even-year general election. But if approval fails for a second time, then no more lands within that state can be designated. (Individual, Whitefish, MT - #A20672.25230)

Do Recommend Roadless Areas for Wilderness Designation

1257. Public Concern: The Forest Service should recommend all roadless areas for wilderness status.

Please add the 60 million acres to the existing wilderness nationwide. The damage to our land using open roads can be seen in Montana. There’s not much time to take care of our home. (Individual, Helena, MT - #A5256.25210)

Designating Areas—Roadless areas absolutely should be proposed to Congress for wilderness designation. (Individual, No Address - #A5242.25000)

The last roadless areas in America should all be designated wilderness and left alone. (Individual, Big Sky, MT - #A106.25200)

I think that [wilderness designation] would give them more protection (i.e. they should be wilderness areas). A new roadless management plan would lead to loopholes I didn’t want. (Individual, Yelm, WA - #A17978.25200)

I’m inclined to prefer that the inventoried roadless areas, as defined in the previous record of decision made before the current Administration’s “review” misstep, revert to Congressionally designated Wilderness, as I believe that would give the highest level of protection of natural forest ecosystem values under current federal management strategies. Unless a stewardship plan for Roadless emerges for the Forest Service, which would convey a higher level of protection to be the best available. (Individual, Goldendale, WA - #A21668.25200)

TO PRESERVE WHAT WILD AREAS ARE STILL LEFT

Designating Areas—Yes, all designated roadless areas should be given consideration for wilderness designation and some may certainly qualify. This may be a good time to expand wilderness areas while we still have some additional wild areas left. However, not all roadless areas will qualify. You should consider a national roadless management process that covers these not-quite-wilderness areas. (Individual, Boulder, CO - #A5250.25000)

All of these lands should be added to the National Wilderness System: Too much of the national forest system has been degraded by over 400,000 miles of logging and mining roads, millions of acres of impoverished over-cut lands and other facets of industrial development. Roadless areas need to be off limits to motor vehicles, including all-terrain vehicles. Roadless areas need little or no protection from lightning-ignited wildfire and native insects. These and other natural processes are vital elements of the ecosystem. (Individual, Richmond, CA - #A18059.25210)

TO STRIKE A BALANCE BETWEEN ROADED AND UNROADED AREAS

All of the 58.5 million acres identified in the Final Environmental Impact Statement should be recommended to Congress for inclusion in the National Wilderness Preservation System, and the sooner this recommendation is made the better, or it is clear from this process and your intent behind it that we will continue to lose, at an alarming rate, remaining lands on national forests that qualify as wilderness.

This Rule only sought to strike a balance; already two-thirds of our national forests have had roads constructed through them, and but one-third remains without roads. Saving the last third does not seem an unreasonable balance to strike. It is not as if a greedy American public is asking that a half or three-quarters be protected in a natural state. (Individual, Ward, CO - #A18076.25210)

TO ENSURE THE LEAST POSSIBLE DAMAGE TO THE ENVIRONMENT

Because it is so difficult to manage roadless areas in ways that enable the least damage, they should be designated and managed as wilderness. This would provide some semi-clear guidance and allow for helpful management steps. For example, snowmobiles (ATVs) are very damaging to plants and especially wildlife. They should be kept out of roadless areas. Wilderness designation would aid in this effort. (Individual, Salt Lake City, UT - #A13520.25200)

TO ENSURE THEIR CONTINUING PRESERVATION THROUGH CHANGING ADMINISTRATIONS

If we are to treat these areas as wilderness, it would be forthright to label them in that manner. That would also ensure that they are not liquidated by changing Forest Service or executive administrations. (Individual, Lacey, WA - #A530.25200)

I believe that inasmuch as we can meet the requirements of the Wilderness Protection Act, inventoried roadless areas should be designated as wilderness. That way they are protected from future "reviews" by corporate-friendly administrations eager to please their contributors by legislative slight-of-hand that opens the door to developing these fragile areas. If they are not designated wilderness, then another permanent designation must be "invented" by which these areas are placed in a natural trust so that they are there for future generations of Americans. (Individual, Denver, CO - #A20707.25100)

TO ENSURE SUSTAINABILITY OF HUMAN LIFE

The bottom line for everyone is clean air, clean water, a functional biosphere. If sustainable human life is the criterion, the only answer is wilderness designation. That issue trumps all economic questions. (Individual, Black Mountain, NC - #A707.25200)

1258. Public Concern: The Forest Service should recommend all roadless areas for wilderness status.

TO REDUCE COSTS

Designate all roadless areas for wilderness now and be done with it now!! Get it passed through Congress quickly so that we can reduce Forest Service staffs and therefore reduce taxes. (Individual, Montrose, CO - #A370.25210)

The inventoried roadless areas selected for protection should also be proposed to Congress for wilderness designation, to give them the highest degree of protection from development. Otherwise regulations for protection will have to renegotiated continuously under pressure from economic interests, which is a waste of taxpayer time and money. (Individual, Boulder, CO - #A19113.25210)

1259. Public Concern: The Forest Service should recommend as many wilderness areas as possible.

The more wilderness designations the better. Focus on pristine wilderness values. (Individual, McDonough, GA - #A805.25000)

1260. Public Concern: The Forest Service should recommend additional wilderness areas on a site-specific basis.

EACH TIME A FOREST PLAN IS REVISED

Each roadless area will require a decision based on its current condition, and how it will be managed in the long run. Some areas should be withdrawn for inclusion in the Wilderness System. This will set

general management parameters, but local folks have some ability to site-specifically tweak management options. Some areas can be withdrawn from roading and timber management for the next cycle. These areas may not contain true wilderness attributes, and the timber may not currently require active treatment. Such areas develop a different set of management parameters at the local level that may allow such use as motorized recreation, chainsaws, etc. Some areas may require immediate access and silvicultural treatment. These areas may carry a different set of parameters, and allow for a decision to do such things as maximize wildlife habitat, or add no new open roads to the system. (Association, Kamiah, ID - #A3685.25000)

BECAUSE LOCAL INPUT IS NEEDED

There may be areas suitable for wilderness designation, and I do not disagree that appropriate management of forest lands should include development restrictions. However, this should be decided on a case-by-case basis, with local input, particularly, but not limited to, direction from the professionals of our local forest service offices. (Individual, Greybull, WY - #A346.25230)

This should be decided on a case-by-case basis at a national level wherein public input should be given significant weight and time, with sufficient notice. (Individual, Astoria, OR - #A476.25230)

1261. Public Concern: The Forest Service should recommend qualifying roadless areas to Congress for wilderness designation.

Our National Parks are great and preserve much spectacular beauty, but they are often crowded and not the best places to go for serenity and enjoyment of natural surroundings. The national forests provide an escape for campers, fishermen, hikers and nature lovers and their families from the stresses of modern life. Designation as wilderness would further protect these areas for all Americans who appreciate the value of nature. (Individual, Port Angeles, WA - #A1044.70320)

It is the responsibility of the Forest Service to identify all lands that are appropriate for wilderness designation. Some roadless lands may qualify, certainly many will not. Management of roadless areas in general need not be as restrictive as management of wilderness areas. (Individual, Two Harbors, MN - #A17502.25220)

Certainly some units should be recommended to Congress as potential additions to the wilderness system. These would be those with outstanding wilderness attributes, large enough to serve as stand-alone wilderness. This might also include units adjacent to existing wilderness. (Association, Spokane, WA - #A21364.25220)

TO COMPLY WITH EXISTING LAW

By law forest plans must evaluate the wilderness potential of all roadless areas and make recommendations for wilderness designation by Congress. (Individual, Cooper, TX - #A13262.25000)

TO PRESERVE THEIR WILD CHARACTERISTICS FOR THE LONG TERM

I strongly believe that all remaining roadless areas must receive the highest level of protection viable, in order to preserve their wild characteristics for the long term. I strongly support Wilderness designation for any area that meets the criteria for such status. (Individual, Portola, CA - #A695.25200)

TO PREVENT DEVELOPERS FROM BUILDING THERE

Homeowners bear the ultimate responsibility for their property and the decision to encroach on pristine land. Reasonable measures should be taken to protect property, but I think property owners should be financially responsible for that effort. Don't build there and designate all roadless areas as wilderness so that real estate developers cannot build. (Individual, No Address - #A5216.35130)

BECAUSE FOREST PLANS HAVE NO TEETH

If the U.S. National Forest plans could have the same "teeth" as Congressional approved wilderness areas, the forest plans would suffice. Unfortunately, this does not seem likely; therefore, wilderness

designation is the only alternative until the Federal government and Forest Service can create comparable legislative protection to allow for the few uses not permitted in wilderness areas, such as the use of chain saws, selective and restricted use of off-road motorized vehicles, carefully selected logging, etc. (Individual, Geneva, NE - #A15512.25210)

1262. Public Concern: The Forest Service should recommend qualifying roadless areas to Congress for wilderness consideration and allocate other areas for roadless management.

If the inventoried areas meet all the legal requirements for wilderness, then there is no reason not to serve them up to Congress. If for some reason they do not meet the standard, then they can just be left as designated roadless areas. (Individual, Billings, MT - #A277.25000)

Both should be pursued. This is not an either/or issue, and no changes in the Roadless Area Conservation Rule are needed to address it. By law, forest plans must evaluate the wilderness potential of all roadless areas and make recommendations for wilderness designation by Congress. The Rule allows the wilderness recommendation process to continue. Forest plans also designate roadless areas for continued roadless management, regardless of whether they are recommended for wilderness. The Rule ensures that roadless areas will, at a minimum, be protected from road construction and commercial logging. (Individual, Woodstock, NY - #A14020.25000)

National Forests should be able to continue to propose Roadless Areas for designation as Wilderness. National Forests should also be able to continue to add Roadless Areas to the RACR. No changes need to be made in the Rule. (Individual, Philipsburg, MT - #A15223.25000)

The issue of wilderness designation is separate from the roadless rule. Forest plans should evaluate roadless areas for wilderness consideration as is currently required. However, even if roadless areas do not receive such wilderness designation, they should still receive the protections provided under the roadless rule. (Organization, Oneonta, NY - #A15449.25200)

This is yet another very leading question [8]. . . the baseline of protection for roadless areas should be protection through the Roadless Rule rather than the forest planning process. The forest planning process should only be used to address any protections above and beyond the protections provided for under the Roadless Rule.

Furthermore, the choice provided is a false one. The protections of the Roadless Rule and recommending a roadless area for wilderness designation are not mutually exclusive. Forest plans are already required to evaluate the wilderness potential of all roadless areas and recommend suitable lands for wilderness designation. The Roadless Rule does nothing to change the wilderness designation process and a particular roadless area can both be protected as a roadless area and recommended for designation as a wilderness. (Organization, Boise, ID - #A8240.25110)

Posing this question [8] as an either/or issue is inadequate. There are various options for management, which still protect roadless values, both in the interim and in the long run. When the Pike and San Isabel revises its management plan we expect them to analyze all IRAs, in addition to other roadless areas proposed by citizens or identified by the Forest Service, for possible Wilderness designation.

The Rule allows the normal administrative, planning and legislative options to be exercised. Implementation of the Roadless Area Conservation Rule would, at a minimum, insure that these areas would not be disqualified from future Wilderness designation by road construction or commercial logging. (Organization, Littleton, CO - #A8829.25110)

TO BEST PROTECT LARGE WILD COMPLEXES

For the most part, all of these identified roadless areas should be maintained and managed under a formal roadless designation, planning and allocation process. Of course, the forest planning process

should determine wilderness recommendations as required by statute and regulation. The emphasis on wilderness designation should be based on this vibrant literature we have spoken of which suggests formal protection of large wild complexes. The first concern ought to focus on adding large (50,000+ a.) roadless areas contiguous to the large extant designated wilderness (i.e. the High Uintas Wilderness and hundreds of thousands of contiguous roadless lands). Second, adding roadless blocks to other existing wildernesses. Third, protecting as wilderness large roadless areas (50,000+ a., e.g. the 120,000 acre Lakes Roadless Area, the western portion of the High Uintas separated from the HUW only by the Mirror Lake Scenic Highway). Protecting roadless areas should focus on protecting roadless areas and clusters of roadless over or equaling 5,000 acres. (Organization, Hyrum, UT - #A13496.25200)

Roadless areas should be combined with our national forest system and wilderness system to create an expanded biodiversity landmass for animals and human recreation. This human recreation area should be non-motorized. Hunting and fishing should be allowed. Camping should be allowed. Snowmobile use and other off-road vehicles should be banned. (Individual, Tucson, AZ - #A872.45100)

1263. Public Concern: The Forest Service should recommend specific roadless areas for wilderness designation.

We urge you to provide Wilderness protection for much of Alaska's Chugach National Forest. Currently, there is none. Wilderness is good business. Wilderness is sustainable. Please insist that the plan revision include Wilderness protection for the existing Wilderness Study Area, the Big Islands of Prince William Sound (Knight, Montague, and Hinchinbrook), the Copper River Delta and the Kenai Peninsula. (Organization, Seward. AK - #A24021.25000)

Secesh, Needles, and Caton Lake Roadless Areas. These three areas should be considered the South Fork Salmon Wilderness in three units. In the included map, the red areas of each of these units shows where the Ponderosa pine habitat it. These are the lands most coveted by timber interests and the most in need of protection. They also include the greatest number of songbirds, owls, and forest carnivores and are increasingly rare because of the Ponderosa pine type habitat. They include the Secesh (South Fork north) west of Zena Creek and along the South Fork of the Salmon; the Needles (South Fork west) along six mile ridge and beside the South Fork of the Salmon to the north and South of Blackmare Creek; and Caton Lake (South Fork east) along the South Fork of the Salmon and the East Fork of the South Fork Salmon River.

The South Fork north area is, fortunately, little threatened. This area includes the lakes portion of Twentymile Lakes, Loon, Enos, and Jungle Lakes, part of the Secesh River and the South Fork. The only area that is threatened is Loon Lake which is popular with trail bicycles. Quartz Creek on the southeast of the area is another spectacular drainage.

South Fork west is another subject. Sixmile ridge, above Krassel, has been controversial for many years because of its timber potential. Include it in the proposed wilderness and go get your timber in another place. It is sensitive because of its place adjacent to the South Fork and Fitsum and Buckhorn Creeks. In addition, the Ponderosa pine habitat is increasingly uncommon and most of this I would say is not in serious jeopardy from fire. The rest of the South Fork west region from Cly Lakes and the Lake Fork watershed and Idler drainage to Nick, Buckhorn and Backmare lakes and the creeks that drain them are shoe-ins for wilderness designation. The Buckhorn drainage is a special case and one that has recently gone from worse to better. A few years ago the main stem Buckhorn Creek "blew out" sediment in a rain on snow storm, carrying much of the road with it. Then the Forest Service chose to close about 6 miles of the road along with pulling out culverts; the "road" is now a trail. Please include this trail in the recommended wilderness. It is roadless at least.

South Fork east (including the Boise NF portion of the Caton Lake Roadless Area) is the lesser known of the South Fork roadless areas and deserves to be wholly designated as wilderness. The area has a myriad of small tributaries and much wild un-traveled area. It contains wolf habitat, endangered salmon and bull trout habitat, and home for mountain goat, cougar, martin, wolverine, goshawk, and three species of grouse (ruffed, spruce, and blue grouse). The Thunderbolt Mountain timber sale illegally cut into this area on the south. (Individual, Boise, ID - #A21369.25200)

IN CONJUNCTION WITH THE BUREAU OF LAND MANAGEMENT, RECOMMEND ALL ROADLESS AREAS IN OREGON FOR WILDERNESS THROUGH A COMPREHENSIVE STATE WILDERNESS BILL

By law, new wilderness area recommendations must be proposed by the Forest Service to Congress during the forest plan revision process for possible new wilderness legislation. The 1.9 million acres of inventoried roadless areas in Oregon, plus the remaining 2.9 million acres of unprotected roadless areas on Forest Service and BLM lands should be designated as wilderness through a comprehensive statewide forest wilderness bill. (Individual, Blue Lake, CA - #A3671.25000)

1264. Public Concern: The Forest Service should manage some roadless areas under specific management prescriptions and some under wilderness designation.

Roadless areas under specific management or wilderness designation: Some of Both. (Individual, Duluth, GA - #A3724.25000)

Should inventoried roadless areas selected for future roadless protection through the local forest plan revision process be proposed to Congress for wilderness designation, or should they be maintained under a specific designation for roadless area management under the forest plan?

Sounds like both would work—use a blend of the two. (Individual, No Address - #A4497.25000)

Wilderness designation and roadless area protection are not precisely the same, and both designations should be maintained in forest plans. Many roadless areas would be suitable for wilderness designation, but Congress's failure to designate roadless areas as wilderness should not prevent continued roadless management, regardless of wilderness recommendations. (Individual, No Address - #A4777.25000)

*Do Not Recommend Roadless Areas for Wilderness Designation***1265. Public Concern: The Forest Service should not recommend roadless areas for wilderness designation.**

Should roadless areas selected for protection through forest plan revisions be proposed to Congress for formal wilderness designation? These areas would not meet the criteria for wilderness areas: they have roads running through them and there are signs of man, culverts, ditches, mine shafts, etc. Besides, we have enough wildernesses for people to tramp through now. (Association, Baker City, OR - #A7990.25240)

BECAUSE ROADLESS AREA CONSERVATION WILL PROTECT THE SAME CHARACTERISTICS THAT MAKE THESE AREAS SPECIAL, BUT WITHOUT ELIMINATING ACCESS

The AMA believes that to impose further restrictions on areas managed as roadless by proposing them for Wilderness designation would do nothing to enhance the protection of roadless area characteristics. In fact, Wilderness designation would act to reduce the long-term health of some roadless areas by restricting management options. The Roadless Area Conservation Rule prohibits or limits activities that threaten the roadless characteristics of IRA. The FEIS lists roadless area characteristics as: Soil, water and air; Sources of clean water; Diversity of plant and animal communities; Habitat for threatened, endangered, proposed, candidate, and sensitive species, and for those species dependent on large, undisturbed areas of land; Primitive, Semi-Primitive Non-Motorized, and Semi-Primitive Motorized classes of recreation opportunities; Reference landscapes; Landscape character and scenic integrity; Traditional cultural properties and sacred sites; other Locally identified unique characteristics. With the exception of some of the characteristic recreation opportunities, these are all attributes commonly associated with designated Wilderness areas. Roadless area conservation will protect the same characteristics that make these areas special and worthy of Wilderness consideration but will do so without eliminating access. (Organization, Pickerington, OH - #A3645.45100)

BECAUSE IT WOULD ELIMINATE TOO MANY ACTIVITIES

These areas should not be proposed for wilderness areas, this would eliminate the area from all activities except horses and hiking, they should have their own designation. (Individual, Denver, CO - #A841.25000)

Don't propose any more land for wilderness designation. It is a ban on man's first invention of note; the wheel. Keep the possibilities open. Don't lock out the future generations, and don't saddle future Americans with lots of rules and public debts, because that is a form of enslavement. (Individual, Burbank, CA - #A18027.25240)

The Idaho Outfitters and Guides Association does not support wilderness management agendas for roadless areas. Wilderness management for these areas would negate much of the recreation opportunity spectrum. Maintenance of trails and other management functions would become more difficult. Mountain bikes, hang gliding, snowmobiling, and affordable outfitted trips are examples of some of the many forms of recreation would be eliminated from Idaho's national forests invoking wilderness management strategies for all roadless areas. (Permit Holder, Boise, ID - #A29589.25240)

I understand that the Snake River and Palisades mountain ranges in Wyoming are designated as "Recommended Wilderness." What I understand this designation to mean is that this area will possibly be designated Wilderness, at which time recreational use of the area by heli-ski operators will be curtailed or terminated. Heli-skiing is a non-intrusive/non-destructive use for public lands. (Individual, Rye, NH - #A26682.25000)

BECAUSE IT WOULD ELIMINATE MOUNTAIN BIKING

A designation of wilderness for these roadless areas would *ban* bikes from using these trails. This would be the worst possible designation and is not acceptable to the mountain biking community. Mountain biking organizations have made huge progress in learning [and] applying appropriate trail design techniques, maintaining existing popular trails, and sharing trails in a socially acceptable manner. Mountain cyclists should not be isolated from other muscle-powered recreational users. Although mountain bikers agree that protection is needed for these roadless areas, a different designation from that of wilderness would be the most appropriate. (Individual, Woodland, CA - #A18071.25000)

BECAUSE IT WOULD RESTRICT STATE WILDLIFE MANAGEMENT FLEXIBILITY

DNR's remaining major concern is over the apparently automatic consideration by the FS of roadless areas for wilderness designation. . . . I want to take this opportunity to firmly state our concern over reduced management flexibility caused by wilderness designation. This apparently default process forces DNR to consider the wildlife management implications of wilderness rather than simply roadless designation for these Georgia tracts. Alternative long-term management options should be available for roadless areas that maintain their current characteristics, but provide more flexibility than wilderness. (State Agency, Social Circle, GA - #A22054.25240)

BECAUSE IT WOULD LOCK UP NEEDED NATURAL RESOURCES

Absolutely not. We should not designate any more wilderness. This should also apply to old growth. We cannot keep locking up our resources—known or yet to be discovered. The risk of being unable to feed, clothe, house, provide energy and provide quality of life for future generations is too great; wise use—yes, sustained yield—yes, BMPS—yes, environmental and science supported activities—yes, wilderness—no! (Business, McBain, MI - #A12006.25240)

BECAUSE IT IS ELITIST, FAVORING THE YOUNG AND WEALTHY

The roadless areas should definitely not be designated wilderness. Only the young and the rich can enjoy the wilderness, leave the forests for the elderly and the poor to enjoy. Every coolie and creek does not have to be accessed, but there should be some for every type of user. (Individual, Bozeman, MT - #A8826.25000)

BECAUSE THERE ARE ENOUGH WILDERNESS AREAS ALREADY

While I do not have a problem with some wilderness areas I have to question at what point does it become enough?. I do believe that there is either enough or very close to enough wilderness areas and shutting down more areas to where they become either wilderness areas or essentially wilderness areas is not needed. (Individual, Boulder, CO - #A4480.25000)

[8.] Congressional designation of a wilderness area takes Congressional action to reverse in the event the area is ever needed to be utilized for anything other than wilderness. Do not attempt to set aside any more large tracts of land. Currently, there are millions of acres of roadless designation in the U.S. This is enough. The balance of the forests should be managed under the multiple use concept, as Congress intended. An example would be the Wasatch-Cache National Forest. There are currently 460,000 acres set aside as wilderness. Resource users agreed in 1984 to this size of wilderness designation. This agreement was understood by all parties as being THE number of acres of roadless designation, even before the 1984 Wilderness Bill was passed by Congress, and ever since, the preservationists have been attempting to enlarge the wilderness boundaries with buffers, corridors, and with large tracts of inventoried roadless. Just because the Forest Service has inventoried a tract of land as roadless doesn't mean it is actually "Roadless," or needing special treatment. That is a preconceived error by the Forest Service. We know of areas which have been inventoried roadless that contain private land, early warning stations, natural gas plants, and many old logging or resource roads that are currently being used to access private land or used to access current Livestock Grazing allotments within the National Forest. Enough is enough please leave some forest for sensible renewable resource use and production. (Fire Warden, Uinta County, WY - #A15287.25240)

I personally feel that there is adequate Designated Wilderness already. A simply look at the percentages of land show that approximately 34% of all federally managed land is Designated Wilderness. This doesn't even include many millions of acres of National Park lands that while not Designated Wilderness, are managed as wilderness, or Wilderness Study Areas, which in most cases are managed as Designated Wilderness. However statistics show how few people actually utilize these areas. A balance needs to be developed, and I feel that we are far beyond a balance at the present time with Designated Wilderness winning out. (Organization, Huntsville, AL - #A13542.25240)

8. Should roadless areas selected for protection through forest plan revisions be proposed to congress for formal wilderness designation?

No. The protective provisions of the roadless conservation rule affect nearly three million acres of National Forest System Lands in Region V alone. Approximately 4.1 million acres within Region V are all ready within designated federal wilderness areas. The addition of three million acres of roadless areas managed as wilderness may result in more than a 40 percent increase in the amount of land managed as federal Wilderness throughout the Region, significantly impacting public access to these lands. The immediate protection proposal will result in almost 70 percent of all land within Alpine County being managed as federal wilderness. Consequently, in Alpine County and through the region, access to National Forest System lands will be significantly reduced for those unable to walk or hike, or user groups who desire other forms of transportation not allowed within areas managed as wilderness. (Elected Official, Alpine County, CA - #A8597.25240)

About 18% of Forest Service lands are currently designated Wilderness, more lands have been recommended as Wilderness and are currently managed to prevent impairment of wilderness qualities. Given the Forest Service's multiple-use mandate, 18% is an appropriate amount of Wilderness, and little—if any, more Wilderness should be designated. (Individual, Logan, UT - #A13482.25240)

In conclusion I would like to comment on the proposed 603 wilderness areas. I oppose any more wilderness areas, especially where existing roads exist. We, the public, have given up too much of our public lands already to special interests. (Individual, Bishop, CA - #A3683.25200)

1266. Public Concern: The Forest Service should not recommend additional specific areas for wilderness designation.

My state of Montana has an average yearly salary of approx \$22,000 per person. We have lost logging, mining, and ranching as industries and are told we need to depend on tourists who want to “view wilderness and more wilderness.” They can view what we’ve got. That’s enough! (Individual, Kalispell, MT - #A1076.75200)

1267. Public Concern: The Forest Service should drop recommended wilderness status for roadless areas if Congress fails to act after a reasonable amount of time.

Wilderness recommendation should not be allowed to let a unit become defacto wilderness in perpetuity. Only Congress can designate wilderness. After a reasonable amount of time, such as a planning cycle, if Congress has not acted, managers must assume that Congress has rejected their recommendation and determine a long-term management direction for the unit other than wilderness. (Business, Lewiston, ID - #A7991.25000)

Identification of a unit of land as an inventoried roadless area must not become a de facto designation, requiring that it be managed forever in some kind of roadless limbo. A thoughtful and definitive decision as to how the unit will be managed must be made once and for all in the forest plan. If the decision is to recommend it for a designation as wilderness, that status must sunset if Congress fails to take action, its inaction in effect rejecting the recommendation. (Organization, No Address - #A8227.25000)

Wilderness Recommendation Criteria

1268. Public Concern: The Forest Service should follow the established legal criteria regarding recommendation of wilderness areas.

Refer to your policies dictated by Congress for designated Wilderness Areas and use them. (Individual, Bristol, TN - #A1024.25000)

The Forest Service has criteria for designating areas including wilderness areas and the forest plan should address those recommendations for designation. The unique roadless areas may be proposed for wilderness designation, however, most areas should be maintained as roadless in the Forest Plan due to the management flexibility that would provide. (State Agency, Phoenix, AZ - #A17678.25220)

I do not believe this question needs to be addressed. Present law and rules deal adequately with the question. (Individual, Newtown, PA - #A19257.25100)

FOREST SERVICE HANDBOOK

The primary type of evaluation of roadless areas should relate to developing recommendations of areas appropriate for Wilderness designation by Congress. The Forest Service Handbook currently includes an entire chapter (Chapter 7) devoted to outlining the factors that should be considered when evaluating inventoried roadless areas. Section 7.23b is devoted to the factors that should be considered. We believe these provisions are adequate for evaluation of roadless areas for wilderness in conjunction with administration of the roadless area conservation rule. (Civic Group, Roanoke, VA - #A1713.25210)

WILDERNESS ACT

The ALC believes that areas with wilderness values as defined by Sec. 2(c) of the Act and defined by forest planning should be recommended for classification by the President to Congress. Those areas not so recommended should be released for multiple uses as defined by the 1960 act and subsequent legislation. (Association, Coeur d’Alene, ID - #A11800.25000)

The Forest Plan should make the decision whether or not any area should be recommended to Congress for formal Wilderness designation, recognizing that the Wilderness Act defines clearly those attributes that must be present for such a designation. (Association, Fernandina Beach, FL - #A15466.25230)

1269. Public Concern: The Forest Service should use the Wilderness Attribute Rating System from RARE I and II if further evaluation is necessary.

These roadless areas have repeatedly been evaluated for wilderness attributes and found wanting. If any passive management is being considered this should be again evaluated using the Wilderness Attribute Rating System used during the RARE I and RARE II efforts. (Organization, Wenatchee, WA - #A22628.25200)

1270. Public Concern: The Forest Service should recommend roadless areas for wilderness designation based on location criteria.

AREAS THAT ARE ADJACENT TO EXISTING WILDERNESS

No formal wilderness designation should be given to any roadless area unless it is adjacent and contiguous with an existing wilderness. (Individual, Whitefish, MT - #A5102.25220)

Should roadless areas be proposed to Congress for Wilderness designation?. Yes, undoubtedly, some should. Most tracts of roadless lands border designated Wilderness and would only complement the function of wilderness. . . . We support the ongoing efforts of the High Uintas Preservation Council to add some roadless areas to the High Uintas Wilderness simply because it makes sense. Management would be simplified because there is already a prescription for managing wilderness. (Organization, Vernal, UT - #A20753.25220)

1271. Public Concern: The Forest Service should recommend roadless areas for wilderness designation based on ecological criteria.

AREAS WITH UNDERREPRESENTED LOWER-ELEVATION ECOSYSTEM TYPES

Little, if any consideration was given for ecosystem representation in previous Wilderness designations, an important factor for long-term sustainability of native species. As a result, 39%, 44% and 37% respectively of all the Pike San Isabel's (PSI's) alpine tundra, barren rock and spruce fir are in Wilderness areas, but only 9% of the PSI's pinyon-juniper, 3% of the ponderosa pine and 1% of the sagebrush shrublands are in Wilderness. This skewing toward high elevation ecosystem types put lower-elevation species automatically in less well protected areas, and thus more vulnerable to population decline or potential extinction. (Organization, Denver, CO - #A8824.50100)

We have no confidence in the ability of local forests nationwide to adequately protect what remains of our federal roadless areas. While 427,000 acres of Pike San Isabel inventoried roadless areas are now Wilderness, they are primarily located at high elevations. Additional low-elevations lands must be incorporated in the Wilderness system so that plant and animal species which depend on them can also be protected. In addition only 15% of the remaining roadless areas disallow road construction, and many of the others have extensive motorized trails networks. It is important to protect roadless areas as now across the nation waiting for administrative process to inch slowly toward completion. (Organization, Littleton, CO - #A8829.25210)

Roadless areas need and deserve protection now, regardless of whether they are recommended, now or later, for wilderness designation. Roadless areas that possess values generally lacking in the wilderness system should be recommended for wilderness. Here in Colorado, there is very little acreage below elevation 8,000 feet in the National Wilderness Preservation System. Certain ecosystems are similarly underrepresented in the Wilderness system here. These include: pinyon-juniper, aspen, ponderosa pine, Douglas-fir/mixed conifer, mountain shrubland, and mountain grassland. (Organization, Denver, CO - #A12008.25200)

AREAS THAT CONTAIN ENDANGERED SPECIES

Very little, if any, land should be declared Wilderness. Only lands with clear-cut historical or TRUE species of endangerment (and not their falsely placed fecal matter) should be protected. (Individual, Humboldt, TN - #A464.25000)

AREAS THAT ARE ECOLOGICALLY SENSITIVE

Areas of special natural beauty or areas of particular sensitivity, e.g., riparian desert areas where endangered species thrive, should be proposed to Congress for Wilderness designation. (Individual, State College, PA - #A15450.25220)

AREAS THAT ARE 1,000 ACRES OR LARGER THAT ARE ECOLOGICALLY SENSITIVE

Some very sensitive inventoried roadless areas, 1,000 acres or more, selected for future roadless protection through the local forest plan revision process should indeed be proposed to Congress for Wilderness designation. The expansive Tongass area in Alaska and the small Quartzite Watershed area north of Spokane, Washington, are prime candidates for such proposals. (Individual, Chewelah, WA - #A5453.25200)

1272. Public Concern: The Forest Service should recommend roadless areas for wilderness designation based on size criteria.

AREAS OF LESS THAN 5,000 ACRES

I believe that all roadless areas (even those less than 5,000 acres) should be proposed to Congress for wilderness designation. The language of the Wilderness Act itself provides an adequate and eloquent rationale: Sec. 2. (a) "In order to assure that an increasing population, accompanied by expanding settlement and growing mechanization, does not occupy and modify all areas within the United States and its possessions, leaving no lands designated for preservation and protection in their natural condition, it is hereby declared to be the policy of the Congress to secure for the American people of present and future generations the benefits of an enduring resource of wilderness. For this purpose there is hereby established a National Wilderness Preservation System to be composed of federally owned areas designated by Congress as "wilderness areas," and these shall be administered for the use and enjoyment of the American people in such manner as will leave them unimpaired for future use and enjoyment as wilderness, and so as to provide for the protection of these areas, the preservation of their wilderness character." (Individual, Sitka, AK - #A15506.25210)

AREAS OF 1,000 ACRES OR MORE

The Roadless Area Conservation Policy is a good first step to protecting some of the roadless forests in Oregon. But even if the policy withstands congressional, legal and administrative challenges blocking its implementation, 3.1 million acres of roadless areas over 1,000 acres will not be afforded protections by the policy. For the forests included in the policy, logging, road building and other destructive activities could continue, albeit on a limited basis. For these reasons, it is essential that more protections be sought for Oregon's wild forest.

I urge you to do all you can to protect all roadless areas 1,000 acres and greater as Wilderness. Our few remaining pristine forests deserve the most permanent and comprehensive protection we can give them. Wilderness designation is the only way to ensure that these wild forests will remain wild for generations to come. (Elected Official, Multnomah County, OR - #A23662.25200)

AREAS OF 640 ACRES OR MORE

Roadless areas that are larger than 640 acres should be proposed for wilderness designation. Roadless areas smaller than 640 acres should be evaluated for wilderness designation or other status. (Individual, Petrolia, CA - #A27839.25220)

5,000 ACRES IN THE WEST, 1,000 ACRES IN THE EAST

Everything over 5,000 acres west of the Mississippi and 1,000 acres east of the Mississippi in designated roadless areas should be considered for wilderness listing. (Individual, Little Rock, AR - #A27507.25220)

1273. Public Concern: The Forest Service should recommend roadless areas for wilderness designation based on practical management criteria.**AREAS THAT ARE LARGE ENOUGH TO MAINTAIN THE ROLE OF FIRE WITHOUT THREATENING MANAGED AREAS**

Wilderness consideration should only be given to areas of adequate size to truly be a wilderness where all natural and biological functions can progress without unduly influencing other managed areas. These functions must include the role of wildfire. The proposed wilderness must be large enough so that wildfire, under the planned prescriptions, can play its natural and historic role. (Individual, Evergreen, CO - #A19178.25200)

AREAS THAT CONTAIN NO ROADS

For the areas that truly do not have roads (which are few and far between in most cases) should truly be classified as wilderness with no fires, no motorized vehicles, no hunting, no fishing, etc. For the areas that actually have roads which you are attempting to classify as roadless, they should continue to be managed as they have in the past with the exception that more education for the user of the area is needed (the public who owns the land). (Individual, No Address - #A356.25220)

Wilderness areas designation is a big farce and should be stopped. Many wilderness areas have been established so as to appease special groups, they have been established for political ploys, and have even been established just to prevent anyone from accessing the areas across someone's back yard. Wilderness areas should be reserved for those areas that have no existing roads, are in fact pristine (and not just with potmarked desert hills eroded through the acts of nature or scrub brush that is nothing more than a fire hazard). (Individual, Maricopa, CA - #A3732.25000)

Another comment I have here is if a given area is going to be proposed as wilderness, why make it roadless first???? Let's just cut to the chase and do it now and do it right!!! If there are roads in a given area, then it is NOT roadless it is NOT wilderness and it should NOT be proposed as such!!! Wilderness has its place, but let's don't call an area wilderness if in fact it is not! I feel wilderness is far too restrictive by and large. If there are roads in a given area, then a I understand wilderness policy the land/area does NOT qualify! (Individual, Ogden, UT - #A590.25000)

1274. Public Concern: The Forest Service should recommend previously overlooked roadless areas for wilderness designation.**BASED ON CHANGES IN FOREST CONDITION, PUBLIC VALUES, AND SCIENTIFIC UNDERSTANDING**

Contrarily to the tone and content in the ANPR, as well as general perceptions in the PSI, our organization, along with many others in Colorado, believe that these remaining roadless areas have great potential for Wilderness designation. On the Pike and San Isabel, we have identified at least 550,000 acres that meet all the Wilderness criteria used by the USFS. Most of this is found in the 669,000 acres of IRAs, and some is in adjacent and/or contiguous unroaded areas. While the Forest Service continues to believe that the findings of RARE II and decisions in the 1984 LRMP forever dismissed these areas as potential Wilderness, we respectfully disagree. Public perceptions, the science of conservation biology, new management priorities and techniques and evolving forest conditions have changed the very nature of evaluation of potential Wildernesses. (Organization, Denver, CO - #A8824.25200)

All roadless areas should be evaluated as to their wilderness potential and recommendations made to Congress for wilderness designation. Areas in particular, such as Pelican Butte, which were originally intended to be included in an adjacent wilderness area should be reevaluated for wilderness designation. (Individual, Klamath Falls, OR - #A5118.25220)

1275. Public Concern: The Forest Service should continually reevaluate roadless areas for wilderness characteristics.

MAKE NEW RECOMMENDATIONS EXPEDITIOUSLY

All Forest Service lands should be continuously evaluated for Wilderness characteristics. When found, areas should be designated as wilderness in the most expedient manner. (Individual, Santa Fe, NM - #A18167.25220)

Management of Roadless Areas That Do Not Meet Wilderness Criteria

1276. Public Concern: The Forest Service should collaborate with organizations regarding management of areas not suitable for wilderness designation.

Some roadless areas should be proposed for formal wilderness designation. For other areas, the Forest Service should work with organizations such as the Alliance for the Wild Rockies, which is trying to establish connecting biological corridors for wildlife throughout the west, yet allow multiple use in some areas. Such joint ventures would encourage hunting, fishing, and other non-motorized outdoor recreational activities. (Individual, Tucson, AZ - #A872.25000)

1277. Public Concern: The Forest Service should maintain areas that do not qualify for wilderness under a roadless category.

Some should be wilderness and some should not. It has been said many times lately. There is great value in maintaining roadless lands as a category between wilderness and general road use. (Individual, Grangeville, ID - #A830.25220)

Wilderness designation. Wilderness offers the strongest protection for our remaining wildlands. However, we do not feel that wilderness designation is necessary for the protection of all roadless areas in light of the protections offered by the Roadless Rule. Decisions about recommending wilderness designation can, and indeed must, be made through forest planning. All roadless areas must be evaluated for potential wilderness designation during forest planning by law. The Roadless Rule does not interfere with this process. Roadless areas not selected for wilderness protection should be managed under forest plans in a manner consistent with the Roadless Rule, with additional protection from motorized off-road vehicles. (Organization, Washington, DC - #A18031.25000)

Where roadless areas are large or where they adjoin existing wilderness, they should be considered for wilderness designation. Otherwise, they should be managed for minimal interference in their own specific designation. (Organization, Washington, DC - #A18031.25220)

TO ALLOW MECHANICAL FOREST MAINTENANCE EQUIPMENT, BUT NOT ROADS OR RESOURCE EXTRACTION

The most precious of the 58.5 million acres should be designated Wilderness Areas. The rest of the 58.5 million acres should be designated "Roadless Areas," where mechanical forest maintenance equipment is allowed but where roads or resource extraction are not allowed. In-good-faith obedience to the spirit of the rulemaking-ecological preservation-should guide the drawing of policy details. (Individual, No Address - #A117.25220)

TO PROTECT THESE AREAS FROM COMMERCIAL DEVELOPMENT

All roadless areas do not need to be designated wilderness. Wilderness should be reserved for those special areas that have specific environmental resources that need specific protections. The current Roadless Area Conservation Rule would allow access, such as mountain bikes, that would be excluded by wilderness designations. We need to protect the forests from commercial development and destruction while allowing the American public to continue to use and enjoy their lands. (Individual, Reno, NV - #A5110.25220)

1278. Public Concern: The Forest Service should drop areas not eligible for wilderness designation from roadless status.

In the process of doing EISs of individual areas, wilderness status should be considered. If an area is found to be of wilderness quality it should be recommended to congress to be included in the wilderness system. If it does not qualify for wilderness status it should be dropped from roadless status. When this process is completed there should be no roadless areas. (Individual, Miami, AZ - #A880.25220)

IN ORDER TO FULFILL THE FOREST SERVICE GOAL OF MULTIPLE USE

Roadless area designation was a holding status, made during the 1980's to provide more time to determine whether or not they should be considered further for Wilderness status. Now, these areas should either be designated as Wilderness, for which most will not qualify, or put into the full planning process, so that the Forest Service goal of multiple-use can be fulfilled. (Elected Official, Plumas County, CA - #A4846.25220)

1279. Public Concern: The Forest Service should assign different designations to areas that do not qualify for wilderness status.**GENERAL FOREST**

Everything that is not Wilderness should be "general forest." (Individual, No Address - #A14054.25000)

NON-MOTORIZED PRESCRIPTIONS CONSISTENT WITH THE ROADLESS AREA CONSERVATION RULE

Roadless areas are appropriate to consider and recommend for Congressional Wilderness designation. Wilderness offers the strongest protection for our remaining wildlands. However, we do not feel that wilderness designation is necessary for the protection of all roadless areas in light of the protections offered by the Roadless Rule. Decisions about recommending wilderness designations can, and indeed must, be made through forest planning. All roadless areas must be evaluated for potential wilderness designation during forest planning by law. The Roadless Rule does not interfere with this process. Roadless area not selected for wilderness protection should be managed under forest plans in a manner consistent with the Roadless Rule, with additional protection from motorized off-road vehicles. (Organization, Washington, DC - #A22129.25000)

*Relationship of Roadless and Wilderness Management***1280. Public Concern: The Forest Service should bear the burden of proof that roadless areas should be entered.**

I don't feel that all of the remaining roadless areas should be made wilderness. I do feel, however, that the burden of proof should be shifted—from the public to the Forest Service. The public should not have to demonstrate the value of the roadless area to the Forest Service every time the Forest Service wants to build a new road. Rather, the Forest Service should have to demonstrate the value of a road every time they want to build a new road. Roadless areas would remain roadless unless extenuating circumstances caused a majority of public comments to change the roadless designation. By extenuating circumstances, I don't refer to some insect outbreak, development interests, or some other weak excuse for logging in roadless areas. (Individual, Nickelsville, VA - #A30521.25120)

1281. Public Concern: The Forest Service should manage roadless areas to preserve wilderness characteristics.

The law and responsible stewardship requires evaluation for official Wilderness status. Roadless areas must be managed as de-facto Wilderness. (Individual, San Jose, CA - #A6276.25100)

These roadless areas are among the last remaining tracts of de facto wilderness within USFS lands. While de facto wilderness lands are not managed as federal Wilderness Areas, as you well know, federal Wilderness Areas are created out of de facto wilderness lands. Less than five percent of the land mass of the United States exists as federally designated Wilderness Areas. The Roadless Area Conservation Rule

is a landmark rule because it sets aside a protected pool of de facto wilderness out of which future Wilderness Areas can be created. (Individual, San Jose, CA - #A17367.25200)

TO ENSURE THAT THEY CONTINUE TO QUALIFY FOR CONGRESSIONAL DESIGNATION

As presently constituted, the Rule allows for Wilderness considerations to continue through the normal administrative, planning and legislative channels. Implementation of the Roadless Conservation Rule would, at a minimum, insure that these areas would not be disqualified from future Wilderness designation by road construction or commercial logging. The important thing is leave options for Wilderness open, for once these areas are roaded they are potentially disqualified for this protection for perhaps hundreds of years. (Organization, Denver, CO - #A8824.25110)

Ultimately, when the individual forest plans are updated, the roadless areas with wilderness characteristics will be evaluated for wilderness designation. (36 CFR 219.17). Until that time, and with regard to the roadless areas that may be proposed for designation other than wilderness, the Roadless Area Conservation Policy should be implemented as promulgated in order to preserve the roadless values that currently exist. (Individual, Eugene, OR - #A15583.25100)

Good information is important to Congress when it makes decisions to protect areas under the Wilderness and Wild and Scenic Rivers Acts. Many areas in Colorado that are still roadless are worthy of protection and deserve this protection because of the uses and values these lands provide. Over thirty years ago the courts handed down the East Meadow Creek decision that said in some cases the Forest Service must reserve the final decision on wilderness designation for the Congress and could not preempt the options of the Congress by administrative fiat. The creation of RARE II after the inadequacies of RARE is another case where the courts found value and importance in how decisions were made about roadless lands. The Roadless Area Conservation Rule is a continuation of this traditions of conservative decision making in regard to this precious natural and economic resource. (Elected Official, Fort Collins, CO - #A13297.25000)

TO PREVENT OFF-ROAD VEHICLE USE AND MOTORIZED TRAILS FROM THREATENING RECOMMENDED WILDERNESS STATUS

The appropriate role of local forest planning is to implement the Roadless Area Conservation Rule across the forest and evaluate all projects within that context. We further believe that the local forest planning must consider immediate protection for some of these areas to protect their unique qualities from such things as environmental damage from off-highway vehicles and motorized trails, a particular problem across Colorado and the PSI. When the forest plan is revised, the Pike and San Isabel will be required to analyze citizen recommended and inventoried roadless areas for potential Wilderness designations. Since more than 500,000 acres of the IRAs meet all wilderness criteria, we are concerned that they may be disqualified unless they are protected now. (Organization, Littleton, CO - #A8829.25000)

BECAUSE RECREATION PRESSURES HAVE BECOME INTENSE AND DAMAGING

Maintain them as de facto wilderness under agency-wide protection. If this means that future administrations could change agency rules and put these areas at risk, then legislation needs to be pursued which would require Congressional consideration of these areas for official wilderness status before rule changes could take effect. In this scenario, Congress would be unable to "deselect" an inventoried roadless area. We need to avoid the creation of "billboarded" wilderness, because recreation pressures have become intense and damaging. (Individual, Flagstaff, AZ - #A5026.25200)

BY ALLOWING ONLY ACTIVITIES SUCH AS HIKING, HORSEBACK RIDING, AND HUNTING

The areas should be treated as wilderness areas allowing only traditional activities such as hiking, horseback riding and hunting. (Individual, Winchester, VA - #A378.25120)

BY MANAGING THEM AS WILDERNESS WITH RESPECT TO FOREST HEALTH TREATMENTS

Inventoried roadless areas should be managed similarly to wilderness areas when it comes to protecting them from severe wildfires and insect and disease outbreaks. (Individual, Laramie, WY - #A1.25200)

BY TREATING FIRES ONLY WHEN THEY THREATEN STRUCTURES OR HUMAN LIFE

Existing roadless areas should be managed like wilderness areas: where active fires threaten structures or human life, action may be warranted. However, any attempts to thwart the implementation of the roadless ban on the grounds of “forest health” are an obvious attempt to mislead the public as to the current administration’s real aim—gutting the roadless ban. Insects and diseases are a natural part of forest ecosystems, and only become a major concern when the management objective becomes resource extraction, not ecological function. (Individual, No Address - #A5224.25220)

1282. The Forest Service should manage roadless areas to preserve wilderness characteristics.**BECAUSE WILDERNESS AREAS CONTRIBUTE TO THE SOCIAL, ECONOMIC, AND ENVIRONMENTAL VALUES OF A REGION**

As for activities that should be allowed in roadless areas, the Forest Service should use management of Wilderness Areas as a guide. Many Wilderness Areas contribute greatly to the social, economic and environmental values of a region. We were in Pinedale, Wyoming, on our way to the Bridger Wilderness, we spoke to many local folks in a small restaurant who bent over backwards to suggest hiking routes, good fishing spots, or just a pretty place to see. (Individual, No Address - #A4523.25000)

1283. Public Concern: The Forest Service should manage areas recommended for wilderness designation to preserve wilderness characteristics.

Roadless Areas recommended for wilderness designation in forest plans should be managed to retain wilderness values and should be managed as Wilderness, under the rules and regulations of the National Wilderness System. (Organization, Boise, ID - #A20363.25230)

1284. Public Concern: The Forest Service should keep all roadless areas unroaded regardless of recommended wilderness status.

By law, forest plans must evaluate the wilderness potential of all roadless areas and make recommendations for wilderness designation by Congress. The rule allows the wilderness recommendation process to continue. Forest plans also designate roadless areas for continued roadless management, regardless of whether they are recommended for wilderness. The rule ensures that roadless areas will, at a minimum, be protected from road construction and commercial logging. Recommending roadless lands for additions to the National Wilderness System should not preclude immediate protections for these places. (Organization, Nevada City, CA - #A4941.25100)

Wilderness designation is preferable, with emphasis on greater connectivity of existing protected areas. But this is not to say that such decisions should be made on a “now or never” basis, i.e. current roadless areas should remain roadless, regardless of whether or not they are deemed appropriate for wilderness designation at this time. (Individual, Corvallis, OR - #A650.25200)

1285. Public Concern: The Forest Service should maintain inventoried roadless areas in the same condition as they appeared when inventoried.

No change in roadless protection can occur until Congress determines whether an area is unsuitable or suitable based upon prior recommendations to Congress. Under the forest plan, Inventoried Roadless Areas must be maintained in exactly the same condition as they appeared when inventoried. The agency has an equal obligation to preserve “suitable” characteristics and “unsuitable” (developed/nonwild) characteristics. (Individual, Moab, UT - #A15790.25100)

Each specific Inventoried Roadless Area should be managed individually by inventorying the needs to the area to attain or maintain good forest health, then implementing any projects which can meet the goals set in protecting forest health. The agency has a mandate to preserve Inventoried Roadless Areas in their exact condition as of the date of their designation as Roadless Areas. The 1964 Wilderness Act

and supporting case law requires the agency to preserve Congress' ability to act upon the "suitability" recommendations of the agency. The agency must therefore not only protect areas found "suitability" for Wilderness designation, but must also preserve areas found "non-suitable" for Wilderness designation. Activities which alter the "snap shot" of the IRA which lead to the agency's "suitability" recommendation are prohibited, whether those activities be permanent road construction or road decommissioning, obliteration, or closure. Therefore, the agency is not only permitted to conduct forest health projects, even those such as fuel load reduction through timber harvest, but is required to do so in order to preserve the exact composition of the area. (Organization, Chesapeake, VA - #A11804.25100)

Each specific Inventoried Roadless Area should be managed individually. The agency must preserve Inventoried Roadless Areas in their exact condition as of the date of their designation as Roadless Areas. Activities which alter the "snap shot" of the IRA which lead to the agency's "suitability" recommendation are prohibited, whether those activities be permanent road construction or road decommissioning, obliteration, or closure. Therefore, the agency is not only permitted to conduct forest health projects, even those such as fuel load reduction through timber harvest, but is required to do so in order to preserve the exact composition of the area. (Individual, Des Moines, IA - #A12587.45500)

1286. Public Concern: The Forest Service should manage roadless areas 5,000 acres or larger as wilderness and allow limited management activities in areas of less than 5,000 acres.

Roadless areas of 5,000 acres and greater should be managed just like wilderness areas. Areas of less than 5,000 acres should be prescribed burned and maybe some helicopter logging of understory to reduce fuel.

You cannot protect the forest from insect or disease, so management to prevent this is impossible. This has been used as an excuse for massive logging. In areas of 5,000 acres and larger, let nature take its course. In areas of less than 5,000 acres maybe some salvage by helicopter could be done without new roads.

Wildfire is going to happen no matter what you do for management. Allow some fires to burn under prescription and prescribe burn to reduce severity. (Individual, Thompson Falls, MT - #A5643.30100)

1287. Public Concern: The Forest Service should not manage inventoried roadless areas as de facto wilderness.

First and foremost, we do not believe that the presence or absence of a road creates a "special place" on the national forests. Areas without roads are not by definition wild or wilderness and should not in every case be managed as if they were. The ecological, physical, and biological attributes present in a particular place best define the values of the national forests. Roads, trails, or other improvements can improve or maintain these values. In many cases, these facilities are necessary if the values are to persist over time, such as in the case of maintaining certain wildlife habitat or access to reduce hazardous fuels. In addition, many of the inventoried roadless areas are not roadless. They have roads, water developments, transmission lines, and in some cases have been previously agricultural land. (Association, Terra Bella, CA - #A15588.45100)

1288. Public Concern: The Forest Service should not manage uninventoried roadless areas as de facto wilderness.

BECAUSE IT IS CONTRARY TO CONGRESSIONAL INTENT

To manage these lands [uninventoried roadless areas] to maintain options for further roadless inventory is contrary to the Congressional intent relative to roadless areas as expressed during the 1981 designation of wilderness in California. We note the following statement in the Committee Report:

The fact that the wilderness option for roadless areas will be considered in future planning raises the hypothetical argument that the areas therefore must be managed so as to preserve their wilderness attributes so that these may be considered in the future. Such an interpretation, however, would result in

all roadless areas being kept in de facto wilderness for a succession of future planning process. Such an interpretation is obviously incorrect, and if applied, would completely frustrate the orderly management of nonwilderness lands and the goals of the Forest And Rangeland Renewable Resource Planning Act. (Committee on Interior and Insular Affairs, 97th Cong. 1st Sess. Report No. 97-181, p. 45) (emphasis added). See also Committee on Energy and Natural Resources, 96th Cong. 2d Sess., Report No. 96-914, p. 26. (Elected Official, Roseburg, OR - #A11811.25110)

1289. Public Concern: The Forest Service should only consider roadless units that have been recommended as wilderness but rejected by Congress through inaction.

This planning effort to address roadless units should be final, ending the limbo status these units have languished in since RARE I. The only units to be addressed in the future should be those recommended as wilderness, but rejected by Congress through in-action. Otherwise management of these units should be addressed in same fashion as other lands during forest plan reviews and revisions. (Individual, Frenchtown, MT - #A11887.45400)

Roadless Designation

Summary

General Comments – The comments provided by the public about the advisability of creating a separate roadless designation echo the broader body of comment about whether or not a national roadless rule should be implemented. In the context of answering Question 8, some ask that the Forest Service clarify to the public that designating roadless areas will not preclude future action by Congress to declare them wilderness. Those who ask that a national rule not be implemented assert that Congress should grant express authority to the Forest Service before any roadless designation is created. Others state that local government consent must be obtained prior to any such designations in any lands covered by the Weeks Act (see also Chapter 5: Forest Management: Roadless Areas General: *Authority for Roadless Area Management*). These respondents also assert that a roadless designation amounts to a de facto wilderness designation by the Forest Service; while those who ask that a national rule be implemented maintain that the Roadless Area Conservation Rule does no such thing, since many more activities are allowed under the Rule than under the Wilderness Act. Some assert that the rulemaking should be dropped because these areas have not been considered or ignored by Congress for official wilderness status. Others assert that this reasoning is not valid due to the slow nature of the political process and the fact that wilderness recommendations follow from the same local planning process that has also so far proved unable to protect roadless areas from entry. Some suggest the Forest Service adopt another term besides “roadless” because it has become too great a political hot potato.

Various respondents also assert that the Forest Service should expand existing roadless areas by restoring and rehabilitating many roaded portions of the National Forest System, especially the roaded portions of inventoried roadless areas. In particular, the low percentage of roadless areas in the eastern United States and in the Appalachians are cited as reasons to broaden a national rule. There are others who believe that a “return to roadlessness” is inappropriate, and some ask that the Agency reduce the size and number of roadless areas to be covered by it.

Adequacy of Analysis – Some comments in this section overlap with those in the section on roadless area designation criteria (below) because they emphasize the need for thorough evaluation of roadless areas or provide suggestions for coordinating this effort with forest plan

revisions. A few individuals suggest that large contiguous tracts of wild forest habitat should be reestablished in order to allow natural processes to function, and ask that this be a prime focus of large scale analysis in future planning. Other respondents provide very specific observations regarding the adequacy of the data and analysis used in the Roadless Area Conservation Rule Draft and Final EISs. Some assert in particular that these analyses lack accurate data on private inholdings, school trust lands, and mineral rights within inventoried roadless areas. An organization states that the amount of roadless acreage currently assigned to protective categories in Oregon is inflated, while several county commissioners and other individuals assert that the Forest Service has under-represented National Forest System lands in categories that limit intensive human uses. Other county commissioners request that Appendix C be revised to acknowledge that many inventoried roadless areas have already been determined to be unqualified for wilderness recommendation by the Forest Service.

Designating Roadless Areas – Many responses to Question 8 are phrased as a simple statement for or against the advisability of a new roadless management prescription. Other respondents address this topic elsewhere in their comments in the context of broader management direction, for instance as the suggested alternative for management of roadless areas that do not qualify for wilderness recommendation. Some respondents believe that a roadless management category is appropriate—although others state that a wilderness designation would be preferable—or alternatively any existing management category that is consistent with a national rule. Respondents also conclude that creation of a new roadless category is inappropriate, although some do recommend a Backcountry Recreation Area prescription. (See also the section below on designating other new management categories.)

Those who recommend a roadless prescription cite many reasons for employing such a prescription, including the assertion that this is a means to resolve ongoing wilderness controversies. Because this prescription could allow activities prohibited in wilderness areas such as mountain biking, as well as administrative tools such as chainsaws, many state that this category is needed and could be supported by a broader array of recreationists. Some individuals recommend the creation of multiple roadless categories with varying sets of uses in order to best respond to local conditions. Others ask that local forest managers be able to add further prohibitions to roadless management categories. Finally, some ask the Forest Service to create a dynamic roadless designation that adopts an adaptive management approach to best respond to changing environmental and social conditions over time.

Others recommend that a new roadless management prescription not be employed and assert that a separate management category is unnecessary, as well as respondents who generally ask that a national rule not be implemented and therefore also recommend that no type of separate roadless category be employed. Further reasons cited for not creating a roadless category include the belief that roadlessness itself is not sufficient justification for it—that conditions vary too greatly between roadless areas for a single category to be effective; that it will strain agency budgets; and that wilderness areas themselves are not being well managed, so a roadless designation will drain resources and result in similar problems. Finally, some say that road management budget problems should not be used as the justification for roadless designations, and assert that other solutions to financial issues should be pursued.

Roadless Area Designation Criteria – Some respondents discuss the overall design and selection of criteria for roadless area designation. A common theme is the request for a clear and specific set of tools to be used in the roadless evaluation process. Others critique the current list

of roadless evaluation criteria found in the Forest Service Handbook and suggest alternatives to be included. Other respondents suggest creating a method for weighting the factors during decisionmaking. One Organization asserts that the current criteria do not work well in the eastern United States, and suggests amending the handbook to take into consideration the specific situations in these regions. Some say that the current criteria reflect wilderness recommendation decisionmaking, but that the Roadless Area Conservation Rule has a different goal from this process. Therefore, they suggest modifications to the handbook criteria in order to meet the goals of the Rule, such as removing the “sights and sounds” criteria and unlinking solitude considerations from recreational opportunity spectrum core area sizes. Finally, a number of respondents ask the Forest Service to make sure that the most up-to-date mapping is used, and that data is ground-truthed for accuracy during the roadless delineation process.

Comments about the criteria that should be used in the roadless designation process vary. Inventory status is one criterion often mentioned by respondents. While some state that a national rule should be limited to inventoried roadless areas only, others say that uninventoried areas should also be covered under a national rule.

Size is another criterion that is widely mentioned in public comment. Some urge the Forest Service to expand the criteria for total acreage to include areas less than 5,000 acres, often citing the acreage cutoff that they consider to be appropriate, such as 1,000 acres. The same respondents also ask that smaller unroaded and uninventoried areas be considered for protection. Other respondents assert that smaller roadless areas should not be considered for protection; one agricultural association suggests that no areas smaller than 10,000 acres should be included. These people say that roadless areas smaller than 5,000 acres, especially uninventoried acres, should not qualify for protection.

Others suggest that acreage alone is less important than proximity to other protected areas, such as existing wilderness areas or National Park Service lands. Still others believe that relative distribution of roadless areas by forest and region should be taken into consideration, with the goal of better balancing the distribution.

Some respondents state that decisions should be based primarily on ecological characteristics, asserting that the current National Wilderness System does not adequately represent many ecotypes, especially those found at lower elevations.

Infrastructure and historic human uses are also frequently mentioned as criteria by which to evaluate roadless areas. Respondents ask that the Forest Service ensure that any inventoried roadless areas with existing roads or other infrastructure be excluded from the Rule. Some request that any roadless areas adjacent to private property be excluded, while others say that any areas with valuable natural resources should be disqualified. Several add that any existing infrastructure should not disqualify a roadless area from protection, especially if the roads are user-created or have been closed. Others request that roadless areas be included for protection despite historic motorized use of a given area, and some ask that roaded areas be rehabilitated and returned to roadless status.

Roadless Designation General

1290. Public Concern: The Forest Service should clarify that designating areas to a roadless management category does not preclude future designation as wilderness.

Question #8—This question is confusing. I would offer forth that the designation of any tract of forest as a “roadless area” should not be construed as to prohibit its future designation as a wilderness area. (Individual, No Address - #A7184.25000)

1291. Public Concern: The Forest Service should implement a national roadless rule to maintain wild and scenic river eligibility for streams in roadless areas.

A protected forest has protected streams. The river we cross when entering our land is the upper Hoback River. Two segments of it have been found eligible for inclusion in the National Wild and Scenic Rivers System. The higher segment is eligible for the designation of Wild. Altogether, segments of more than 30 streams on our Bridger-Teton National Forest have been found eligible. The ones eligible for Wild are, by necessity, located in roadless (if not Wilderness) areas. Roadless areas protect the criteria that identify Wild NW and SR candidates. (Individual, Bondurant, WY - #A15465.25350)

1292. Public Concern: The Forest Service should not create special roadless designations without legislation from Congress.

Those areas with wilderness values as defined by the act of 1964 should be so recommended to Congress by the President. Under the forest plan these areas can be managed for their wilderness values until Congress acts. Areas not meeting the values defined by Sec. 2(c) of the act should be managed under the Multiple-Use Sustained Yield Act of 1960 and other authorizing statutes. The forest plan should recognize that there are areas requiring special management; however, there should be no specific designation for roadless areas without legislation by Congress. (Individual, Moscow, ID - #A5380.25320)

1293. Public Concern: The Forest Service should obtain the consent of local counties before designating any lands purchased under the Weeks Act as roadless.

The DEIS (3-13) noted that the Weeks Act of 1911 allowed the Forest Service to purchase lands in the Eastern United States, however note that lands were also purchased in Oregon under the same authority. The Weeks Act is particularly relevant to this decision in that lands that were acquired under the Weeks Act were acquired only with the consent of the affected counties, which consent was given with the understanding these lands would be used for commodity production and in turn a 25% return to the counties. Prior to placing any of the Weeks Act lands into roadless or unroaded categories under this action the Forest Service should obtain the consent of the counties. (Elected Official, Roseburg, OR - #A11811.25000)

1294. Public Concern: The Forest Service should not create de facto wilderness through roadless area designation.

In 1964 the Wilderness Act was passed and signed into law. Congress required that the Forest Service and the Bureau of Land Management inventory their lands and recommend to Congress the areas that should be wilderness. This was done. Now comes Clinton and makes de facto wilderness by declaring roadless areas. This is wrong. (Individual, Miami, AZ - #A880.25200)

Wilderness designation and public lands management are the responsibility of the U.S. Congress. Implementation of the proposal of lock up millions of acres, including roaded lands, will for all practical purposes create de facto wilderness. Science cannot be used for justification of such action. Sound science is not biased and is not based on unchallenged biological opinions. Under current law the Forest

Service and BLM are mandated to consider the heritage, customs and culture of communities adjacent to public lands. They are still mandated to be “stewards of our resources,” not “restorers of some utopian concept of what those resources once were.” (State Representative, State of Montana - #A18045.25110)

1295. Public Concern: The Forest Service should emphasize that the Roadless Area Conservation Rule does not create de facto wilderness.

BECAUSE FAR MORE ACTIVITIES ARE ALLOWED

The Roadless Area Conservation Rule prohibits road construction, reconstruction and timber harvest (with exceptions) within inventoried roadless areas, while excepting road reconstruction needed for road safety improvement and Federal Aid Highway projects. This is considerably different from management direction associated with Wilderness Areas. A great many there management activities may be allowed in roadless areas that would otherwise be prohibited in Wilderness Areas.

The Rule, therefore, is not a substitute for Wilderness designation. The Rule provides direction for road construction and timber management activities for roadless areas that are not designated or recommended for Wilderness designation. Roadless Areas that are identified in the Roadless Area Conservation Rule as well as additional areas that may be identified in future plan revision processes should be managed under prescriptions consistent with the prohibitions and exemptions defined in the Rule, and they should be evaluated for recommendations to Congress for inclusion in the Wilderness Preservation System during each plan revision cycle as required by law. (Organization, Damascus, VA - #A17723.25100)

1296. Public Concern: The Forest Service should consider that since many roadless areas have not been recommended for wilderness, a national roadless rule is unwarranted.

ON THE NATIONAL GRASSLANDS

While the Forest Service emphasizes that the National Grasslands have been studied for wilderness since 1972, the Forest Service must also acknowledge that each and every time the agency itself recommended against wilderness management. This is a highly significant fact that supports the position of the counties that no wilderness designation or roadless management is appropriate. The public record provided information omitted by the Forest Service proving that there has been no change in the facts or resources. The Forest Service’s unstated change in policy cannot make roaded lands roadless, cancel mineral leases and royalty rights, or revoke easements and public roads. These lands simply do not meet the statutory definition of roadless or wilderness and must be managed consistent with the purposes for which the United States originally acquired these lands. (Organization, Denver, CO - #A21358.25240)

1297. Public Concern: The Forest Service should reject the argument that many roadless areas do not deserve protection under a national roadless rule.

BECAUSE THEY HAVE NOT YET BEEN RECOMMENDED FOR WILDERNESS

Assertion: many inventoried roadless areas were not recommended for wilderness. This is plainly true but irrelevant to Roadless Rule revision for three reasons. First, the Rule does not create wilderness, allowing as it does many activities and forms of management, including ORV use. Second, protection as wilderness is a reason not to protect (redundantly) through administrative rule rather than a reason to do so, so the failure to protect as wilderness cannot, analytically, be a reason against administrative protection. And third, the wilderness recommendations were themselves a product of the same NFMA planning process whose shortcomings necessitated the Roadless Rule, so their failure cannot serve as a basis for rejecting the Rule. (Organization, Olympia, WA - #A20145.25200)

1298. Public Concern: The Forest Service should follow the model used in the Olympic National Forest Plan.

WITH RESPECT TO ROADLESS AREA DESIGNATION AND MANAGEMENT

I was a participant in the preparation of the Olympic National Forest Plan in 1978-1980. We identified the roadless areas on the forest that met the criteria for potential Roadless Area designation at that time. We attempted to display the characteristics of these areas and the potential environmental effects of designating and managing these areas under the Roadless Area classification. I believe that this approach is still valid and appropriate for these areas. (Individual, Olympia, WA - #A278.45100)

1299. Public Concern: The Forest Service should use other terms instead of "roadless."

USE "RESERVE"

If the Forest Service feels it must have a separate name or a transition term, lets refer to the land as "reserve" instead of "roadless." (Business, McBain, MI - #A12006.25300)

USE "WILD"

On a secondary note, let's start calling these areas "wild" instead of "roadless." The roadless designation still defines these pieces of wild country in relation to vehicles and our ability to gain access. Let's show the wild some respect. It is worth talking about and loving in its own right, not simply because there aren't any roads there. (Individual, Jackson, WY - #A16263.25300)

1300. Public Concern: The Forest Service should increase roadless areas.

Please do not amend rules about roadless forests to allow road building, logging etc. On the contrary, I feel roadless areas should be expanded. Carving up roadless areas doesn't make sense even to Republicans like me. (Individual, Lancaster, PA - #A7030.10150)

I urge you to seek other areas that may also qualify as roadless and to extend protections to them. (Individual, Lansdale, PA - #A611.10160)

BY REMOVING ROADS IN CURRENTLY ROADED, HIGH INTEGRITY AREAS TO MAXIMIZE THE BIOLOGICAL AND ECOLOGICAL IMPORTANCE OF THE FINAL SUITE OF PROTECTED AREAS

To maximize the biological/ecological importance of the final suite of protected areas, the roadless policy should require the use of carefully prioritized road removal - followed by inclusion in the roadless protection program - for all high integrity areas.

In other words, we strongly request that the universe of areas to be considered for final roadless protection not be limited to those areas currently roadless, but include those areas that if restored to roadlessness would achieve the greatest biological and ecological integrity should be considered for immediate road removal followed by inclusion in the roadless area protection program. (Business, Coarsegold, CA - #A1589.45400)

BY EVALUATING OTHER UNROADED AREAS FOR POSSIBLE ROADLESS DESIGNATION

The regulations should provide authority for Forest Supervisors to evaluate other areas for consideration as Roadless designation and management only in the case where such areas are "unroaded". Unroaded should be defined as any area which does not contain any roads (whether such roads are categorized as classified, unclassified, or uninventoried) or motorized trails. (Organization, Chesapeake, VA - #A11804.45512)

BY MAKING ROADLESS AREAS AS LARGE AS POSSIBLE

The real problem is not in giving protection to these ancient remnants. The real problem is that they are not large enough. In every case, they were reduced in size because of specious ideas about buffer zones, and what constituted roads. Every one of the areas in the two Carolinas should be expanded to bring their boundaries out to the nearest roads that presently are in daily use. The guiding principle of the

Forest Service should be how can it make these areas as large as possible; not how can it reduce them in size as much as possible. (Individual, Walhalla, SC - #A6292.45300)

BY RESTORING LANDS TO THEIR ROADLESS CHARACTER

A key element has been entirely missing from your questions and from the Advanced Notice in particular. At no point do you address the issue of rehabilitating former roadless lands to return them to an essentially roadless character. The national dialog concerning roadless areas is inherently flawed if it does not take into account the desirability of establishing procedures and mechanisms for identifying areas to be converted back to a roadless status. Public resources would be far better spent on increasing our bank of roadless lands than in meddling with the remnant of roadless that remains. Obvious candidate areas for such rehabilitation include lands that were identified as roadless in RARE II but have since been degraded by logging or similar intrusions. Other obvious candidates would be relatively small areas of disturbance that separate existing roadless areas, especially when some of those roadless areas are below 5,000 acres in size. Until we start examining in earnest the need to expand the amount of our National Forests that is fundamentally roadless, we will only be looking at half of the question. (Individual, Pendleton, OR - #A30482.45000)

Our property is bordered on three sides by the 1.1 million acre Winema National Forest. Of that 1.1 million acres a mere 32,200 acres or 2.97% would be managed under the Roadless Area Conservation Rule. It is my belief that this is not enough, especially given the fragmented and disconnected nature of roadless areas in the Winema. Steps should be taken to restore National Forest Lands wherever possible to connect these smaller roadless areas. The Winema should draft a long term plan which would increase land managed under Roadless Area Conservation to 10% of its total area. Water quality and quantity is the most important issue in the Klamath Basin. Pelican Butte is a Teir II Watershed and is recognized as a significant source of the highest quality water entering Upper Klamath Lake. It is also a critical element in the ecological health of the Upper Klamath Marsh and Wildlife Refuge. Pelican Butte would also become the largest continuous roadless area in the Winema National Forest and must be provided the highest level of protection afforded under Roadless Area Conservation. (Individual, Klamath Falls, OR - #A4970.45622)

1301. Public Concern: The Forest Service should address the low percentage of roadless acreage in the southern Appalachians relative to the national average.

In Southern Appalachians generally, the roadless areas inventoried by the U.S. Forest Service comprise only 15 percent of national forest land. That's well below the national average of 31 percent. The Southeast is one of the fastest growing regions, putting more people pressure on national forests than anywhere else in the country. In this region the growing dilemma is more people clamoring for use of the national forest, but fewer acres to accommodate them. (Civic Group, Nashville, TN - #A10552.10111)

1302. Public Concern: The Forest Service should not expand roadless areas by restoring roaded areas.

The concept of **reversion to roadless** as described by Mr. Shea in his published article and as written to me by staff of HCCA is contrary to the spirit of this process. (Individual, Littleton, CO - #A13845.45100)

1303. Public Concern: The Forest Service should reduce the number and size of roadless areas proposed.

“Cut back on the number of ‘roadless areas.’ Do we really need as many as proposed? Don’t be so ‘stiff’ on not allowing roads in ‘roadless areas.’ You can ‘soften regulation’ if you choose.” (Individual, No Address - #A834.45100)

I oppose all roadless areas as they block use from motorized trail users. Please reduce the size of the existing roadless areas and do not create any more. Please do not enact any of the ‘Clinton roadless areas.’ (Individual, White Salmon, WA - #A16469.10000)

Adequacy of Analysis

1304. Public Concern: The Forest Service should evaluate roadless areas to see if they are large enough to serve as viable repositories of our natural heritage.

PLACE EMPHASIS ON ENLARGING OR LINKING ROADLESS AREAS THAT ARE TOO SMALL TO SUPPORT HEALTHY FORESTS

How should inventoried roadless areas be managed to provide for healthy forests? After a century of misguided policy, it is nearly impossible for human intervention to restore the forests to their former health. The best we can do is leave them be. Eventually nature will restore a balance, if the roadless area is large enough. Roadless areas should be evaluated to see if they are large enough to serve as viable repositories of our natural heritage. Emphasis should be put on enlarging or linking roadless areas that are too small to support healthy forests. (Individual, Albuquerque, NM - #A13459.30100)

1305. Public Concern: The Forest Service should include assessments that would qualify or disqualify each inventoried roadless area for such status.

AS PART OF EACH FOREST’S NEXT SCHEDULED FOREST PLAN REVISION PROCESS

Each National Forest’s Plan must, as a part of its next scheduled revision, include assessments that would “qualify” or “disqualify” each inventoried roadless area for such status. Those qualifying inventoried roadless areas would then be explicitly depicted on maps. Strict attention must be paid to road classifications in and around roadless areas by means of lists and maps of classified, unclassified and old obliterated roads. Based on local citizen input, establish a spectrum of active forest management methods and protection/preservation guidelines and, when applicable, assign them to each “qualifying” inventoried roadless area. (Organization, Moscow, ID - #A15318.45500)

1306. Public Concern: The Forest Service should ensure that the roadless area evaluation process accurately presents land ownership and mineral rights information.

As further evidence that process alone will not result in better decisions within the Forest Service, one need only look at the FEIS treatment of the roadless conservation areas. In 1987, when the Forest Service issued the Custer Forest Plan, the Forest Service identified both inholdings, such as state school sections and mineral rights, and roads. The 1999 Draft Plan Revision and the 2001 FEIS completely omit these significant interests which would otherwise disqualify these areas for roadless management. The Bell Lake RCA was described as having no inholdings, FEIS, App. C 28-34, while the Custer Forest Plan shows that there are 365 acres of mineral rights and 1,120 acres of state lands. Custer FEIS, App. C 241-250. These interests still exist within the Bell Lake RCA but are omitted from the FEIS.

The extensive inholdings and mineral rights, as well as oil and gas leases, directly affect any determination that these areas can be managed for wilderness or to protect their natural qualities. While the roadless rule did not do a site-specific analysis, the DPG FEIS claims to have done so. Unfortunately, the DPG FEIS omits many of these factors. Process alone will [not] result in all of the information being considered. (Organization, Denver, CO - #A21358.45618)

1307. Public Concern: The Forest Service should correct errors in forest roadless statistics that inflate the acreage of inventoried roadless areas and non-motorized categories.

Oregon Cascade Roadless Area. The FEIS assumes that 75,000 acres of the Umpqua are designated inventoried roadless areas. This is incorrect. The 75,000 acres include the Oregon Cascade Recreation Area. In the Umpqua NF, the OCRA outside wilderness is 35,000 acres—almost half of the Umpqua’s

claimed “designated roadless.” However, of these 35,000 acres in the Umpqua, 26,100 acres are open to motorized vehicle all winter (zone 3, 5, and 6) and 16,700 acres are open to motorized vehicles all year long (zone 3 and 6) Of the 75,000 acres that the Umpqua NF claims is designated roadless, almost one quarter sustains motorized vehicle traffic all year long—on and off designated roads *increases* in “roadless” areas.

Clearly to properly analyze the effects of protecting roadless areas, the Umpqua National Forest must correctly assess its current roadless area figures. These 26,100 acres in the OCRA are not currently protected. The Proposed Rule is our best opportunity to afford the protection they not only deserve and the protection that the Umpqua National Forest claims they already have. (Individual, Roseburg, OR - #A19127.45620)

1308. Public Concern: The Forest Service should accurately list all National Forest System acreage included under management categories emphasizing environmental protection.

TO ALLOW THE PUBLIC TO MAKE INFORMED COMMENT

Page 3-1 of the DEIS states that 28% of the National Forest System is within inventoried roadless area, 22% is within Wilderness, National Monument, Wild and Scenic River or some other similar designation that the remaining 50% is managed for other uses which by implication includes road construction and reconstruction. This DEIS statement is misleading in that it ignores that the majority of the forests in Oregon are managed as late succession reserves, spotted owl habitat, riparian buffers and other similar land classification. To present an accurate picture of the land management status, it would be more appropriate to include all land management [in] each of these classifications. Absent this information the public does not have the opportunity to knowingly comment on the proposed action. (Elected Official, Roseburg, OR - #A11811.25000)

1309. Public Concern: The Forest Service should revise the Roadless Area Conservation Rule Final EIS Appendix C to acknowledge that many roadless areas do not qualify for wilderness status.

Appendix C of the FEIS does not acknowledge that the Forest Service made specific findings that these units did not have wilderness characteristics and did not qualify for wilderness. This was true for each of the roadless conservation areas. The FEIS omits this material information and fails to address how these badlands could be disqualified from wilderness due to roads, state lands, and range improvements and now qualify when these interests are still there. (Elected Official, McKenzie County, ND - #A27737.25100)

1310. Public Concern: The Forest Service should recognize that science does not support the idea of resource protection through roadless designation.

The idea of increased resource protection through roadless designation is unrealistic. Past practices and current science demonstrate that roadless areas do not ensure proper land stewardship. (Association, Boise, ID - #A20607.14500)

Do Designate Roadless Areas

1311. Public Concern: The Forest Service should remove all wilderness designations and use a modified roadless designation.

Remove all ‘Wilderness’ designation, and use a modified ‘roadless’ designation. (Individual, No Address - #A834.25000)

1312. Public Concern: The Forest Service should manage roadless areas under a specific roadless management designation.

DO NOT designate further wilderness. Should be maintained under a specific designation for roadless area management under the forest plan. (Individual, Brimley, MI - #A3659.25240)

I favor a new type of designation if protection is needed from resource extraction—call it a “wild lands protection area” or name of your own choosing. In such a designated area, all forms of recreation are permitted but not resource extraction. The only logging permitted is to maintain forest health. (Individual, Palmer Lake, CO - #A23361.25300)

TO RESOLVE ONGOING WILDERNESS CONTROVERSIES

Anytime you involve Congress you get into political posturing, egomaniacs, vote trading, power trips and high-paid lobbyists who do not represent the public. Wilderness designation does not protect an area from development. It also can be undesignated by a less environmentally friendly Congress or president (like Mr. Bush). It is best to leave the designation locked in for as long as possible under the forest plan. (Individual, Anchorage, AK - #A5342.25000)

ARRA prefers that any areas identified for future roadless protection should be maintained as a specific designation through the local management plan for each National Forest. Wilderness designation debates in Congress are often controversial and once designated, it is very difficult to revisit an issue. Keeping the designation within the management plan for each forest allows more rapid resolution while at the same time allowing for further refinement in future years. (Organization, Washington, DC - #A5069.25340)

Assuming that we ever return to a 10-year planning process, areas remaining roadless under the designated uses of a forest plan will be just that: roadless. Just like elk habitat will be elk habitat. Why treat the two differently?. If the purpose is to “preserve the Wilderness option” (which is unfortunately often an unspoken but key issue in this debate) then we again create for ourselves a half-pregnancy that does nothing to help solve the legal swamp we’re in.

The rules, quasi-rules and pseudo-rules that have invaded our national forest management system have all the attributes of the dense, spindly thickets that many of those forests have become. The same approach to clearing up both is called for, namely, the active implementation if established, firmly grounded, and clearly articulated legal and scientific principles, leading to a far higher degree of certainty in the roles that Forest Service professionals are called upon to play. (Individual, Spokane, WA - #A17819.25100)

TO RESOLVE PROBLEMS OF COMPETING INTERESTS

With regard to competing values, an effective way for the Forest Service to manage lands for users with competing views is to provide different designations of land. Most of the conflict arises over an attempt to make public land everything for everybody. The roadless initiative represents an excellent solution to this problem. It basically says that we will take this portion of Federal land and manage it in a manner consistent with the resource values that this land provides. Land that already has roads, developed campgrounds, or active logging will obviously be managed in a different manner. Designating land to serve specific management goals rather than trying to manage all land for all uses is the only way to serve all user groups effectively. (Individual, Seattle, WA - #A17843.15160)

1313. Public Concern: The Forest Service should manage roadless areas under a specific roadless management designation.

WHICH WOULD ALLOW MECHANIZED RECREATIONAL ACTIVITIES NOT PERMISSIBLE IN WILDERNESS AREAS

Although mountain bikers agree that some protections should be afforded these special Roadless Areas, and certainly our trail experiences are enhanced by single track trails, wildlife and forest qualities of the

areas, we are fully aware that wilderness designation would BAN us from riding on these trails. This would be unacceptable to the mountain bike community. Our impacts are no more than an equestrian's or a hiker's. A pack train of several horses or dozens of hikers on a poorly designed or un-maintained trail can cause severe damage and any erosion problems can detract from the natural resources. The mountain bike community has made huge efforts in learning trail design, in maintaining existing popular trails, and in sharing trails in a socially acceptable manner. Wilderness designation shuts the door on these interested, knowledgeable trail users who've been collaborating successfully for years with the local forest staff. A different designation, which would afford certain protections for these roadless areas, short of designating them wilderness, would be a win-win situation for the forest and for a large recreational community. (Organization, Boulder, CO - #A17252.25240)

Some areas should be designated wilderness areas. However, a designation of roadless that could allow mechanized but not motorized recreation depending on the environmental concerns of the area might be plenty of protection. And again, maybe some roadless areas should be closed to all recreation. (Individual, Silverthorne, CO - #A28101.25310)

8. Designating Areas. I think that Inventoried Roadless Areas should be managed separate from wilderness and therefore should be granted their own land designation—less protective than wilderness (in that bikes should be allowed), but more protective than non-roadless national forest land. (Individual, Dallas, TX - #A17005.25300)

WHICH WOULD ALLOW SOME ADMINISTRATIVE ACTIVITIES NOT PERMISSIBLE IN WILDERNESS AREAS

While roadless areas may have many of the same qualities as wilderness, they are not identical. For instance, an area may be roadless but still allow access by planes or helicopters for management purposes consistent with the area, such as a prescribed burn, removal of invasive species, or studies of radio-collared wildlife. Therefore, roadless areas need to be considered as a designation separate from wilderness and one that is entirely within the authority and mission of the Forest Service. (Organization, Anchorage, AK - #A17358.25000)

I do not believe that all roadless areas need to be managed as official big “W” wilderness areas. I believe there is room for some areas to be managed in some sort of special roadless management designation. Such rules might allow for the use of some motorized equipment within roadless areas. For example, I would not be completely opposed to the use of chainsaws for trail maintenance or other administrative purposes as long as the “roadless” character is maintained. I believe, the final rule allows some options that would not be permissible in an officially designated wilderness area. (Individual, Moscow, ID - #A4871.25000)

In general roadless areas should be managed as de-facto wilderness, including prohibition of mechanized access except for narrowly drawn exceptions for the legitimate direct use of the managing agency. For example, use of chain saws or mechanical “toters” for trail maintenance purposes could be permitted. (Individual, Seattle, WA - #A17261.25200)

I prefer the idea of Wilderness areas that have roadless areas around them. Thinning can occur in the roadless areas . . . some roadless areas are critical wildlife corridors between wilderness areas. We need both types of areas with different management, but that remain roadless and non-motorized, except maybe helicopter logging or those new tree cutting/removal machines that don't need roads but can cut and remove weak trees. Can't use those in the wilderness. (Individual, Silverthorne, CO - #A28101.25310)

8. DESIGNATING AREAS. Roadless areas by and large are key watersheds, which provide snowpack retention and habitat and protect water quality. Nevertheless, to designate these areas as wilderness would foreclose critical management activities that may be needed to protect the most important roles

key watersheds serve. If specific designation of a roadless area is appropriate, it should be made under the local forest plan. (Elected Official, Union County, OR - #A8707.25230)

WHICH WOULD SERVE AS A NON-MOTORIZED TRANSITION ZONE BETWEEN WILDERNESS AND ROADED AREAS

I hope that one option for the roadless areas is to transition to a wilderness condition, where motorized vehicles are prohibited and strict limits are made on the kind and amount of access. I would like to see these areas protected on a permanent basis. There is little enough left. (Individual, Olympia, WA - #A9083.25200)

WHICH WOULD SERVE AS A MOTORIZED TRANSITION ZONE BETWEEN WILDERNESS AND ROADED AREAS

IRAs should be managed to offer opportunities and values between wilderness and “managed” (roaded) N.F. lands. The relatively natural forest setting envisioned in the RACR provides for a wide range of recreational opportunities including camping, hiking, hunting, fishing, motorized use, adventure exploration, etc. as well as amenity values such as clean water, undisturbed wildlife habitat, research, appreciation of natural vistas, etc. Commercial uses such as special forest products, outfitting/guiding, range allocation, timber harvest and salvage are also appropriate to the extent that they don’t require roading and/or significantly alter the general forest setting toward the “managed” or “matrix” end of the spectrum. (Individual, Lyons, OR - #A13491.45100)

1314. Public Concern: The Forest Service should create a dynamic roadless designation.

If ecosystem management is not politically passe yet, let’s apply it to this situation. In a landscape that is intensively managed for timber extraction (as many National Forests are), roadless areas are most often ecologically unique in that they are in a late seral successional stage (e.g. “old growth”). But note the term “successional,” implying an inherently dynamic system. In forest ecosystems fire, disease, windstorms, and logging are the main processes which reset the successional clock. So if maintaining late seral islands and corridors within our forests is the ultimate goal, then declaring a certain area roadless only eliminates the human-induced disturbance. And the sense of “permanent protection” such a legal designation implies is at odds with the reality of a dynamic system. One of the other “natural” factors is likely to reset the successional clock. This probability will only be exacerbated in a global warming scenario. A static roadless designation doesn’t go far enough toward maintaining a stable percentage of late seral ecosystems. I propose a “dynamic designation.” I know this would be an implementation nightmare, especially for a federal agency, but it has a lot of merits for all “stakeholders” concerned. . . . (Individual, McCall, ID - #A25834.50100)

So these are some general thoughts on how a dynamic roadless designation could work. There are a lot more details I’ve considered, but don’t want to elaborate on here. There are doubtless many more angles I haven’t even thought of. I know that you, dear NEPA reader, have to summarize and pigeonhole this entire letter, so if nothing else, just capture the key concept of “dynamic designation.” Now I know that thinking outside the proverbial box is not the Forest Service’s forte, so if this just sounds like too wild an idea, then just put me on record as supporting the implementation of the RCA rule as it stands. (Individual, McCall, ID - #A25834.25000)

REQUIRE DIFFERENT LEVELS OF NATIONAL ENVIRONMENTAL POLICY ACT ANALYSIS BASED ON THE TYPE OF ENTRY PROPOSED

The level of NEPA required should be directly related to the level of access proposed to the newly opened area. Once again using a post-fire salvage logging example, if it were helicopter logged, then do a Categorical Exclusion, land based harvest using temporary roads which were then obliterated would require an Environmental Assessment, and a case where new system roads were constructed and left open would need an Environmental Impact Statement. What about a case where disease is the agent of ecological reset? That’s a little touchier, because of the potential for abuse. I’ve seen foresters look at a stand, see a few bug-infested trees, declare the trees “imminently dead,” and then draw up a clearcut unit for the entire stand in order to “stop the bugs.” Sort of reminds me of burning villages in Vietnam to

“save them.” I don’t think entry should be allowed unless there is a significant contiguous portion (say 15%?) of the area with 100% mortality. (Individual, McCall, ID - #A25834.25000)

ALLOW BOUNDARY MODIFICATIONS

A “dynamic designation” would allow for future additions and subtractions of land from a given roadless area. Perhaps an example is in order here. Say part of a roadless area burned. Remove that portion from roadless designation and allow salvage logging of any merchantable timber (adhering to all the relevant resource protection and BAER practices). Then add an equivalent adjacent area to the remaining roadless block. Selection of what area to add should be that which is in the best condition. Criteria for additions. The chosen area should be that which is in the best condition. Criteria for selection would have to be defined (preferably in advance), and besides successional stage might include biodiversity, connectivity to other roadless areas, habitat quality (particularly for ESA species), lack of tree disease, watershed integrity, etc. A simple case would be the choice of a patch of 50-year-old second growth mixed-conifer over a diseased stand of lodgepole pine. Obviously a decision matrix would include a variety of relevant factors, but in many cases I suspect the choice would be fairly obvious. (Individual, McCall, ID - #A25834.25000)

1315. Public Concern: The Forest Service should create multiple roadless prescriptions that can be applied based on site-specific conditions.

During the plan revision/amendment process, roadless areas should be evaluated for a number of different management allocations that preclude roadbuilding and timber management. During the process, and with the participation of the public, a variety of prescriptions should be developed to address a variety of management options reflecting the values associated with the roadless areas. Among the values that should be addressed . . . in the prescriptions are:

Values important for science and scientific research.

Watershed integrity values to support aquatic diversity and critical refuge habitat for aquatic and riparian associated species.

Public water supply values.

Backcountry, non-motorized recreation.

Habitat for wide-ranging species that prefer mature unfragmented forest conditions.

Scenic integrity values.

Habitat for rare communities and threatened, endangered, sensitive and locally rare species.

Cultural, historical and “sense of place” values.

Biological diversity values.

“Old Growth” restoration. (Organization, Damascus, VA - #A17723.25310)

1316. Public Concern: The Forest Service should allow local forest plans to add additional prohibitions to roadless management prescriptions.

Inventoried roadless areas that are not recommended for Wilderness should be allocated to prescriptions in the Forest Plan that maintain the roadless characteristics of the area in a manner consistent with the Roadless Area Conservation Rule, but that emphasize the special or unique characteristics of the area. While remaining consistent with the Roadless Area Conservation Rule direction, a prescription may be applied to a specific area or parts of an inventoried roadless area that recognizes specific additional prohibitions or mandates additional required management activities for that area. We have also noted that some of the allowed exemptions for road construction or timber harvesting may be identified as appropriate for some roadless areas and the area is allocated to an appropriate prescription. We would expect a variety of management emphases for various roadless areas. Thus, we believe it would be inappropriate to specify only one designation for the management of roadless areas that are not allocated to Wilderness recommendations. (Individual, Asheville, NC - #A22623.25300)

1317. Public Concern: The Forest Service should allow local forest plans to allocate roadless areas to prescriptions that do not contain the exemptions in the national rule.

We believe the FS should begin by defining the types and locations of roadless areas for which exceptions to the prohibitions should not be considered. This would provide an important improvement to the Rule by placing the most socially and ecologically important portions of the inventoried areas off limits to road building and timber harvesting. Through the rule-making process, the FS should establish categories of roadless areas for which exceptions should not be granted, and then document and map those areas in the course of subsequent forest plan revisions. These would include areas with scarce social and ecological values such as; a source of drinking water, reference areas for research; areas of high or unique biological diversity and old growth forests; areas that provide a bulwark against invasive, noxious, or exotic pest of weed species, areas where other roadless lands are scarce; areas that provide important historic or potential sources of dispersed recreation; areas of cultural or historic importance; and all areas that provide unique or important seasonal habitat for wildlife, fish, and plant species. For all other inventoried areas, the FS should maintain the Rule's prohibitions on road construction and resource extraction, and also maintain categories of exceptions designed to meet legitimate concerns put forward by stakeholders. As discussed above, the design and implementation of these controlled exceptions should provide the primary focal point for input by citizens living near the roadless areas. (Organization, Washington, DC - #A21762.25310)

1318. Public Concern: The Forest Service should only use roadless as a temporary designation.

A specific category labeled 'inventoried roadless' should only be a temporary label applied until designation as wilderness or for multiple use is made. Once made, these decisions should not be open for continual reevaluation. (Governor, State of Montana - #A17660.25000)

If this "roadless" scheme is implemented, there needs to be an "effective" mechanism to reclassify the area from "roadless" to allow usage of this land in the future. Without this mechanism the roadless designation is essentially a "closed" designation. (Individual, Tustin, CA - #A20777.25000)

Do Not Designate Roadless Areas

1319. Public Concern: The Forest Service should not create a specific roadless area designation.

Roadless areas should be managed no differently than any other area of the forest that is not designated as WSA or Wilderness. There is absolutely no reason to make the FS manage roadless areas as de facto wilderness or any other special designation. All activities that are permitted within the forest should be allowed within roadless areas to the extent that current forest management plans allow. (Individual, Anaheim, CA - #A953.25000)

Roadless areas as a management category should not be the discussion. Extremists have seen fit to take this specific word and try to establish it as a valid management category.

In fact, this eight letter word is and has been a word to differentiate public lands that were/are either Wilderness, potential Wilderness, or "Multiple Use Lands" (no roads).

This "wordsmithing" attempts to change public policies and laws outside of the legal process. (Association, Cody, WY - #A41559.25300)

BECAUSE CONDITIONS AND SITUATIONS VARY

There should definitely not be a separate Roadless designation. Conditions and situations vary too much for such a designation to be needed or workable. (Individual, Payette, ID - #A1049.25240)

BECAUSE THE PRESENCE OR ABSENCE OF ROADS IS NOT SUFFICIENT JUSTIFICATION

The Forest Plan should make the decision whether or not any area should be recommended to Congress for formal Wilderness designation, recognizing that the Wilderness Act defines clearly those attributes that must be present for such a designation. For other areas that do not meet these criteria, there is a full range of land use categories already in existence to use for land allocations. Forest Plan revisions should use recognized land use categories that allow for a locally specific complement of the land management activities. While we fully support Wilderness designation, we do not support a national land use allocation category for "roadless" because we do not agree that the simple presence or absence of a road constitutes an appropriate land allocation category. In the event the Forest Service pursues such a policy, even on an interim basis, the roaded portions of inventoried roadless areas should be deleted from the designation. (Association, Terra Bella, CA - #A15588.25320)

BECAUSE IT WILL STRAIN FOREST BUDGETS

There is no reason that has been identified to develop a new category of National Forest land management such as roadless. As the Forest Service should have already discovered with other special designations, such as the White Clouds and Hells Canyon National Recreation Areas, Congress is not impressed and usually does not fund these increased special agency emphasis areas because extra budget money is not really available. The money for their management is siphoned off of other legitimate programs. Simply keep the program in the Forest Plan's designation unless the unique roadless area has unusual support that would require congressional support through a special designation. (Individual, Cambridge, ID - #A11714.25220)

BECAUSE IT IS AN UNNECESSARY LAYER OF REGULATION

At present, Forest Plans must (1) evaluate whether roadless areas meet wilderness criteria and (2) make recommendations to Congress for wilderness designation. Forest plans may also designate roadless areas for continued roadless management, regardless of wilderness recommendations. It therefore appears that the January 12 Rule imposes an additional and unnecessary layer of regulation upon roadless areas. Implementing both roadless area rule making and Forest Plan revision provides no clear benefit; rather the combined approach appears to cause significant redundancy and wasted resources. (Elected Official, Eureka County, NV - #A20741.25110)

Establishing a management category of ROADLESS unnecessarily complicates and compromises the management of public lands. There ALREADY is a sound legal process to bring roadless areas up for Wilderness inclusion by Congress. The general public is sadly unaware of this, and is being misled down the path of public policy panic. The United States Forest Service should be playing a major role in educating the public about existing legal mechanisms. It should not continue to allow itself to be "used" to this end. (Association, Cody, WY - #A41559.25300)

Regulations should not be used to allocate the roadless units. Rather, they should be short and simple, providing general guidance to forest planners. We would question that special regulations for roadless areas are actually necessary. The guidance might better be provided in manual or handbook form. (Individual, Frenchtown, MT - #A11887.25000)

1320. Public Concern: The Forest Service should not designate additional roadless areas.**BECAUSE IT WOULD NEGATIVELY IMPACT RECREATIONAL ACCESS**

Protecting access. The forests belong to ALL Americans and appropriate access should be available for everyone, including access roads, trails and waterways. The current policy of land trades is acceptable if it is balanced for all parties. However, adding additional roadless areas is not appropriate any longer, population and demand for recreational access is high. WE SHOULD NOT SEEK ADDITIONAL ROADLESS STATUS. (Individual, Aurora, CO - #A538.25000)

UNTIL IT LEARNS TO MANAGE EXISTING WILDERNESS AREAS

We have already established wilderness areas and I see no need for additional roadless areas. Let us learn to manage our existing wilderness areas before we create more, hard to manage wilderness areas.

Advantages of NOT having roadless areas:

1. Minimize the possibility of catastrophic wildfires.
2. Minimize the amount of time it takes to respond to a lightening strike and, or, wildfire.
3. Minimize insect infestation of National Forests and monitor wildlife habitat.
4. Increase the area that the general public can travel to enjoy our National Forests.
5. Communities and private properties adjacent to Federal lands would be at less risk of damage or destruction due to wildfires. (Individual, Kamiah, ID - #A5419.30100)

1321. Public Concern: The Forest Service should not use inadequate road maintenance funding as an excuse for declaring an area roadless.

The Forest Service should . . . avoid the temptation of trying to solve administrative problems through planning expedencies. For example, issues such as the inability of the Forest Service to maintain roads within an area should not be used as justification for declaring an area roadless. Financial capability is a matter of the congressional budgeting and appropriations process, not a land-use matter. We recognize the situation is complex, but believe shortcuts create more problems than they solve. (Association, Spokane, WA - #A17351.17240)

Roadless Area Designation Criteria

1322. Public Concern: The Forest Service should develop objective evaluation criteria for local roadless area planning and management.

There must be regulations that aid Forest Supervisors and the plan revision teams that provide a consistent procedural approach to Roadless Area management.

The procedural regulations must give objective criteria upon which to determine, during "Analysis of the Roadless Situation": (a) which areas will be subject to Roadless Area evaluation, consistent with the parameters of roadless evaluations established in the 1964 Wilderness Act; (b) the values that must be considered in evaluating Inventoried Roadless Areas, including but not limited to (i) the developed nature of the area, (ii) the existence of roads, whether classified or unclassified, (iii) the existence of trails, whether motorized, mechanized, equestrian, or pedestrian, (iv) the existence of listed Threatened or Endangered species, (v) the remoteness of the area under evaluation (i.e. is it located under large cities, how many miles is it from the nearest metropolitan area with a population larger than 30,000); (vi) water quality, wildlife habitat, and air quality, then utilize this information to consider what management decisions are necessary to improve or maintain desired levels for these conditions recognizing that dispersed recreation, whether motorized or non-motorized does not necessarily cause negative impacts to these values; (c) what recommendation the agency made in prior evaluations as to the "sustainability" or "non-suitability" of the area for Wilderness designation, and the disposition of such designation (has Congress acted upon the recommendations); (d) whether there are any factors, and what those factors are, which would chance the agency's prior recommendations. If no contribution factors exist, the area should not be reevaluated through current planning to avoid for the nation's lumber needs; (f) the need for pedestrian recreation (how much of a need is there vs. how much of an opportunity already exists . . . ; (g) the need for motorized and mechanized recreation (how much of a need is there vs. how much of an opportunity already exists . . . ; (h) the current and historic use of the area (is the area used for canoeing, hiking, camping, cross-country skiing, OHV use, etc.); (i) the economic impact upon local economies should any alternative management decision be implemented; (j) objective criteria for measuring each consideration (are there cities or towns within 5 miles, 10 miles, 15 miles, 100 miles, etc.); (k) the likelihood of catastrophic wildfires, disease, or insect infestation (overlay map of roadless areas and their fire potential assessed by the integrity fire team); (l) whether proposed project are compatible with the values and considerations listed above. (Organization, Chesapeake, VA - #A11804.25100)

There is no hard-fast rule for evaluating protection and management of inventoried roadless areas (IRA). A number of factors must be considered when managing IRAs, among those:

Consider the current state of the IRA, not the desired state.

Consider local needs over non-local needs—locals usually know (the land) better.

Consider fire/pests/non-indigenous species and their management.

Consider displaced recreation—when recreation is displaced it adds congestion, effects elsewhere.

Consider proximity to urban areas—urban populations need a place to get away from it all—there will be adverse affects to our overall environment and economy if people must drive large distances to recreate in a manner of their choosing.

Consider accurate science that pertains directly to issues at hand. A number of studies I've seen attempt to relate outcome from one study to a totally different set of circumstances. Good, high-quality, relevant science is needed.

Finally, a local process planning forum/process is needed to consider all of the above. (Individual, Palmer Lake, CO - #A23361.45100)

1323. Public Concern: The Forest Service should clarify the criteria for identification of roadless areas in the Forest Service Handbook to ensure consistency.

FOR ROADLESS AREAS IN THE EAST

As part of the Southern Appalachian Assessment, a revised roadless inventory was conducted for the Jefferson, Chattahoochee/Oconee, Alabama, Sumter, and Cherokee National Forests. There were significant differences among those Forests in how they applied the criteria found in Chapter 7 of the Forest Service Handbook that outline the procedures for conducting a roadless inventory. Based on this experience, we believe it is important to clarify the criteria for identification of roadless areas in the Forest Service Handbook to assure consistency in its application on all Forests. Among the aspects that require clarification for roadless criteria in the East are the following:

- i. Substitute the term “classified” for “improved” in the procedures for calculating the allowable road density in an area. Similarly, substitute the term “unclassified” for “unimproved”. Adopted the definition of “classified” and “unclassified” used in the road policy.
- ii. Definition of “Solitude” should not require cores of ROS categories of Semi primitive Non Motorized or Semi primitive Motorized lands, as was done in the SAA roadless inventory.
- iii. Definition of “Solitude” should not require absence of “sights and sounds” from surrounding areas throughout the roadless area, especially not east of the 100th meridian.
- iv. The standard should remain that road density is determined by dividing total acreage by mileage of classified road. The methodology for defining areas eligible for the roadless inventory should yield consistent results whether done by GIS means or manual means. We believe it is important to add direction to the FS Handbook for GIS delineation of roadless areas to assure consistent results are achieved. It is important that GIS analyses be used so that exact areas can be designated and mapped. It is important that final acres for roadless areas be reported only after the GIS analyses are completed. This will reduce the apparent conflict and ill feelings generated by the current procedures.
- v. The Handbook should clarify that “unclassified” roads do not count toward the limit of 1/2 mile of road per 1,000 acres. Old railroad or road grades that have been abandoned and are no longer in use should not be included as “classified” roads.
- vi. There should be clarification about what existing mileage of “unclassified” roads can be allowed within a roadless area. We suggest that there be no limitation on the existence of “unclassified” roads in defining allowable road mileage with a roadless area.
- vii. We believe there should be greater emphasis on creating quantifiable evaluation criteria for roadless areas for consideration of these areas as Wilderness recommendations.

viii. The Handbook should clarify that the existence of privately held mineral rights or outstanding leases for areas should not be a factor in determining eligibility for the roadless inventory. These may be relevant factors in the evaluation regarding Wilderness recommendations.

ix. In general, boundaries of roadless areas should be set back a minimum distance from existing roads rather than using ridges or other topographical features. We suggest using the setback distance that has been used in a plurality of designated Wilderness areas. It may be appropriate to have different standards east and west of the 100th meridian. (Civic Group, Roanoke, VA - #A1713.45000)

1324. Public Concern: The Forest Service should amend the Forest Service Handbook.

TO REFLECT THE CHANGE IN PURPOSE FOR IDENTIFYING ROADLESS AREAS

The process and criteria for identifying roadless areas are contained in the Forest Service Handbook. Among the characteristics identified there are size, configuration, adjacency to existing Wilderness Areas, solitude, and road density. We think these 5 characteristics are appropriate for evaluating whether or not a unit of land should be included in the inventory. With regard to these characteristics, however, we think the handbook should be amended to reflect the change in purpose for identifying roadless areas. The Handbook criteria presuppose these areas need to attain minimum qualities for Wilderness designation. We think the Roadless Rule has different objectives. To address the objectives of the Roadless Rule, we think the following changes are needed:

The solitude characteristics should have nothing to do with the size of SPNM or SPM core area, nor should “sights and sounds” be considered a factor.

The term and definitions of “improved and “unimproved roads” should be changed to “classified” and “unclassified.” Road density should be calculated based on miles of classified roads per 1000 acres. (Organization, Damascus, VA - #A17723.45100)

1325. Public Concern: The Forest Service should provide up-to-date, consistent criteria for the delineation and use of roadless areas.

If a national policy regarding roadless areas is to be enacted, it should provide timely, consistent criteria for the delineation and use of these lands. (Association, Sacramento, CA - #A3681.75000)

In evaluating the Roadless designation, there needs to be a well-defined criteria. Included are unique geological/topographic character, proximity to appreciative users, the damage from past intrusion by human activities, regional watershed protection and (the difficult to define) special aesthetic qualities. (Individual, No Address - #A23613.45000)

The Forest Service must first define up-to-date criteria incorporating backcountry values in identifying roadless areas. I participated in that process, and had some concerns about the proposed revisions, which I felt were too Wilderness oriented. Those draft policies were never finalized. Nevertheless, the draft version was used to reinventory the roadless areas in the Wasatch Cache and Uinta National Forests.

These draft roadless criteria should be finalized to incorporate backcountry values. They should consistently apply on all forests as reinventories are done as a part of local forest planning. (Organization, Idaho Falls, ID - #A20543.45100)

WITH ALL MAPPING BEING GROUND VALIDATED

The first step is for the Forest Service to provide national direction on the criteria for delineation of roadless areas. This criteria should include standards for mapping classified and unclassified roads, mapping of forest health, fire and insect/disease risks, wildlife habitat, water quality, scenic values, access needs, recreational opportunities, timber values, wilderness attributes, etc. Using the above information, national forest should be remapped to accurately reflect their roadless areas with all mapping being ground validated. (Business, Colville, WA - #A3362.45000)

WITH THE DELETION OF ROADED PORTIONS OF INVENTORIED ROADLESS AREAS

The Forest Service must first provide up-to-date criteria for the delineation of roadless areas. The criteria should be consistently applied on all forests and should include such factors as forest health, wildlife habitat, water quality, scenic values, access to non-federal land, and variety of recreational opportunities. Roadless portions of inventoried roadless areas should be deleted from the inventory. (Elected Official, Boise County, ID - #A4889.45000)

1326. Public Concern: The Forest Service should develop criteria for identification of unroaded areas outside of inventoried roadless areas.

One of Idaho's major concerns is the so-called "procedural rule," which was removed from the RACR and included in the Final Planning Rules. The Rule requires local managers to identify "unroaded" areas lying outside IRAs and determine whether it is appropriate to restrict road construction and other activities on such lands so that they will remain essentially roadless.

The Rule, however, made no effort to identify unroaded areas or provide criteria and parameters for the identification of such areas during the planning process. Without such parameters, it will be very time consuming and costly for local managers to identify and examine such areas during the planning process. Indeed, requiring examination of unroaded areas without parameters for their identification poses a serious threat to the timely completion of forest plan revisions. Forest planning may well get bogged down by arguments and lawsuits over the exact scope of the lands that must be examined to fulfill the requirements of the rule. (Governor, State of Idaho - #A20141.13000)

1327. Public Concern: The Forest Service should develop criteria in the Forest Service Handbook for identifying areas to be excluded from the Roadless Area Conservation Rule.**DUE TO PRIOR DEVELOPMENT ACTIVITIES**

The current roadless area conservation rule exempts areas from the rule that have been developed since the last roadless inventory, generally RARE II. It states that timber harvesting may occur in portions of roadless areas that have been developed. Specifically, it states: (4) Roadless characteristics have been substantially altered in a portion of an inventoried roadless area due to the construction of a classified road and subsequent timber harvest. Both the road construction and subsequent timber harvest must have occurred after the area was designated an inventoried roadless area. Timber may be cut, sold, or removed only in the substantially altered portion of the inventoried roadless area.

This direction leaves unclear exactly where the developed portions are located and available for additional timber harvesting (provided the prescription for the area allows such activities). When the reexamination of areas eligible for roadless status is conducted during revision of the Forest plan, this uncertainty is removed because boundaries of roadless areas are clearly delineated, and the areas to which the roadless conservation rule applies is delineated.

However, until the delineation of roadless areas is conducted as part of the revision of a Forest Plan, additional criteria should be developed in the Forest Service Handbook. These should provide more specific guidance to the Forest managers about areas that should be excluded from application of the rule due to prior development activities. (Individual, Asheville, NC - #A22623.45500)

1328. Public Concern: The Forest Service should designate areas as roadless based on inventory status.**ALL AREAS IDENTIFIED IN PAST AND PRESENT INVENTORIES**

Don't limit immediate, permanent protection to RARE II or forest plan inventoried roadless areas; include areas identified in all existing inventory data. (Individual, Corvallis, OR - #A11653.45620)

AREAS IDENTIFIED IN ALL FOREST ASSESSMENTS FOR WHICH INVENTORY DATA EXISTS

The Rule should not limit immediate, permanent protection to Roadless Area Review and Evaluation II or forest plan inventoried roadless areas only, but should also include areas identified in other forest assessments for which inventory data exist. (Individual, Arvada, CO - #A17160.45400)

AREAS CLEARED THROUGH THE NATIONAL ENVIRONMENTAL POLICY ACT PROCESS AT THE TIME OF THE ROADLESS INVENTORY AND WHICH REMAIN ROADLESS

Areas with NEPA cleared units at the time of the roadless inventory which remain roadless should be given full protection under the roadless policy:

There are locations in the Tongass, such as Ushk Bay/Poison cove, and the head of Crab Bay, both on Chichagof Island, which were given a special status in the roadless inventory due to an assumption they would become roaded, since they contained NEPA cleared units. This assumption was unwarranted and these areas should be treated equally with all other areas qualified in the roadless inventory. The NEPA unit areas were left out of the maps published in the roadless FEIS. Analysts used the wrong coding rule to select roadless areas. If this situation has a parallel in other national forests, those existing roadless areas should be protected as well.

The roadless database (rdls95, an ArcInfo cover) used by the Tongass Land Management Planning Team includes the following items:

Area perimeter, rdls95_, rdls95_id, rdls_area, acres, category, category2, and type. Area provides the area in square feet of the polygons in the dataset, and perimeter the perimeter. Rdles96 and rdls95_id number the polygons. Type describes whether the polygon is land or freshwater. Acres contains the acreage for all polygons within the dataset.

The items that provide important information relative to the purpose of the dataset are rdls_area, category, and category2.

Item Description Code Code from TLMP data dictionary

Category2	Roadless-Area	Code L	Roadless Area
		M	Monument Area
		N	NEPA Unit Area
		P	Non-National Forest
		R	Roaded Area
		S	Smaller than 5000 Acres polygon
		SW	Saltwater Polygon
		T	LUD II Polygon
		W	Wilderness

Item Description Code Code from TLMP data dictionary

	Roadless Area		
Rdls_Area	Unique Feature I	200-299	Stikine Roadless polygon
		300-399	Chatham Roadless polygon
		500-599	Ketchikan Road-less Polygon
		888	Wilderness

The category item has similar distinctions to category2, including roadless, roaded, and NEPA Unit area.

The rdls-area item has polygons coded as zero, or from 1-577. The zero group includes areas containing NEPA cleared units, wilderness, national monuments, non-National Forest lands, and National Forest roaded areas. Therefore the zero group is not a good discriminator of the presence of roads. The numbered group reflects the code given to individual unroaded areas greater than 5000 acres. The size of the number reflects the management location of the roadless area, within the Stikine, Chatham, or Ketchikan management areas. Areas with NEPA cleared units were not given an individual number, perhaps due to the expectation they would eventually become roaded, nor were roadless areas less than 5000 acres (except for Kadin, Kasherverof, and Fake Pass). However, they remained part of the roadless

inventory and were identified by special codes in the category2 item. Simply because an area had not yet been assigned a unique feature identifier does not disqualify it from status as a suitable roadless area.

The definition of a roadless area is “undeveloped areas typically exceeding 5,000 acres that were inventoried during the agency’s formal Roadless Area and Evaluation (RARE II) process, and remain in a roadless condition through forest planning decisions.” Areas with NEPA cleared units were inventoried during the Rare II process, given a special code, and that remain roadless fit the definition of roadless area and should be treated equally.

It is likely that the maps produced for the FEIS were made by using the rdls-area attribute and eliminating areas coded as zero. However, this was a simplistic method that did not take advantage of all information contained in the dataset, and was therefore poor analysis procedure. The conscious decision to exclude these areas with special status in the roadless inventory due to the assumption they would become roaded was unwarranted, since in fact they did not all become roaded. The proper query would have been to select for all category2 codes L or N, where N remains unroaded, or to portray them as roadless areas with NEPA cleared units. Therefore, the maps are in error due to the omission of these areas from portrayal as roadless areas, and corrected maps should be generated. (Individual, Sitka, AK - #A15506.45623)

AREAS OF DE FACTO ROADLESS LAND ADJACENT TO THE INVENTORIED AREAS

A primary concern I have is that the inventoried roadless areas leave out large areas of de facto roadless land adjacent to the inventoried areas. (Individual, Painted Post, NY - #A357.45331)

UNINVENTORIED ROADLESS AREAS

The proposed rule should also include provisions governing the designation, management and protection of uninventoried unroaded areas. The process by which the existing roadless areas were designated wanes conservative and many areas that do not currently contain roads lie outside their boundaries. Adequate management and protection of inventoried areas should not preclude the protection of uninventoried roadless areas. (Organization, Boston, MA - #A23083.45420)

In implementing the Conservation Rule, we ask you to consider that the Forest Service obviously could not have had the personnel to inventory all roadless areas. As a result, there are large areas that are still uninventoried. As we have noted before, it should not be difficult to avoid building roads in uninventoried areas since naturally there is some requirement of knowledge of an area before road construction could intelligently be authorized. Consequently, we strongly urge that the Conservation Rule apply to all roadless areas, whether inventoried or not. They all furnish the same benefits referred to above and, thus, it is just as cost-effective to protect uninventoried as well as inventoried roadless areas. (Organization, Birmingham, AL - #A21582.45420)

1329. Public Concern: The Forest Service should designate areas as roadless based on scarcity on a forest-by-forest basis.

Scarcity. If a Forest has only a few roadless areas, they probably should keep what they have. In contrast, if a Forest has over 50% IRAs, then they have options to develop some of them if they’re suitable.

I recommend that a Forest be required (through a National policy) to provide for, at least, the average acreage currently existing on a State-wide (FS), Region-wide (FS), or National (FS) basis, whichever is lowest, unless there’s a strong reason not to. (The Chief should be required to concur in these situations. For example: an IRA is located in the path of a critically needed electric power transmission corridor.) A policy like this would ensure a minimum acreage of roadless values for future generations. (Individual, Libby, MT - #A2301.25000)

1330. Public Concern: The Forest Service should designate areas as roadless based on ecological characteristics.

SMALLER ROADLESS AREAS OF ECOLOGICAL IMPORTANCE

Proximity to other such areas — a roadless area of seemingly small scale may be ecologically extremely important if the distance to adjacent similar areas is biologically significant, allowing gene flow or movement of animal populations or individuals between. (Individual, Astoria, OR - #A476.50100)

An area (such as a watershed) should be recognized as roadless if is such, even though it falls below some acreage threshold. View it on a watershed level as well as an acreage level. This could result in some really neat small local areas being preserved. (Individual, Sandia Park, NM - #A26171.45330)

Please keep in mind that studies of forest ecology have shown that it takes a MINIMUM of a patch of forest NO LESS THAN 5 MILES ON A SIDE to preserve the moisture levels and wildlife status within a “virgin” forest area. (Individual, Fairfax, VA - #A26362.45330)

While protecting inventoried roadless areas will contribute to overall conservation objectives, scientists believe that roadless areas smaller than the arbitrary 5,000-acre criteria are biologically significant and should also be considered as part of your forthcoming roadless area rule. In December, 1998 170 scientists signed a letter to the Forest Service urging the agency to protect all biologically significant area. The scientists’ letter said:

There is growing consensus among academic and agency scientists that existing roadless areas—irrespective of size—contribute substantially to maintain biodiversity and ecological integrity on the National Forests. The Eastside Forests Scientific Societies Panel, including representatives from the American Fisheries Society, American Ornithologists’ Union, Ecological Society of America, Society for Conservation Biology, and the Wildlife Society, recommended a prohibition on the construction of new roads and logging within excising (1) roadless regions larger than 1,000 acres, and (2) roadless regions smaller than 1,000 acres that are biologically significant (Henjum et. al. 1994). In our view, a scientifically-based policy for roadless areas on public lands should, at a minimum, protect from development all roadless areas larger than 1,000 acres and those smaller areas that have special ecological significance because of their contributions to regional landscapes.

FOREST GUARDIANS strongly believes the final rule must incorporate the best available scientific information. With that in mind, we urge the Service to implement a policy that includes all biologically important roadless areas within the National Forest System. There is no scientific justification for the exemption of these lands from roadless area protection. (Organization, Santa Fe, NM - #A22092.45320)

UNDERREPRESENTED LOWER-ELEVATION ECOSYSTEM TYPES

In the Tongass as well as many other national forests, many of the most valuable forest habitats have already been logged. The remaining roadless areas should remain exactly that, roadless and should be proposed as wilderness areas, particularly those forests with remaining stands of old growth. Much of the currently designated wilderness in the Tongass encompasses inhospitable areas, and is barren, or snow covered much of the year. Additional roadless areas could augment lowland and coastal habitats not adequately represented in current roadless areas. These should be managed for non motorized uses only. (Individual, Seldovia, AK - #A8803.25000)

Roadless areas contain habitat for numerous species, including many at risk of extinction. Better representation of all natural communities in protected areas means better protection for the myriad species they support. In general, higher numbers of species are associated with the low- and mid-elevation ecosystems found in roadless areas compared to high-elevation ecosystems. For instance, in the Southern Rockies, alpine tundra has roughly 50 associated vertebrate species while lower elevation sagebrush and semi-desert shrublands have over 160 vertebrate species. Thus, protecting roadless areas will also protect more species-rich ecosystems. This could potentially prevent many species from

becoming imperiled and eventually listed as Threatened and Endangered under the U.S. Endangered Species Act.

SREP's analysis of roadless areas in the Southern Rockies has revealed that numerous species listed as rare or imperiled by state Natural Heritage Programs, as well as several species listed as Threatened and Endangered under the U.S. Endangered Species Act, occur within roadless areas. Although further research is needed to determine the specific habitat requirements for these species, most of their remaining habitat has likely been destroyed or degraded on multiple-use public lands and private lands. Thus, roadless areas may offer a last refugia for these species, and protection of roadless areas will undoubtedly benefit many of these at-risk species. Large roadless areas are especially critical to maintain refugia for at-risk wide-ranging and sensitive species, such as wolverine, lynx, or grizzly bear, which require large tracts of land relatively free of human presence and influence. Nationwide, roadless areas support more than 280 threatened, endangered, proposed, or sensitive species. (Organization, Denver, CO - #A21367.25000)

AREAS WITH BIOLOGICAL INTEGRITY AND ECOLOGICAL SIGNIFICANCE

We wish to comment primarily on the issue of using biological integrity and ecological significance - in addition to size - as primary criteria by which additional areas are considered eligible for roadless area protection. (Business, Coarsegold, CA - #A1589.50500)

1331. Public Concern: The Forest Service should provide an independent scientific assessment of roadless areas 1,000 acres or more and ecologically significant areas less than 1,000 acres.

PERMANENTLY PROTECT THESE AREAS

We urge the Forest Service to develop a policy that:

Provides an independent scientific assessment of roadless areas of 1,000 acres or greater and ecologically significant areas less than 1,000 acres. These areas, along with inventoried areas, should be permanently protected. (Organization, Bloomington, IN - #A28110.45320)

1332. Public Concern: The Forest Service should designate areas as roadless based on size considerations.

AREAS 10,000 ACRES OR MORE IN IDAHO

Outside of Alaska, Idaho has the largest amount of inventoried roadless areas. Over 45% of Idaho Forest Service land is designated as inventoried roadless areas. On a national level, only 23% of the total Forest Service Land is designated as IRAs; this means that Idaho already has twice the national average. With this in perspective, we suggest that the 5,000 acre figure used to qualify a parcel of land as an IRA is too small. From a fairness perspective, the vastness of Idaho's forests should be taken into account, and if the plan is absolutely needed, nothing smaller than 10-15,000 acres should be inventoried as a roadless area in Idaho. If this were taken into consideration, the plan would affect Idaho much more proportionately to the rest of the country. (Association, Boise, ID - #A20607.45300)

AREAS 5,000 ACRES OR MORE

We have supported and continue to support the Roadless Area Conservation Rule. We are very much offended by the Bush Administration's plans to ignore this Rule and allow logging on National Forest roadless lands greater than 5,000 acres. As long standing Idaho residents, we are particularly concerned about the threat to Idaho's remaining roadless areas which will occur now that the Bush administration will allow logging and road building on these lands. Important portions of Idaho's National Forests lands are now threatened—areas such as the Selkirks, the Clearwater, the South Fork of the Salmon, the Boulder-White Clouds, the South Fork of the Snake, and many others. (Individual, Coeur d'Alene, ID - #A13448.45310)

A roadless area should be protected if it is an inventoried roadless area of 5,000 acres or more. (Individual, Salem, OR - #A13948.45310)

1333. Public Concern: The Forest Service should include smaller unroaded areas in a national roadless rule.

AREAS LESS THAN 5,000 ACRES

While protecting inventoried roadless areas will contribute to overall conservation objectives, many scientists believe that roadless areas smaller than the arbitrary 5,000-acre criteria are biologically significant and should also be considered as part of your forthcoming roadless area rule. In December, 1998 170 scientists signed a letter to the Service urging the agency to protect all biologically significant areas.

The Alliance for the Wild Rockies strongly believes the final rule must incorporate the best available scientific information. With that in mind, we urge the Service to implement a policy that includes all biologically important roadless areas within the National Forest System. **NO AREA, INCLUDING THE . . . MANY ROADLESS AREAS LESS THAN 5,000 ACRES, SHOULD BE EXEMPTED FROM THE FINAL RULE.** (Organization, Missoula, MT - #A17234.45310)

I firmly believe that the USFS must reduce the minimum size that an inventoried roadless area must be, when they look to the many unroaded areas that might be added. It is imperative that their analysis must expand to those areas without roads that are **LESS THAN 5,000 ACRES**. Although many of these areas are too small for wilderness, many of them contain key habitats for a variety of species. They are also special places for humans.

Currently none are identified that are less than 5,000 acres in size. Each new unroaded area should not necessarily be examined for potential wilderness designation, but for their roadless character. Areas less than 640 acres and narrow slivers between existing roads should probably still be excluded. (Individual, Grangeville, ID - #A830.45310)

I urge you to maintain the Roadless Area Conservation Rule, and include roadless areas of less than 5,000 acres and larger if it is adjacent to an existing wilderness area. (Individual, Roanoke, TX - #A4626.45310)

While protecting inventoried roadless areas will contribute to overall conservation objectives, scientists believe that roadless areas smaller than the arbitrary 5,000-acre criteria are biologically significant and should also be considered as part of your forthcoming roadless area rule. In December, 1999 170 scientists signed a letter to the Forest Service urging the agency to protect all biologically significant areas. (Organization, Nevada City, CA - #A4941.45310)

While protecting inventoried roadless areas will contribute to overall conservation objectives, scientists believe that roadless areas smaller than the arbitrary 5,000-acre criteria are biologically significant and should also be considered as part of your forthcoming roadless area rule. In December, 1998 170 scientists signed a letter to the Forest Service urging the agency to protect all biologically significantly area. The scientists' letter said:

There is growing consensus among academic and agency scientists that existing roadless areas-irrespective of size-contribute substantially to maintain biodiversity and ecological integrity on the National Forests. The Eastside Forests Scientific Societies Panel, including representatives from the American Fisheries Society, American Ornithologists' Union, Ecological Society of America, Society for Conservation Biology, and the Wildlife Society, recommended a prohibition on the construction of new roads and logging within excising (1) roadless regions larger than 1,000 acres, and (2) roadless regions smaller than 1,000 acres that are biologically significant (Henjum et. al. 1994), In our view, a scientifically-based policy for roadless areas on public lands should, at a minimum, protect from development all roadless areas larger than 1,000 acres and those smaller areas that have special ecological significance because of their contributions to regional landscapes.

FOREST GUARDIANS strongly believes the final rule must incorporate the best available scientific information. With that in mind, we urge the Service to implement a policy that includes all biologically

important roadless areas within the National Forest System. There is no scientific justification for the exemption of these lands from roadless area protection. (Organization, Santa Fe, NM - #A22092.45320)

AREAS LESS THAN 2,000 ACRES

We should even be protecting roadless areas under the 2,000 acre limit that were omitted from current Forest Service inventories. (Individual, Eugene, OR - #A17989.45300)

Roadless Areas under 2,000 acres should also receive additional protection through the forest planning process, especially destructive off road vehicle use and hard rock mining. (Individual, Eugene, OR - #A17989.45300)

AREAS 1,000 ACRES OR MORE

The role of local forest planning and evaluation/management of the roadless areas should be INITIALLY limited to qualifying areas of 1000 acres or more for protection management. Once all of the roadless areas have been selected then, under the USFS protection and broad guidelines, and only then should local districts begin their management plan. (Individual, No Address - #A101.45320)

The Forest Service should protect all roadless areas greater than 1000 acres in size, but they should especially focus on low-elevation forests that are not adequately represented in current federal wilderness areas, but that contain some of the highest-quality and most productive fish and wildlife habitat. (Individual, Corvallis, OR - #A28160.45320)

I still support the significantly strengthened Roadless Area Conservation Rule even though it still does not go far enough - roadless areas of 1,000 acres or more need to be covered by the rule, especially since we are in catastrophe mitigation made for (1) carbon sequestration of older growth trees as a way to not exacerbate global warming further and (2) fire prevention since over 98% of all fires occur in roaded areas. (Individual, Seattle, WA - #A15157.45320)

Instead of weakening the roadless rules, I urge the Forest Service to strengthen the rule by lowering the 5,000 acre limit of roadless area to 1,000 acres. Unless this acreage limit is changed, National Forest east of the Mississippi will not be protected by the Roadless initiative. The Chippewa National Forest has NO roadless areas. The Superior, with 60,000 acres and the Chequamegon-Nicolet with 69,000 acres must have better protections not less protection. (Individual, Minneapolis, MN - #A10523.45320)

It is important to note that on forests west of the Cascade Crest in Oregon, Washington, and northern California, nearly all inventoried roadless areas are protected by administrative reserves under the Northwest Forest Plan. However, many unroaded areas are unprotected on national forests west of the Cascades, and are open to logging simply because they had the misfortune of escaping the RARE processes in the 1970s. At the time the Forest Service commenced RARE I and RARE II, scientific literature was uncertain whether roadless areas less than 5,000 acres were ecologically significant. Today, we know that roadless areas 1,000 acres or greater are incredibly important for a variety of forest species and functions.

The Forest Service has refused to heed the advice of scientists that unroaded areas that are at least 1,000 acres in size should be protected. For example, the Forest Service on the Gifford Pinchot National Forest recently approved the Acci timber sale, located in the Mount Adams Ranger District. This sale proposes to log 7.7 million board feet of timber, much of it east side old growth as defined by the Forest Service. Not satisfied with logging old growth from the matrix, the agency is proposing to enter the 5,228 acre Monte Cristo Roadless Area. (Organization, Portland, OR - #A12004.45320)

In addition to ceasing road construction, we need to prohibit off road vehicles and stop mining, oil and gas development, and logging on all roadless areas of 1000 acres or more. Public lands are the only places where we have the opportunity to maintain natural areas large enough to make a difference. We need to get this right. (Individual, Deadwood, OR - #A882.90110)

AREAS 1,000 ACRES OR MORE WITH A MINIMUM WIDTH OF 1/2 MILE

This inventory could be done during the upcoming Forest Plan revision, as a prerequisite to any IRA protection or use decision. I recommend an inventory criteria of 1,000-acre minimum size with a minimum width of 1/2 -mile wide. (Individual, Libby, MT - #A2301.45300)

AREAS 1,000 ACRES OR LESS

Areas of 1,000 acres and even less should be considered for roadless designation, as long as they are manageable in their natural conditions to protect their inherent values.

Precedent for designating areas [less] than 1,000 acres in size as roadless areas exists throughout the National Forest system, including 107 acre Odessa Roadless Area (adjacent to the Mountain Lakes Wilderness Area) and the "stand alone" 490 acre Devils Garden roadless area on the Winema National Forest. (Organization, Cave Junction, OR - #A17235.45320)

Roadless areas smaller than 1,000 acres that contain rare plant communities or that are a key part of a watershed should be protected. (Professional Society, Missoula, MT - #A17054.45320)

AREAS 500 ACRES OR MORE

Of course the main characteristic is that there are no functioning roads in blocks of land. I would like to see a 500 acre minimum but would be willing to compromise at 1000 acres. The environmental values include unfragmented habitat for sensitive species (including connecting to travel corridors), unsedimented water courses, native vegetation structure and species (old growth stands and rare plants), natural fire regimes (less fire suppression), allowing indigenous forest "pests" their place in the ecology . . . less human intrusion especially motorized vehicles, no commercial timber harvest and its associated creation of fire prone forest structure. The social and economic considerations must include national pride for conservation of natural ecosystems, the opportunity for recreation in wild places without intrusion by internal combustion pollution (noise and exhaust) and the tourist dollars generated by the recreationalists and scientific research into forest ecology to develop realistic models of forest health. (Organization, Chico, CA - #A25114.45100)

Wild Wilderness suggests that roadless areas of 500 acres or more **MUST** be protected from logging, mining, grazing and specifically from off-road vehicle use. To do anything less is to lay open to new and continued abuses the few lands not yet destroyed by Forest Service mismanagement and incompetence. (Organization, Bend, OR - #A19225.45300)

The Roadless Area Conservation Rule should provide for the inventory and protection of smaller roadless areas, as small as 500 acres east of the Mississippi River, and 1000 acres west of the Mississippi. DellaSala and Strittholt (1999) have documented the importance of smaller roadless areas, which share many attributes in common with inventoried roadless areas, including:

- Source areas for recolonization of native forbs, lichens, and mycorrhizal fungi
- Source areas for species that are disturbed as metapopulations
- Refugia for species with restricted distributions (endemic species)
- Aquatic strongholds
- Habitats for rare mollusks and amphibians
- Pockets of late-seral forests
- Stepping stones for wildlife movements and dispersals
- Winter habitat for resident birds and ungulate species
- Building blocks for restoring regions that are highly fragmented by agriculture, industrial forestry, urban and suburban developments, and roads. (Organization, Washington, DC - #A27037.45300)

AREAS 150 TO 200 ACRES OR MORE

End logging, off-road vehicle use and road building in all unroaded areas 200 acres and larger, and in any roadless area of 150 acres and larger if it is adjacent to an existing wilderness area. (Individual, Roanoke, TX - #A4626.90110)

AREAS LARGE ENOUGH TO ALLOW NATURAL PROCESSES TO WORK

According to the principles of conservation biology, roadless areas should be in large enough acreages (we might call them core habitat areas) where natural processes can be allowed to work. If a typical stand replacement fire (such as on our forest) is 10,000 acres then the roadless area should be five times that size to allow one/fifth to be in recovery. Impoverishment of biodiversity is blamed in part upon forest fragmentation which has been previously aggravated by roads and "units". (Union, No Address - #A8392.45300)

1334. Public Concern: The Forest Service should exclude unroaded areas from roadless designation based on size considerations.**EXCLUDE AREAS SMALLER THAN 5,000 ACRES**

Future designations should not include "unroaded" areas smaller than 5,000 acres, which currently are classified as roaded. Identifying such "islands" of unroaded areas is ultimately a fruitless exercise. Proper ecosystem management requires examination of national forest lands on a watershed scale to determine the proper road density that will provide a balance between ecosystem integrity, forest health, commodity production, and access needs. (Governor, State of Idaho - #A20141.45310)

If the agency decides at this time to adopt "roadless protection" guidance or directives to be applied by agency personnel in the local forest planning process, those directives should address the following:

(1) Not all inventoried roadless areas are equal. Conditions on NFS lands have changed in the past two decades, and as a result not all inventoried roadless areas have the same importance or value. Some roadless areas have become significantly smaller in size--others may have roads and other nearby developments that diminish roadless values. For example, roadless parcels adjacent to ski areas may have some roadless characteristics, but not the full range of natural characteristics that would commonly be associated with a "roadless" designation. These areas are not remote are not "undisturbed landscapes", and inevitably are influenced by nearby resort operations. As a matter of general forest planning guidance, parcels smaller than 5,000 acres in size should not be considered for roadless designation, nor should areas immediately adjacent to developed recreation sites. (Permit Holder, No Address - #A5285.45300)

No area under 5,000 acres should be considered roadless. (Individual, Anaheim, CA - #A953.45310)

Everyone should agree that the reason we are all drawn to the National Forests are for the trees and the environment they provide. However, this is the point at which we all differ in the amount and kind of management we feel should be provided. The Roadless designation to land should only entail those areas which exceed 5,000 acres in size. To afford areas of lesser size the designation could preclude some areas from reaching their greatest public benefit while balancing the conservation interests of the land. (Business, Twin Bridges, CA - #A8808.45310)

Not all inventoried roadless [areas] are equal. Conditions on NFS lands have changed in the past two decades, and as a result not all inventoried roadless areas have the same importance or value. Some roadless areas have become significantly smaller in size--others may have roads and other nearby developments that diminish roadless values. For example, roadless parcels adjacent to ski areas may have some roadless characteristics, but not the full range of natural characteristics that would commonly be associated with a "roadless" designation. These areas are not remote, are not "undisturbed landscapes", and inevitably are influenced by nearby resort operations. As a matter of general forest planning guidance, parcels smaller than 5,000 acres in size should not be considered for roadless

designation, nor should areas immediately adjacent to developed recreation sites. (Permit Holder, Winter Park, CO - #A13541.45310)

EXCLUDE AREAS SMALLER THAN 500 ACRES

No area under 500 acres should ever be considered as “roadless”. (Individual, El Dorado, KS - #A5117.45310)

1335. Public Concern: The Forest Service should attempt to designate roadless areas in close proximity to each other.

Distribution. A group of IRAs in close proximity (within a mile or so) is preferable to a widely scattered bunch of IRAs. A close group of IRAs has more connectedness, and the surrounding landscape has a more wild and remote feeling.

In contrast, a widely scattered bunch of IRAs has the appearance and feeling of “islands” in the surrounding developed area. It’s better than nothing, but it doesn’t have the same wildness. It’s more of an “oasis” feeling, which is still okay but not as wild as a group of IRAs. (Individual, Libby, MT - #A2301.45000)

1336. Public Concern: The Forest Service should designate additional areas as roadless based on current forest plan designations.

ALL AREAS UNDER CONSIDERATION FOR RESEARCH NATURAL AREA OR SPECIAL INTEREST AREA STATUS, REGARDLESS OF PROXIMITY TO ROADS

We ask that all areas presently under consideration for Research Natural Area or Special Interest Area designation be included for protection, regardless of their size or proximity to roads. (Association, Kelsey, CA - #A15815.25000)

1337. Public Concern: The Forest Service should designate areas as roadless despite existing infrastructure.

AREAS WITH PRIMITIVE ROADS OR OFF-ROAD VEHICLE ROUTES

The presence of primitive but “classified” roads, such as primitive jeep trails, should not disqualify areas. (Organization, Missoula, MT - #A17950.45525)

Wildlands CPR is adamantly opposed to the exclusion of potential roadless areas on the basis of off-road vehicle routes. User-created two-tracks, ORV routes, and other primitive travelways, for example, should not be used to exclude an area for roadless and wilderness designation. To whatever extent the final rule includes road definitions, they should be clarified to ensure that only actual roads, deliberately constructed and maintained as such, intended for and capable of use by street-legal passenger vehicles, be counted as roads when making these determinations. This concern extends to both areas already inventoried as roadless as well as uninventoried areas that would otherwise meet the roadless criteria. (Organization, Missoula, MT - #A21359.45620)

AREAS WITH GHOST ROADS OR WAYS

Two-track roads and “ghost roads” should not disqualify an area from roadless designation; we need to save these remnants, recover and reconnect them. (Individual, Flagstaff, AZ - #A5026.45522)

AREAS WITH ROADS THAT ARE CLOSED OR NOT IN USE

Roadless is not always roadless yet should be managed as such. In Idaho we have miles of unused roads, and un-maintained roads in the forests. Since these roads are not used or they are closed, these areas need rehabilitation and protection as roadless areas. Due to the low quality of the roads, overgrowth, and lack of use many areas appear roadless and since the future holds no further need for these roads we should include them in our roadless maps. Reseed and rehabilitate the roads and leave it at that (Individual, Boise, ID - #A64.45522)

1338. Public Concern: The Forest Service should not designate areas with existing infrastructure as roadless.**AREAS WITH ROADS**

Roadless areas must only be mapped where there are NO roads. Just because a non-system road exists is no reason to include it in a "roadless" area. (Individual, Ridgeway, PA - #A4933.45100)

Areas that have roads that are unmaintained or abandoned, or blocked by the USFS are not "roadless," they are merely abandoned or not maintained. It appears that the USFS is calling many of these areas roadless. (Individual, Stayton, OR - #A1042.45200)

I'm sure communities near roadless areas already have roads or there wouldn't be communities. By definition if you build a road in a roadless area it is not roadless. What nutcase wrote these questions? (Individual, Atlanta, GA - #A4509.45000)

Inventoried roadless areas that contain old, overgrown or obliterated should not qualify for status in the category. The USFS must map and list all roads (new and old). (Individual, Viola, ID - #A23458.25200)

The Summary Section of the DEIS referenced the following statement by President Clinton dated October 13, 1999:

"Within our national forests there are large parcels of land that don't contain roads of any kind, and in most cases, never have . . . " (DEIS, S-1). Notwithstanding the President's direction to develop regulations for these roadless areas, the Proposed Rule departed from the President's direction and now encompasses lands which are in fact roaded. If this program is truly directed toward roadless areas, then only those areas without roads, ways, stock driveways, etc should be included. (County Attorney, Grant County, OR - #A17667.45512)

AREAS CONTAINING ROADS THAT MIGHT QUALIFY AS VALID REVISED STATUTE 2477 RIGHTS-OF-WAY

No area should be considered roadless if there is any road that might qualify as a valid RS-2477 right-of-way. (County Administrator, Saguache County, CO - #A28774.45510)

AREAS WITH TRAILS

Roadless areas should not contain anything that resembles a trail. If a trail exists, it should be for multiple uses. If a trail is 70" wide, it should be open for 4WD vehicles even if it fails to meet "road" requirements. Single-track trails are sufficiently wide for motorized bike access that should also be permitted. Snowmobiles may also take advantage of existing trails in inventoried roadless areas. (Individual, Helena, MT - #A150.91110)

1339. Public Concern: The Forest Service should designate areas as roadless despite historic motorized use.

It infers that those areas not recommended to be designated as roadless areas are somehow unsuitable or inferior. Burke Branch is not designated as roadless yet, but it is ideal for roadless designation and only has not been designated as so because of historical use by ATV riders despite it presently being protected by a permanent injunction against such use.

Who determines "potential," "interest," and "low wilderness value"? We continue to erode our wilderness areas without considering the need to develop new areas to perpetuate our inheritance. (Individual, Brookport, IL - #A17229.45624)

1340. Public Concern: The Forest Service should not designate areas with specific resources as roadless.

AREAS WITH NATURAL RESOURCES

Roadless areas are to remain roadless only if they do not offer extractive resources that further the needs of society or they were designated as a national park or wilderness before the Clinton/Gore administration started their silliness. First and foremost priority of Land and Resource management should be to support and compliment the society with the renewable and non-renewable extractive resources that are present on the land in question. (Individual, Hamilton, MT - #A94.65000)

Your role in forest service lands is to first manage the development of natural resources and to issue permits for mining and grazing and for timber. Some entity needs to control the acres so that we do not have the problems before the Taylor Grazing Act but again be careful of your management to stifle the economy. Without some sort of control of livestock permits this may cause a battle similar to early part of the 20th century between the cattleman and the shepherd. (Individual, Elko, NV - #A4853.65000)

Additionally, for logging, grazing and mining requirement, we need a policy of resource management, not resource lock-up. (Individual, Olathe, KS - #A5001.65000)

1341. Public Concern: The Forest Service should not designate areas surrounding private property as roadless.

It should be clearly recognized that access rights limit the ability of the Forest Service to manage an area as roadless. The agency must adhere to the spirit and letter of the law by providing reasonable access through the local land management planning process. In general, if private property is surrounded by roadless lands, these lands should not be officially designated as roadless. (Organization, Anchorage, AK - #A15542.40100)

Inclusion/Exclusion of Specific Areas from a National Roadless Rule

Summary

Inclusion – A number of respondents request that specific areas be included in roadless area protection. These people state that the Forest Service should not allow any exemptions or exclusions from the Roadless Area Conservation Rule. One individual suggests the Forest Service replace any area exempted from roadless designation with equal acreage in smaller roadless areas. Several respondents suggest that national forest districts and certain geographic areas be protected in a national roadless rule. These respondents often mention that roadless areas in the eastern United States are disproportionate to those in the western United States and that areas in the East should be included. Others suggest the Forest Service include roadless areas in a national roadless rule based on proximity to other protected areas including areas adjacent to national parks, designated wilderness areas, and areas that cross administrative boundaries. Some people request that the Forest Service include roadless areas in a national roadless rule regardless of forest plan revision status. An organization asks the Forest Service to include areas that are returning to a wild condition. (A list of specific areas requested to be included in/excluded from roadless area protection is found in Appendix F.)

A number of respondents request protection for Alaskan national forests and specifically request that the Tongass National Forest be included in a national roadless rule. People offer a multitude of reasons for protecting these areas. Some propose the Forest Service include Alaskan national

forests in a national roadless rule for social and recreational values. Others state that they should be included to protect the environment and environmental values such as biodiversity, old growth, wildlife and fish habitat and species, etc. People also request Alaskan national forests be included in order to reestablish the balance of multiple resource use; because these forests should be treated the same as all other forests; because there is much public support for protection of these forests; and as a commitment to global rainforest conservation. Further suggested reasons for inclusion include the importance of these areas to those who rely on subsistence food, to tourism, and to commercial fisheries. Several individuals assert that the Forest Service should immediately implement the Rule in the Tongass National Forest because scheduled timber sales make the Rule even more necessary; while others state that timber sales in these forests are not economically viable. Some Organizations assert that the Forest Service should not use the fact that the Tongass National Forest has a recently revised forest plan as a reason to exclude it from a national roadless rule.

Exclusion – A number of respondents assert that specific areas should be exempted from roadless area designation/protection. One group suggests that the Forest Service develop additional criteria to provide guidance to forest managers regarding areas that should be excluded from the Roadless Area Conservation Rule due to prior management activities. Others suggest the Forest Service exclude certain roadless areas from roadless designation/protection based on active management potential, including areas adjacent to recreational sites; special use permit areas or master active management plan areas; areas with existing or future operations at four-season resorts within or adjacent to existing or future special use permit boundaries of ski areas; and areas used for pipeline transportation and oil and gas development. People also comment on what they believe to be the disproportionate amount of acres of roadless areas in the western United States and ask that these areas, as well as national grasslands, be excluded. Others say the Forest Service should exclude certain roadless areas from roadless designation/protection that have recently completed forest management plans.

Some people state that the Forest Service should exclude Alaskan national forests from a national roadless rule because inclusion of these forests, they say, would be contrary to Alaska state and federal laws. One tribal organization asks the Forest Service to recognize that it cannot supercede land allocations on the Tongass National Forest with a national roadless rule. People say Alaskan national forests should be excluded because the Tongass National Forest has just revised its Land Management Plan; because decisions should be made through the local forest planning process; because extensive local forest planning has been completed; because the Tongass Land Management Plan is currently under appeal; because the Chugach National Forest is now at the stage of releasing a Final EIS; and because the proposed Rule was not addressed in the Chugach National Forest plan revision process. Others suggest the Forest Service exclude Alaskan national forests for environmental and forest health reasons. Some suggest they be excluded in order to maintain traditional multiple use management, and to maintain the availability of natural resources upon which local economies depend.

Inclusion

1342. Public Concern: The Forest Service should not allow any exemptions or exclusions from the Roadless Area Conservation Rule.

I very strongly urge you to exclude ANY exemptions or exclusions that could potentially weaken the Roadless Area Conservation Rule. I especially urge you to ensure that Alaska's Tongass National Forest,

as our nation's largest, receives full protection. In order to preserve our nation's wild forests, and thus our cultural, economic, social, recreational, and biological wealth, I urge you in the strongest tone possible to protect ALL of America's Roadless Areas including Alaska's Tongass and Chugach, from ALL logging, roadbuilding, mining and fossil fuel exploration/drilling. THE PEOPLE HAVE SPOKEN: PLEASE DO NOT IGNORE THEIR VOICES. (Individual, Kennett Square, PA - #A689.10150)

INCLUDE EACH NATIONAL FOREST DISTRICT

Do not allow any exemptions for individual National Forests Districts (N.B. most important). (Individual, Long Beach, CA - #A21202.45620)

1343. Public Concern: The Forest Service should replace any area exempted from roadless designation with equal acreage in smaller roadless areas.

If you eventually remove the roadless designation from some areas in order to please the folks who live nearby, it is only fair to replace them acre for acre with smaller roadless areas that were not included before. (Individual, Deadwood, OR - #A881.45621)

1344. Public Concern: The Forest Service should include certain geographic areas in a national roadless rule.

INCLUDE AREAS IN THE EASTERN UNITED STATES

Expand roadless area protection to include all areas in the E. U.S., including those not presently covered as small as 200 acres. No weakening or exemptions. (Individual, Paoli, IN - #A10608.45300)

The National Forests in the east need such protection in smaller roadless areas because of the greater press of civilization and higher population. (Individual, Bethel, VT - #A8684.45621)

The Roadless Area Conservation Rule must be maintained and vigorously defended as previously written. Some of the proposed changes are very bad ideas, such as requiring that roadless areas be at least 5,000 acres. This isn't appropriate in our smaller eastern forests and the previous 1,000 acre threshold should be maintained. (Individual, Decatur, GA - #A19228.45320)

Another factor relating to the protection of roadless areas the Forest Service should consider is the scarcity of roadless areas in the eastern United States. In the first published draft of the proposed Roadless Area Conservation Rule, the Forest Service appropriately highlighted the need for special treatment of eastern areas in part of the proposed Roadless Area Conservation Rule where it stated: "In selecting areas, the responsible official should consider the distance from, and the scarcity of, other unroaded areas, particularly for those areas east of the 100th meridian." Roadless Area Conservation, 65 Fed. Reg. 30275, 30288 (2000) (to be codified at 36 C.F.R. 294.13(b)(2)) (proposed May 10, 2000) (emphasis added). Because only some 726,600 acres of inventoried roadless area remain in the Southern Appalachians, it is imperative that special attention and consideration be given to Eastern roadless areas. Our scarce roadless areas are increasingly in demand for all sorts of recreation, making the need to preserve them more pressing than ever. (Organization, Charlottesville, VA - #A15659.45341)

Superior Wilderness Action Network (SWAN), urges the Forest Service to uphold the Roadless Area Conservation Rule (RACR), as published in the Federal Register on January 12, 2001. SWAN submitted comments during scoping and on the draft environmental impact statement for the roadless rule. Instead of weakening the rule, SWAN urges the Forest Service to strengthen the rule by lowering the 5,000 acre limit of roadless area to 1,000 acres. As we stated in our previous comments, unless this acreage limit is changed, National Forests east of the Mississippi will not be protected by the Roadless initiative. The Chippewa National Forest has NO roadless areas. The Superior, with 60,000 acres and the Chequamegon-Nicolet with 69,000 acres must have better protections not less protection. (Organization, Plymouth, MN - #A7116.10150)

1345. Public Concern: The Forest Service should include roadless areas in a national roadless rule based on proximity to other protected areas.**INCLUDE AREAS ADJACENT TO NATIONAL PARKS AND DESIGNATED WILDERNESS AREAS**

Several of these roadless areas have been evaluated and rejected for wilderness consideration. However, some of them are adjacent to national parks and designated wilderness areas and can provide larger buffer zones for habitat protection. Therefore they should be maintained under roadless area management until further planning processes can address which roadless areas should be converted to wilderness. (Individual, Ethel, WA - #A11767.45331)

The 5,000 acre, or adjacent to existing Wilderness, condition should be maintained as a requirement for roadless areas. (Individual, Logan, UT - #A13482.45331)

We were also disappointed that the Roadless Rule does not protect uninventoried roadless areas and roadless areas smaller than 5,000 acres, even if such areas were adjacent to existing protected areas (designated Wilderness, wild rivers, national parks, etc.). Ironically, the previous moratorium on road construction in roadless areas, which took effect in March, 1999, did protect some of these smaller roadless areas if they are adjacent to protected areas. We believe protecting smaller "unofficial" roadless areas that have been identified by the Forest Service or citizens is of the utmost importance, especially those adjacent to designated wilderness and other protected areas. We strongly urge the Forest Service to incorporate smaller roadless areas identified in maps submitted by citizen groups into the Roadless Rule; specifically, we ask you to incorporate maps previously submitted by the Aspen Wilderness Workshop and the Upper Arkansas and South Platte Project, as well as other information from conservation organizations in Region 2, into the Roadless Rule. (Organization, Denver, CO - #A21367.45621)

INCLUDE AREAS THAT CROSS ADMINISTRATIVE BOUNDARIES

They deserve a broader national protection, one that crosses current administrative boundaries (e.g. Park Service, USFS, BLM, and private holdings), in other words, the values are not necessarily for the USFS alone to determine. An excellent example of such umbrella designation is the proposed Northern Rockies Ecosystem Protection Act H.R. 288, NREPA provides an excellent example of such value designations. (Individual, Boulder, CO - #A28606.12312)

This summer I visited the Sunshine Basin east of Yellowstone National Park. This clearly should be provided the same kind of protection that Yellowstone enjoys. Areas like this must be considered in a context which crosses administrative (e.g. Park Service, USFS, BLM and private) holdings. In other words, the values are not necessarily for the USFS alone to determine. For the northern Rockies, the proposed Northern Rockies Ecosystem Protection Act H.R. 488, NREPA provides an excellent example of such value designations. (Individual, Boulder, CO - #A28606.12312)

1346. Public Concern: The Forest Service should include roadless areas in a national roadless rule regardless of forest plan revision status.

In the past, the Forest Service has argued that those forests with plans in the final stages of the revision process should also be exempted from the roadless area policy. But upon closer analysis of forest plans, it is clear the revision process has not proven adequate in assessing either the present problems or future impacts of roading in pristine forests. The revision of forest plans includes a legal requirement to re-inventory roadless areas. Under ideal circumstances, a National Forest would conduct an on-the-ground inventory of roadless areas and evaluate any potential impacts of proposed management activities within or adjacent to these pristine areas. However, many of those reassessments have been sloppy and inadequate. (Organization, Portland, OR - #A12004.12450)

The Wyoming Wilderness Act protected high altitude habitat and did not garner protection for complete ecosystems and watersheds, or the lower mountain regions that would protect large herds of wintering and migrating elk, deer, and moose. The Bridger-Teton and Shoshone National Forests should protect

the wild integrity of the remaining roadless areas in the impending Forest Plan Revision process. (Individual, Jelm, WY - #A27247.20000)

Roadless areas in the National Forests covered by the Northwest Forest Plan are also at risk. During the roadless area “open houses,” Region-6 staff were repeatedly asked why they continued to develop and implement commercial timber sales in roadless areas. Their responses to this concern were uniformly evasive and confirmed that many timber planners in the region intend to log and degrade roadless areas, hence limiting the areas eligible for inclusion in the Wilderness system.

Examples of current timber sales impacting roadless areas in the Willamette National Forest include:

Moose Timber Sale, Sweet Home District, Willamette National Forest (EIS completed, Decision Notice signed). The sale includes commercial harvest in the 5,674 acre RARE I Moose Creek Roadless Area, which currently provides important connectivity for wildlife between the Menagerie and Middle Santiam Wilderness Areas. Moose Creek proper is eligible for designation as a Wild and Scenic River. Moose Creek is also a major tributary to the South Santiam River, which provides municipal drinking water to the communities of Lebanon, Sweet Home and Albany. The proposed timber sale calls for logging 22.5 mmbf and constructing 1.9 miles of new roading (outside the inventoried roadless area).

South Pyramid Timber Sale, Sweet Home District, Willamette National Forest (EA in scoping). This newly proposed timber sale includes two alternatives that call for logging in the Three Pyramids unroaded area (and one alternative that would stay out of the roadless area). As yet, little information has been developed or made available about this timber sale. The scoping notice indicates that between 99 and 209 acres of the roadless area will be logged and that helicopter, skyline, and tractor logging would be allowed. The Three Pyramid’s unroaded area is an extremely popular recreation destination and the South Pyramid Creek trail travels through the heart of the planning area.

Helldun Timber Sale, Middle Fork District, Willamette National Forest (EA completed, currently offered as replacement volume to Scott Timber). While avoiding logging in inventoried roadless areas, the proposed 9 mmbf, 100-acre clearcut Helldun timber sale will have a disproportionate impact on irreplaceable roadless values in the Middle Fork District. Currently, the Helldun ancient forest is part of a 2,000-acre block of fragmented ancient forest that connects the Waldo Wilderness with the RARE II inventoried Cornpatch roadless area. Combined, these roadless areas total over 35,000 acres, one of the largest intact forests in the Middle Fork District. The timber sale calls for logging over the popular Eugene to Crest Trail and degrading the Eagle Creek Special Interest Area, one of only two special interest areas in the Willamette National Forest. The planning area has also been proposed as a Research Natural Area to be preserved for scientific study of its unique ecological characteristics.

Coffin Timber Sale, Detroit District, Willamette National Forest (EA completed, Decision Notice signed, sale unawarded). While the EA for the Coffin timber sale proposed logging 2.77 mmbf from 277 acres of the Coffin/Bachelor Mountain roadless “semiprimitive area” after the decision notice was signed, the volume doubled to 5.37 mmbf. The Coffin Mountain timber sale is located within the Mary’s Creek Sub-basin of the Upper North Santiam watershed, which contributes to the municipal drinking water supply for over 165,000 Oregonians. Many of the slopes within the proposed timber sale are extremely steep. The entire sale is within the transient snow zone in which “rain-on-snow” events associated with logging and road-building often increase peak flows, turbidity and sediment loading to the watershed. (Individual, Washington, DC - #A30150.45500)

1347. Public Concern: The Forest Service should include roadless areas in a national roadless rule based on environmental characteristics.

INCLUDE AREAS THAT ARE RETURNING TO A WILD CONDITION

The majority of comments received about the roadless initiative in Vermont stated that the roadless initiative was a positive initiative, and that in fact it did not go far enough in protecting old growth forests in the Tongass, and further that it did not go far enough in protecting de facto roadless areas in eastern forests such as Green Mountain National Forest, where many areas are returning to wild conditions after heavy human use in the 19th century. (Organization, Waterbury Center, VT - #A29884.10150)

1348. Public Concern: The Forest Service should include Alaskan national forests in a national roadless rule for social values.

I visited Alaska (which included the Tongass National Forest) about three weeks ago. It is a beautiful, peaceful, and serene place! Please protect the Tongass and Chugach National Forests (as well as our National Forests) from any type of Logging, Roadbuilding, and other development. (Individual, Fremont, CA - #A9229.45620)

I have personally seen the beauty of Alaska's Tongass National Forest. Alaska's Tongass National Forest is the only rainforest in the U.S. Not many Americans even know there's a temperate rainforest in the USA. Alaska is the last remaining wilderness untouched by man I only hope and pray it stays that way. Pure, untamed wilderness untouched by man - wilderness wild and free - my God, how can anyone not be awestruck or blown away by the site of a massive glacier in the site of not one but seven bald eagles in their natural habitat - a habitat still pristine, wild, natural and not touched or destroyed by man? This is what I saw on a hike in the Tongass and I will never forget the emotions it worked. To see and experience such beauty made me want to cry I did. These are treasures that no amount of money can buy. (Individual, Dracut, MA - #A6220.45623)

I strongly urge the conservation of the Tongass and our other National Forests and wilderness areas as forever wild.

The oxygen these areas generate is not just physical; it is spiritual oxygen as well, more and more valuable in a society where access to large, unspoiled tracts of natural beauty is under siege from short-sighted, greed-motivated companies and individuals. (Individual, Schenectady, NY - #A30333.45620)

FOR FUTURE GENERATIONS

We have so little pristine wilderness left that it is imperative to protect that which remains for future generations. For this reason I also oppose any attempt to deny protection to Tongass National Forest in Alaska. (Individual, Tempe, AZ - #A8713.45623)

I have lived in various parts of the Tongass since 1982 and I treasure it for what it is and want to see it remain this way for succeeding generations. Anymore, such places are rare and rapidly disappearing. It is high time that our nations wakes up and halts this destructive habit which has so altered the environment and ecology of our great land. (Individual, Wrangell, AK - #A24501.45623)

Living in Washington state, I am reminded of the ugly unsightly destruction that follows road building in our National Forests every weekend. If the Tongass rainforest was disturbed as much as the west and south side of the Olympic National Forest, we would be destroying pristine land that can not viewed again in our lifetime or our children's lifetime ever in the same pleasurable manner that it can today. We must protect our heritage and preserve the small areas of land that have not been altered for thousands of years. (Individual, Kingston, WA - #A4414.45623)

1349. Public Concern: The Forest Service should include Alaskan national forests in a national roadless rule for recreational values.

Pristine areas of the Tongass are important for fish and wildlife habitat, clean water, subsistence, and recreational activities, all of which contribute to the quality of life for Southeast Alaska residents, and those who visit our area to enjoy an experience that they can't find where they live. I personally use the Tongass for introducing people from all over the world to the incredible beauty of our area as experienced from a kayak. Under Forest Service Permit, I conduct guided tours from several hours to extended overnight periods, and educate my clients to follow a leave-no-trace camping ethic. Road building and logging in these areas would be in direct opposition to that ethic that I am trying to convey to those that use our National Forests for recreation. Our type of operations preserve the forest for all to enjoy in the future. My continued use of these areas depends upon them remaining in a pristine, undeveloped state. Road building and the logging that will follow changes its entire character, never to

be the same again. There are no areas left in the country like the Tongass. Can't we leave this last vestige of true wilderness the way it was meant to be before all others are totally lost? (Business, Sitka, AK - #A24665.45623)

The Chugach and Tongass National Forest embody the definition of reason for people living in and loving Alaska. In what other state in the United States can you commonly see bear and moose with the opportunities to view the elusive wolf and lynx? In what other state can you find not only the fishing opportunities that pristine watersheds provide but also the incredible amount of backcountry wilderness recreation that surrounds those living in Southcentral and Southeast Alaska. (Individual, Cooper Landing, AK - #A17758.45622)

We enjoy the outdoors. Camping in Alaska is great. I support the permanent protection of the Chugach and Tongass National Forest. (Individual, Union City, MI - #A25152.45623)

1350. Public Concern: The Forest Service should include Alaskan national forests in a national roadless rule to protect the environment.

FROM DESTRUCTIVE ACTIVITIES

In spite of the fact that at public hearings held throughout SE Alaska last summer the majority of Alaskans wanted immediate and irrevocable protection for the Tongass National Forest, the poor forest is once again open to assault from the logging and mining industries.

I have been a resident of SE Alaska since 1968 and have witnessed first hand degradation of one of the most beautiful states in the Union of States. I not only worked on fishing boats, I owned and operated my own boat for a number of years. The bays and areas where I fished no longer exist. They are water deserts fed by slash choked streams and poisoned from the efforts of mining operations.

I lived in Petersburg when thousands of acres were "accidentally" logged in Portage Bay off Frederick Sound because of "confusion" over the boundaries of the timber sale. Cape Fanshaw, Farragut Bay and Pinta Point were areas that were lovely, now they look as though bombs have been dropped on them. And these areas were and are being logged because less visible areas have already been decimated. Prince of Wales used to be a lush, verdant island. It now looks like a mowed off golf course. Gravina Island is becoming an industrial park.

I have written many letters over the years to Murkowski, Stevens, and Young, protesting the treatment the Tongass is being given, and have repeatedly been told I am a lonely misfit and that the majority of Alaskan residents want logging to continue. This was proven false with the testimonies given last summer. (Individual, Ward Cove, AK - #A5673.45623)

The Tongass National Forest needs to be covered in your roadless policy because it has 2 million roadless acres that are right now at risk of logging and other development schemes under the current forest plan. This includes more than 400,000 acres of old growth. Combine that with the fact that the Tongass National Forest has the most heavily subsidized logging program in the entire national forest system (costing taxpayers \$33 million a year) and you have a situation that is NOT good. The Forest Service can't maintain existing roads (including fixing blocked culverts). If it can't do that, it better not be building any new roads! This includes NO boondoggle roads like the proposed Bradfield Canal, Taku River, and Juneau-Skagway roads! (Individual, Minneapolis, MN - #A8375.90110)

Five years ago I spent 3 and a half months living in the Tongass National Forest in Alaska. I was in awe the full duration of my stay. Being somewhere American Bald Eagles (the very symbol our country adopted for pride and dignity) are not a rare occurrence but they flourish, had renewed my sense of patriotism. What would it say about us as a people if we plunder the lands of our chosen national symbol (and the countless other species that are not as lucky to be revered, or even noticed by our population) for the sake of a quick small profit? Why is it that much of the wood harvested from the Tongass National Forest is practically given away to Japan as 'war reparations'? They have more than recovered

economically since World War II ended is 1945. Such practices are no longer necessary. (Individual, East Aurora, NY - #A6187.45623)

American Lands urges the Forest Service to include the Tongass National Forest, the largest National Forest in the system, in the roadless area protection policy. Some 2 million acres of roadless wildlands in the Tongass are at risk of clearcutting, road building, and other development—an area bigger than Delaware and Rhode Island combined.

The Tongass is home to many wildlife species, including salmon, grizzly bears, black bears, river otters, deer, moose, mountain goats, bald eagles, and wolves. This spectacular array of wildlife thrives thanks to the combination of rainforest habitat and Alaska's relatively wild character, which buffers the deleterious impacts of development common in the rest of the country. For example, bald eagles depend on ancient trees for nesting, deer depend on large stands of ancient forest for cover and access to winter forage, and grizzly bears depend on large tracts of healthy forest for food, shelter, and solitude. To survive, grizzly bears particularly depend on wilderness. They simply cannot exist in close and constant proximity to humans.

But the natural beauty and abundant wildlife of the Tongass have long been threatened by clearcut logging and road building. In May 1997, the Forest Service issued a land management plan for the Tongass. During the planning process, scientists from within and outside the agency warned that continued road building and logging in large blocks of old growth forest areas pose a serious threat to fish and wildlife (Powell et al. 1997). The Service's own economists concluded that demand for Tongass timber is at an all-time low and is expected to remain so for at least the next ten years. And, of more than 19,000 public comments to the plan, more than 70 percent supported lower levels of logging and greater protections for fish and wildlife. In short, new scientific and economic information, coupled with the cancellation of long-term pulp contracts and overwhelming public sentiment, have created a critical moment of opportunity on the Tongass.

Unfortunately, the Tongass Forest Plan runs counter to scientific recommendations, public opinion, economic data, and the federal government's commitment to protecting the Tongass. The Plan threatens the future of this incomparable wilderness by authorizing levels of destructive clearcut logging and road building. It allows logging in previously undisturbed areas and more than doubles allowable logging levels for the next ten years over the amount cut last year.

Only about 11 percent of Alaska's rainforest has been clearcut to date, but more than half the best timber stands—which are also the best wildlife habitat—have already been logged. While the Alaska rainforest still boasts healthy populations of fish and wildlife, continued road building and logging would dramatically impact fish, wildlife, and the ecosystems upon which they depend. (Organization, Missoula, MT - #A17234.45623)

It is unfortunate that these so-called representatives of Alaskan residents are actually citizens of Washington, DC, one of the most densely populated cities in the US. It appears they have come to believe that overcrowding and asphalt are the standards to which Alaska should aspire. Perhaps if they actually lived in Alaska they too would be saddened by what has happened to this unique state over the years. The mining, logging, and oil industries, abetted by Murkowski, Stevens, and Young, have all conspired to turn this state into just another, slashed, burned, poisoned, sucked dry piece of land, while they all go to the bank.

Please, please don't make it easy for them. Protect the roadless watersheds that are left in the Tongass National Forest. This forest is a special case, but not in the sense that it should be exempt from protection. It should have even more stringent protection. It is the last little bit of "wild" forest left in the US. (Individual, Ward Cove, AK - #A5673.15100)

Case for conserving America's wildest roadless forest

As background, it is useful to point out that that Chugach National Forest (CNF) was specifically created in 1907 by President Theodore Roosevelt to protect its unique character, which included fisheries protection as well as the protection for forests and watersheds. Today, more than ever, this need still exists.

The Chugach is the wildest and most-glaciated National Forest in the national forest 2.7 million acres of the 5.5 million in the Chugach is classified as rock, snow and ice. At 98% inventoried roadless, more than half of the roadless areas on the Chugach are classified as “rock, snow and ice”. [*Footnote 1: The Chugach is 98% inventoried roadless-multiplied total CNF acreage of 5,467,615.45 y 0.98 to get = (5,358,263.141) then divided by 2.718,842.89 (total rock, snow and ice acreage) and multiplied by 100 to get 50.741122980619235542926991162489 or 51%.] that public resources be protected. Too often, true public resources (those resources from which the general public benefits, such as clean air and water or productive soils) are confused with extractive resources (those resources leased to private companies, such as timber, minerals or oil and gas). The disservice to Americans is profound. Clean air and drinking water is polluted, fish habitat compromised and taxpayers left to foot the clean-up bills. (Organization, Anchorage, AK - #A23038.45622)

BECAUSE IT WOULD PREVENT COSTLY AND ENVIRONMENTALLY DAMAGING STATE HIGHWAY CONSTRUCTION PROJECTS

Protecting all roadless wildlands on the Tongass under the roadless policy would prevent costly and environmentally damaging state highway construction proposals. Instead of investing limited resources into construction of roads like those up the rugged Lynn Canal from Juneau to Skagway, from Sitka to Baranof Warm Springs, across the Cleveland Peninsula, or up the Bradfield Canal to Canada, devote those scarce funds to improving the most natural and cost-effective transportation route in Southeast Alaska—the Alaska Marine Highway System. (Organization, Juneau, AK - #A23091.90120)

BECAUSE THE ALASKA STATE FOREST PRACTICES ACT IS INEFFECTIVE

Throughout my twenty year tenure on the Tongass I saw the atrocities wreaked upon the land by the long term contracts which now pale when compared to the effects of logging practices wreaked upon the 800+ square miles of forest land grants from the Tongass to the Alaska Native Corporation under ANSCA. These lands have now been largely liquidated of timber, with all raw log export to the Orient, under the toothless and ineffective Alaska State Forest Practices Act. (Individual, Sitka, AK - #A1056.65200)

1351. Public Concern: The Forest Service should include Alaskan national forests in a national roadless rule to protect environmental values.

TO PROTECT ECOLOGICAL CHARACTERISTICS

Of great concern to me are the political forces that would like to exempt, or in other ways relieve the Tongass National Forest from the Roadless Rule. I recommend that the rule apply equally to the Tongass, the largest and in many ways one of the wildest forests in the National Forest system.

The current transition in the timber industry of Southeast Alaska is from one dominated by a few large corporations (with massive infrastructure and road-building capability) to one characterized by many small and a few medium-size operators (desiring smaller timber sale offerings and with limited capacity to construct major roads). Institution of a policy to protect the ecological characteristics of remaining roadless areas is best done under such circumstances, when existing industries will be least disrupted. In evaluating the Forest Service’s obligations to provide for multiple uses, we suggest that you evaluate the ability of currently-roadless areas on the Tongass where habitat values have already been compromised, to provide timber to support the existing industry. We note that only 16 percent of the inventoried roadless areas are classified and tentatively suitable for timber harvest (USFS 1997, p.e-164). So it seems that relatively little would be given up. (Permit Holder, Juneau, AK - #A23220.45613)

“The 8.7 million roadless acres in the Tongass National Forest need immediate protection. This area has a high degree of biological integrity and overall ecosystem health is largely due to the quantity and quality of the inventoried roadless areas. Preserving roadless areas is central to maintaining a high degree of biological diversity.” (Individual, Puyallup, WA - #A829.45623)

ACE has been active for many years in conservation of the Tongass and Chugach National Forests because of the numerous and irreplaceable ecological benefits provided by the forests in their currently

wild and un-roaded condition. These benefits, which accrue equally to local communities and the nation, include:

clean air and water, diverse and numerous fish and wildlife populations, and the ecological, cultural and economic benefits of the intact forest flora.

Roads fragment habitat for fish and wildlife, opening forests to industrial activities and motorized uses that add cumulative impacts, which can disrupt the carrying capacity and biological diversity of the land. (Organization, Anchorage, AK - #A23038.45622)

TO PROTECT BIODIVERSITY

No exemption should be made for the Tongass Rainforest—and outstanding example of biodiversity which needs to be kept as a part of our heritage. (Individual, San Pedro, CA - #A11584.45623)

I am writing to express my opposition to any change to the Roadless Area Conservation Rule that would allow logging in the Tongass National Forest or any of the national forests currently protected by this rule. I particularly oppose allowing this in Alaska's Tongass rainforest. I was able to visit this area recently and was impressed by both the diversity of wildlife and plants present as well as the fragility of the area, particularly the islands. I am concerned that logging roads will disrupt much more than just the logged areas and the noise of the operations will be detrimental to the local wildlife. (Individual, Columbia, MD - #A21226.45623)

The unspoiled forests in Alaska deserve extra protection because of their high level of natural biological richness and the absence of invasive plant species that plagues our California-Oregon landscapes. (Organization, Chico, CA - #A25114.45621)

TO PROTECT OLD GROWTH

I'm a Finish citizen writing from Finland, Europe. Because we have practically no old growth forests left in Finland and in the whole of Europe, I regularly visit Alaska, especially Chugach and Tongass National Forests just to experience these marvelous ancient forests. I would like to point out that Alaska's forests are highly valued not only in the US but also world-wide. Destroyed landscape and logged forests can be found everywhere in the world, but vast areas of unspoiled landscape and wilderness is something I've only experienced in Alaska. (Individual, Helsinki, Finland - #A2789.45622)

The Tongass, and every forest that still exists, is a jewel that should be looked at admired but not touched. Prime old growth habitat, like that found at Southeast Cove and Fool's Inlet near Anan, AK are scheduled to be logged. Those areas of old growth are ideal habitat for grizzlies and Sitka black-tailed deer. Trees that lie within these areas provide shade to cool the waters for salmon to run. Though there are rules stating that there must be buffer zones surrounding streams, these buffer zones are more subject to disease and windthrow because they are exposed. (Union, No Address - #A17699.45623)

I find it appalling that I even have to write this letter after years of comments, meetings, planning, etc on the current TLMP (1999) which protected over 40 roadless watersheds and the additional roadless rule, were decided upon the whole thing is now jeopardized by the short-sighted Bush administration.

I have lived and worked and depended on the Tongass for almost 30 years of my life. I urge you to implement the above mentioned plans and save as much as is possible of the old growth Tongass. We don't need to log this last remaining area for the few temporary jobs it would provide or to line the pockets of timber company owners and executives while leaving nothing for future generations. (Business, Pelican, AK - #A3370.45623)

A roadless area protection policy that excludes the Tongass National Forest, the country's largest national forest, is patently unjustifiable and clearly contrary to sound science.

As 330 eminent scientists said in a letter to President Clinton in December, 1999, "Excluding the Tongass would severely compromise the legitimacy of any national policy on the protection of roadless areas."

Noting that many species depend on the old-growth forests of the Tongass, the scientists wrote: "The ecological characteristics of old-growth forests require centuries to develop. Clearcutting old growth (at 100-200 year rotations) will permanently reduce its habitat value for old-growth dependent species and building new roads will further fragment this important ecosystem." (As the DEIS notes, the Tongass is a naturally fragmented landscape, with some 22,000 islands.) (Organization, Sitka, AK - #A30486.45623)

Unlike most national forests, the Tongass and Chugach still encompass many undisturbed watersheds with a full complement of all native species, including productive populations of bald eagles and northern goshawks, numerous other forest birds, wolves, brown and black bears, moose, black-tailed deer, mountain goats, and five species of anadromous salmon. Proactive application of the roadless policy in Alaska will help forest managers avoid costly and reactive, restoration management. It is critical that we not squander this chance in Alaska because there are few national forests where we still have such opportunities on this landscape scale.

On the Tongass forest, two million acres of roadless areas have been left open to development under the Tongass Land Management Plan (TLMP), including 450,000 acres of roadless old-growth forest. These roadless old-growth areas are especially critical because only four percent of the Tongass land-base encompasses the low elevation, high-volume, old-growth forest most important to fish and wildlife and much of this rare forest type has already been clearcut. The revised TLMP does not prohibit the harvest of the rare high-volume, old-growth forest stands. Even though the allowable sale quantity has been reduced, if there are inadequate provisions to prevent "highgrading" old-growth stands (cutting the best and leaving the low-quality sites), this plan will permanently eliminate important wildlife and fish habitats and erode the integrity of this ecosystem. The committee of scientists the Forest Service asked to review the adequacy of conservation measures for vertebrate species in the Tongass National Forest Land Management Plan recommended cessation of high grading the higher-volume (classes 6 and 7) old-growth stands. (Organization, Anchorage, AK - #A22992.45622)

TO PROTECT WILDLIFE HABITAT

The Forest Service roadless draft EIS specialist report on the Tongass (Johnston, May 2000, Biological Resources Effects) provides several reasons for including the Tongass in the roadless policy.

"The Tongass is unique (from other national forests) because the majority of subsistence and game species are integrally linked to the habitat qualities provided by unroaded areas." "Because relatively little is known about the current status, needs and response to management activities for some species on the Tongass, conservative management approaches that emphasize retention of roadless areas may provide a necessary 'buffer' to ensure higher likelihoods of maintaining biodiversity and species viability."

Forest Service databases on vegetation, the tim-typ database, were developed to characterize timber volume for harvest. The tim-typ layer is one which we documented for our National Spatial Data Infrastructure grant. One of the limitations of this database is that it does not characterize differences among forest stands in terms of forest structure. Forest structure, canopy layering and understory plant type, are important factors in determining habitat quality for wildlife. (Individual, Sitka, AK - #A15506.45623)

Of the 17 million acres of the Tongass, only 1/3 contains commercially productive forest. Only 2 million acres of the Tongass contain high volume forest. And only a portion of that forest is coarse canopy old growth forest with structural characteristics which certain species are dependent upon for survival. These stands are also very valuable for timber harvest, and over time have been high-graded by man. Thus, timber sales have and have had a disproportionate impact on habitat. The roaded areas of the Tongass tend to be in valley bottoms where highly productive stands of timber were targeted. New timber sales are scheduled into adjacent unroaded areas or as entries into locations never before targeted. We cannot

afford to lose these areas. Too much valuable habitat has already been lost. It is not a question of acreage, but of quality. (Individual, Sitka, AK - #A15506.45623)

The TLMP revision process was delayed significantly (from 1986 to 1996) by the need to gather research to resolve state and federal resource agencies' concerns over species viability and resource damage. Many reports were produced during that process detailing the need for habitat conservation areas, streamside buffers, and reassessment of vegetation cover datasets' weaknesses in estimating volume, habitat quality, and forest structure. This research resulted in better standards and guidelines, but which still fell short of recommendations by scientific panels in size of old growth reserves, stand structure characteristics within the reserves, headwater stream buffer protections, and others. The TLMP process violated the NEPA process by failing to consider the addition of more wilderness, a shortcoming which is currently being litigated by SCS and others. Goshawk standards do not adequately protect the huge foraging areas required. The USFandWS has been directed to reassess the goshawk population as part of a lawsuit to have the goshawk listed as an endangered species. TLMP did not take into serious consideration the predictable continued shortfall of funds for road maintenance, and consequent continued resource damage. The recent report documenting the condition of road/stream crossings and fish passage damage was not finished in time to affect the TLMP process. Due to these shortcomings, there were an unprecedented number of appeals filed on the TLMP decision. The Lyons decision, now overturned, to remove some areas from the timber base provided more acreage for habitat, but did not address weaknesses in standards and guidelines. (Individual, Sitka, AK - #A15506.45623)

I would appreciate if some form of permanent protection was placed on the Chugach and Tongass National Forests. Unhindered wildlife is becoming increasingly rare in America, and those national forests serve several very important purposes. (Individual, Fargo, ND - #A25160.45623)

TO SAFEGUARD PRIMARY FISH HABITAT

Including the Tongass in the Roadless Area Conservation plan would safeguard close to 65% of the "Primary Fish Producers" on the Tongass from the harmful effects of roadbuilding and commercial logging, thus retaining a significant number of the existing intact watersheds on the Tongass. In the face of habitat losses elsewhere in the region and the Pacific Northwest, and given the importance of a relatively few watersheds on the Tongass to health and sustainability of the salmon fisheries in Southeast Alaska, expert scientists recommend protecting all the remaining intact watersheds on the Tongass. See Bryant and Everest, *Management and Condition of Watersheds in Southeast Alaska: The Persistence of Anadromous Salmon*, submitted to Northwest Science at 20 (1998). (Organization, Juneau, AK - #A23091.54110)

TO PROTECT NATIVE SPECIES

Unlike most national forests, the Tongass and Chugach still encompass many undisturbed watersheds with a full complement of all native species, including productive populations of bald eagles and northern goshawks, numerous other forest birds, wolves, brown and black bears, moose, black-tailed deer, mountain goats, and five species of anadromous salmon. Proactive application of the roadless policy in Alaska will help forest managers avoid costly and reactive, restoration management. It is critical that we not squander this chance in Alaska because there are few national forests where we still have such opportunities on this landscape scale. (Organization, Anchorage, AK - #A29062.53100)

1352. The Forest Service should include Alaskan national forests in a national roadless rule.

TO REESTABLISH THE BALANCE OF MULTIPLE RESOURCE USE

The roadless policy does not undo the good work of TLMP, but adds to it. The roadless rule is necessary in the Tongass to reestablish the balance of multiple resource use that was lost during the era of the 50 year contracts. (Individual, Sitka, AK - #A15506.10150)

BECAUSE THESE FORESTS SHOULD BE TREATED THE SAME AS ALL OTHER FORESTS

We hereby specifically name the Tongass and Chugach National Forests in Alaska as included in our specific request for roadless protection, because there is too often an unfortunate tendency among some to somehow allege that these beautiful and largely pristine forests, with their immense and important roadless and wildlife resources, are somehow 'different' and should be treated differently than the other forests in our national system.

They shouldn't. Their roadless areas must also have the full protection of a comprehensive Roadless Protection Rule. (Organization, Madison, WI - #A22099.45622)

I am writing this email to ask you to treat the Tongass the same as other National Forests, nothing more. While the final roadless rule protected some Tongass roadless areas, it arbitrarily left many special roadless areas unprotected. The roadless rule should be strengthened to safeguard all the critical inventoried roadless areas on the Tongass, including Totem and Douglas Bays on Kupreanof Island; Cape Fanshaw and Farragut Bay on the mainland near Petersburg; Virginia Lake near Wrangell; Emerald Bay on the Cleveland Peninsula, north of Ketchikan; and Bostwick Inlet and Creek on Gravina Island next to Ketchikan; and Saltery and Sunny Coves, and Clover Bay on east Prince of Wales Island. (Individual, Juneau, AK - #A10396.45623)

I am particularly offended that the Forest Service is considering treating the Tongass differently than other National Forests by minimizing its inclusion in the roadless area rule. There is no legitimate scientific or policy basis for doing so. (Individual, Seattle, WA - #A11644.45623)

Roadless areas of the Tongass fulfill the same functions that make them so valuable to forests in the Lower 48. Besides sheltering wildlife, they provide high-quality fish habitat and support healthy runs of anadromous fish. They provide supplies of clean drinking water. They offer refuges for quiet, wilderness recreation.

The only difference between roadless areas in the Lower 48 national forests and the Tongass is that the Tongass has more of its roadless areas left intact. Are we to infer, then, that business as usual on the Tongass can continue, clearcutting ever more roadless areas, before having to worry about systematically protecting what is left? (Organization, Sitka, AK - #A30486.45623)

BECAUSE THERE IS PUBLIC SUPPORT FOR PROTECTION OF THESE FORESTS

The Forest Service's historic rule to protect 58.5 million acres of roadless areas in our national forests must be preserved and not weakened. We must continue to preserve our remaining pristine forests, especially Alaska's Tongass Rainforest. As a local legislator I know that there is overwhelming support for preservation. This is also evident by the more than 1 million citizens who supported the policy in prior comments to your agency. (Elected Official, Berkeley, CA - #A18120.45620)

Alaskans support Tongass protection! At public hearings held last summer in Southeast Alaska, about 60% of those testifying supported immediate protection of the Tongass. (Individual, Bainbridge, WA - #A10563.45623)

AS A COMMITMENT TO GLOBAL RAINFOREST CONSERVATION

Protect all roadless areas in all National Forests. The policy should provide protection to the Tongass National Forest, which, as America's largest and wildest National Forest and the heart of the last great temperate coastal rainforest on Earth, is a key test of our country's commitment to rainforest conservation. (Organization, Plymouth, MN - #A7116.45620)

The Tongass's vast expanse of coastal rainforest in southeast Alaska supports abundant wildlife, including the world's largest concentrations of grizzly bears and bald eagles. The new Forest Service ban on roadbuilding and commercial logging in unspoiled areas of national forests, coupled with the closure of the last subsidized Tongass pulp mill in 1997, offer a unique opportunity—one that

Americans favor overwhelmingly - to save the millions of acres of this ancient rainforest still standing. (Individual, Mason City, IA - #A10326.45623)

The Tongass must be protected. How can we be concerned about the rainforests of the tropics when our own temperate rainforests are being destroyed? Forests of large trees are the ideal vegetation for an area with that much rain. They soak up the water and recycle it into the atmosphere.

Erosion can be extremely severe in a steep and rainy area such as SE Alaska. I hoped that when the contracts with the Japanese companies were ended, the Tongass had a chance, but it always seems to be threatened again. Please don't sacrifice it. (Individual, Northfield, MN - #A22395.45623)

1353. The Forest Service should include Alaskan national forests in a national roadless rule for economic reasons.

BECAUSE OF THEIR IMPORTANCE TO THE LOCAL ECONOMY

The Chugach National Forest was established primarily to protect its fish, wildlife and recreational resources. Much of the Chugach is roadless and provides exceptional opportunities for outdoor recreation, including fishing, hunting, kayaking, hiking, skiing, wildlife viewing, and photography, as well as an expanding tourism industry. Compared to the Tongass, the availability and value of timber are much lower on the Chugach. In terms of sustainable economics, the fish, wildlife, and recreational values of the Chugach certainly outweigh even a small-scale commercial timber industry. (Organization, Anchorage, AK - #A29062.45100)

Members of the Alaska Center for the Environment both use and reside within communities nearby the roadless areas of the Chugach and Tongass National Forests. Our members rely on these intact forest lands, rivers and wetlands for activities including hiking; camping; sport and subsistence hunting; sport, commercial and subsistence fishing; kayaking; wildlife viewing; backpacking and general aesthetic enjoyment and solitude. ACE members also include Alaskan small business owners involved in low-impact commercial operations that include tourism enterprises, cottage industries and photography whose profitability is directly linked to protection of forest resources and wilderness character.

Because their activities are incompatible with roads, commercial logging, mining, and oil and gas development, our members will avoid areas with these impacts. Our members seek roadless areas for their recreational, subsistence, economic and spiritual fulfillment. If the roadless rule is revoked, given loopholes or changes, held in violation of law or enjoined, ACE and its members will be irreparably harmed. (Organization, Anchorage, AK - #A23038.45622)

I support including the Tongass National Forest in the Roadless Rule. The large-scale clear-cutting that has occurred in this forest is a travesty—to blot the environmental legacy of every administration that allows it to continue. There is absolutely no excuse for allowing this assault on the environment to continue.

Economically, the large-scale clear-cutting has allowed a couple of large corporations to profit at everyone else's expense. American taxpayers have largely unknowingly subsidized—for total of over half a billion dollars since 1992—hundreds of miles of roads through old-growth rainforest. Native Americans have watched their subsistence lands and game populations diminish to the point where further declines in habitat will—without question according to wildlife biologist in the area—lead to a shortage of deer and increased conflict among users (Ecotrust, "Forest Condition in Southeast Alaska," 1999), Local businesses such as forest products, commercial and sport fishing, and ecotourism have been stifled because of their inability to compete-or-exist-with the heavily subsidized logging giants.

Lack of economic diversity has affected regional economic health. With the closing of two pulp mills this decade, the regional economy is changing rapidly with a growing emphasis on activities that build on the natural wealth. According to research by Ecotrust and others, significant opportunities in ecotourism, small scale, value-added forest products and seafoods are part of the emerging economy. Subsistence and traditional use also remain a major element of community life. Based on 1990 census

figures, residents of Southeast [Alaska] harvested over 6.4 million pounds of wild foods—at a replacement cost of \$5 per pound, this represents an annual value of \$32 million.

Including the Tongass in the Roadless Rule and protecting the remaining roadless areas will help residents meet the needs of the future rather than prolong past mistakes. It will save taxpayers money—and it won't exclude logging because the existing roads network can be used to access timber outside of roadless areas. (Individual, Cordova, AK - #A8044.45623)

Please do not allow any exemptions or exclusions that would undermine or weaken the Roadless Area Conservation Rule. For example, Alaska's Tongass and Chugach National Forests much included in any national prohibition on logging and roadbuilding. Exempting them would permanently damage the biological integrity and ecosystem health of our large remaining temperate rain forests. It would also make no sense economically, as taxpayers stand to lose million of dollars from the below-cost timber sales. Recreational use by hikers, bikers, boaters, and other non-extractive users brings in most of the money that our national forests contribute to the national economy. (Individual, Auburn, CA - #A30708.45623)

BECAUSE MANY ALASKANS RELY ON SUBSISTENCE FOOD

I implore you to include the Tongass and Chugach Forests in the roadless protection rule as it was written into the Federal Register on Jan. 12, 2001.

We depend upon subsistence fishing, crabbing, shrimping and occasional hunting around the Tenakee Inlet area for a large part of our existence. We also gather and use berries and local vegetation in our diet. (Individual, Tenakee Springs, AK - #A26905.45622)

As a Southeast Alaska resident, I am writing to express my desire that the U.S. Forest Service maintain the roadless area protection rule recently adopted for the Tongass National Forest. Intact roadless watersheds on the Tongass should be protected and additional road building in the Tongass should be prohibited. New road building and associated timber harvesting will adversely impact my use of forest resources. I depend on the Tongass to provide myself and family with salmon, wild berries and other traditional foods. We also depend on the forest for wilderness recreation. These activities would be negatively impacted by new road building. (Individual, Juneau, AK - #A29872.45623)

In addition to wage employment, traditional gathering of subsistence foods plays a substantial role in Southeast Alaska's rural communities. Since time immemorial, subsistence has been a way of life and culture for Alaska Natives. Non-Native immigrants to the region have also learned to rely on harvest of wild game and fish. Eighty-five percent of the rural households in Southeast Alaska harvest some kind of subsistence food and nearly one-third of rural households supply half their need for fish and meat by hunting and fishing. Subsistence may provide 70 to 80 percent of the protein consumed in less accessible households in the Gulf of Alaska region. Reductions in wildlife and fish populations threaten the foundation of Native culture and the classic Alaskan tradition of living off the land. (Individual, Ashland, OR - #A23399.45623)

BECAUSE TIMBER SALES ARE NOT ECONOMICALLY VIABLE

Timber Sales in the Tongass do not make fiscal sense. The taxpayers of the US lose money. According to the Roadless DEIS, timber sales in the Tongass result in a net revenue loss of \$178 per thousand board feet of timber (p. 3-184). If the Tongass National Forest sells 539 mmbf of roadless area timber over the next 5 years as planned, the total net loss to the government, according to the Forest Service, would be about \$96 million. This is likely a conservative estimate, since the agency typically underestimates the costs of its timber program. (Individual, Sitka, AK - #A15506.45626)

It makes absolutely no sense to: build roads, log, mine or drill the National Forest in Alaska. The cost of harvesting is too great for a fair return to the government. In essence, the Alaskan trees are just given away to anyone that will remove them. The MFB (or ton) price is so low that there is absolutely no

public benefit from this type of operation. However, there is public benefit for recreation in an uncut forest. (Individual, Shreveport, LA - #A24980.45622)

BECAUSE TOURISM INDUSTRIES DEPEND ON THE TONGASS NATIONAL FOREST

Our business is built around and dependent on our wild forests, which is why we support the PERMANENT PROTECTION of Chugach and Tongass National Forests, and would like to see the Roadless Rule implemented as it stands. (Business, Homer, AK - #A15420.45620)

As professional wildlife photographers, our business is built around and dependent on our wild forests, which is why we support the permanent protection of the Chugach and Tongass National Forest, and hope you implement the Roadless rule as it stands. (Business, Anchorage, AK - #A14076.10150)

Salmon require clean, clear and cold streams to successfully spawn. The sedimentation of rivers due to high runoff caused by logging reduces the number of fish. This effect does not take years to be noticed. It is immediate and long lasting. The soil on the islands of Southeast Alaska is only 2-8 inches deep. This thin layer is easily washed away by the precipitation of a temperate rainforest.

Fishing is more than a way of life here in Alaska. Salmon and steelhead trout bring tourism and commerce to communities across the state. I urge you to consider the drastic damage that logging has inflicted on salmon populations in the Tongass National Forest. (Individual, No Address - #A10390.45623)

We request the Forest Service include the Tongass National forest in the roadless policy. Our fly fishing business, which operates on streams throughout northern Southeast Alaska, depends on healthy watersheds and streams to provide catch and release fishing opportunities for salmon, Dolly Varden, cutthroat and steelhead. Our trips are also enhanced by the remote "wilderness" experience, which are still available in many non-roaded areas.

The Forest Service has the opportunity to provide additional protection to a national forest that is home to some of the large intact wild salmon and steelhead runs in the world. Roadless protection would not only benefit businesses like ours but also subsistence users, sport and commercial fishermen. (Business, Juneau, AK - #A28683.45623)

BECAUSE ROADLESS AREAS SUPPORT THE COMMERCIAL FISHERIES IN ALASKA

The commercial fishing and seafood processing industry accounts for approximately 20 percent of Southeast Alaska's private industry employment. Commercial fishing provides large incomes, over a short summer season, to a broad spectrum of Southeast Alaskans. This income provides the critical source of capital to most rural communities, where year-round employment is scarce. The industry is dominated by salmon harvesting, which depends on high-quality stream habitat in the rainforest. (Organization, Plymouth, MN - #A7116.75000)

I am writing to express my disapproval of the recent attempts by the Bush Administration to overturn the current protection of roadless areas on Alaska's Tongass. A resident of Tenakee Inlet has drawn my attention to this issue. This proposed policy change would affect Crab and Saltery Bays in the Inlet. If logged or clear cutting were allowed in Tenakee Inlet, it would not only affect the majestic view, but also destroy people's way of life. There are hundreds of Inlet locals who rely on the land and inlet to provide for their families. Commercial fishing is the area's largest employer. These men's entire livelihood is tied to the salmon population. In fact, 80% of all of Southeast Alaska's salmon need the streams of the Tongass for spawning and reproducing. According to the Forest Service and Alaska Fish and Game, as many as 66% of logging roads cross over active salmon reproductive streams and 85% of resident fish streams crossing are not adequate for fish passage. (Individual, Cambridge, MA - #A19185.75400)

I am a 26-year resident of Southeast Alaska, in the heart of the Tongass National Forest. My two sons, husband, and I commercial fish for salmon, as well as other fish and crab species in the waters

surrounding the Tongass. Our livelihood depends on the health of the habitat for those species, both upland and marine. As you know, anadromous habitat, as well as marine ecosystems are directly and adversely affected by logging, mining, road construction, and other development activities. (Individual, Petersburg, AK - #A5427.75500)

One thing I learned really caught my eye; the Forest service and Alaska Department of Fish and Game report that as many as 66% of the logging road culverts over anadromous fish streams, and 85% of resident fish stream crossings, are not adequate for fish passage. Now, commercial fishing is the area's largest employer, much more important than the logging industry. And eighty percent of salmon in Southeast Alaska spawn in Tongass streams. So why should the logging industry be favored over the fishing industry? (Individual, Juneau, AK - #A23012.75500)

1354. Public Concern: The Forest Service should immediately implement the Roadless Area Conservation Rule in the Tongass National Forest.

SCHEDULED TIMBER SALES MAKE THE RULE EVEN MORE NECESSARY

I do not believe that it is possible to defer the implementation of the roadless policy in the Tongass. Over 500 mmbf of harvest from roadless areas is scheduled in the next 5 years, more than twice that scheduled for the entire remainder of the National Forest System. 75% of the total Tongass timber harvest will come from roadless areas, including St. John the Baptist Bay, Schulze Cove, Cape Fanshaw, Bradfield Canal, Gravina Island, and Moira and Chomondeley Sounds on Prince of Wales Island. With the exception of Prince of Wales, I have been to the other locations. I do not want to see the wild character of these special places lost. I want to be able to visit these locations on Prince of Wales Island and see them as they are today. (Individual, Sitka, AK - #A15506.45623)

The Cholmondeley timber sale, one still allowed under the roadless policy, is an example of this problem. It is bitterly opposed by business owners living in the project area. "The Cholmondeley Project Area was given the highest priority (in the South POW Planning process) because of the large expanses of potentially suitable timber. Through further analysis, the ID team determined that much of the project area was isolated, low-volume timber, and only three areas of forest provided economical timber harvest opportunities" (Cholmondeley DEIS, p.2-1) The Moira sale, if allowed to proceed, will be an even more desperate example. (Individual, Sitka, AK - #A15506.45626)

I would be disgusted to hear of any exception or exemption to the Roadless Area Rule for the Tongass National Forest—or any other. It would seem to me to be a cynical and subversive bid by some to attempt to road and log as much as possible within the years exemption proposed. There should be no exceptions to the Roadless Area protection rule. (Individual, Vashon, WA - #A27214.45623)

1355. Public Concern: The Forest Service should not use the fact that the Tongass National Forest has a recently revised forest plan as a reason to exclude it from a national roadless rule.

When will the policy apply to Alaska's Tongass National Forest? *Its recently revised Forest Plan should be no grounds for exemption, (even if Senators Young and Murkowski sit at the helms of Interior Appropriation and Natural Resource Committees.) A national conservation policy of this caliber should not be bogged down by special interests of extractive industries and their cohorts in congress. A National RA policy should not be riddled with exceptions.* (Organization, Albany, OR - #A19057.45623)

The past justifications for exempting the Tongass from new roadless area protections are unquestionably economic and political, rather than scientific. Consider the following rationales the Forest Service has offered for the Tongass exemption, in the EIS or other public forums:

1. We just finished an expensive and time-consuming forest plan revision that protects a lot of roadless areas.
2. Economic dislocation would be too severe from the reduction in roadless area timber cutting.
3. We'd have trouble trying to meet market demand for timber, as supposedly required by law (The Tongass Timber Reform Act).

This is not a sound rationale. The Tongass is no different from many other forests that have also had plan revisions or amendments in recent years, including plans with significant land protections like those in the Tongass. The entire premise for the proposed rule is that there is a need for national level direction on roadless areas that is not adequately met through the forest planning process. EIS, 1-10 ("Given the history of controversy surrounding the management of roadless areas and the level of interest expressed by the public, the agency has determined that there is a need for national level direction for roadless area management."). The proposed rule incorporates new approaches to roadless area management nationally that are not reflected in the TLMP Revision or any other forest plan. The reasons cited for national level direction in the EIS are as applicable to the Tongass as to any other forest, notwithstanding the TLMP Revision.

Only 4% to 5% of the Tongass includes the high-volume old-growth forest most critical to fish and wildlife protection and also most economically valuable to the timber industry. The most valuable high-volume timber has already been harvested in southeast Alaska. The Native corporations selected the most valuable remaining timber lands in southeast Alaska. This fact and the early industry high grading has resulted in the loss of about 70% of the most productive old growth timber throughout southeast Alaska. This situation significantly reduces forest diversity and poses a substantial risk of long-term population declines of many populations including salmon, brown bears, wolves, and goshawks. Protecting the remaining roadless areas offers some hope of balancing this serious inequity.

For these reasons, the TLMP Revision does not set the Tongass apart from any other national forest, including those with recent forest plan revisions or amendments. Accordingly, the TLMP Revision is not a sound basis on which to exclude the Tongass from the proposed rule. (Organization, Sitka, AK - #A30486.45623)

American Lands strongly believes the final rule must incorporate the best available scientific information. With that in mind, we urge the Service to implement a policy that includes all biologically important roadless areas within the National Forest System. **NO AREA, INCLUDING THE TONGASS NATIONAL FOREST, FORESTS IN THE NORTHWEST FOREST PLAN, AND MANY ROADLESS AREAS LESS THAN 5,000 ACRES, SHOULD BE EXEMPTED FROM THE PLAN.**

There is no scientific justification for the exemption of these lands from roadless area protection. A new Tongass forest plan would convert 400,000 roadless acres to roaded status on the Tongass every decade. Thus, roadless area protection is very much needed on the Tongass . . . Administration officials have argued that, with a solution (the Northwest Forest Plan) already in place for Northwest forests, no further management changes are needed for the region. Yet roadless area sales are being justified in the Gifford Pinchot National Forest (GPNF). The Service is "committed to sell a certain volume of timber each year—goals that cannot be met if it stays out of every roadless area," a spokesman for the GPNF told the Tacoma News Tribune in 1999.

Because few of those areas identified by the RARE I and RARE II processes were protected and the inventories were incomplete, many areas still intact are sure to slip through the cracks. Roadless areas in the Sierra Nevada that deserve protection may not be spared from logging and road building. For example, in the Tahoe National Forest, which has nearly 3,000 miles of roads, forest activists found that Devils Canyon, which contains the largest stand of old growth trees in Nevada County, Lafayette Ridge, which also has old growth, and an area near Downieville and north of New York Ravine, which is important springs habitat to four rare subspecies of Caddis fly, could be logged and roaded because all three areas are less than 5,000 acres and may be overlooked by the Regional Forester. (Organization, Nevada City, CA - #A4941.45621)

The Proposed Changes included exempting forests which have a revised forest plan. This singles out the Tongass (the only forest so far to have revised its forest plan), even though the forest plan revision was

made prior to the January publication of the roadless rule. The revision of the Tongass Land Management Plan did not adequately consider protection of roadless areas or the recommendation of Wilderness designation. This lack is currently the subject of a lawsuit. Therefore, no exemptions should be given on the basis of whether or not a forest plan revision has been completed. (Individual, Sitka, AK - #A24495.45623)

A recent report, Deconstructing the Timber Volume Paradigm in Management of the Tongass National Forest, (Caouette et al, March, 2000. Pacific NW Research Station PNW-GTR-482) shows how the Forest Service relied on unsuitable data to manage the ecological health of the forest, and therefore failed to maintain that health. The Tongass is a unique forest ecologically because it is naturally highly fragmented and patchy in forest character and value. It has been extensively high graded. The most productive valley bottoms, with the rarest and most valuable forest structure for wildlife habitat, were logged first. Because of that, nothing we do right in the future can repair what we have done wrong in the past. We have put old-growth dependent species at risk. Standards and guidelines in the 1999 Tongass Land Management Plan are not comprehensive enough to ensure that populations can remain viable. (Individual, Sitka, AK - #A15506.45623)

Your recent actions also appear intent on removing protection from the greatest national forest created by Theodore Roosevelt, Alaska's Tongass National Forest. I am strongly opposed to any effort to modify the Jan. 12 roadless policy as it applies to the Tongass.

I am especially concerned regarding an apparent presumption that the Tongass Land Management Plan adequately addressed roadless issues on the forest. This conclusion appears to have been reached in spite of the fact that the plan was concluded years before the roadless policy existed and that TLMP has been set aside by a federal district court decision, in part, over its treatment of roadless areas.

Alone among forests in the National Forest System, the Tongass still contains large blocks of fully functioning old growth ecosystems not yet impacted by industrial logging and associated roadbuilding. I would observe that your agency's own analysis recognizes the importance of the inventoried roadless areas on the Tongass in providing the Forest's "high degree of biological integrity and overall ecosystem health" (p.3-26 Roadless DEIS). This point of view is also shared by 330 of the nation's leading ecologists and biologists that in a December 20 letter to President Clinton declared that the Tongass "still encompasses many undisturbed watersheds with a full compliment of all native species." The scientists correctly point out that it "has been consistently demonstrated that roadless areas are crucial to the protection of our nation's wildlife, fisheries and water resources.

However, much of this low-elevation, high quality wildlife habitat has already been developed on the Tongass. According to the scientists, the roadless reserves are "especially critical because only four percent of the Tongass land-base encompasses the low elevation, large old growth most important to fish and wildlife and much of this rare forest has already been clearcut." Therefore, failing to apply the roadless protections contained in the January 12 rule will merely hasten the day when the Tongass resembles the cut over forests of the Pacific Northwest. I speak from first-hand observation when I say that many areas of this magnificent rainforest already do, such as Central Prince of Wales Island and Zarembo Island. I conclude my comments on the Tongass with another observation from the scientist's letter. The scientists correctly maintain that "there is no scientific basis to exclude the Tongass National Forest from the Forest Service's national roadless policy". Furthermore, they hold that "excluding the Tongass would severely compromise the scientific legitimacy of any national policy on the protection of roadless areas in our National Forest System." (Individual, Alexandria, VA - #A22990.45623)

Exclusion

1356. Public Concern: The Forest Service should develop additional criteria to provide guidance to forest managers regarding areas that should be excluded from the Roadless Area Conservation Rule.

DUE TO PRIOR DEVELOPMENT ACTIVITIES

This direction leaves unclear exactly where the developed portions are located and available for additional timber harvesting (provided the prescription for the area allows such activities.) When the reexamination of areas eligible for roadless status is conducted during revision of the forest plan, this uncertainty is removed because boundaries of roadless areas are clearly delineated, and the areas to which the roadless conservation rule applies is delineated. However, until the delineation of roadless areas is conducted as part of the revision of a forest plan, additional criteria should be developed in the Forest Service Handbook. These should provide more specific guidance to the Forest managers about areas that should be excluded from application of the rule due to prior development activities. (Civic Group, Roanoke, VA - #A1713.65241)

1357. Public Concern: The Forest Service should exclude certain roadless areas from roadless designation/protection based on development potential.

EXCLUDE AREAS ADJACENT TO DEVELOPED RECREATIONAL SITES

Not all inventoried roadless areas are equal. Conditions on NFS lands have changed in the past two decades, and as a result not all inventoried roadless areas have the same importance or value. Some roadless areas have become significantly smaller in size—others may have roads and other nearby developments that diminish roadless values. For example, roadless parcels adjacent to ski areas may be roadless, but not have the full range of natural characteristics that would commonly be associated with a roadless designation. These areas are not remote, are not undisturbed landscapes, and inevitably are influenced by nearby ski area operations. Generally speaking, areas immediately adjacent to developed recreation sites should not be considered for roadless designation. (Permit Holder, Hood River, OR - #A13230.45617)

EXCLUDE SPECIAL USE PERMIT AREAS OR MASTER DEVELOPMENT PLAN AREAS

For Northwest ski areas not under the jurisdiction of the NFP, exceptions should be allowed when the risks of fire or disease are present. Exceptions also should be made for existing, reserved, or outstanding rights so that roadless prohibitions do not get applied within special use permit (SUP) or master development plan (MDP) boundaries. Consistent with the original January 12, 2001 rule, management of roadless areas should “not suspend or modify any existing permit, contract, or other legal instrument authorizing the occupancy and use of National Forest System lands.” Finally, any timber cuts incidental to management activities other than road building, such as trail construction or maintenance, should be permitted. (Permit Holder, Hood River, OR - #A13230.45617)

A further remedy would be to include in any action or decision an exemption excluding all lands in the National Forest system, and as to DCC, those areas within the INF, previously identified for resort or recreation site development or expansion from consideration in the Roadless Initiative. This would include all lands within the SUP boundaries of SSA, those identified in master development plans, those lands designated in forest plans for potential ski area development, and Management Prescriptions 13 and 14 in the INF Forest Plan. (Business, Mammoth Lakes, CA - #A30296.45500)

It appears that the following areas are proposed to be included and subjected to the Roadless Area rules:

Section 8, Township 12 North, Range 19 East, Mt. Diablo Base and Meridian;

The southern portion of Section 4, Township 12 North, Range 19 East;

The northern portion of Section 9, Township 12 North, Range 19 East; and

The eastern portion of Section 7, Township 12 North, Range 19 East.

The lands proposed for inclusion lie immediately adjacent to the 4,500 acres of land presently under Term Special Use Permits to Heavenly (permits #4056/01 and #4056/02), or adjacent to private held lands which Heavenly owns or controls. In fact, the entire area of Section 7 is already within Heavenly's Special Use Permit boundary and is used for downhill skiing.

They are adjacent to an existing winter sports ski resort that is under an approved Forest Service Master Development Plan and adopted by several other governmental agencies with jurisdiction. The Master Plan was approved in 1996 following an interdisciplinary planning process. The approved master plan is required to be reviewed and updated at regular intervals. Work on the update will begin early in 2002. Beginning in 1998, Heavenly has had discussions with local Forest Service official's plans regarding a possible realignment of a portion of the Term Permit boundary in part to include the sections of land or portions thereof, which are indicated above. By that time, the roadless area boundary had been drawn. The area in question (identified above) does not meet the letter or the spirit of roadless area; the parcels are surrounded by private lands on either two or three sides, and lie at the edge of the existing residential development along the western side of the Carson Valley. The valley's character has changed to a much more urbanized landscape. Many nearby residents use the adjoining National Forest lands for a variety of purposes.

The local Forest Service office has requested that we consider jointly amend the existing Heavenly Ski Resort permit boundary to delete certain lands from the area under permit which are clearly not needed for current or future resort use permit. In cooperation with the Forest Service, Heavenly is considering proposing to add portions of the land identified above to its permit. Adding the lands will not only enhance the mast plan as descried below, but will consolidate lands for management purposes, and will help to offset the potential loss in revenue to the local county government under whose jurisdiction both areas lie.

It appears that the proposed roadless area boundary was simply drawn along the edge of an existing electrical transmission line. There was very little coordination between Heavenly and the Forest Service, thereby, missing an excellent opportunity to share knowledge regarding the master plan and the impacts of this proposal.

Inclusion of these areas within Heavenly's Special Use Permit boundary (i.e., not subject to the proposed Roadless Area rules) would allow a continuous connection to be developed between a potential base area at the bottom of the slopes near the Kingsbury Grade (Nevada State Route 207), on land which Heavenly controls, and the existing resort facilities located on the Nevada side.

The ability for the public to access the resort in this manner ensures that the Forest Service and Heavenly will continue to provide a high-quality public outdoor recreational experience, and, that transportation impacts to the existing road network, particularly those on the Kingsbury Grade and in the Lake Tahoe Basin are minimized by providing public access at the bottom of the hill and then transporting visitors onto national forest lands using ropeway forms of transportation.

The opportunity exists for these lands to help meet the expanding recreational needs of the public. Prohibiting future construction or reconstruction of roads will foreclose that recreational opportunity.

Portions of the lands identified above already contain roads which are non-system roads that connect private lands managed for like purposes.

Any new roads which may be constructed to provide access to new skiing facilities are expected to be designated as non-system roads but will be constructed and maintained so as to have minimal environmental impact under the direction of the Forest Service watershed staff using private dollars.

Any new roads which may be planned as a part of the Master Plan process will be subject to full NEPA disclosure and analysis, including the mitigation of any identified impacts to less than significant levels. (Permit Holder, Stateline, NV - #A21708.45617)

EXCLUDE AREAS WITH EXISTING OR FUTURE OPERATIONS AT FOUR-SEASON RESORTS WITHIN OR ADJACENT TO EXISTING OR FUTURE SPECIAL USE PERMIT BOUNDARIES OF SKI AREAS

The Forest Service should revise the proposed roadless area rules to clarify that they do not apply to existing or future operations at four-season resorts within existing or future special use permit boundaries. This would have little effect on the conservation of 58.5 million acres of roadless areas

nationwide. It would likely involve only a tiny amount of inventoried roadless areas (many of which are now roaded) and would have a positive effect on the agency's ability to accommodate existing recreation and future increases in demand.

Therefore, in addition to exemptions for fire and other natural hazards and valid existing rights discussed above, Vail Resorts urges the agency to clarify that an exemption from roadless rule prohibitions would be available for operations within current and future special use permit boundaries, one which includes unroaded areas and inventoried roadless areas immediately adjacent to existing ski area sites, particularly where those areas and/or sites are currently allocated to four-season recreation or are under consideration for such allocation by forest plans. In order to avoid the undesirable forecast of higher density recreation at developed recreation sites, ski resorts need the flexibility to improve and expand their offerings in the future. Such an exemption also would acknowledge that lands adjacent to existing ski areas (and perhaps to other developed recreation sites, as well) are already likely impacted to some degree and such existing impacts may be inconsistent with the full range of roadless characteristics and values. The Forest Service should clarify this ambiguity by revising the Final Rule that its prohibitions do not apply to operations within or adjacent to the existing or future special use permit boundaries of ski areas.

Importantly, this appears to be the intent of the Final Rule. Although the January 2001 Final Rule would generally prohibit the construction or reconstruction of roads and the cutting and removal of timber in inventoried roadless areas, the Forest Service stated that the Final Rule does not apply to certain ski area operations. Specifically, the Forest Service stated that:

New ski areas or other activities outside of existing special use permit boundaries that do not require road construction, but require timber harvest, may be allowed in inventoried roadless areas, if approved by the local Responsible Official. (Permit Holder, Avon, CO - #A28852.45600)

EXCLUDE AREAS USED FOR PIPELINE TRANSPORTATION AND OIL AND GAS DEVELOPMENT

Williston Basin is a natural gas transporter, operating storage fields and over 3000 mile of pipelines throughout its traditional service territory in Montana, Wyoming, North Dakota and South Dakota. Williston has operated a transmission pipeline crossing the Little Missouri National Grasslands in North Dakota since 1930. The original pipeline was replaced and relocated within another corridor several miles north of the original corridor. The Roadless Initiative could prevent pipelines from crossing lands that may indeed be less environmentally sensitive than other potential routes.

Williston Basin is opposed to the Roadless Initiative and urges the Forest Service to reconsider implementing this rule or exempt pipeline transportation and oil and gas development from the Roadless Initiative. By utilizing proven, modern technologies, the development, production and transportation of oil and gas reserves in these areas can be accomplished with only minor and temporary (if any) impacts to the environment. Once a site has been abandoned it is reclaimed to and, in most cases, better than original site conditions. Pipeline rights-of-way generally revegetate within the first and second growing seasons, and by utilizing best management practices soil erosion can be virtually eliminated. (Business, No Address - #A29748.45610)

As a transporter of natural gas in interstate commerce, Williston Basin is dependent upon the oil and gas industry being allowed to explore for gas reserves, develop them and transport the gas on the Williston Basin system. A portion of this gas (gas associated with oil production) is currently being produced and gathered from Forest Service lands within the Little Missouri National Grasslands. Continued use of these lands (and other lands included in the Roadless Initiative) for the production and transportation of the gas is also necessary to ensure any users an ample supply of natural gas and products derived from crude. For example, the Tesoro Refinery in Mandan, North Dakota received all natural gas used for fuel and/or processing from the Williston Basin pipeline. This refinery also receives much of its crude from the grasslands. By eliminating potential new wells and pipeline rights-of-way, continued operation of the refinery is at risk. The local and state economies are very dependent upon the refinery. (Business, No Address - #A29748.45610)

1358. The Forest Service should exclude certain roadless areas from roadless designation/protection based on geographical location.

EXCLUDE AREAS IN THE WESTERN UNITED STATES

We are concerned that so much public land in the west is designated as public. A basic concern is that much of that land should be returned to the states. Why should those with larger populations in the East be allowed to rob and keep lands from those on the West? If more wilderness is desired, let all Chicago inhabitants be relocated, and wolves and bears reintroduced in Illinois, while the "wilds" are allowed to take over again as all mankind is kept away. Then let Philadelphia be next, then Atlanta and other parts of the East and South. Go pick on someone else rather than westerners. (Individual, Salt Lake City, UT - #A19191.45341)

EXCLUDE NATIONAL GRASSLANDS

North Dakota contains 1.05 million acres of land in the National Forest System. Of these, 266,000 acres are considered inventoried roadless areas. As opposed to much of the land designated roadless in the Forest System, North Dakota's portion is primarily not forested and is instead contained within three National Grasslands.

The greatest concern that I and many others in North Dakota have had with regard to the roadless rule is its application to a wide range of public land without consideration of locale-specific concerns. Roadless rule restrictions were originally designed for implementation on forested land. Placing the National Grasslands under the umbrella of the roadless area initiative ignores the quite significant difference between the landscapes of grasslands and forests. Given that one of the primary purposes of the initial roadless rule was the protection of forested lands for intensified logging, I cannot imagine how the inclusion of grasslands would contribute to this goal.

The inclusion of grasslands in the roadless initiative is further complicated by the comprehensive grasslands management plan proposed for the Dakota Prairie Grasslands as part of the U.S. Forest Service regular review process. The Final Environmental Impact Statement has been recently released, and comments will be taken for six months (up to January 22, 2002) prior to signature of the Record of Decision. While this management plan is still being evaluated and is certainly not perfect, it does reflect a more site-specific approach for public land management. If such plans are to be valid, they must incorporate such local decision-making plans into any national rule-making. (United States Representative, North Dakota - #A23212.45340)

I believe that any rulemaking relating to roadless areas must exclude National Grasslands from applicability of the rule, due to their significant difference from forested lands. Barring an outright exclusion, the local grasslands Management Plan should be considered with implementation of any roadless rule, and special emphasis should be paid to the impact (both economic and social) on local communities from the implementation of roadless restrictions, including loss of revenue and jobs due to mineral extraction restrictions.

I certainly appreciate the considerable work that was done and continues to be done to create a workable initiative, and I recognize the attempt to reduce road maintenance backlog within the agency and focus most on current roads. However, I believe the roadless rule as it currently stands and applies to grasslands is unacceptable. (United States Representative, North Dakota - #A23212.45340)

1359. The Forest Service should exclude certain roadless areas from roadless designation/protection based on forest plan status.

EXCLUDE AREAS THAT HAVE RECENTLY COMPLETED FOREST MANAGEMENT PLANS

Our State Society also did not agree that the Roadless Rule should include the Black Hills National Forest because it had just finished a new management plan only a short time before the Roadless Rule process was initiated. We found it inconsistent that the Chief of the Forest Service had signed off and agreed with the management directions of Black Hills National Forest roadless areas only a year earlier. (Professional Society, Rapid City, SD - #A21751.12230)

Exceptions must be allowed. Under the interim rule that suspended road building, the agency exempted Northwest Forest Plan (NFP) forests because of the scientific input gathered during the ecosystem management assessment team process (begun in 1993). Scientific analysis of the ecosystem, and related watersheds, led to the issuance of the NFP record of decision, and subsequent revisions to the NFP. This forest planning process was subject to an exhaustive public comment period, and the implementation of the revised NFP led to a new management direction for the forests under the jurisdiction of the NFP. (For every development proposal, the NFP requires a companion strategy for maintaining and enhancing overall watershed health.) The Association believes a new set of guidelines for the protection and management of roadless areas will lead to great disruption in the management of NFP forests. Many of the PNSAA's ski areas are located within NFP forests. For this reason, the Association urges the Agency to exempt the forests covered by the NFP from any future roadless conservation rule. (Permit Holder, Hood River, OR - #A13230.45610)

1360. Public Concern: The Forest Service should exclude Alaskan national forests from a national roadless rule.

BECAUSE INCLUSION OF ALASKA'S NATIONAL FORESTS WOULD BE CONTRARY TO ALASKA STATE AND FEDERAL LAWS

We strongly oppose the rule, especially its application to the Tongass and Chugach national forests in Alaska. Including the Tongass in the final rule prohibits the Forest Service from complying with the Tongass Timber Reform Act (TTRA) and the Alaska National Interest Lands Conservation Act (ANILCA). (Business, Juneau, AK - #A11824.45613)

Inventoried roadless areas should be evaluated based on a consideration of all the relevant factors. These include the requirement to provide for multiple use of the national forests and the sustained yield of products and services from those forests as required by the Organic Administration Act, the Multiple-Use Sustained Yield Act, and NFMA. They also include factors such as social and economic needs and providing for community stability. With respect to the Tongass, the Forest Service must also consider the Tongass Timber Reform Act (TTRA) requirement that it seek to meet the demand for timber from the Tongass.

The Forest Service should consider that each forest has unique characteristics and that local communities depend on the national forest in varying degrees for their economic, social and environmental health. Application of the present Roadless Rule prohibitions to the Tongass failed to recognize these considerations and is contrary to ANILCA, NFMA, TTRA and the other forest planning laws. (Manager, City of Wrangell, AK - #A17670.45100)

Application of the roadless rule to the national forests in Alaska essentially means no more logging because there has been such limited access into the forest. Timber in areas where roads have been built won't be old enough to harvest for at least 65 more years. Given Sections 708 and 1326 of ANILCA, it is clear that the roadless rule cannot be applied to National Forests in Alaska and that the forest planning process is the only way in which environment, social and economic values can be achieved in a balanced way. (Individual, Sitka, AK - #A12821.45611)

In conclusion, the Forest Service's proposal to eliminate road construction activities in roadless areas on the National Forest System, and to develop regulations for the protection of roadless areas as roadless areas, cannot lawfully be adopted or applied to the Chugach National Forest or Tongass National Forest because the proposal (1) violates existing law with respect to the forest planning process, (2) conflicts with provisions of ANILCA prohibiting wilderness studies and the creation of new conservation systems units, (3) violates the Forest Service's multiple-use mandate by effectively prohibiting resource development in the Chugach and Tongass National Forests, (4) unjustly frustrates value existing rights of access to private inholdings across federal lands administered by the Chugach National Forest, and (5) violates NEPA by failing to adequately and accurately analyze all issues and concerns in the FEIS. The Forest Service should withdraw the proposal or adopt Alternative 1 - No Action (no rule prohibiting

activities in inventoried roadless areas would be issued). (Professional Society, Anchorage, AK - #A21707.45612)

Sealaska determined that the Proposed Rule was inappropriate as a National policy; and specified that it should not be applied to the Tongass and Chugach National Forests.

Our understanding is that effective July 27, 2001 Interim Directive No.: 7710-2001-2 part 7710.4 states "...reserves to the Chief the authority to approve certain proposed road construction or reconstruction projects in inventoried roadless areas until revision of a land and resources management plan or the adoption of a plan amendment that has considered the protection of other management of inventoried roadless areas as defined in FSM 7712.16a." The Tongass NF has been operating under a revised plan since 1997. This plan classified all of the inventoried roadless areas into land uses deemed appropriate by the Regional Forester. The 1997 record of decision is being appealed for many reasons; the most important being ANILCA prohibits nationally directed agency land set-asides. Therefore, the valid planning process must apply to all lands without regard to whether a specific area is roaded or unroaded. (Tribal Corporation, Seattle, WA - #A20468.10130)

1361. Public Concern: The Forest Service should recognize that it cannot supercede land allocations on the Tongass National Forest with a national roadless rule.

The Tongass Land and Resource Management Plan (TLMP) just completed an 11-year, \$13 million revision funded by American taxpayers, which is currently under appeal by several entities. In addition to other legal impediments to the application of the roadless proposal on the Tongass, no changes in land allocations on the Tongass can be made by the Forest Service except to correct legal errors in the TLMP revision procedures or pursuant to a forest plan amendment following NFMA procedures. (Tribal Corporation, Anchorage, AK - #A20340.20400)

1362. Public Concern: The Forest Service should exclude the Alaskan national forests from a national roadless rule.

BECAUSE THE TONGASS NATIONAL FOREST HAS JUST REVISED ITS LAND MANAGEMENT PLAN

The Assembly of the City and Borough of Sitka passed the enclosed Resolution 00-78, A RESOLUTION OF THE CITY AND BOROUGH ASSEMBLY OF SITKA, ALASKA OPPOSING INCLUSION OF THE TONGASS NATIONAL FOREST IN THE U.S. FOREST SERVICE NATIONAL ROADLESS INITIATIVE, POLICY REVIEW AND SUPPORTING ALTERNATIVE T-1, on July 11, 2000.

This resolution was previously submitted to the Forest Service July 14, 2000, with a request to include this official position of the City and Borough of Sitka in the official comments concerning the Roadless Area Conservation Proposed Rule. We want to ensure these comments are also included in any subsequent review of any comments relating to the Roadless Initiative or any related actions.

Per the Resolution, we were pleased the Forest Service has exempted the Tongass National Forest from the interim directives due to its current Revised Tongass Land Management Plan. As the Resolution states, the City and Borough of Sitka supports alternative T-1 and permitting the Tongass to be managed under the Tongass Land Management Plan. (Elected Official, Sitka, AK - #A11819.45613)

It took over 10 years and a lot of hard work to craft the Tongass Land Management Plan (TLMP) finalized in the 1997 Record of Decision. Within that document is a planning process through which Alaskans can participate in making informed and sound decisions to appropriately and responsibly assist the federal government in managing operations within the Tongass Forest.

Our community and our region have, in the past, reasonably relied on the Forest Service's commitment to support a stable, broad-based economy, yet Southeast Alaska's communities have suffered adverse social and economic impacts due to the declining timber supply from the Tongass and other restrictions

on use of the forest. Any further actions must use the TLMP forest planning process to ensure that our economies not experience further degradation.

We respectfully request that the Secretary of Agriculture exclude the Tongass Forest from the national roadless policy in his final decision, and that future roadless issues here be addressed through the processes in the carefully crafted, legally mandated Tongass Land Management Plan. As Governor Knowles wrote in a recent letter: “any unilateral arbitrary federal edict imposing a roadless policy would be a ‘double-cross’ to the integrity of the public process.” (Elected Official, Juneau, AK - #A23218.45613)

Balanced resource management on the Tongass is more closely approximated by the recently completed land management plan revision. The 97 “ROD” contained the compromises and tradeoffs between a full spectrum of interests and represents a good balance for the decade, as intended by NFMA. The 99 ROD circumvented most of the analysis, but is considerably more balanced than the remnants of management that would be imposed by the full adoption of the “Roadless Initiative”. (Individual, Petersburg, AK - #A30209.20200)

The first major concern is based upon our belief that a decision to amend a national forest plan should be made through the regulations in place, mandated by law. Both the 1997 Tongass Land Management Plan (TLMP) and the 1999 amendment by Undersecretary Lyons not only considered the status of roadless lands; they also resulted in a further reduction in potential timber harvest in the Tongass. TLMP was supposed to be the decisional document for management of the Tongass, a fact underscored by Mr. Lyons during his 1999 visit to Alaska when he assured us that the Department’s decision would “finally provide some certainty with regard to future uses and management direction on the Tongass.” The proposed rule runs counter to that intent. (Elected Official, Ketchikan, AK - #A27725.20000)

BECAUSE DECISIONS SHOULD BE MADE THROUGH THE LOCAL FOREST PLANNING PROCESS

The final Agriculture Department decision on TLMP came in 1999. That decision included additional protection for unroaded, old growth areas along with significant additional restrictions on timber harvest. Though controversial, it appeared to be the culmination of the TLLMP process. However, this year, a federal district court vacated the Agriculture Department’s decision and simultaneously ruled “the Forest Service shall prepare a SEIS [TLMP supplemental environmental impact statement] that evaluates and considers roadless areas within the Tongass for recommendation as potential wilderness areas. The Forest Service must also provide the relative contribution to the National Wilderness Preservation System in its analysis.”

Although the Forest Service has not announced how it will proceed with implementation of the court order, it appears the roadless and wilderness issues will be addressed in the context of the forest plan.

In Alaska, the forest planning process has worked, and can continue to work. In fact, the adaptive management process outlined in TLMP provides the opportunity to adjust forest management based on new scientific information and the information from the cooperative monitoring effort to which the Forest Service committed in TLMP. The State of Alaska sincerely hopes the federal government will allow the forest planning process to work here in Alaska. (State Agency, Juneau, AK - #A23217.45613)

We believe that decisions regarding what to do with the roadless areas and other land use decisions on the national forests, including Alaska’s Tongass, should be made through the local forest planning process which is governed by the rules at 36CFR219 and others. As an example, the second Tongass Land Management Plan was completed in 1997 after ten years of studies, plans, and public input from local and national groups including the state and Alaska native bodies. Many millions of dollars and countless hours of work by men and women in the office and the field went into the development of this plan. Putting the Tongass under the roadless rule nullified all this work. Needless to say, many of the planners and local groups are discouraged that their labors have been spent for nothing. (Professional Society, Juneau, AK - #A11803.45613)

Since I live in Alaska I can not speculate on what is correct for the other 49 states. But I can tell you the Roadless policies do not make sense here in Alaska! Look at an Alaska state map, you will quickly

realize we need more roads and trails, yes even in our parks and national forests. Over 3/4 of our state is not accessible except by boat, snowmobile or dog sled team? Please help get us a ruling allowing state-by-state decisions, allowing local conditions [to] dictate policy. (Individual, North Pole, AK - #A7175.45611)

Please exclude the Tongass from the main "body" of Roadless Rule making, and allow decision on land management to be made at the Forest Planning level, where NFMA intended. (Individual, Petersburg, AK - #A30209.45613)

The State of Alaska urges the Forest Service to affirm the central role and importance of the forest planning process on Alaska's national forests. Specifically, we urge the Forest Service to make decisions regarding management of Alaska roadless areas through the forest planning process, repeatedly asking for public participation for the Tongass and Chugach National Forests in Alaska, and throughout the national roadless policy discussion finalized last year.

Unfortunately, those calls were not heeded. In January of this year, the State of Alaska filed suit in federal court seeking to stop the application of the national roadless rule to the Tongass and Chugach National Forests.

The Chugach National Forest Plan (CLMP) is very nearly complete following extensive public review. Certainly areas of significant natural value and public interest need protection, such as the Copper River delta and other key fish and wildlife areas. The best course of action is to address such issues in the forest plan, not through the national roadless rule.

On the Tongass National Forest, recent federal court decisions present a unique situation. The Tongass Land Management Plan (TLMP) was completed in 1997 after one of the most comprehensive public reviews and most comprehensive planning processes ever undertaken on a national forest. The State of Alaska's comments on the draft plan called for adherence to Governor Knowles' principles of "doing it right": sound science, prudent and sustainable management, and an open public process that brings all stakeholders to the table. (State Agency, Juneau, AK - #A23217.45613)

When we reviewed the map of the Tongass in your office, it should have been apparent to all present that the Tongass is already well protected by prior federal actions. The Tongass National Forest is 16.9 million acres, of which approximately 6 million acres are forested. 938,000 acres (or about 5.5% of the total and 16% of the forested acreage, is already off limits to commercial timber harvest which of course is what the roadless proposal is intended to further restrict. Furthermore, after the implementation of further restrictions to protect habitat for fish and wildlife (goshawks, marten, deer, and wolves), the 1999 Record of Decision makes a total of 576,000 acres available for timber harvest. As I noted, federal policy has created a dilemma relative to management of the Tongass. The 1999 Record of Decision, with 200 year rotations and other restrictions, forced timber harvesting projected for the next 10 years to move into inventoried roadless areas. Now, the U.S. Forest Service is putting those areas off limits to logging emphasis). . . . Now, ten years after that landmark citizen legislation, the lands protected by the Tongass Timber Reform Act are still standing proud, wild and free. The bear, wolf, salmon, deer and every other creature carry on." This candid assessment clearly indicates that the 1999 ROD adequately protected the Tongass National Forest.

Thank you for meeting with us last week. In closing, the roadless policy should not be used to further amend TLMP. I believe that the preferred alternative in the draft EIS was correctly identified as the right decision with respect to proper management of the Tongass National Forest. You have the opportunity to protect both the Tongass and the communities of Southeast Alaska by sustaining the forest planning process as the proper way to manage our national forest. (Elected Official, Ketchikan, AK - #A27725.45613)

BECAUSE EXTENSIVE LOCAL FOREST PLANNING HAS BEEN COMPLETED

You are well aware of the history that has gone into the preparation of the Land Management Plans for both of Alaska's forests. The last revision to the Tongass was finalized in 1997 and took over six years to write at a cost of \$13 million. The Chugach plan is near adoption after years of input and millions of

dollars in preparation. Both plans thoroughly address the “non-entry” option to guide the agency planners and ensure the public resources are protected. When you first accepted the special role to lead the roadless review for the previous administration neither Alaska forest was scheduled to be included in the roadless policy because current management plans were adopted or soon to be finalized. Bowing to political pressure and a massive letter writing campaign over the next 18 months, the Government was persuaded to include both of Alaska’s forests in the final decision. The decision to include the Tongass and Chugach flies directly in the face of local input and promises made to Governor Knowles and all Alaskans for the past four years. (Association, Juneau, AK - #A879.45612)

Leave the Tongass National Forest out of this roadless plan. Through extensive painful local forest planning the Tongass has done their work and it should be allowed to stand. The lawsuit in progress over the inventoried roadless areas in the TLMP should be thrown out of court because the matter is already decided. Over 60% of the Tongass is already wilderness. Companies have invested millions in helicopters and developed methods to fly timber offshore to barges where no roads are necessary. The very small industry there depends on raw material from these areas. To prohibit timber harvest in the Tongass roadless is to kill that industry. Go to Deer Island in the Wrangle District and look at the helicopter logging taking place there this summer. You cannot even tell the trees are removed. (Business, Portland, OR - #A10558.45613)

Coeur Alaska, Inc., a wholly owned subsidiary of Coeur d’Alene Mines Corporation, strongly disagrees with the Roadless Area Proposed Rule. Likewise, we are opposed to the roadless proposal being extended to the Tongass National Forest. Coeur Alaska has operations within the Tongass National Forest, including patented federal mining claims and associated facilities, exploration and production rights to substantial number of unpatented claims, and a general interest in exploration and mining throughout the northern Tongass Forest. This forest has very recently been the subject of an extensive and costly area-wide planning effort resulting in adoption of the Tongass Land Use Plan. This plan withdrew from development over half of the land in the Tongass. Presently roads disturb less than five percent of the forest, and land available for timber harvest has been reduced to approximately 10 per cent of the Tongass land with commercial forest potential. (Association, Juneau, AK - #A23080.10130)

BECAUSE THE TONGASS LAND MANAGEMENT PLAN IS CURRENTLY UNDER APPEAL

The Tongass Land and Resource Management Plan (TLMP) just completed an 11-year, \$13 million revision funded by American taxpayers, which is currently under appeal by several entities. In additions to other legal constraints to enactment of the roadless proposal, no changes in land allocations on the Tongass can be made by the Forest Service unless these are to correct legal errors in the TLMP revision procedures or are changes made through a forest plan amendment following NFMA procedures. The single fact that the TLMP is currently under appeal is quite adequate to preclude the Tongass from any consideration under this proposed roadless rule. (Professional Society, Anchorage, AK - #A21707.20200)

BECAUSE THE CHUGACH NATIONAL FOREST IS NOW AT THE STAGE OF RELEASING A FINAL EIS

The Chugach Land Management Plan Revision has been in process for more than four years and is now at the stage of releasing a FEIS specifically for the Chugach. Many groups and individuals have spent countless hours working with the Inter-Disciplinary Team on the Plan revision process, which has had over 100 public meetings and expended more than \$3 million to date in the revision. As with the Tongass, including the Chugach National Forest in national roadless policy would make a sham of the Forest Service planning process established under NFMA. (Professional Society, Anchorage, AK - #A21707.20200)

BECAUSE THE PROPOSED RULE WAS NOT ADDRESSED IN THE CHUGACH NATIONAL FOREST PLAN REVISION PROCESS

The proposal cannot be adopted or implemented until such time as it is developed in a manner consistent with the NFMA requirements for amending forest plans. Because this proposal was not addressed in the CNF plan revision process, it should not be implemented on the CNF. (Tribal Corporation, Anchorage, AK - #A20340.20000)

1363. Public Concern: The Forest Service should exclude Alaskan national forests from a national roadless rule for environmental reasons.

BECAUSE ROADLESS VALUES HAVE BEEN MORE THAN ADEQUATELY PROVIDED FOR WITH NON-DEVELOPMENT LAND USE DESIGNATIONS

Nearly 6.8 million acres of the Tongass National Forest are presently designated as wilderness or Congressional LUD II areas where timber harvest and other activities are prohibited. Only 676,000 acres are classified as suitable for timber management under the 1997 Tongass Land Management Plan. Due to the non-development land use designations and other prescriptions in the 1997 TLMP, at least 90% of the presently unroaded lands in the Tongass will be unroaded at the time of the next land management plan revision. It is the Borough's position that roadless values have been more than adequately provided for on the Tongass and that meaningful consultation with local governments and others that have actual knowledge of local conditions will bear this out. (Elected Official, Ketchikan Borough, AK - #A17476.65241)

Alaska already has enough land that cannot be developed. We currently have 154 million acres locked away in some kind of federal conservation unit or another. To give you an idea of how large that is, consider that Texas is 161 million acres total land area.

The roadless policy makes no sense for Alaska now and it never did. Please do not include Alaska in any roadless policy that you are considering. (Individual, Anchorage, AK - #A15680.45610)

Most of the non-roaded [areas] of both the Tongass and Chugach National Forests are already [under] some form of protection provided either by Congressionally approved non-developed designations or one or more provisions in the Tongass Land Use Plan. [Please] respect the "No More" agreement in ANILCA, and specifically exempt the Tongass and Chugach National Forests in Alaska from any further consideration of roadless protection. (Association, Juneau, AK - #A23080.45612)

Please register my official opposition to the rule as it now stands and my strong support for exempting the Tongass and Chugach from any final national management prescription for roadless areas. A one-size-fits-all national rule does not make sense for either forest, given the fact that both are primarily roadless in a state that contains more than 100 million acres of conservation system units, most of which are also largely roadless. (Individual, Juneau, AK- #A17238.45610)

The Tongass Land Management Plan (TLMP), adopted in April 1999 after many years in process and after the expenditure of large sums of federal funds on environmental and related studies, already excludes 94.5% of the total acreage of the Tongass National Forest from commercial timber harvest. Put it another way, the vast majority of the 5,000,000 acres which have been identified by advocates of additional roadless restrictions are already restricted by being placed in a category which does not allow commercial timber harvest. These facts have been completely ignored by those who advocate that the Tongass be subjected to further restrictions. (Elected Official, Ketchikan, AK - #A27725.20200)

Here are four simple statements from hundreds of facts about land use and timber harvest on the Tongass.

Total acres of Forest available for timber harvest: 676,000 acres

Percent of Forest available for timber harvest: 3 percent

Productive Old-Growth (POG) Forest-wide (1995): 5,060,648 acres

Acres of managed timber stands in timber base: 234,000 acres

To compare us with other national forests in the lower 48 is unfair and shows a bias against the professional work by USFS staff in Alaska. I would urge you to remove the Tongass and Chugach forests from inclusion in the national roadless policy and allow the Land Management do the job they were designed to perform. (Association, Juneau, AK - #A879.45612)

BECAUSE THE UNIQUE AND ISOLATED TERRAIN PROVIDES INHERENT PROTECTION

Considering the unique and isolated terrain of the Tongass National Forest, we feel a roadless policy is unnecessary. (Tribal Association, No Address - #A23324.45613)

Despite the demands of non-development interests, it makes little sense to include both the Tongass and Chugach in the roadless rule. Both forests are primarily roadless in a state that has a very limited road system. The policy may make some sense in forests with few roadless areas remaining, but in Alaska it is neither necessary nor appropriate. Under current forest plans, the wild character of both the Tongass and Chugach are adequately protected and preserved. (Organization, Anchorage, AK - #A15542.45612)

The Tongass and Chugach National Forests are unique in the National Forest System. In reality, a very small portion of the Inventoried Roadless Areas will ever be developed because of their inaccessibility. Many of these areas are already protected under wilderness, remote recreation, Wild and Scenic River, or old growth reserve status. There are very few private inholdings and access to them is adequately addressed under ANILCA. We simply do not need another layer of "protection" administered at the national level. (Elected Official, Petersburg, AK - #A23084.45613)

1364. Public Concern: The Forest Service should exclude Alaskan national forests from a national roadless rule for forest health reasons.

There are a very vocal minority of residents in Southeastern [Alaska] who are on a "crusade" to eliminate any prospects for forest management. Many of these people have not lived and worked on the forest for very long. Yet these folks have been very effective in extending support for their radical cause.

Roadless on the Tongass is a VERY RADICAL proposal. This contrasts greatly with most lower 48 forests, where the initiative mainly reinforces many de-facto actions already consciously not taken. I read comments to a couple Wisconsin papers describing the merits of the proposal to protect the 60,000 acres of the Chequamegon (out of about 1,600,000 acres). This is a very minor effect on Wisconsin, yet the article devoted more space to the Tongass than the local forest. They essentially extended their view of the merits for the proposal on "their" forest, to "our" forest. Having spent some time there, I can understand the merits to "their" forest. Yet they obviously had no information or experience with which to judge the effects on "our" forest other than their conjectures.

Here, "full" roadless implementation may even close access to lands already harvested and in need of silvicultural treatment to maintain resource values, especially for wildlife habitat. The "anti-timber industry crusaders" tend to refer to lands already accessed by roads or having had timber harvest as though the land no longer existed. (Individual, Petersburg, AK - #A30209.45613)

The inventoried Roadless areas on the Tongass and Chugach National Forests have different vegetation cover types, stand conditions, fire, insect and disease risk values and different proximity to communities. The NFMA mandated that a forestland management planning process include the assessment of values, risks, protection and management options for each Roadless area. This assessment should provide the basis for determining what management options will best provide for healthy forests and include the option of a recommendation to Congress for Wilderness Area Classification. Areas not recommended for Wilderness Area Classification should not remain in a "Roadless category," but be managed to promote healthy forests under appropriate management prescription in the forest plan. The over one million acres of spruce bark beetle infested forest in South Central Alaska includes National Forest Roadless areas where insect control, salvage and rehabilitation prescriptions were appropriate, but blocked by special interest groups. Healthy forest management includes a variety of tools to maintain the vigor of the forest, among which include forest health. Just arbitrarily putting areas into Roadless status compromises the ability to use this tool. (Association, Ketchikan, AK - #A28980.30100)

FIRE HAZARD REDUCTION

We feel strongly that the process used to create the roadless rule was deeply flawed, forged by politics rather than professional reasoning, and in direct conflict with several federal laws. A single, one-size-fits-all rule that affects roadless areas across the entire national forest system cannot possibly address

conditions unique to each roadless area within each forest. For instance, national forests in Alaska were not analyzed for fire risk because “of the low fire hazard and fire occurrence associated with their temperate rain forests” (p. 3-409 Roadless Area Conservation FEIS). The FEIS failed to recognize the risk of fire within the CNF, which has been the subject of arguably the largest spruce bark beetle epidemic in recorded history and has killed more than 95,000 acres of white and lutz spruce stands on the CNF. The Forest Service spent \$2.8 million in 2001 battling a single 3,260 acre out-of-control prescribed burn in this area of “low fire hazard.” (Tribal Corporation, Anchorage, AK - #A20340.10120)

The Chugach National Forest is presently suffering from a pandemic of spruce bark beetles which has devastated more than 95,000 acres of Forest Service land on the Kenai Peninsula. An arbitrary ban on road construction in areas along the Seward Highway which qualify as “roadless” (whether inventoried or uninventoried) would preclude most management options (when economic viability is factored in) presently available to the Forest Service to deal with the extremely high forest mortality that has resulted from this insect problem. At this time, ecological and silvicultural considerations argue strongly against foreclosing options until the extent of appropriate management techniques can be fully assessed. (Professional Society, Anchorage, AK - #A21707.45612)

The FEIS, in its analysis of unique characteristics in Alaska, essentially ignored the 5.5 million-acre [Chugach National Forest] CNF. The CNF, with an astonishing 98.9% of its land base classified as roadless, is impacted by the proposed rule to a far greater extent than any other national forest in the nation, yet the effect of the roadless rule on the CNF, its users and land owners such as Chugach, who depend on it for access to their lands, was allocated only a cursory analysis in the FEIS. The roadless rule, as it is presently written, effectively eliminates the ability of land managers to maintain forest health and provide for future multiple-use opportunities on the CNF. The fact that ANILCA issues on the CNF were not even addressed further shows the abysmal failure of the roadless FEIS to identify critical local issues unique to each national forest. (Tribal Corporation, Anchorage, AK - #A20340.10131)

The FEIS failed to recognize the risk of fire within the CNF [Chugach National Forest], which has been the subject of arguably the largest spruce bark beetle epidemic in recorded history and has killed more than 95,000 acres of white and lutz spruce stands on the CNF. The Forest Service spent \$2.8 million in 2001 battling a single 3,260 acre out-of-control prescribed burn in this area of “low fire hazard”. The roadless rule effectively eliminates the ability of land managers to maintain forest health and provide for future multiple use opportunities on the CNF. (Professional Society, Anchorage, AK - #A21707.20207)

1365. Public Concern: The Forest Service should exclude Alaskan national forests from a national roadless rule.

BECAUSE THEY SHOULD BE MANAGED FOR TRADITIONAL MULTIPLE USE

Approximately 98 percent of the Chugach National Forest would remain roadless under the new rule. The rule would prevent the Forest Service from providing additional access, whether for resource extraction, forest health, recreation or tourism, despite future needs. It is vital that both the Tongass and Chugach be managed for multiple uses, especially in Alaska where 85 percent of the nation’s national wildlife refuge lands are located, as well as 70 percent of its national park lands. These units, like most of Alaska, are primarily roadless and wild. (Organization, Anchorage, AK - #A15542.50100)

I am opposed to designating the Chugach National Forest as roadless. The Chugach was set aside to provide timber, water, minerals, fisheries and recreation to be managed under multiple-use. To close the Forest to vehicle use will severely limit management prerogatives. It will also limit public ingress and egress on the forest lands.

The natural land forms on the Chugach will limit vehicle use naturally without additional legislation or designation. This Forest is not a National Park and should not be managed as such. The personnel of the

Forest should be staffed with competent foresters and trained land managers who understand vegetative growth and other competing uses to provide continuing resources uses in perpetuity.

I do not want the Chugach or Other large areas of the National Forest System to be closed off to a large segment of the public or restricted to a single use. (Individual, Eagle River, AK- #A25956.45612)

1366. Public Concern: The Forest Service should exclude Alaskan national forests from a national roadless rule for economic reasons.

BECAUSE ROADLESS AREAS MUST BE AVAILABLE TO PROVIDE FOR THE BASIC INFRASTRUCTURE NEEDS OF THE REGION

The present Roadless Rule impacts the Southeast Alaska Electrical Intertie Project, the Southeast Alaska Transportation Plan, and the Bradfield Canal Road, which would provide a much needed link to Canada and the U.S. mainland. On the Tongass, roadless areas must be available to provide for the basic infrastructure needs of the region such as roads for transportation and electric power transmission lines. Access to roadless areas is needed for timber harvesting and mineral extraction. (Manager, City of Wrangell, AK - #A17670.45613)

The Tongass is largely undeveloped, and inventoried roadless areas must be available to provide for the basic infrastructure needs of the region such as roads for transportation and electric power transmission lines. On the Tongass, areas within inventoried roadless areas must also be available for timber harvesting and mineral extraction. If not, the economic decline and attendant social problems experienced by the region because of increasing restrictions on the use of the forest and the decline in the timber supply from the Tongass will continue and worsen. (Elected Official, Ketchikan Borough, AK - #A17476.45613)

Roadless areas must be created with a purpose, the importance of which does not warrant Congressional designation. In the Tongass and Chugach National Forests a significant part of the land area under Federal jurisdiction has not been roaded or harvested. Designation of these areas as roadless would create administratively designated wilderness areas. In the Tongass and Chugach National Forests this action is contrary to ANILCA, which stipulates that there shall not be more studies of lands that could place them in a de facto wilderness status. Therefore, the planning effort should not impose roadless designation or preclude land access to Alaska communities, constrain opportunities to develop municipal water supplies, hydroelectric sites, sand and gravel extraction, transportation corridors and other attributes required for community commerce and development. (Tribal Corporation, Seattle, WA - #A20468.20207)

Transportation and utilities are key to the long-term viability of any economy and it takes an economy of critical mass in order to maintain an environmentally sound infrastructure. By restricting transportation and utility corridors, the policy limits the economies of Southeast. (Business, Juneau, AK - #A11824.75700)

The Tongass National Forest dominates the economy of Southeast Alaska. It surrounds all of our towns and villages many of which are predominately Native communities. Forest Service decisions regarding roadless policy can isolate the communities from each other, preclude the communities from benefiting from regional electrical intertie systems, development of safe water supply and many forms of recreation. (Tribal Corporation, Seattle, WA - #A20468.75300)

AELP, through its corporate affiliate, Lake Dorothy Hydroelectric, Inc. (LDHI), plans to construct the Lake Dorothy Hydroelectric Project in electric consumers located within the CBJ. In order to construct and operate Lake Dorothy, it will be necessary to construct a road from tidewater to Bart Lake, more or less paralleling the proposed penstock. Heavy equipment will be required to construct the transmission line from the Lake Dorothy powerhouse linking it with AELP transmission grid. It is AELP's

understanding, that the Roadless Policy now in effect, but now under review, will not allow the construction and operation of Lake Dorothy.

The proposed Lake Dorothy Hydroelectric Project is located on the east side of Take Inlet within the Tongass National Forest. It is within an area classified by the U.S. Geological Survey as a Power Site Classification (No. 238; established June 5, 1930). This classification recognizes the potential of the area for electrical generation and requires management of the area in compliance with Section 24 of the Federal Power Act. When the U.S. Forest Service's Tongass Land Resources and Management Plan (TLRMP) was approved this area was specified as a Transportation and Utility System Land Use Designation (TUS) to provide for the construction of the Lake Dorothy Hydroelectric Project as well as a transmission line connection with the existing transmission grid. If Lake Dorothy cannot be constructed, the alternative is to satisfy the electric energy deficit with diesel fueled engines and turbines. The use of diesel fuel has become more and more unpalatable due to air contamination, risk of spills and cost. Lake Dorothy is the next logical addition for the generation facilities owned by AELP.

It is AELP's understanding that the existing Roadless Policy will also block construction of the Southeast Electrical Intertie. The Intertie will link all of the Southeast Alaska electrically and make it so communities now dependent on diesel generation to instead purchase non-polluting hydroelectric energy from proposed projects such as Lake Dorothy.

AELP urges the United States Forest Service to allow the construction and use of roads within the Tongass National Forest in order to permit construction of the Lake Dorothy Hydroelectric Project, other hydroelectric projects and electrical interties within the Tongass National Forest. (Association, Juneau, AK - #A3023.91610)

BECAUSE COMMUNITIES DEPEND ON THE TONGASS NATIONAL FOREST

Of the 17 million acre Tongass National Forest, approximately 6.8 million acres are Congressionally designated wilderness or LUD II areas where resource development and other activities are either prohibited or restricted. Under the 1997 TLMP, at least 90% of the unroaded areas of the Tongass will remain unroaded when that plan is revised. On the Tongass, roadless values are already more than adequately protected, and no further protection is needed. Besides being illegal, it is simply irrational to apply a national-level prohibition on road building to the Tongass. Doing so will only serve to send Wrangell and its residents further down the economic spiral they are struggling against due to the decreased supply of timber from the Tongass and other restrictions on the use of the forest by those who depend on it the most. (Manager, City of Wrangell, AK - #A17670.45613)

The Roadless Policy significantly limits potential futures for the people of the Tongass. Unlike the residents of the lower 48, the communities of the Tongass are pockets of State and private land surrounded by the United States, Canada and the Pacific Ocean. The Roadless Policy preserves the accomplishment of the environmental groups to significantly reduce human habitation of the Tongass, and limits those remaining human's potential sources of income, transportation and basic infrastructure.

Transportation and utilities is key to the long-term viability of any economy and it takes an economy of critical mass in order to maintain an environmentally sound infrastructure. By eliminating transportation and utility corridors, the policy limits the economies of Southeast to where they are or less.

Southeast Alaska is dependent on the income generated by the Tongass National Forest. Income is derived from the fish, timber, mineral and tourism industries. Those industries support the basic infrastructure includes the water and sewer systems, electricity, roads, ferries, phones, healthcare and local government. The people of Southeast Alaska deserve the right to develop their communities and build a future for their children, it should not be dictated to them by the Sierra Club.

Without the income derived from the natural resources of the Tongass, communities will not be able to maintain their current infrastructure, let alone improve it. The harvest of the natural resources creates the critical mass of the economy. That harvest allows the economies of Southeast to grow, mature and build infrastructure to support exportable services for income.

First the long-term timber contracts were voided, in what appears to be a violation of Federal laws. Then the Tongass Land Management Plan, an exhaustive exercise in killing the timber industry by environmentalist and the former Secretary of Interior was passed.

Finally the Tongass was thrown in at the last minute to this Roadless Policy without regard to the long-term impacts of the people and communities of the Tongass.

Yes, the Roadless policy successfully eliminates the opportunities for the people and communities to exist in Southeast Alaska. Is that goal of the Federal Government? Eliminate human habitation in Southeast Alaska! Without a viable economy of critical mass, those remaining people will have a greater negative impact on the Tongass than larger, more diverse economy. Sewage systems will be too expensive and the disposal will revert back to running into the sea. Water systems will deteriorate and not be replaced. Healthcare will decline, and folks will have to fly to Seattle or Anchorage, but that means Coast Guard will be flying more emergency runs because commercial air transportation will not be available. As most economies are pyramids, remove the foundation which is the source of income; everything else will implode unto itself. (Richard Jackson, President, Alaska Native Brotherhood, No Address - #A15742.45613)

TO PROTECT THE TIMBER JOB BASE

The Tongass National Forest has been managed over the past ten years to achieve the agenda put forward by the environmental industry. This has already resulted in a massive reduction of the lands available for development and maintenance of an economic base. The Tongass timber program was established in the 1950s to create an economic base that provided year round employment for the citizens of Southeast Alaska. However, because of the changes in the management of the Tongass over the last ten years, much of Southeast Alaska has returned to an economy based on seasonal employment. The tourist industry provides only a few months of work per season. The fishing industry is also seasonal with a large portion of the fleet coming in for the fishing season only and therefore limiting their contribution to the economy. The timber industry has been reduced to the point that there remains only a few hundred year-round jobs out of the thousands that existed when the land base was large enough to provide the raw material for a significant forest products industry. (Association, Ketchikan, AK - #A20443.75310)

At a meeting of Southeast Alaska mayors (as well as in a personal conversation with me) in Sitka last year, Undersecretary of Agriculture Jim Lyons assured us that, based upon his record of decision on TLMP, there would be a timber harvest sufficient to operate existing and projected timber-related businesses in our communities. Additional restrictions in the Tongass National Forest, which would clearly result by inclusion of the Tongass, would contradict the statements made by Mr. Lyons. (Elected Official, Ketchikan, AK - #A27725.45613)

Most Southeast Alaska local communities have developed their economic base by using the resources available from the Tongass. Over the past 5-10 years the Tongass land base available for development has been reduced to the level that it is no longer possible to provide timber and other resources necessary to maintain a viable economic base. In evaluating the Tongass roadless areas, this issue must be viewed as the major difference between the effects of the roadless rule in other National Forests. We currently have over 90% of the forest in non-use categories. It is now time to review the few remaining areas in terms of maximization of commodity production rather than further restrictions. Wilderness is a single use category. In order to provide a balance, the remaining areas in Alaska must remain available for resource development so that the dependent communities have the resources necessary for maintenance of their economic base. (Association, Ketchikan, AK - #A20443.75510)

The potential timber products industry in South Central Alaska (the Chugach National Forest) has not had a chance to develop because of the lack of a viable supply of timber. The release of a draft plan that has no ASQ is not going to encourage investment or job creation in the area. This must be changed in the final plan and that plan must not be invalidated by implementation of a roadless rule. (Association, Ketchikan, AK - #A20443.75510)

The basic economy of southeast Alaska relies very heavily on natural resource development. Enormous land withdrawals from the timber base have driven down timber harvest levels and resulted in a severe reduction in the regional economic base. On the Tongass, only 7% of the original timber base is left

from which to provide the timber and other resources necessary to support the southeast Alaska economy. A similar situation holds for the Chugach as well. There is no ASQ in the draft land management plan for the Chugach, yet there are several mills that could be running viable operations if a reliable timber base existed. (Association, Ketchikan, AK - #A20443.75510)

Use of Existing Forest Plan Designations

Summary

A number of respondents believe that wilderness and roadless designations need not be a mutually exclusive choice, and some suggest applying existing forest plan designations as appropriate. Some respondents suggest using categories that minimize human impacts and preserve the unroaded character of these areas. Others ask that any areas that do not meet wilderness recommendation criteria be allocated to these types of categories. Some mention specific categories that they say are most appropriate, such as backcountry non-motorized, both winter and summer. Others specifically ask that the Forest Service rule out certain management categories for roadless areas, such as summer motorized, matrix, general forest, or any category that permits roadbuilding. Some state that individual forest plans should simply choose categories that are consistent with a national rule.

Others state that the Forest Service should reject both increased wilderness recommendations and roadless designation alike. Instead, some ask that existing management categories be used. These respondents request that the Forest Service apply categories that allow more intensive uses, especially motorized vehicle travel.

1367. Public Concern: The Forest Service should use appropriate existing management categories to protect roadless qualities.

RECOMMEND QUALIFYING AREAS FOR WILDERNESS AND ALLOCATE THE REST TO FOREST PLAN CATEGORIES THAT PRESERVE ROADLESS CHARACTER

IRAs which are not designated as wilderness should remain in some form of local Forest Plan allocation that preserves the spirit and intent of management direction of the RACR. (Individual, Lyons, OR - #A13491.25300)

We think both; that is, of those roadless areas selected to remain roadless, some should be recommended for wilderness and some should be put in a management prescription, like semi-primitive non-motorized, to protect them. This also is a decision to be made in the forest planning process. A few areas may warrant proposed wilderness status. Most will be placed in an unroaded prescription. Either way, the public will point the direction for that split. It will then be up to Congress to decide if a recommended wilderness warrants that protection. (Organization, Saint Anthony, ID - #A13225.25000)

In general, ATC strongly supports land-management designations, including Wilderness, that limit those incompatible developments and activities and provide additional protection to the Appalachian Trail corridor. The Trail crosses 66 such areas and comes within 0.5 miles of 50 additional areas that are managed in a roadless condition. There are undoubtedly other areas that have similar characteristics but are not currently managed in this manner. (Organization, Harpers Ferry, WV - #A21737.25000)

DESIGNATE ROADLESS AREAS AS BACKCOUNTRY NON-MOTORIZED

The Forest Service must—both by law and regulation—analyze remaining roadless areas for additional protections within the framework of their forest plan revision. Many of these have high quality, low elevation wilderness potential, or should be managed for backcountry non-motorized recreation to restore balance between motorized recreation and quiet use recreation. This is particularly important

because of the increasing pressure to extend motorized recreation for OHV trails, used only by a tiny minority of forest visitors, ever farther into de facto non-motorized areas. (Organization, Denver, CO - #A8824.25330)

Roadless lands having wilderness characteristics should definitely be considered for wilderness classification. Other roadless areas could be maintained under a specific designation for roadless area management under the forest plans if they are managed to remain roadless, undeveloped and have a semi-primitive, non-motorized recreation emphasis. (Individual, Bozeman, MT - #A8818.25000)

DESIGNATE ROADLESS AREAS AS BACKCOUNTRY WINTER NON-MOTORIZED

There are definitely areas that should have special designations assigned. This document should not be the deciding factor for them. Backcountry skiing, snowshoeing and other non-motorized winter activities must also be given designated areas. (Individual, Kemmerer, WY - #A8383.25350)

DO NOT ALLOCATE TO CATEGORIES THAT ALLOW SUMMER MOTORIZED USE

The mechanics of roadless area protection—i.e. what land management designations will be used—should be considered on a cases-by case basis in the local planning process. In some instances recommendations for Wilderness status, or designations to MA 6.2 or 8.1 (Scenic Areas) might be appropriate. Any existing snowmobile access routes in the inventoried roadless areas should be preserved, but ATV usage should not be allowed on these lands. (continuing the current policy). (Individual, Lincoln, NH - #A5640.25000)

DO NOT ALLOW INVENTORIED ROADLESS AREAS TO BE DESIGNATED MATRIX OR GENERAL FOREST

Local Forest Plans should not be allowed to establish blanket designation of IRA to “General Forest” or “Matrix” allocations. (Individual, Lyons, OR - #A13491.25330)

1368. Public Concern: The Forest Service should allow individual forests to allocate roadless areas to any management prescriptions that are consistent with a national roadless rule.

CREATE OR MODIFY PRESCRIPTIONS IF NEEDED

Individual forests should be allowed to designate roadless areas into management categories consistent with their existing land allocation structure, as long as such designations provide the level of protection required by the national rule. In no such management designation exists that is consistent with the national rule, one must be created or modified. (Organization, Boston, MA - #A23083.25100)

NFMA requires all forest plans to evaluate wilderness potential of all roadless areas and make recommendations concerning wilderness designation to Congress. Conservation of Inventoried Roadless Areas would not affect this provision of NFMA. This rule would most likely do neither of the 2 options given in Question 8. Forests already have designated lands for roadless area management. This rule should simply direct Forests to prohibit road building and logging in Inventoried Roadless Areas. If individual Forests find these areas sufficient for wilderness designation, the existing procedures can be enacted as under NFMA. (Organization, Tucson, AZ - #A21813.25110)

1369. Public Concern: The Forest Service should assign roadless areas to the most protective designation possible.

Should inventoried roadless areas selected for future roadless protection through the local forest plan revision process be proposed to Congress for wilderness designation, or should they be maintained under a specific designation for roadless area management under the forest plan?

Whichever protects them from development better and will be passed. I'm not familiar with the legal differences between these designations, but I expect Congress would not pass this. (Too many big-business interest and short-term thinking, if any at all. (Individual, Arlington, MA - #A1152.25000)

Whatever designation has the best chance of keeping the roadless areas roadless and the wilderness wild despite changes in political administrations and their policies is the most desirable. (Individual, Anchorage, AK - #A518.25120)

I am less-versed in the differences between wilderness designation and the forest plan. In either case, the best interest of the ecosystem should be the ultimate goal, with political bureaucratic [considerations] secondary to the needs of the environment. (Individual, No Address - #A22265.25000)

THAT WILL PREVENT ROAD BUILDING

Roadless areas should be maintained under whatever designation is most likely to prevent road-building. If roadless areas are “lumped together” with areas that have roads, then they are less likely to be protected. Roadless areas need special protections that are not afforded to other areas, and whatever category they are ultimately placed in should cause road-building to be an extremely difficult proposition, if not impossible. (Individual, Columbus, OH - #A659.25000)

1370. Public Concern: The Forest Service should assign roadless areas to the category that will ensure protection as quickly and easily as possible.

[Q8] Whichever method is the LEAST complex, time-consuming, and difficult to accomplish to achieve protection for roadless areas. (This is one of the questions which confuses me; I am not an expert on Federal policy-making). I would guess that attaining Congressional designation for roadless areas would be more difficult than designating it through the forest plan. (Individual, Cumming, GA - #A21156.25000)

1371. Public Concern: The Forest Service should assign roadless areas to a modified National Conservation Area prescription.

WITH TEETH TO RESTRICT RESOURCE EXTRACTION AND DEVELOPMENT

An alternative to Roadless Area designation may be to modify the current National Conservation Area guidelines. Empower the National Conservation Areas with the authority to protect the resource from development and resource extraction, while allowing the current recreational activities to continue. Currently neither the National Conservation Area nor the National Recreation Area designations have the teeth to protect the land resource from development or resource extraction. (Individual, No Address - #A22297.25350)

Other New Management Categories

Summary

Several respondents suggest that the Forest Service create other new management categories rather than a specific roadless designation. Several groups suggest that the Forest Service revisit the “primitive area” concept of Bob Marshall and update it to create a Backcountry Recreation Area category. Those who recommend this category state that it will allow recreational activities that are prohibited in wilderness areas, while still preventing commodity use in roadless areas. They suggest that this would go a long way toward reducing conflict between various user groups over a national roadless rule by meeting the needs of a broad range of recreationists while still maintaining the primitive nature of these areas.

1372. Public Concern: The Forest Service should classify roadless areas as recreation areas.**ALLOW RECREATIONAL ACTIVITIES BUT NO RESOURCE EXTRACTION**

At a bare minimum, every remaining scrap of roadless area should be considered seriously for Wilderness Area designation, under the 1964 act. Many ought to receive National Monument or Park status. Some won't pass muster, of course: these should be classified as Recreation Areas (the only designation that allows motorized use, while still giving wildlife and flora a fighting chance). (Individual, No Address - #A49.25210)

I do not favor additional wilderness designations of IRAs selected for future roadless protection. I feel wilderness too strict a designation. I favor a new type of designation if protection is needed from resource extraction—call it a “wild lands protection area” or name of your own choosing. In such a designated area, all forms of recreation are permitted but not resource extraction. The only logging permitted is to maintain forest health. (Individual, Palmer Lake, CO - #A22106.25300)

1373. Public Concern: The Forest Service should manage roadless areas as backcountry recreation areas.

“Backcountry” designation has been bantered around for years and rejected by the “all-or-nothing” timber industry and environmental organizations. But most of us who live near and play in the National Forests realize that wilderness or full development are not the only choices. Now is the time to dust this important concept off and make it a reality. Years ago the agency led the nation by designating several “Primitive Areas” under Bob Marshall’s guidance. Eventually Congress made the pioneering concept permanent with the Wilderness Act of 1964. This is an opportune time for the agency to again demonstrate leadership with a backcountry designation and show what it can do with professional management. (Organization, No Address - #A8227.25300)

We believe these areas should not be named “roadless areas” as part of the ongoing forest land use planning by the US Forest Service. Because, these same areas include thousands of miles of “roads,” trails and ways, which are an important forest infrastructure and public asset. We believe a more appropriate name to assign these areas for forest planning designation is “Back Country Recreation Area.”

The Back Country Recreation Area (BCRA) designation should be designed to provide reasonable protection of our natural resources and at the same time enhance the backcountry recreation opportunities. All “roadless” federal lands, not currently designated as Wilderness, should be reviewed for their importance to backcountry recreationists and considered for designation as BCRA's within the next 2 years. We need a designation that encourages cooperation, not only between diverse recreation interests, but between recreationists and the need for fire protection, forest health and wildlife concerns. The BCRA can be that designation. (Individual, No Address - #A1709.25300)

During my 42 years as a FS employee, I have always had a keen interest in wilderness and roadless areas. It has long been my opinion that we need a third category such as “back country.” Many areas of the National Forests should be left relatively undisturbed, but without all the restrictions and politics of wilderness designation. (Individual, No Address - #A722.25300)

The anti-access groups scored a huge win when the previous administration pushed the highly flawed and questionably illegal Roadless Management Plan through. One of the reasons this was so important is the fact that now they can call an area “roadless” that indeed has many existing roads going through it.

When we brought this fact up in the Forest Service roadless scoping meetings, we were assured that if existing roads and trails were in “roadless areas”, these roads would remain open as before the ruling. We have already seen lawsuits trying to stop some of the planned routes in the ATV Jamboree because they are in “roadless areas”. Do you see where the problem lies and the advantage anti-access groups

have in calling areas “roadless” that are not? People across the country will now support shutting down these roads because surely there shouldn’t be roads in “roadless” areas.

If an area has classified or unclassified roads or trails that have been in existence for many years with people driving on them, how can it be classified as roadless? I would respectfully suggest totally re-inventorying them with the help of the local people and user groups that know these areas, then renaming them “backcountry” areas. (Organization, Richfield, UT - #A20428.45514)

I believe these areas should not be named “roadless areas” as part of the ongoing forest land use planning by the US Forest Service because, these same areas include thousands of miles of “roads”, trails and ways, which are an important forest infrastructure and public asset. They are, in fact, NOT roadless at all! I believe a more appropriate name to assign these areas for forest planning designation would be “Back Country Recreation Area”. (Individual, Livermore, CA - #A23445.45514)

TO PROVIDE A RANGE OF RECREATIONAL ACTIVITIES THAT ARE PROHIBITED IN WILDERNESS

Some roadless areas are definite candidates for wilderness, others are important backcountry recreation areas where activities prohibited in wilderness are allowed (large groups, hut systems, mountain biking, snowmobiling). Since the public is never assured that non-designated areas will be managed forever as backcountry, perhaps it is time to resurrect Bob Marshall’s idea for congressionally designated backcountry. (Individual, Jackson, WY - #A10527.25300)

TO PROVIDE MOTORIZED RECREATION OPPORTUNITIES

I would like to see the lands currently under study as roadless, to be managed as the Blue Ribbon Coalition proposed **backcountry** designation and left open for motorized and other types of recreational use. (Individual, White Salmon, WA - #A700.25300)

I urge you to scrap the Clinton roadless policy and replace it with a more user friendly multiple use policy, such as the “backcountry” proposal from the Blue Ribbon Coalition. There is room for common sense use and protection without locking out any particular user group. (Individual, Colorado Springs, CO - #A720.25300)

Agency Organization and Funding

This section includes three subsections: Agency Organization, Agency Funding, and Monitoring/Enforcement.

Agency Organization

Summary

General Comments – One respondent suggests that the Forest Service should restructure its organization to focus on ecosystem values rather than commodity production. Another individual suggests that the forests “should provide inspection and oversight of district administrative and management functions.”

Forest Service Personnel/Training – Some respondents comment about the education and activities of Forest Service personnel. Several suggest that the Forest Service should employ staff trained in all forest uses, while others state that the Forest Service should employ staff trained in multiple use management or the “new disciplines.” One group suggests that the Forest Service improve screening during hiring of personnel for education and experience. Other individuals focus personnel comments on educating existing employees. These respondents suggest educating personnel in conservation biology, to implement laws, to manage timber removal and transportation, to protect communities, and to effectively communicate and work with the public. Additionally, a number of writers comment about agency interactions with employees. Some suggestions include providing adequate staff and resources in the field; halting downsizing efforts; allowing local personnel to perform their duties; allowing employees to voice their views without fear of recrimination; and reducing the paperwork required of personnel.

Agency Organization General

1374. Public Concern: The Forest Service should restructure itself to focus on ecosystem values rather than commodity production.

Until the USFS is restructured to clear out old school, commodity oriented personnel, acquires expertise in social sciences and nonmarket social values, and replaces commodity production with ecosystem integrity and sustainability as its primary focus, I will not hold much hope that it will be genuinely committed to management of roadless areas within forest plans for non-commodity values. (Individual, Corvallis, OR - #A650.17300)

1375. Public Concern: The Forest Service should allow forests to provide inspection and oversight of district administrative and management functions.

AND DEVELOP AND DISPERSE BUDGETS

The forests should provide inspection and oversight of District’s administrative and management functions and develop and disperse budgets. (Individual, No Address - #A26264.13200)

Forest Service Personnel/Training

1376. Public Concern: The Forest Service should employ staff trained in all forest uses.

In regards to good or appropriate forest management, how can this occur when there are not practicing timber foresters on the local staffs? All conservation practices are essential in good forest management. Also, each forest has to be addressed separately, just like the expression “one size does not fit all” forest management is no exception—each forest is different and must be handled as such. Staffing for all forest uses is a must. The multiple-use concept is a sound one and one that must be kept in use. Long-term non-use is not a good conservation practice. (Conservation District, Sublette County, WY - #A28888.30100)

1377. Public Concern: The Forest Service should improve screening of personnel for education and experience.

Employing people in the Forest Service from very diverse areas has produced abundant, often deep conflicts within the organization and some of these have increased the apparent public/agency conflicts. Improved screening for appropriate education and experience will benefit the Service and the nation. Failure to provide employment stability and to allow loss of experienced staff has been costly and has resulted in major conflicts. Both improved employment and retention of superior staff will improve the Service and reduce conflicts. (Civic Group, Roanoke, VA - #A1713.15164)

1378. Public Concern: The Forest Service should require local personnel to have at least 10 years experience on the forest before granting them decisionmaking authority.

The appropriate role of the local forest planning is to have personnel with numerous years of experience in that particular forest system to create a plan, which maximizes recreational opportunities while keeping the forest in an overall healthy condition. Every forest and its needs are different and for this reason only a person who has spent at least ten (10) years exploring and studying a forest can know the proper manner in which to manage that forest. Decisions cannot be made by someone in Washington D.C. or a state’s capital . . . or by the recently transferred heads to local forests who have no real knowledge of the forest they have been assigned to. The key is having personnel with forest experience not political experience manage these resources. (Individual, Columbia Falls, MT - #A29651.13100)

1379. Public Concern: The Forest Service should employ scientific-minded managers.

IN ORDER TO PROVIDE MULTIPLE USE MANAGEMENT

Proper forest management should be and can be accomplished by employing sensible, scientific-minded managers. What I have observed more and more over the past decade or so is that the Forest Service has tended to hire and employ people that have a strong individual leaning toward preservation. I could and will provide several examples of this if you wish. If you employ the wrong person, then poor management results. Change your criteria and philosophy to a more sensible multiple-use management and improvement in the forest lands will result. Use good and real science not politically driven, agenda-oriented “science.” (Individual, Elko, NV - #A23650.30100)

1380. Public Concern: The Forest Service should encourage professionals trained in the new disciplines to join the Agency.

Remember that public trust in forest management is very low. The forest service has been promising everything to everybody and this strategy has been a failure. Closed management where public oversight is forbidden and where extraordinary environmental damage is occurring, like livestock grazing, is only working to the detriment of the agency. Encourage professionals trained in the new disciplines to join

the agency and actively seek ways to work collaboratively with willing participants. (Union, No Address - #A8392.12230)

1381. Public Concern: The Forest Service should educate personnel.

All those who participate in the process of decision making should be educated in the relative administration rules, attend public meetings, ask questions about that which is not understood and most importantly comply with environmental statutes. Those statutes regarding endangered species and environmental impacts including logging practices, timing of harvest, suitability of land for timber production and timber removal prescriptions. (Union, No Address - #A17699.15163)

IN PRINCIPLES OF CONSERVATION BIOLOGY

The Forest Service should consider the protection of the nation's biological heritage as its paramount value in addressing roadless areas. Forest Service managers and decision makers should become schooled in principles of conservation biology, particularly the need to protect large unbroken areas of habitat. (Individual, Dallas, TX - #A18002.15164)

The ultimate mission, mandate and original purpose for the creation of national forests and the U.S. National Forest Service should be well understood and appreciated by each and everyone of those under employ for the Forest Service; and, each and everyone held accountable to that calling. Now do your job; and, do not be detoured by those who choose to compromise that responsibility. Those who are unable to defend their actions on the foundation of the mission and principle should be relieved from further service. The founding purpose of the national forests was to serve conservation—let there be no doubt. (Individual, Geneva, NE - #A15512.10111)

TO ADVANCE COLLABORATIVE COMMUNITY FORESTRY

The Forest Service must downsize its historic timber-production workforce through retraining for advancing collaborative community forestry. (Individual, Cleveland, OH - #A26411.15164)

TO IMPLEMENT LAWS

The United States Forest Service needs to embrace the idea and reeducate its resource managers that one cannot lead from the middle. Their training and professional development should include the basic philosophy that as public resource managers one of their main responsibilities is to protect all Americans from the constantly changing political winds. This is done by fair and consistent implementation of the public laws, not by embracing panic mode responses to emotionally driven agendas. (Association, Cody, WY - #A26503.15164)

TO CARE FOR THE FORESTS

Local forests should be responsible for taking care and protecting local forests and wild life as its first priority. The Forest Service, Fish and Wild life people should be educated in their area/field and not by government bureaucrats or "big business." (Individual, Bozeman, MT - #A665.15164)

TO MANAGE TIMBER REMOVAL AND TRANSPORTATION

Most plans that are developed for the forests are based on such things that are ambiguous to a fault or esoteric to a fault. Plans should be developed by "knowledgeable" people who can do a good job. Many of the roads that have been constructed by the USFS have been done by foresters or others who have limited knowledge about road building, including the location design, construction, and maintenance of these roads. The same is true about harvest plans that have been designed by people with little knowledge about what they are doing. Harvesting and transportation systems are ENGINEERING activities that should be done by engineers and not ill-trained foresters and managers. (Individual, Corvallis, OR - #A1132.15164)

I met with [the Siuslaw National Forest supervisor] . . . One of our first questions to her was "what are your feelings about the Roadless Initiative?" She was completely unaware as to what we were talking about. That is probably the largest concern to our organization yet today. We do not feel that [this supervisor] has the expertise to handle forest issues. Her reorganization attempt for the Siuslaw Forest

proves that point. She is a lovely person and is great with people but does not belong in a forest which grows and produces timber faster than any other forest in the world. (Organization, Florence, OR - #A11849.12230)

TO PROTECT COMMUNITIES

I am writing to you to protest what the United States Forest Service is doing to the community of Happy Camp, California.

I built a small mill starting in 1997 to help this community with some work and industry in what was called the old growth diversification program funded in part by the state and the United States Forest Service.

We expected the management of the forest to sell timber that was burned, dead, and/or dying timber that should be salvaged to protect the forest.

After we joined this program and spent a great deal of time and money, the Clinton Administration sent a man to the Klamath National Forest to close it down. This he has done, plus any other damage he could do to the people in this community. We can not even purchase a load of rock.

This forest [should] be managed, but it has to be done to preserve it and not destroy it. The people living here should have something to say about preserving this forest. We think it belongs to the people. The United States Forest Service is going to let a man that knows nothing about forestry destroy it. It is going to burn down.

I think this Ranger has to be removed at once. Or the people of this community will have to get together and remove the United States Forest Service. (Association, Happy Camp, CA - #A5708.12230)

TO EFFECTIVELY COMMUNICATE THE NEW PLANNING DIRECTION

Luckily, future forest planning on a province level basis and the direction of the Committee of Scientists will allow for collaborative efforts which can aim for ecological sustainability and integrity. A degraded forest with endangered species, increasing concern over noxious weeds, streams out of compliance with the Clean Water Act, native plant communities disappearing will no longer be able to support the heavy resource use of the past. Forest Service people need to be able to communicate the new direction and reasons for it effectively. (Union, No Address - #A8392.15111)

1382. Public Concern: The Forest Service should provide adequate staff and resources in the field.

TO IMPLEMENT FOREST PLANS

The agency should ensure that there are enough staff and resources in the field so that forest plans are implemented and objectives are achieved. (Individual, Cornish, NH - #A1712.17100)

To have a reasonable chance for success, the agency must provide adequate local forest funding and staffing to not only assure proper planning but to also assure consistent high quality project implementation and monitoring. (Business, Colville, WA - #A3362.17100)

TO ENSURE THAT PROHIBITED ACTIVITIES DO NOT OCCUR IN ROADLESS AREAS

Protection will require some major management of people numbers and monitoring of actual conditions and trends. The Agency must dedicate enough human and monetary resources to assure that prohibited activities are not occurring in any roadless areas at any time. (Individual, Grangeville, ID - #A830.17300)

1383. Public Concern: The Forest Service should dispose of its weapons.

The U.S. Forest should give up their attack helicopters, automatic weapons and side arms. What is the U.S. Forest afraid of that they need all these weapons? (Individual, Longview, TX - #A16468.17300)

1384. Public Concern: The Forest Service should not employ archeologists.

Get rid of the phony government archaeologists (who are nothing but self serving liars). Ever wondered why you never see a shingle on a storefront saying archaeologist for hire? These phony liars derive all their income from government. (Individual, Longview, TX - #A16468.17300)

1385. Public Concern: The Forest Service should halt staff downsizing efforts.

On the Siuslaw, R-6 the Regional Forester . . . has approved a plan to consolidate all of the southern administrative units into one office in Florence and lay off almost 30 people. Because of the travel time necessary to reach many areas of the forest from Florence and the reduction of people from the workforce, this consolidation virtually assures that vital thinning will not occur in a timely manner.

Please stop this alarming trend. Our national forests need to be managed to provide the ecological and economic needs of our society. Direct [the regional forester] to abandon the consolidation of the Siuslaw and the associated reduction in workforce. Don't allow the most productive national forest in the country to deteriorate because of lack of people and facilities. Please do this today, as I understand that the consolidation is underway and personnel on the Siuslaw are being reassigned. (Individual, No Address - #A2312.17300)

1386. Public Concern: The Forest Service should ensure that employees support multiple use.

All USDA Forest Service employees should support multiple-use including timber production or find jobs elsewhere. (Individual, Princeton, WV - #A18086.50200)

1387. Public Concern: The Forest Service should allow local personnel to perform their duties.**IN ORDER TO SAVE TAXPAYERS' MONEY**

Why don't you save the taxpayers some money, and let the USFS troops in the field get on with their jobs. I work with my local rangers, and they work hard and effectively at what they do. And if they don't love it, they've got me fooled. (Individual, Clemson, SC - #A898.12125)

1388. Public Concern: The Forest Service should allow its employees to voice their views without fear of recrimination.

The Union is very concerned about recent threats of reprisal from the Administration toward Forest Service employees who have voiced their concerns about the Roadless Area initiative. It is totally unacceptable for any employee to be threatened by the Administration with retirement if they voice questions about the Roadless Area Initiative. Nor should they be told that they cannot be talking to certain people. Forest Service employees take pride in their public service and professionalism. Forest Service employees should be treated respectfully—most certainly by Forest Service leadership. All employees should be encouraged to have diverse opinions and to use all their skills to solve problems and facilitate public relationships and debates. (Union, No Address - #A13245.15000)

1389. Public Concern: The Forest Service should analyze the potential impacts on its employees resulting from implementation of the Roadless Area Conservation Rule.

The Forest Service Council was not informed of, nor were we part of, any discussion on this large, percussive issue. We did not know about it until we read about it in the newspapers. We have still not been approached by the Administration to discuss the potential impacts of this proposal on our lives.

Downsizing has already devastated Forest Service employees. Reduction in force (RIFs) occurred as a result of the Spotted Owl shutdowns in Oregon and Washington, and the downsizing hasn't stopped there. **Forests around the country continue to have their work force ransacked.** This is particularly frustrating when we see the enormous growth in size and power of the Washington Office. We do not know the full impact this latest proposal will have on our remaining work force. But certainly hundreds,

and possibly thousands, of jobs could be eliminated, and another RIF could possibly result. (Union, No Address - #A13245.15000)

1390. Public Concern: The Forest Service should reduce the paperwork required of its personnel.

MANAGEMENT of the National Forest is the absolute KEY WORD! No one can manage an area they cannot get into. Forest personnel are so tied up in paperwork they don't have time to manage so the first item should be de-paperwork them! (Individual, Spring City, UT - #A15783.15100)

Agency Funding

Summary

General Comments – Some respondents suggest that the Forest Service should be adequately funded and that these funds should be efficiently allocated. One individual urges the Agency, “Instead of spending millions on building new roads, consolidate duplicate organizational structures conceived in the days when ranger district offices were located a reasonable horseback ride from each other. Combine ranger districts, combine national forests; reduce the top-heavy overhead at the Regional and Washington level, and put that saving into the field.”

Funding Sources – According to some respondents, the Forest Service should remove timber in roadless areas to help support the Agency's budget. Other respondents state that Forest Service funding should not depend on revenues from timber removal or other commodity uses. One individual suggests that “income from non-timber products [should] stay within the Forest Service” in order for it to operate within its income.

Funding Priorities and Financial Accountability – A number of respondents provide comment regarding how the Forest Service should manage its funds. Some suggest providing funds for ranger stations, educating the public, or for fostering environmental and human values. Others suggest ways they think taxpayer funds should not be used. Suggested inappropriate uses of funds include maintaining areas restricted to the public, settling lawsuits filed by environmental groups, revising regulations, and purchasing agency vehicles. According to one individual, the Forest Service should “be concerned only with raising money to help reduce the national debt.” People also suggest that the Forest Service adequately identify the costs and benefits of the Roadless Area Conservation Rule, including the costs of implementing the Rule. Several respondents assert that the Forest Service should be held accountable for its expenditures.

Agency Funding General

1391. Public Concern: The Forest Service should be adequately funded.

Back the Forest Service, pay them for their worth and potential and maybe enlarge their dept. If the government can afford to subsidize big business and fleecing of America they/we can surely pay for the work the F.S. can and will do if given a chance. (Individual, Bozeman, MT - #A665.17100)

1392. Public Concern: The Forest Service should request adequate funding.

Please ask for funds to adequately support the Forest Service's recreation and trail programs. For many years the Forest Service has said they support recreation but they have NOT asked for the appropriated monies to do so. “On the ground monies” have decreased for the last 3 years, while money for various plans have increased! Please ASK for more money for field level staff and projects. (Organization, Los Gatos, CA - #A1062.17100)

1393. Public Concern: The Forest Service should efficiently allocate its funding.

Instead of spending millions on building new roads, consolidate duplicate organizational structures conceived in the days when ranger district offices were located a reasonable horseback ride from each other. Combine ranger districts, combine national forests; reduce the top-heavy overhead at the Regional and Washington level, and put that saving into the field.

Instead of spending millions on building new roads, spend it on fully funding an efficient wild land fire organization, an efficient recreational organization, and more dollars into the trails program. (Individual, Gridley, CA - #A3712.17000)

*Funding Sources***1394. Public Concern: The Forest Service should seek more dependable funding.**

Develop political clout; advance the cause of more dependable funding including grants from NIH, tax exemptions for forest supporters. (Individual, Del Mar, CA - #A868.75600)

1395. Public Concern: The Forest Service should continue to removal timber in roadless areas to support the Agency's budget.

Let me make it clear I am not a logger, nor from a logging family. However, I would think it prudent to harvest the timber, as timber sales would help with your budget. (Individual, Big Timber, MT - #A5630.75510)

1396. Public Concern: The Forest Service should not rely on timber sales to support the Agency's budget.

What you really must do is figure out how to fund the Forest Service without timber sales, since I believe the Forest Service will still be necessary to protect this fabulous resource. As a nation we must figure out the best way to take care of our forests, just as we must do with our national parks. (Individual, Cedar Mountain, NC - #A28624.17130)

1397. Public Concern: The Forest Service should insist that income from non-timber products stay within the Agency.

USFS should insist that income from non-timber products stay within the FS. Congress should insist that USFS live within its income. IF the full cost of timbering and providing various recreational services is really charged, there will be adequate funds for providing the services the forest needs to be ecologically sustainable. Stop using the public forests to provide subsidized products to the timber industry and recreational users. Use the forest in ways that are ecologically sustainable. P.S. Experienced foresters will testify that these admonitions will result in refraining from building roads that will cause destructive erosion and that won't generate timber revenues adequate to off-set the costs of the roads (much less the erosion). (Individual, No Address - #A906.75400)

1398. Public Concern: The Forest Service should ensure that funding for individual forests is not dependent on extractive industries.

The budget for the local forest service representative should not be dependent on extractive industry, such that short-term business concerns pressure decisions. (Individual, Boulder, CO - #A20502.13110)

Funding Priorities

1399. Public Concern: The Forest Service should manage its funding for certain purposes.

FOR RANGER STATIONS

By providing funding for Ranger stations, all of these problems can be addressed in a single step. Rangers provide first-hand information to forest management, from detecting fires to monitoring insect populations. By keeping the areas truly roadless, one hopes that hazardous fuels would not build up. (Individual, Rego Park, NY - #A5996.17230)

FOR EDUCATING THE PUBLIC

More funds in general can go toward educating the public on ecological issues, the changing of the American public, and the values of recreation to the local economies. (Individual, Missoula, MT - #A6143.17000)

1400. Public Concern: The Forest Service should use tax dollars for certain purposes.

TO FOSTER ENVIRONMENTAL AND HUMAN VALUES

I would also like to see our tax dollars used to restore wildlife habitat, water quality and the quiet enjoyment of our publicly owned National Forests. (Individual, Missoula, MT - #A3647.17100)

1401. Public Concern: The Forest Service should not use taxpayer funds for certain purposes.

TO MAINTAIN AREAS THAT ARE RESTRICTED TO THE PUBLIC

I don't think citizens should be taxed to maintain lands they can't have access to, except for military bases. (Individual, Asheville, NC - #A15196.17110)

TO SETTLE LAWSUITS FILED BY ENVIRONMENTAL GROUPS

I am appalled that taxpayer money is wasted on settling ridiculous law suits filed by liberal environmental groups that feel the need to save every animal or placing them on some endangered species list without evidence to even suggest that they are endangered. (Individual, Whitefish, MT - #A8765.15121)

TO REVISE THE ROADLESS AREA CONSERVATION RULE AND THE PLANNING REGULATIONS

The Roadless Area Conservation Rule should be implemented as it currently is written. The Bush Administration should stop trying to undermine the rule and wasting taxpayer dollars in the process. I would like to know how much was spent gathering input on the last rule, and how much has been spent trying to undo it. The administration should also let stand the new planning regulations drafted by an independent committee of scientists, and stop further waste of taxpayer dollars by attempting to undo those. (Organization, Ellijay, GA - #A17692.17210)

TO PURCHASE AGENCY VEHICLES

I haven't seen a Forest Service employee on a horse in years. It's one employee to one vehicle running up and down the roads doing nothing, at taxpayers expense. (Individual, Elko, NV - #A20279.17100)

1402. Public Concern: The Forest Service should be concerned only with raising money to pay down the national debt.

The Service should not be concerned with trying to "meet all of the desires of all of the parties". They should be concerned only with raising money to help reduce the national debt. (Individual, Port Townsend, WA - #A964.15160)

1403. Public Concern: The Forest Service should adequately identify the costs and benefits of the Roadless Area Conservation Rule.

The Costs and benefits listed all seem to be guess work. Most categories were assessed by "Qualitative discussion". (Page A-21) Can you say, "junk science"? (Organization, Bozeman, MT - #A11947.17220)

INCLUDING THE COSTS OF IMPLEMENTING THE ROADLESS AREA CONSERVATION RULE

The alternatives and effects must adequately reflect the costs of survey and landline location, law enforcement, signing, studies, and other related costs that will be imposed on local Forests to implement this proposal. (Individual, Alturas, CA - #A28581.17120)

1404. Public Concern: The Forest Service should not allow the cost of road obliteration to take away from other funding priorities.

Roads exist in several of the roadless areas in the Superior National Forest. The cost to obliterate some of these roads will take away from the funds needed for other forest programs and result in increased fire fighting costs. (Elected Official, Lake County, MN - #A18049.17240)

1405. Public Concern: The Forest Service should use money designated for the Advance Notice of Proposed Rulemaking for forest improvements.

Other Concerns. What other concerns, comments, or interests relating to the protection and management of inventoried roadless areas are important?

Yes, this was a waste of our tax dollars and my time. We've already done this.

You could have used the money to improve the national forest. (Individual, Atlanta, GA - #A4509.17200)

*Financial Accountability***1406. Public Concern: The Forest Service should be accountable for its expenditures.**

A major concern is that the funding for our National Forests and other Public Lands have been cut to the bone over the years. This makes it impossible to deal with the many issues facing the Stewards of the Land. Without proper funding these agencies are stuck in the mud. On the other hand these agencies must also be more accountable with how they spend what funding they get. (Individual, Coulterville, IL - #A114.17100)

I am a Town Clerk for one of the small communities that lay in the valleys of the Manti-LaSal and it seems to me that there is a problem here. You use taxpayers' money to maintain the Forest Service and its National Forests and yet you are barring those same people from enjoying the very forests their money goes to support. WE have to account for every penny we spend of taxpayers' money. They have a say in how it is spent. That should apply to you also. (Individual, Centerfield, UT - #A12776.10130)

1407. Public Concern: The Forest Service should take no action that cannot be paid for with funds raised by that action.

The Service should take no action that it cannot pay for with funds raised by that action. (Individual, Port Townsend, WA - #A964.17000)

Monitoring/Enforcement

Summary

Some respondents assert that the Forest Service should monitor abuse of public lands; others further suggest engaging the public in identifying abuses. Respondents comment particularly that the Forest Service should enforce land use policies. Some suggest enforcement is needed in order to ensure environmental integrity, while others state that enforcement should be used before restricting uses. At the same time, one individual states that the Forest Service should prevent any interference with legal forest uses. Respondents offer several suggestions on how to enforce land use policies. These suggestions include strengthening and enforcing pollution and anti-dumping laws, providing adequate people-power, providing adequate funding for law enforcement, and using money allocated for administration to prosecute abusers.

1408. Public Concern: The Forest Service should monitor abuse.

There also needs to be a method of monitoring for those few who abuse the right and privilege of public lands. (Individual, No Address - #A340.15161)

1409. Public Concern: The Forest Service should engage the public in identifying abuses.

Put up questionnaire cards or pamphlets in camping areas and perhaps road interests asking the public for help in spotting problems. Maybe put in signs showing what to watch for. Use the forest guests (no one loves the forest more than the people who come there to spend time). A GOOD ROAD will help keep the forest healthy by using the eyes of those who come to enjoy our forests. Keep the roads maintained. If someone breaks a new trail . . . fine him or her . . . then block the road break. (Individual, Glade Park, CO - #A22419.90120)

I am in favor of programs similar to Cal Tip where the users are encouraged to report abuses. We need to keep users informed and allow them to monitor the areas since they are most likely the ones who will be in the area. We need to use regulations wisely to achieve access while maintaining the forest for generations to come. (Individual, Simi Valley, CA - #A16470.15161)

1410. Public Concern: The Forest Service should enforce land use policies.

Designating Areas: First of all this should be done as part of the process mentioned in question one and two. Does adding more rules work? Up the road in the same National Forest there was a problem of inappropriate and over camping (besides the litter). Problem was USFS did not have enough resources to ENFORCE the RULES. Solution they added more rules; now you can not camp, have a fire or park on the road without paying three dollars! The effect on the partying college kids from the other side of the mountain? They still drive up in daddy's 4X4, camp where they like, start fires anywhere they please, leave their beer cans along the sides of the whole ten mile road, and would you believe they do not pay the three bucks to park either! Maybe those well meaning people, who dug up and removed all the fire rings, should have instead dug up the roads at both ends! I could still walk there and there are no parking fees in my yard, but if there are any fishermen left they might be a little mad. (Individual, Center Sandwich, NH - #A3669.15161)

I'd like to see facts and data that really supports this roadless concept as to its benefit. Perhaps this is just another way to side-step problems with poor regulations, or in not enforcing existing laws? . . . A few areas, that have been poorly managed or that some people have abused, should not spoil it for the rest of us. However, I think that most people would support a "road-limited" policy. In many areas such as Nevada, there are way too many dirt roads (because of idiots who have to 4 wheel drive every ridge and

peak). However, many of these *do-it-yourself* roads could have been prevented if the current “No Off-Road Travel” policies had been initially enforced with severe penalties. (Individual, Elko, NV - #A21907.10110)

Currently I live in Colorado and enjoy the outdoors as often as possible, through many types of activities and recreation. It is especially pleasing to have truly wild areas to explore and view, however, these areas are shrinking year by year. I often encounter new ATV trails, improper campfire practices, out of season kill remnants, and lots of trash. It is my belief that the current system of protecting these areas is failing. Either the areas of these local agencies to observe are too large, they are under funded or under staffed. I have also found in some localized places, when informed these agencies say that there is nothing they can do, or outright admit that they do not care. (Individual, Kittredge, CO - #A11768.13110)

TO ENSURE ENVIRONMENTAL INTEGRITY

Roadless area management needs sufficient enforcement to ensure the environmental integrity is preserved. (Individual, Ennis, MT - #A102.17230)

TO PROVIDE FUNDS FROM CITATIONS

Why not police the roads and give citations for the ones that are abusing the areas. I know you will say that you don't have money for the extra manpower—but the money generated from the citation should more than cover it. We have encountered MANY people drinking and such and would greatly appreciate them being taken care of as we are on family outings when we are there and do not appreciate this kind of activity in front of our children.

Please reconsider this drastic act and consider the thousands of families and individuals that you will be affecting. (Individual, No Address - #A6719.17130)

BY STRENGTHENING AND ENFORCING POLLUTION AND ANTI-DUMPING LAWS

I think pollution and anti-dumping laws of public lands should be strengthened and enforced. IRAs should above all else be clean. (Individual, Fraser, CO - #A30203.45400)

BY PROVIDING ADEQUATE MANPOWER

We have noticed that once roads are opened they often become illegal trash dumping grounds, because the areas are isolated and there is not enough manpower locally for enforcement. (Individual, Randleman, NC - #A14005.15161)

BY PROVIDING FUNDING FOR ADDITIONAL LAW ENFORCEMENT NEEDS

In some forests such restrictions might require the implementation of law enforcement patrols. In these cases, USFS should provide additional funds to cover the need for new law enforcement positions. (Individual, No Address - #A29334.15161)

BY USING MONEY ALLOCATED FOR ADMINISTRATION TO PROSECUTE THOSE WHO ABUSE THE FOREST

I would suggest spending some of the money you use administering to use punish those that abuse the forest. This would include off road vehicles as well as hiker and horse backers. Allow all present roads to be used and make laws with penalties for those that leave the roads. Gather help from ORV clubs to help enforce this. I have witnessed local clubs monitoring areas for just such a reason. (Individual, Longmont, CO - #A17891.3.17230)

BEFORE PROHIBITING FURTHER USES

All current and legitimate activities should be allowed. The Forest Service must better enforce current laws for dumping, off-road use, etc., before further prohibiting uses. (Individual, Fountain Hills, AZ - #A5990.90000)

1411. Public Concern: The Forest Service should prevent the interference of legal uses of forest resources.

Interference with legal users of forest resources must be prevented. Any form of interference or intimidation must be swiftly crushed, and the perpetrator(s) punished. (Individual, Spring Creek, NV - #A26896.15110)

Chapter 6

Protecting Forests, Communities, and Property Access

This chapter includes three main sections: Protecting Forests (Question 3), Protecting Communities (Question 4), and Protecting Access to Property (Question 5).

Protecting Forests (*Question 3*)

Question 3: Protecting Forests. How should inventoried roadless areas be managed to provide for healthy forests, including protection from severe wildfires and the buildup of hazardous fuels as well as to provide for the detection and prevention of insect and disease outbreaks?

This section includes five subsections: Natural Disturbance Processes and Forest Health General, Roads/Access, Timber Removal, Fire Management, and Insects, Disease, and Noxious Plants.

Natural Disturbance Processes and Forest Health General

Summary

General Comments – A number of respondents comment about forest health management in general. Some suggest using the precautionary principle, or managing forest health according to land use designations and management restrictions. Others ask the Forest Service to focus forest health management efforts in roaded areas rather than roadless areas where some believe the need is more urgent. Another individual suggests that wilderness areas cannot be properly managed for forest health because these areas promote fire and insect and disease outbreaks.

Respondents also comment about forest health management strategies. Several suggest that the Forest Service develop a detection and prevention strategy for natural disturbance events. Others suggest the Forest Service have contingency plans in place to act quickly to manage disease, blowdown, and wildfires. One individual proposes the Forest Service develop plans and strategies similar to those used by the Federal Emergency Management Agency.

Several respondents suggest engaging local non-profit groups to help with forest health management activities. Others say that forest health management should be left to professional Forest Service personnel.

Many respondents comment about forest health, specifically as it relates to roadless area management. A number of people suggest making forest health a top priority, allowing decisions

to be made at the local level, and protecting adjacent lands from insects, disease, and fire. A few individuals state that the Forest Service should manage forest health in roadless areas no differently than in the rest of the forest. One individual asserts, “The RACR does not preclude employment of management actions to control insects and diseases which may occur in IRA, nor does it preclude fire/fuel management strategies within the National Fire Plan.”

Adequacy of Analysis –A number of respondents ask for more in-depth analysis, particularly with respect to forest health. This includes requests to inventory forest health at the local level and to fully disclose the consequences of various management strategies, and to continuously collect forest health data. Some organizations suggest the Forest Service use roadless areas as a baseline to gauge the effects of management techniques on forest health in other areas. A few respondents suggest the Forest Service provide evidence that the Roadless Area Conservation Rule will have a positive effect on fire and forest insect management, or provide studies to support the claim that thinning small-diameter trees will restore ecological processes, provide habitat for endangered species, and avert catastrophic wildfire.

Some respondents comment about concepts related to forest health. Some would like the Forest Service to define the terms “healthy” and “forest health.” One individual states, “First, we must define a healthy forest. Healthy according to whom?” Others state that forest health may be defined according to the management objectives at each forest site. One individual suggests the Forest Service define temporary and short-term forest health treatments. Several respondents recommend the Forest Service acknowledge the concept of natural disturbance regimes.

Funding – One individual advises the Forest Service to consider that policy changes and attendant litigation have cost a great deal of money that could have gone to forest health treatments. Another individual states that there should be a process in place where litigants are held responsible for damages to the environment that happen when lawsuits prevent health management activities from occurring.

Management – In general, people recommend either ‘active management’ or ‘ecosystem/restoration management.’ Respondents state that the Forest Service should actively manage resources in roadless areas. Suggested active management practices include timber removal, managed fire, and insect control. (See also subsequent sections on fire management and insects, disease, and noxious plants.) Other respondents suggest that the Forest Service utilize best management practices and work to restore forest health. One individual suggests the Forest Service use conditions that existed prior to Euro-American contact as a baseline for management.

Other respondents assert that forest processes such as fire and insects and disease outbreaks should be allowed to run their natural course. People state that these elements are part of the natural forest stand replacement cycle and should not be suppressed or controlled. Respondents also say that human activities, such as road access and timber removal, cause more damage than natural processes.

One individual states, “The so-called ‘exceptions’ to the road building and timber harvest prohibitions are too narrow to provide the needed flexibility.” This person suggests that these exceptions will foster more litigation and that the needed flexibility can be provided by allowing local forest supervisors to tailor forest plans to respond to local circumstances. Another individual requests that the Forest Service define specific national criteria for management exceptions requiring roads in designated roadless areas. On a similar note, one respondent

suggests the Forest Service constrain exceptions to the Rule with specific conditions and restrictions.

Forest Health Management General

1412. Public Concern: The Forest Service should follow the precautionary principle.

TO DECIDE IF ADDITIONAL TIMBER REMOVAL WILL IMPROVE FOREST HEALTH

The US has signed a number of international treaties invoking the Precautionary Principle, which says in essence: **“When there is a significant probability of harm to the environment or to human health, it is not necessary to have 100% proof of harm to justify preventive and corrective actions.”** The Forest Service should follow the Precautionary Principle as they decide if more logging will improve the health of the forests. (Individual, Spokane, WA - #A23849.30100)

TO MANAGE THESE AREAS MINIMALLY

Use the Precautionary Principle and “manage” these areas minimally. Indeed “manage” is the wrong word, since we do not manage the forests; we influence and impact them, they manage themselves. Since the roadless areas have likely been “managed” minimally, they should be left for future generations as reference areas, in humble admission that our forestry is ignorant of many subtle ecosystem dynamics, and that our management is still incapable of appreciating and integrating the diverse social and economic interests in our forests. Indeed, insufficient time has passed since true old growth ecosystems, especially in the West, were first clearcut to know whether they do grow back as they were. The whole notion of a decadent forest is outdated. The latest research from the Wind River station shows that old growth forests continue to function as carbon sinks. (Individual, Cleveland, OH - #A26411.30100)

1413. Public Concern: The Forest Service should manage forest health according to land use designation and management restrictions.

IRAs should be managed according to how they are allocated. If they’re allocated to non-developmental uses (such as roadless recreation or recommended wilderness) they can be prescribed burned to prevent the buildup of hazardous fuels. If they’re allocated to developmental uses, they can be logged, thinned or prescribed burned. (Individual, Libby, MT - #A2301.30510)

ALLOW MORE OPTIONS FOR MANAGING FOREST HEALTH IN ROADLESS AREAS THAN IN WILDERNESS AREAS

Emphasizing that areas identified to continue as unroaded, non-wilderness areas should not be managed as pseudo-wilderness, the options for controlling wildfire and insect/disease outbreaks should be much greater compared to wilderness areas (e.g., use of chainsaws, motorized equipment, and aircraft). Also . . . noted above, many forest management activities may be feasible/desirable within the scope of the purpose of these unroaded areas to help prevent the buildup of hazardous fuels and insect/disease outbreaks (e.g., prescribed fire, thinning, aerial spraying). (State Agency, Saint Paul, MN - #A30025.30200)

1414. Public Concern: The Forest Service should focus its management efforts on roaded areas rather than remote roadless areas.

Given limited resources, how can the Forest Service conserve managed landscapes? The Forest Service seems confused about where the controversy lies. Relatively speaking roadless lands are not controversial. The data and public opinion supports the status quo. In contrast, managed Forest Service lands are in poor to fair ecological condition, despite billions of dollars of public expenditure over the past sixty years. How the US Forest Service managed those lands will largely determine agency efficacy and viability, and perhaps the credibility of the forestry professional as well. (Individual, Colville, WA - #A20889.12120)

BY TREATING FOREST HEALTH IN ROADED AREAS

The agency should focus its efforts where they are needed most urgently, in roaded areas, not roadless areas. Most of the areas that are at greatest risk of unnaturally intense fire or excessive mortality due to insects and disease are in already roaded areas. The areas where fire risk is greatest are low elevation forests that evolved with frequent low intensity fires that burned the under-story below larger trees. These areas were also most heavily logged and roaded. Roadless areas on the other hand, are often at higher elevations and moister and wetter than roaded areas. They evolved with longer fire intervals, thus the effects of fire suppression and past timber management have not been as acute.

Furthermore, even in roadless areas where forest health concerns do exist, the Forest Service ought to be very careful to not trade one environmental liability—the effects of constructing new roads in roadless areas—for another—treating forest health. Exchanging one liability for another is not good public policy. (Organization, Arlington, VA - #A23474.30100)

Applying effective fire suppression/exclusion results in an increase in fuel hazards and potential fire severity, and a decrease in biological diversity and ecological integrity. The forests most in need of vegetation and fuels treatments to reduce fire hazards, insect and disease outbreaks, and restore biological diversity are not roadless areas, but rather, areas that have already been roaded and logged. Building roads allegedly for the purpose of “forest health restoration” or “fire hazard reduction” only makes sense if mechanical thinning treatments are being proposed. However, the use of mechanical thinning as a tool for fire hazard reduction is highly controversial, scientifically unsubstantiated, and fundamentally experimental in nature. Unfortunately, it appears that mechanical thinning is becoming yet another euphemism for industrial-scale commercial logging—one of the prime management activities that degrade ecosystems and cause forest health/fire hazard problems.

In some instances, it has been demonstrated that commercial thinning treatments intended to reduce fire hazard have actually had the opposite effect. Although gross tonnage of fuels may have been reduced, there has been a net increase in hazardous fine fuels accumulating on the surface and available for burning—primarily logging debris or “slash.” Also, changes in microclimate from tree removal serves to increase solar radiation and wind penetration, which in turn increases site flammability following thinning treatments. (Organization, Eugene, OR - #A30352.30500)

Extensive management of these areas is not economically possible or logical. The only logical solution to protecting forest health in general is to manage species and spacing in the already roaded and logged areas, wherever extensive forest management is possible. This will reduce fuel loadings on the forest floor and ladder fuels that lead to catastrophic, stand replacement fires. These fires result in wholesale water quality and wildlife devastation in addition to the huge fire fighting costs, and loss of homes, property and lives. This same management is definitely not appropriate for roadless areas, however, which should be managed as wilderness, since this is what they are and is most cost effective. (Individual, Olympia, WA - #A20849.30200)

Fires in unroaded areas are not as severe as in roaded areas because of less surface fuel. Many of the fires in the unroaded areas produce a forest structure that is consistent with the fire regime, while the fires in the roaded areas commonly produce a forest structure that is not in sync with the fire regime. Fires in the roaded areas are more intense, due to drier conditions, wind zones on the foothill/valley interface, high surface-fuel loading, and dense stands (Hann et al.1997).

Frost (1999) expands:

As summarized earlier in this paper, scientific assessments conducted for federal lands in several western regions generally agree that previously roaded and logged areas should be the highest priority for fuels reduction and forest health treatments (SNEP 1996, FEMAT 1993, Hann et al. 1997). (Organization, Missoula, MT - #A613.30500)

BY RESTORING ROADED AREAS TO SUSTAINABLE LEVELS

The benefits of managing forests to reduce the potential for large scale natural disturbance are undeniable. Given that these natural systems, for example the ponderosa pine forests of the Interior

Columbia Basin, have been put in a position well outside the range of historic variability, it is necessary that active management be used to return them to a sustainable condition. However, given certain budgetary constraints to accomplish such work, the currently roaded areas are of far greater priority than are roadless areas. When all or most of the roaded areas have been restored to sustainability, then it's time to begin focusing on the roadless areas. First tools for consideration should be pre-commercial thinning and prescribed fire. Commercial logging should be used as a last resort to achieve the desired conditions. (Individual, La Pine, OR - #A30048.30100)

BY CONSULTING WITH LOCAL SUPERVISORS, STATES, COMMUNITIES, AND TRIBES

We believe that local supervisors, in consultation with states, communities, and tribes, should focus their planning attention on proper harvesting in areas already roaded, and on means of improving forest health without building additional roads in inventoried roadless areas.

The existing rule allows for exceptions [for] wildfire protection and forest health and local supervisors should be given narrow authority to grant such exceptions in consultation with state, Tribal and local government and other federal agencies. (Individual, Olympia, WA - #A8793.13130)

1415. Public Concern: The Forest Service should consider that wilderness areas cannot be properly managed for forest health.

Wilderness areas cannot be properly managed. They become a threat to citizens and private property owners. No vehicles are allowed in the areas and no hazardous ground fuels can be cleared which promotes fire danger as well as disease and insect outbreaks. (Individual, Pencil Bluff, AR - #A22117.30100)

1416. Public Concern: The Administration should clarify its position on natural disaster management.

The Bush administration needs to clarify its position on natural disaster management. In some cases, such as along the Mississippi River, the current administration threatens towns and communities with the removal of federal disaster relief. Yet, this summer the federal government has spent millions of dollars and six fire fighters have died attempting to put out blazes. The only common thread is an anti-environment tone from the Bush administration. People that want to protect their environment are punished while those that destroy it are supported with my tax dollars. (Individual, Boulder, CO - #A26520.15000)

1417. Public Concern: The Forest Service should not allow excessive support for short-term visual values to prevent the implementation of forest health treatments.

Values should then be synthesized with the value of forest health needs. That connection is highly important as excessive support for short-term visual values can and does prohibit the implementation of treatments that result in healthier forests. Aquatic and vegetative values must be applied in a balanced manner. (Organization, Moscow, ID - #A25639.45000)

Forest Health Management General – Management Strategies

1418. Public Concern: The Forest Service should develop a detection and prevention strategy for all natural disturbance events.

BY DEFINING THE EXPECTATIONS OR PROCEDURES IN THE FOREST PLAN AND ASSOCIATED RESOURCE PROGRAM PLANS

You question how the inventoried roadless areas should be managed to sustain their health, including wildfire protection? It is interesting that your agencies and the Universities that train your people should need to answer this question. The problem I see is a lack of a lot of alternatives for many ecosystems based on the situations created by the decisions and the willingness of the American Taxpayer to pay. I don't believe the agency has been at all truthful about the short and long term outcomes or expectations

from various regimes of management in some ecosystems, there has been a great effort to sell effects based on what you believe people want to hear. In particular your decision to use something as unanchored as “ecosystem management” is an example of the Services searching for results without knowing what they will be. If there were conflicts about expected outcomes over a long term of time the agency has acted as though all things were possible. That might be true over some sort of array in space and time, but most people were evaluating things within their relatively short life span in relation to the normal western forests. It is unfortunate, but I believe most of the public’s view of the forest is a series of what I call Kodak moments. There is little comparison with things that change about the Forest over time. Those of us that worked on and studied forests, their various interactions and visit the same areas many times see how really quickly things about a forest change. The changes if not treated or altered at appropriate times actually preclude a number of alternatives and in some cases limit treatments or even publicly acceptable decisions.

That is unless “mother natures” great excuse, burns through and restarts the alternatives on another decision path. As a public agency with many conflicting elements I find it hard for the agency to make any promised outcomes that are based on a time dependant set of events. That concept seems poorly understood and even more poorly portrayed in your decision documents. To have a public accept your decisions you must portray that you know and understand the various decision paths and the consequences of not getting certain things implemented. The obvious thing is that some members of the public can accept dead trees from the numerous perturbances in the Forest. The most obvious thing that is seldom really discussed is how these alter and influence management outcomes. Areas managed for timber production that are burned or insect affected have a presumed waste, yet that process in a wilderness is looked at as naturally acceptable because that apparently is how that system currently functions naturally. It meets one goal but foils another.

It is imperative that every area of National Forest has the detection and prevention strategies for all the natural perturbation events such as fire and disease or insects. The expectations or procedures should be defined in the Forest Plan and associated resource program plans. (Individual, Cambridge, ID - #A11714.30100)

BY INCLUDING DESCRIPTIONS OF HOW DISTURBANCES ARE ALLOWED OR ARE PURPOSEFULLY CARRIED OUT IN PLANS FOR ALL ROADLESS AREAS

Providing sustainable healthy forests should be the goal of all management. Our western forests are disturbance dependent, therefore plans for all Roadless areas must include descriptions of how such disturbance may be allowed or purposefully carried out. Such disturbances will logically favor orderly timber harvest and subsequent post harvest measures, slash disposal, site preparation, reforestation, and stand stocking control. Road access may be provided by some permanent roads as well as temporary ‘roll up roads’.

Prescribed fire or naturally ignited fires burning under prescription can also be used to reduce forest fuels, but such means often results in leaving large volumes of dead but unconsumed trees standing and down.

Stand examination and other inventories must be made, and all existing and predicted future conditions must be accurately described and mapped. Only then can officials bring forth the data and provide necessary analysis to the interdisciplinary team and the public. (Individual, Manhattan, MT - #A21848.30520)

1419. Public Concern: The Forest Service should have contingency plans in place to act quickly to manage disease, blowdown, and wildfires.

INCLUDING PREPARATION OF AN EIS

The Forest Service should have the necessary plans and EISs in place so they can act quickly to deal with disease, blowdown, and wildfires. (Individual, Minneapolis, MN - #A8016.30100)

In exceptional cases where insects and fuels do become a hazard, an environmental impact statement for proposed action can be prepared. This was done in the Boundary Waters Canoe Area Wilderness after a 1999 storm left ten times the normal fuel buildup. (Individual, Grand Marais, MN - #A15355.30100)

INCLUDE UNEXPECTED EVENTS IN FOREST PLANS SO THE FORESTS CAN BE MANAGED EFFECTIVELY AND RESPONSIBLY

The blowdown in the Superior National Forest, I believe it was July 1999, highlights a major problem. Instead of acting quickly to salvage timber as practical and to reduce fire danger, the USDA forest service could do nothing except write environmental impact statements (EIS) for a year and a half. This inaction must be dealt with, and my suggestion is to include unexpected events in the forest plans so the forests can be managed effectively and responsibly. Having the responsibility to manage must be coupled with the authority to act. The state and local communities tend to act quickly to deal with the large blowdown, but why can't the US forest service act quickly? What needs to be done or included in the forest plan so the forest service can act quickly in the future? (Individual, Minneapolis, MN - #A8016.30500)

Even if the final designation is for roadless area designation, contingency plans must be included to allow for human intervention in case of serious fire danger, disease outbreak, human use controls, etc. (Individual, Starkville, MS - #A11715.30200)

1420. Public Concern: The Forest Service should develop plans and strategies similar to those used by the Federal Emergency Management Agency.

My view is that wildfires differ from tornados, floods, and earthquakes only in the perception that they're preventable. Even in highly-managed forests, this isn't always the case. Why not develop the same plans and strategies the FEMA uses for other disasters? (Individual, New Haven, CT - #A706.30400)

*Forest Health Management General – Public Involvement***1421. Public Concern: The Forest Service should employ local non-profit groups to observe forest health conditions.****TO OFFSET THE COST OF FOREST HEALTH MANAGEMENT**

The Forest Service should employ (not hire) local non-profit groups to help offset the cost of observing and keeping the forest healthy. For instance, I know a group of motorcycle riders in Montana who could tell the Forest Service exactly where the most dangerous build-up of fuels are. Their knowledge could be put to good use if only there was mechanism to receive their input. (Individual, Palmer Lake, CO - #A23361.17140)

IF THE FOREST SERVICE DOES NOT MANAGE FOR FOREST HEALTH; A LOCAL NONPROFIT ORGANIZATION SHOULD DO IT

Under such a law, forest hazard "management" (if any) should be performed by the forest service itself, or by concerned local non-profit organizations. Any for-profit enterprise involved in forest hazard management should be closely monitored, if not prohibited, for violation of a conflict of interests. (Individual, Olympia, WA - #A25533.30600)

1422. Public Concern: The Forest Service should engage other government entities to educate and advocate practices to promote forest health.

If it is responsible for managing the health of the nation's forests, then the Forest Service can not restrict itself to parcels within boundaries on a map but must include protection of the entire forest and protect it from its greatest adversary, mankind. In doing so, the Forest Service must engage not only the public but itself and other parts of the government to educate and advocate practices and policies that would promote forest health, including but not limited to: acting as the champion of the forest as an ecosystem, educating Congress about ecology and biodiversity and employing all possible means to persuade Congress to make statutory that the mission of the Forest Service is to champion the forest as ecosystems, eliminating the leasing of forest lands for grazing—a practice that has been widely documented as very destructive to forest health; working with the department of Labor and Commerce

to assist communities and small businesses economically dependent on forest use to other bases of economic viability; assuring that the EPA is fully aware of the impacts of environmental quality on forest and employing all possible means to move the EPA in directions that would promote forest health through environmental quality; advocating alternatives for all forest resource uses, especially but not limited to extractive . . . (Individual, Nederland, CO - #A19016.15167)

1423. Public Concern: The Forest Service should not ask the public how to manage forest health on public lands.

LEAVE IT TO PROFESSIONAL FOREST SERVICE PERSONNEL

It is absurd that you would ask the general public how to manage lands that are over-run with dead timber, beetle infested pines and potential fire hazards! We pay taxes to hire trained professional Forest Service personnel with years of collective service and the know-how to deal with these issues. You know what needs to be done! (Individual, Annabella, UT - #A30323.30100)

Forest Health Management General – Roadless Areas

1424. Public Concern: The Forest Service should consider forest health when managing roadless areas.

When evaluating Roadless Areas, the Forest Service should consider:

The likelihood of catastrophic wildfire, or insect or disease outbreaks. (Individual, Des Moines, IA - #A12587.30100)

When evaluating Roadless Areas, the Forest Service should consider:

The overall health of the area. (Individual, Des Moines, IA - #A12587.30100)

BY MAKING IT A TOP PRIORITY

The health of the forest and associated lands has to be the top priority for the management of roadless areas. Other considerations have to be set aside if they interfere with the highest priority. As a country we have a very poor history trying to implement multiple use. (Individual, Ennis, MT - #A438.30100)

Let all people know the highest priority in a roadless area is forest health. The Forest Service will do as Teddy Roosevelt wanted them to do when he established the National Forests, promote forest health and allow whatever activities on the forest that will promote this goal. (Individual, Ennis, MT - #A438.30100)

I believe that the health and conservation of wilderness to be a higher priority than our consumer needs for more natural resources. Having spent much time in our Forest Service lands as a wilderness guide, I see the impact of roads, even remote roads, on the ecological systems of the area. Just putting in roads, much less the intended use of the roads, (mining, logging, etc), creates disturbances in the flow of life in a forest. (Individual, Boulder, CO - #A212.50000)

Local and regional economic interests dominate forest management policies even though these lands do not exclusively belong to these interests. Although I live in Montana, I have an equal stake in national forests in Utah to those held by Utahans, and vice versa. The vast majority of commercial logging in the U.S. occurs on privately-owned lands and the use of national forests for this purpose is no longer a legitimate use of national forests. They are not farms, they are forests. While I have no problem with certain activities, such as hunting, I see little policy difference between a roadless forest and a national park. Thus, I believe the pendulum of policy must start to swing closer to preservation than to consumptive use in our national forests. (Individual, Billings, MT - #A277.50000)

Economic interests of private corporations should have less standing than the general interests of the national policy, and the Forest Service should recognize and argue the case that the protection of many areas from logging will inevitably raise the prices for forest products from other areas that are harvested by timber companies. It is therefore in the interests of everyone to maintain large protected areas for both current environmental health and possible rotation as future sources of supply of forest products. In no case should short-term economic interests of a few take precedence over the national interest of maintaining healthy forests. (Individual, New Haven, CT - #A616.30130)

BY CONSIDERING THE HEALTH OF THE ENTIRE FOREST/REGION

It is a sunny morning and I am writing from my porch, overlooking a small patch of my forestland and that of my adjacent neighbor, U.S. Timberlands. We bought this patch of forest ten years ago as a recreation haven, for access to hiking and snowmobiling, but over the years I have learned about forest management, and now regard it as a place to respect and protect, not just to enjoy. As I watch my neighbor ruthlessly and inappropriately clearcut in mixed conifer and ponderosa pine forest, I worry about the health of the entire forest region in this area, with the resulting microclimate and ecosystem effects of such damaging timber practices.

This is private land, albeit in the questionably legal possession of a timber corporation. However, I have the same concerns about public land, which has been treated with similar disregard for forest health. (Individual, Olympia, WA - #A4929.30100)

Much of the watershed area in the western states is not forest at all but rangeland. If we do nothing to manage for resource health the resources will become weaker and the area will be invaded by species that thrive with regular wildfire. Bare ground will become the norm and healthy soils and native plants will be a thing of the past. (Individual, No Address - #A7186.65000)

BY FOCUSING ON LONG-TERM FOREST HEALTH AND ECOSYSTEM MANAGEMENT

The Forest Service has a unique responsibility in the public trust. More than most public agencies, the Forest Service's work is critical to the well-being of future generations. Long-term issues such as maintaining biodiversity and protecting ecosystems are integral to the responsibilities we entrust to you. You are stewards of a vital part of America's future, and if you can maintain that as your top priority, it will help you sort out the many competing short term economic and political pressures. You seem to have grasped some potential techniques already, such as this public comment opportunity. Work on it, keep your eye on the long-term health of our forest ecosystems. You'll figure it out. (Individual, Chestertown, MD - #A462.15110)

BY USING A STEWARDSHIP FORESTRY CONCEPT

The USFS no-burn policies of the last 100 years contributed to the unnatural build up of hazardous fuels, disease and insect infestation. Though unrealistic to return to the "natural ways" of yore, the *stewardship forestry* described in the RAC DEIS May 2000 offers a functional and scientifically sound method of keeping forests healthy. "Severe wildfires" are a part of the natural order of forest life and should return to their proper place. Insects and disease also perform natural functions, wildfires keep these two "blights" in check. (Individual, Kemmerer, WY - #A8383.30100)

BY ALLOWING DECISIONS ABOUT FOREST HEALTH TO BE MADE AT THE LOCAL LEVEL

The Forest Service should allow local forest-level decisions for forest health treatments, including timber removal to reduce the risks of wildfire, where such activities will not adversely impact roadless areas. (Individual, Laramie, WY - #A949.30520)

Protecting forests by making decisions in Washington D.C., absent the knowledge and information available on the local forest level, does not allow for adequate protection of our National Forests. Local input is critical to forest health. The few maps that were provided were incorrect because local sources were not consulted. To declare roaded area unroaded by edict, and then manage them based on that misinformation, will only result in inadequate management which then leads to additional fire danger. It also fails to allow for adequate management of other forest problems, such as disease infestations, blow downs and insects. (Organization, Yreka, CA - #A8381.30100)

Let the local managers manage the roadless areas. Where mortality strikes in stands of timber, whether it is from insect, windthrow or previous fire, it must be dealt with. The most obvious method of dealing with it is to remove it. In most, but not all cases, we think the roadless areas should be kept roadless and the timber removed by aerial means. Technology exists to do this and do it in an economical manner if it is done in a timely analysis. If the mortality is allowed by court action, what value was in the commodity is lost to deterioration. If the project ever clears all the analysis and legal hurdles, it seldom resembles what was originally proposed by the local manager who actually knew what needed to be done. And at that point the project, if in the form of a timber sale, is so deficit that it cannot pay its own way with the value of the ruined commodity. And so the fuel builds and the forests burn on what has become a predictable basis. Between 40 and 60 million acres of this situation now exists on National Forest land, with a high percentage of this in roadless areas. It has gone on for so long now it will be a major undertaking to clean the areas up. But again, you need to ask yourselves as managers of the forest, "Is it better to take an active role in management or let nature take its course?" We think you are seeing a shift in what the public thinks when it comes to forest health and fuel buildup. Look at the Bitterroot where close to 400,000 acres burned last summer. The local population has changed over the years toward the preservationist side of the scale and almost 100% of the logging has been stopped.

Now after seeing the two months of raging infernos a recent poll shows almost 90% of the locals think the fire killing timber should be removed, even in the roadless areas, in order to reduce fuel loading for the future. Of course much if the fire could have been prevented if forest health programs has been carried out. So in summary, take charge of forest health and use all the tools you have at your disposal to take good care of our roadless [areas]. (Individual, Canby, OR - #A15507.30500)

It is essential that most roadless areas remain as roadless as possible, but this should not be at the expense of forest health because according to the NFMA protection of the resources to maximize the use of those resources is extremely important. Decisions on whether a road is necessary to maintain forest health should be made on a local forest level, decisions on local forest cannot be made adequately on a national or even regional level. Even if roads are not constructed, consideration should be given to clearing hazardous fuel buildup, again on a local forest basis. (Organization, Huntsville, AL - #A13542.30200)

We think that the current role provides sufficient and appropriate general guidance for addressing concerns related to managing the health of the forest and addressing the effects of wildfire and pests. We think the plan revision process can add specifics to those general guidelines. Among other considerations, the plan revision process should:

Define the values, goal, and objectives for which each roadless area is managed. Direction for management activities related to forest health should be in harmony with the values for which the area is managed.

Identify those roadless areas where management activities to reduce the threat of wildfires will not be applied, recognize that periodic wildfire - in some cases even severe wildfire—serve to engender health forest ecosystems.

Identify thresholds of "fuel loading" that might trigger management activities to reduce the effects of wildfire, considering the effects may be more significant for certain localities than for others.

Provide that insect and disease outbreaks may be controlled when necessary to protect the values for which the area is managed, recognizing that native pests and diseases play a significant role in promoting the overall health of the forest.

Provide that eradication of recently established populations of exotic pests may be considered when outbreaks exceed an acceptable threshold.

Provide that first consideration be given to biological controls, hand control methods, and pesticides when pest outbreaks exceed an acceptable threshold. (Organization, Damascus, VA - #A17723.30100)

A blanket, national EIS diminishes local officials' flexibility to take action to prevent losses of important ecosystems due to catastrophic fires or other events. Construction of a low-impact, temporary road or

firebreak to fight a fire is preferable to a catastrophic fire that wipes out a vital ecosystem remnant. Harvesting timber infested with beetles, for example, may also require mechanical thinning to maintain forest health but that should be done with the least amount of impact possible to roadless areas. Idaho is no longer a mosaic of large ecosystems that can sustain large fires without loss of vital habitat. Today's forests are isolated fragments of once majestic ecosystems. Loss of any of these fragments to catastrophic fire could jeopardize vital wildlife and plant habitat and thus threaten the sustainability of important species. Catastrophic fire can also wipe-out backcountry transportation systems such as traditional trails and bridges. (Permit Holder, Boise, ID - #A29589.30500)

BY CONDUCTING ACTIVITIES WITH CLEAR PROCEDURES THAT ARE OPEN TO THE PUBLIC

Management actions with a clear purpose, such as maintaining fire regimes in long-leaf pine forests or removal of non-native species, may sometimes be necessary in roadless areas. In such cases, activities should be conducted with clear procedures that are open to the public. In addition, these activities should be conducted without roads and with minimum disturbance to roadless characteristics. (Organization, Washington, DC - #A18031.30200)

BY BASING MANAGEMENT DECISIONS ON ROADLESS AREAS' INDIVIDUAL CHARACTERISTICS

Inventoried roadless areas should be managed to provide for healthy forests based on their individual characteristics. That is, some roadless areas are sparsely forested on steep rocky terrain with shallow soils, while others are heavily forested on moderate terrain with deep soils. We suspect protection from insects, disease and wildfire are most important in these latter instances. They should be protected by building roads, harvesting old, overmature stands in a preemptive strike, and thinning stands with an abundance of small trees and brush in the understory which provide ladder fuels to the crowns of larger trees.

On the other hand, roadless areas with scattered stands on steep rocky slopes should be managed by leaving them alone. Insects, disease and fire can play their natural role there without unduly threatening surrounding national forest land. (Organization, Saint Anthony, ID - #A13225.30000)

There is no "one" answer as to how IRAs should be managed, since every roadless area is a distinct and unique unit. The diversity of factors that must be addressed in managing roadless areas is profound. Forest types, stand conditions, values at risk, management objectives and the context of the area in relation to the surrounding lands are among the factors that must be considered. Consequently, each IRA should be managed individually.

Since the agency must preserve the IRA in the condition it was in as of the date of the designation as a Roadless Area, any activities that significantly alter the condition of the IRA at the time of designation are prohibited. The agency should conduct forest health projects, including but not limited to timber harvest, in order to preserve the condition of the area at the time of designation.

It is unwise for the agency to let any national initiative eliminate effective tools for preserving the conditions of IRAs as well as managing other areas of the forest. (Organization, Salt Lake City, UT - #A15263.30000)

TO PROTECT ADJACENT LANDS FROM INSECT, DISEASE, AND FIRE

The health of our forests also directly impacts our ability to provide protection for communities, homes and property. Insects, diseases and fires do not recognize the artificial boundaries placed across the landscape by governments, organizations or private individuals. To effectively treat these problems and/or restore the landscape to a more resilient condition, management actions need to be planned and carried out within a landscape context which means the impacts to NFS neighbors must be accounted for. Imposing a one-size-fits-all regulation on roadless area management will inhibit the Forest Service's ability to participate in these necessary landscape restoration and risk-reduction efforts.

The CWSF [Council of Western State Foresters] believes the potential impacts of known forest health problems, fuel load problems, and fire suppression needs on adjacent landowners must be considered in the development of roadless area management decisions. Without such considerations, liability and loss of trust will again rule the day. (Professional Society, No Address - #A29920.30600)

The lands ultimately allocated to roadless status will in large measure have to be allowed to grow, mature, and decay under natural process. This does not mean that silvicultural treatments such as thinning, burning, or harvesting should not be allowed. Those activities will simply be limited to the topography and/or economics of each opportunity. Management's ability to protect adjacent roaded areas, such as plantations, rangeland, or riparian areas from insect, disease, and fire threats should be without question. With the exception of underburning and slash/piling projects, this limits much of the mechanical treatment options to the perimeter of the roadless area. Such treatments have little relative effect on the area's roadless nature, but can have great effect on maintaining the values already invested in on the adjacent roaded lands. (Individual, Bozeman, MT - #A28120.30500)

Recently in Kentucky, endangered red-cockaded woodpeckers had to be relocated, due to loss of habitat caused from insect infestation. The infected trees should have been cut and removed. "Protections" such as these are counter-productive. The Bankhead NF in Alabama is also becoming infested with beetles but the trees cannot be removed due to "protections" and access restrictions. I hear similar reports from members on many other national forests.

Diseases and insects will not remain confined to National Forests. They will spread into State, County, tribal and private lands just the same as wildfires spread into private lands. These blights know no boundaries. District offices should closely monitor the health of their forests and do whatever is necessary to prevent these problems. The old adage about "an ounce of prevention is worth a pound of cure" truly applies to forest health. (Organization, Three Rivers, CA - #A28739.31220)

A roadless area can be a liability as can a slum tenement building next to a home or business. The government lands should be the good example of stewardship and community, not the undesirable, unwanted, bad example of a neighbor. Do we need to cut a wide swath around each unmanaged piece of federal land to protect the citizens and adjacent communities from fire, infestations, drug crops and marauding wild animals? I hope not but ranchers, towns, private home owners and individual citizens deserve consideration in our country too. Some forms of silviculture, logging, and health maintenance can be conducted without building extensive roads, permanent roads, or banning chemical uses. Is an antibiotic bad if you have an infection in your body? Why then do we not treat our ailing forests? Balloons, helicopters, chemical spray, selective harvest, prescribed burning, basal treatments . . . there are many ways to 'manage' our roaded and unroaded or limited roaded forests with beneficial results to habitat, air and water quality, and long term value to our country. Local forest managers should know what is best for their area of responsibility, not congress. (Individual, Olympia, WA - #A26972.30100)

1425. Public Concern: The Forest Service should manage roadless areas no differently than the rest of the forest.

The Forest Service should protect the roadless areas in the same manner it protects *all* forest areas. Why should the roadless areas be any different? As far as protection from buildup of hazardous fuels, as these are roadless areas, why would there be any hazardous fuel buildup in the first place? (Individual, Monroe, GA - #A4875.30100)

Inventoried roadless areas should be subject to appropriate silviculture methods to protect from disease or insect infestation, as well as an active management program to reduce and control fuels that could feed wildfires. Ecosystem health should be a primary concern in the management of our national forests, and the best available tools to sustain forest health should be applied. Inventoried roadless areas should be subject to the same scientific management process as other areas of the forest. (Individual, Marietta, GA - #A4827.50100)

1426. Public Concern: The Forest Service should not designate areas as roadless if they cannot manage those areas to keep them healthy.

Inventoried roadless areas or any other management alternatives for public lands must allow stewardship activities like thinning and removal of hazardous fuel buildup. If roadless designation does not allow such management activities then the area should not be designated as roadless. Perhaps the best example

I can think of is the western white pine cover type. This cover type in northern Idaho and adjacent states has been reduced to about 5% of its original range due primarily to the introduction of the white pine blister rust disease. Science has produced a genetically improved blister rust-resistant tree stock. Foresters have the appropriate silvicultural techniques to ensure successful regeneration of this genetically improved stock. Much of the suitable site for this cover type is on national forest lands. Yet extensive recovery on public lands is in doubt because proper silvicultural techniques and access to these potential areas is denied due to roadless designations. For a complete analysis of this situation, I refer you to *Return of the Giants-Restoring White Pine Ecosystem* authored by a group of forestry professionals from USDA Research, Forest Service ecologists and silviculturalists and University of Idaho forestry professors. The simple truth is if you cannot manage the land to keep it healthy in a roadless designation, it should not be roadless. (Business, Colbert, WA - #A17500.30500)

1427. Public Concern: The Forest Service should determine federal management objectives achievable by a specific roadless area.

BY COLLABORATING WITH THE PUBLIC AND ADHERING TO FEDERAL DESIGNATION GOALS

Ecologically, a 'healthy' forest is subjective, in my opinion. My experience makes me believe that public land and national forest management is half sociology - you're always using the best available (but imperfect and statistically insignificant) information to work towards designated conservation goals, which are determined by the public. What's 'healthy' for nesting goshawks and spotted owls - lots of snags and blowdowns - may not produce the most timber. I believe that, realistically, this is a social more than a scientific question. I think that you should first decide federal management objectives achievable by a specific roadless forest tract - collaborating with the local community while ensuring adherence to federal designation goals. I think this process will free your ecologists to manage a forest that is 'healthy' by both local and federal definitions. Though this is kind of a complex idea, the idea is that ecologists can be freed to categorize such subjective definitions of 'healthy forests' as guiding assumptions and proceed with objective inquiry into that specified, constrained question, giving you more useful information. (Individual, New Haven, CT - #A706.30100)

1428. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule does not preclude management actions to control insects, disease, and fire.

The RACR has adequate flexibility and allowance for a variety of management activities. These include road construction, thinning of forest stands, prescribed fire, etc. When the primary purpose is long term protection and maintenance of IRA. Decisions on why, where, when and how to apply these tools should be focused on long term maintenance of a relatively natural forest ecosystem. The RACR does not preclude employment of management actions to control insects and diseases which may occur in IRA, nor does it preclude fire/fuel management strategies within the National Fire Plan. (Individual, Lyons, OR - #A13491.30000)

Adequacy of Analysis

1429. Public Concern: The Forest Service should evaluate forest health.

BY INVENTORYING CURRENT FOREST HEALTH CONDITIONS AT THE LOCAL LEVEL

Forest health protection can best be addressed by inventorying the local current health conditions and allowing the local forester to determine the best management practices. (State Agency, Phoenix, AZ - #A17678.30100)

Forest health conditions should be inventoried at the local level so that management options can be assessed and the decisions made locally on how to address management including the use of timber removal and trail system construction to reduce wildfire risk. The resource protection methods applied in Washington and Oregon may not be suitable in the intermountain areas. Selection of "appropriate"

activities shouldn't be blanketly applied on the say so from Washington DC. (Individual, Bozeman, MT - #A19102.30100)

BY CONTINUOUSLY COLLECTING FOREST HEALTH DATA

Forest Health must be a main concern of all planning activities. Continuous data collection must occur to correctly identify any areas at risk of catastrophic wildfires, and insect and disease infestations. The forest managers as well as local communities and landowners must consider this information as the results will certainly cross boundaries and could possibly have devastating impacts on others. (Association, Kane, PA - #A6300.30100)

BY CONDUCTING A FORMAL, LOCALIZED RISK ASSESSMENT OF THE CONSEQUENCES OF PROHIBITING ACTIVE FOREST HEALTH MANAGEMENT

The flawed premise of the current roadless rule is that the prohibition of active land management will only create positive ecological consequences for our nation's policy. The fallacy of this premise lies in the overall success of our wildfire prevention policy. This 60-year-old policy has reduced the number of acres altered by wildfire nationally from 50 million acres a year to 5 million. The exclusion of fire from the ecosystem has created unnatural forests, choked with vegetation and dense undergrowth. The ecological result of these un-managed dense forests is disease, decay and potentially catastrophic wild fires that will destroy the very ecosystems that this initiative is trying to protect.

According to the Forest Service's Roadless DEIS, of the 54 million acres of inventoried roadless land in the country, 22 million acres are at moderate to high risk from catastrophic wildfire. A recent U.S. Government Accounting Office (1999) report states:

" . . . a serious problem related to the health of national forests . . . is the overaccumulation of vegetation, which has caused an increasing number of large, intense, uncontrollable, and catastrophically destructive wildfires These fires not only compromise the forests' ability to provide timber, outdoors recreation, clean water, and other resources but they also pose increasingly grave risks to human health, safety, property, and infrastructure"

The members of AFRC believe that the Forest Service must conduct a formal, localized risk assessment of the consequences of prohibiting active management within these areas. This was not done in the last assessment of the roadless areas. What are the risks of wildfires and insect and disease infestation, on these and adjoining lands if no active management is undertaken? Each roadless area is unique. Forest types, stand conditions, values at risk, management objectives and the context of the area in relation to the surrounding lands are among the factors that must be considered. This argues strongly for the use of the forestland management planning process. (Association, Portland, OR - #A19004.30410)

Forest health is the most important management responsibility of the US Forest Service. Managing for Forest health includes disease prevention, reduction of catastrophic fires, stabilizing soils, wildlife enhancement, watershed and water supply improvement, and supporting rural communities. It is not known how the Roadless initiative will impact these key management responsibilities and activities. Analysis of these impacts of restricting management access to millions of acres must be comprehensive yet detailed, forest-by-forest and ranger district-by-ranger district. This has not been done yet, and this initiative should be deferred until the next round of forest planning. (Elected Official, Reserve, NM - #A15538.30100)

BY COMPLETING AN INVENTORY OF ALL NATIONAL FOREST SYSTEM LANDS WITH FULL DISCLOSURE OF THE CONSEQUENCES OF VARIOUS MANAGEMENT STRATEGIES

Full resource inventory of all lands (multiple use, roadless, and wilderness) must [be] completed and then full disclosure of the consequences of various management strategies on the forest health. (Organization, Ketchikan, AK - #A23227.13212)

BY ANALYZING THE EFFECTS OF MANAGEMENT ACTIVITIES, THE NEED FOR TIMBER STAND IMPROVEMENT TREATMENTS, AND DEVELOPING A STRATEGY TO ADDRESS THE BACKLOG OF VEGETATION MANAGEMENT NEEDS

The Forest Service would benefit from having data that analyze the relationships between the probable causes of forest stress (such as fire suppression, intensive logging followed by a substantial lack of

precommercial thinning, etc.) and the probable effects of those stressors (such as increased stand densities; increased competition for space, light, water and nutrients; increased evapotranspiration; increased insect and disease outbreaks; and increased catastrophic fire conditions. We suggest identifying the consequences of an ever-widening gap between timber stand improvement needs (2,021,000 acres in FY 2000) and timber stand improvement treatments (224,000 acres in FY 2000) and how this contributes to the current conditions and trends with respect to insects, diseases and wildfire. We also suggest developing a strategy that addresses the back log of vegetation management needs on the lands that are not suitable for timber production, which may not be accounted for in the timber stand improvement program. (Federal Agency, Washington, DC - #A28843.30100)

1430. Public Concern: The Forest Service should use up-to-date science conservation and biology principles.

TO RESTORE ECOLOGICAL PROCESSES

The management of roadless areas for forest health should use up-to-date science conservation and biology principles to restore ecological processes. To keep a forest healthy is to keep it roadless. (Individual, Santa Cruz, CA - #A15357.30100)

1431. Public Concern: The Forest Service should protect roadless areas as a baseline to gauge the effects of management techniques on forest health in other areas.

Insect and disease issues are largely overstated for roadless areas. Naturally occurring insects will tend to cycle between high and low levels. The rule did not prevent management with all options outside of roadless areas. There is no evidence that roadless areas are any more prone to these problems. Indeed roads have helped move diseases into Port Orford Cedar. Roadless areas also provide badly needed control areas to gauge the effectiveness of management techniques on other lands. The need to control costs would suggest that we critically evaluate the effectiveness of various techniques. Without control areas free of manipulation, no scientific estimate of their validity can be made. (Organization, Missoula, MT - #A26424.31210)

Roadless areas provide a baseline for judging the impacts of more intense land-use activities on multiple use lands.

Because roadless areas in the Southern Rockies and elsewhere provide examples of ecologically healthy landscapes, they provide important opportunities to gauge the health of lands being managed primarily for resource extraction and more intense levels of use. Without roadless areas, there is no reliable ecological baseline to compare the relative health of our more intensely used lands. Thus, roadless areas are an invaluable tool for land and resource managers, helping to ensure the health of all our public lands. Providing this baseline, however, requires protecting a substantial amount of roadless lands in all ecosystem types found on the national forests, as a variety of ecosystem types occur across our national forests. (Organization, Denver, CO - #A21367.30100)

1432. Public Concern: The Forest Service should consider that our infrastructure programs, budgets, and knowledge of the best way to deal with forest health concerns are rudimentary.

Nationally, fuels buildup and forest health are vital concerns, but our infrastructure programs, budgets and even our knowledge of the best way to deal with them are still rudimentary. Luckily, aerial and satellite based remote sensing, together with on-ground sampling and truthing, provide a way to monitor roadless areas as well as roaded areas—better than simply by sampling from roads.

It is possible that “roadless” status is not an irrevocable classification for future generations, but for now roaded area acres are more than ample to strain all existing budgets manpower and equipment, and to try out a variety of treatment methods—to explore their costs and benefits and to compare results against the “control group” of unroaded acreage. It makes no sense to modify “roadless” designations now on the basis of these concerns, until these concerns are already adequately addressed on all roaded acreage.

Once the Forest Service has been given a more than adequate budget to deal with all areas, and once it has accumulated sufficient practical experience applying management methods and well understands their advantages and limitations, then it will be in a position to recommend any changes that should be made to roadless area management. That is knowledge we don't now have. (Individual, Spokane, WA - #A20648.30100)

1433. Public Concern: The Forest Service should define and publicize the forest health risks that will result from roadless designation.

TO ADJACENT PRIVATE AND STATE LANDS

All roadless areas should be managed under a local forest plan. Such plans can best provide for healthy forests while protecting adjoining lands from wildfires and the spread of disease. Areas designated as roadless pose a higher risk for disease and wildfire because roads are not available but are necessary for many management techniques required to ensure forest health. If the USFS determines that keeping an area roadless is worth the risk to adjacent private and State lands, then it must define and publicize the risks that will result. In the Chugach National Forest of Southcentral Alaska the USFS has failed miserably in controlling a major infestation of the spruce bark beetle, even though they had the authority to control the problem. If the roadless rule had been in place it would have been totally impossible. Today these areas, as well as adjacent state and private lands are at tremendous risk to wildfire. (Association, Anchorage, AK - #A23255.30600)

1434. Public Concern: The Forest Service should provide scientific data to support the claim that a national roadless rule will have a positive effect on fire and insect management.

The proposed rulemaking and policy indicates a belief that its adoption would have a positive effect on fire and forest pest management, but offers no scientific data to support this determination. Without a road system to support ecosystem management, timber harvesting to create wildlife habitat, salvage logging of dead and dying timber to remove fuel loading, sanitation harvesting to control insect and disease epidemics, thinning to achieve the desired number of trees, and reforestation projects all become largely uneconomic. Forest health will continue to decline in non-roaded areas without management, and fuel buildups will increase without mechanical removal of the material. It is time to group Forest Service priorities: the National Fire Plan addresses some of these same topics proactively while the Roadless Area Conservation proposal effectively ignores the need for management where conflagrations are likely. (Professional Society, Anchorage, AK - #A21707.30100)

1435. Public Concern: The Forest Service should provide empirical studies to support the claim that thinning small-diameter trees will restore ecological processes, provide habitat for endangered species, and avert catastrophic wildfire.

BECAUSE OTHERWISE, LOCAL EMPLOYEES MAY EXPLOIT AREAS IN THE NAME OF FOREST HEALTH

While the rule also gives local forest managers discretion, on a site-specific basis, to thin small-diameter trees where needed to restore ecological processes, provide habitat for endangered species, and avert catastrophic wildfire—we know of no empirical studies that prove this works. Allowing this discretion is a loophole that some Rangers are already exploiting in the name of “forest health.”

The best way to maintain healthy roadless areas is to keep them roadless. According to the Forest Service, less than 2% of the inventoried roadless areas are at combined risk of insects, disease, and fire. Wildfires are much more likely to start in areas with roads, due to increased public access. The Forest Service has successfully controlled 98% of wildfires in inventoried roadless areas without building roads into these pristine forests. (Business, Spokane, WA - #A22047.30100)

1436. Public Concern: The Forest Service should bring together a bi-partisan group to discuss forest management tools and to make science-based recommendations.

FOR FOREST HEALTH

At the recent Governors' Conference, the pact for massive thinning promulgated by the Dept. of Interior and Dept. of Agriculture is cause for grave concern. How will this thinning be done? By helicopter? If not, how many miles of new logging roads will be required?

Whether or not, lightning will strike and forests will burn.

If all the underbrush is removed, what happens to the many creatures and plants, including endangered species, whose habitat is destroyed?

Before embarking on a costly and potentially destructive program, wouldn't it make sense to bring together a bi-partisan group of knowledgeable persons to discuss what works best and what works less well and to make science-based recommendations? This Forest Service planning process is reportedly done for the next 10 years. Why is a policy not considered to maintain healthy, sustainable forests for the next 50-100 years? (Individual, Berkeley, CA - #A5762.30100)

1437. Public Concern: The Forest Service should allow staff scientists to make recommendations about forest health and other situations, and then allow the general public to comment on those recommendations.

The Forest Service has many outstanding scientists on staff whose job should be to make such recommendations as these forest health and others as situations arise. The general public can then comment on these recommendations. (Individual, Grayson, KY - #A16450.30100)

Adequacy of Analysis – Concepts

1438. Public Concern: The Forest Service should define “healthy.”

AS THE MEANING MAY VARY ACCORDING TO AN INDUSTRIAL OR AN ECOLOGICAL PERSPECTIVE

“Healthy” is a subjective term. A tree farm may be “healthy” from the view of lumber production, but not by environmental measures. With one exception [Footnote 1: White pine blister rust was introduced by the timber industry from seedlings grown in Europe in the 1920s.] the insects and diseases of Northern Rocky Mountain forests are indigenous. Their abundance waxes and wanes with climatic or stand conditions. For example, bark beetles attack trees such as lodgepole when tree diameter exceeds eight inches, and may become widespread in older even-aged stands, especially following drought or widespread blow down. This is a natural event. Is it unhealthy? Little can be done to prevent it except to remove (i.e., log) the susceptible trees. Is this the answer you are seeking? Beetle killed trees may form large areas of “standing dead”, highly fire susceptible trees. In the natural course of events, e.g., Yellowstone in 1988, forest fires occur and following that a new stand regenerates, relatively immune from beetle attack for the next half century or more. Is this unhealthy? (Individual, Lolo, MT - #A111.31200)

First, we must define a healthy forest. Healthy according to whom? The author's definition of a healthy forest is one with reduced fires, reduced fuels, reduced insect attacks and reduced disease attacks. This is so incorrect ecologically. Fires (even severe ones), insects and diseases are all natural elements that the forest and its animals, birds, fish inhabitants have evolved with and need.

The only reason for reducing severe fire, insects and disease is to increase the value of trees that would be milled into boards. This may be quite important on industry owned lands, but must not be a prime motivator on National Forest managed lands. (Individual, Grangeville, ID - #A830.30130)

This is the old forest service speaking, the agency which has had to swallow bitter pills in courts of law due to outmoded science and thinking. We need serious discussion on how to define a “healthy forest”.

Many of us would opt for throwing out the term completely and replace it with ecological integrity. My particular efforts are to bring people together around the principles of conservation biology which addresses “forest health” through issues related to biodiversity. Landscape ecology is also an excellent new way of looking at forest management and a forest in Oregon has done some pioneer work. (Association, No Address - #A8392.30100)

AS THE MEANING MAY VARY ACCORDING TO MANAGEMENT OBJECTIVES ON EACH SITE

Forest “health” is an enigmatic and meaningless term; the definition varies according to management objectives on each site. Whatever it may mean, we do not need roads to conserve diverse forests that support wildlife and other values. (Individual, West Glacier, MT - #A5946.30000)

Your question on “healthy forests”, implies that fire, insects and diseases are undesired or rare elements in a forest ecosystem. These things occur everywhere on the forest, not just in roadless areas. The use of the term “healthy forest” is an unscientific term which has been concocted to exploit a political end - the commercial logging of public forests. Natural processes are not unhealthy when viewed over the long term. The F.S. should concentrate on preserving roadless areas as naturally functioning ecosystems and concentrate on the remainder of the forest for experiments on managing forests. (Individual, Great Falls, MT - #A13329.30000)

How can forest health be a factor when the standards by which forest health is gauged is not agreed upon? Biologists; opinions on what constitutes a healthy forest vary; when credentials are comparable and recommendations differ, how can the decision-making individuals at the Forest Service decide who is correct? The idea of forest fires and bug infestations as indicative of an unhealthy forest is illogical and unproven, and rather should be seen as a necessary and inevitable part of nature. Look to history: our western forests have existed and thrived for thousands of years without Forest Service “management” and should be left to continue to do so. In hindsight, most “management” of ecosystems result in disaster and cost taxpayer dollars to fix. In Montana, planted lake trout destroyed the salmon fisheries, which in turn eliminated a main food source for bald eagles -- we now plant thousands of salmon fry a year to try and repopulate fisheries; channeled streams and rivers have resulted in severe flooding—we now are returning some to their original flow in order to combat flooding; logging in steep federal-forested drainages has resulted in silt contaminating the streams in which bull trout reside, facilitating their endangered status—we are still fighting on how best to boost the fish population; roads constructed on federal land in grizzly habitat has resulted in human and motorized vehicle access which directly contributed to the deaths of several grizzlies within the last year which will keep them on the endangered list even longer. My point is that every time humans go in and “manage” something, it produces eventual negative consequences which ultimately need to be fixed with lots of tax dollars. The time is long overdue for a hands-off management policy. Leave them alone and the forests will thrive as they always have. (Individual, Kalispell, MT - #A26974.30100)

1439. Public Concern: The Forest Service should go beyond the traditional concept of “healthy forests” to embrace the concept of healthy ecosystems and natural processes.

We had hoped that the Forest Service had gotten beyond the traditional concept of “healthy forests” to embrace the concept of *healthy ecosystems* and *natural processes*. After all, you are not managing a tree farm but an incredibly complex system which may be better left to its own destiny. At any rate, it can be shown by the agency’s own research that roadless areas have more biological diversity and a wider range of habitats than roaded areas, and thus may be deemed *healthier* than Forest Service lands with roads. Roads don’t help much with anything but the management of *trees*, and makes the management of motorized recreation all the more difficult, if not impossible. (Organization, Vernal, UT - #A29144.30100)

1440. Public Concern: The Forest Service should measure forest health in terms of clean water, biodiversity, and solitude.

The forest health and wildfire arguments raised by the timber industry are red herrings. The forest fires in the western United States have burned predominately in roaded and logged areas and “forest health” should be measured by more than just the board feet a given acre can produce. Measured in terms of clean water, biodiversity and solitude, our roadless areas are the healthiest forests remaining. (Organization, Bozeman, MT - #A20515.30100)

1441. Public Concern: The Forest Service should define temporary and short-term treatments.

A variety of methods and techniques will be needed and some or all may or may not be allowed in them depending on the management goals and objectives. Thus some IRAs may allow some road and trail construction to facilitate management treatments for temporary or short-term projects. Definitions of temporary or short-term should be included, such as 18 months for temporary and 5 for short-term. These options will allow for treatments that treat fuel build-up, insect and or disease problems or potential problems. There should be a standard that these words would not be open for general public use during the life of their use. (Individual, Missoula, MT - #A28297.30120)

1442. Public Concern: The Forest Service should acknowledge the concept of natural disturbance regimes.

Wildfires, insects and disease are natural mechanisms that act across landscape scales to sustain a healthy mix of forest successional stages fostering high biodiversity and providing a variety of important habitats for the forest’s many plants and animals. The build-up of “hazardous fuels” mentioned in the question is a simplistic description of the manifestation of decades of fire suppression. It is not a widespread phenomenon in natural forest ecosystems but a symptom of expanding human settlement into forested landscapes. It annoys me to think that professional foresters employed by the federal government do not acknowledge the concept of natural disturbance regimes, a concept taught in any high school biology class. (Individual, No Address - #A27789.30100)

A very critical aspect that in the past has not been considered in doing this analysis is the temporal variation that occurs in ecosystems. Therefore the conditions now AND in the future, need to be put in the context of the disturbance regimes that are associated with the ecosystems being managed. (Individual, Missoula, MT - #A28297.30110)

*Funding***1443. Public Concern: The Forest Service should consider that policy changes, and attendant litigation, have cost a great deal of money that could have gone to forest health treatments.**

The issue of Forest Management has been controversial for years. The present changes in the ‘Management Planning Regulations’, the ‘Road Management Policy’, and this ‘Roadless Area Conservation Rule’ have been initiated by emotions, with political pressure, and have not been based on scientific data. I would be very interested to know how many areas that burned in 2000 and 2001 had litigation that prevented or delayed needed treatments designed to promote forest health. The extensive loss of natural resources in these burn areas will manifest themselves far into the future. The money spent on litigation, in the last 10 years alone, could have been put to a greater use with management activities on the ground. The error ridden Roadless Conservation Rule cost \$9.4 million to compile. The money could have provided much needed fuel load reductions and prevented much of the devastation by the last 2 years of catastrophic wildfires. (Individual, Centerfield, UT - #A30440.20000)

1444. Public Concern: The Forest Service should hold litigants responsible for the damages caused by their lawsuits that prevent forest health treatment or management activities.

BECAUSE MANAGEMENT OF NATIONAL FORESTS WILL CONTINUE TO BE STIFLED, FURTHER EXACERBATING FOREST HEALTH

I would like to see litigants be held responsible for damages caused by their lawsuits preventing treatment/management activities aimed at restoring forest health, controlling insect and disease outbreaks, and the destruction of watersheds. Until litigants are held accountable for the misrepresentation of facts, management of our National Forests will continue to be stifled, which further exacerbates the declining health of our National Forests. (Individual, Centerfield, UT - #A30440.30100)

Active Management

1445. Public Concern: The Forest Service should actively manage natural resources in roadless areas.

BY EVALUATING PRACTICES IN OTHER STATES

View every state and see what they are doing and what is working and what is not. Again, South Carolina seems to have a good plan in place. Evaluate our practices and see if they will work in other areas. Keep in mind that the local forest planners may have ideas that work in their areas. Actively managing our forest with prescribed burns, thinning or cutting should eliminate most problems if done in a timely, thought-out manner. (Individual, No Address - #A57.30000)

BY USING INFORMATION FROM ITS EXTENSIVE DATABASE ON WILDFIRE AND INSECT RISK AND ELEMENTS FROM THE NATIONAL FIRE PLAN

The Forest Service currently has an extensive database on the risk of wildfire and insects infestations on national forest lands. Local forest planning processes should utilize this information and the elements of the National Fire Plan to increase activities that will protect forests from severe wildfires. These lands should be actively managed and full range of options including mechanical treatment and timber removal to protect and maintain desired conditions. (Association, Boise, ID - #A17232.30500)

BY CONSIDERING THE SITE-SPECIFIC CHARACTERISTICS OF EACH FORESTED AREA

The management of Roadless or any other areas of the National Forests to provide for "healthy forests" depends on the characteristics of the specific forest area under consideration. An old growth Douglas fir stand that is considered prime habitat for the northern spotted owl and other old growth dependent wildlife species contains large quantities of dead, dying and "defective" trees but is healthy. In contrast a 20-30 year old Douglas fir stand that is being managed for timber production may be considered "unhealthy" if it is overstocked or infested with insects that will in time result in the death of some of the trees which will become fuel for wildfires or breeding sites for woodpeckers. (Individual, Olympia, WA - #A278.30100)

Protecting forests: Management of inventoried roadless areas to provide for healthy forests should vary depending on the type of forest. For example, in forest systems characterized by frequent low intensity fires (e.g., Ponderosa pine forests throughout the West, Sequoia forests of California's Sierra Nevada), thinning of small (<10 inch dbh) trees and brush removal should be conducted to prevent catastrophic high intensity fires that result in extensive mortality of large (> 12 inch dbh) trees. Such activity will also prevent the spread of many insects that can kill mature trees and increase the danger of catastrophic fires in systems whose species are not adapted to them. Thinning activities should be conducted first in the urban interface zone, but later in more remote areas. Rather than construct roads to access remote areas, crews should land by air or travel by foot and leave cut trees in place, in piles, for controlled burns. I have observed such management on the White Mountain Apache Reservation within Arizona, perhaps the best management of ponderosa pine forests that I have ever seen. (Individual, Davis, CA - #A30523.30531)

It depends on the forest and where it is. It is not realistic to manage a lodgepole forest in Montana in the same manner as a redwood forest in California. As for the forests in Montana, the dead and dying trees should be removed and used. The waste should be chipped. Fires are unacceptable as they are too dangerous and cause too much air and water pollution. This pollution detracts from our local and statewide tourist industry. (Individual, Columbia Falls, MT - #A29651.30100)

There is no "one" answer as to how IRA's should be managed, since every roadless area is a distinct and unique unit. The diversity of factors that must be addressed in managing roadless areas is profound. Forest types, stand conditions, values at risk, management objectives and the context of the area in relation to the surrounding lands are among the factors that must be considered. Consequently, each IRA should be managed individually.

Since the agency must preserve the IRA in the condition it was as of the date of the designation as a Roadless Area, any activities that significantly alter the condition of the IRA at the time of designations are prohibited. The agency should conduct forest health projects, including but not limited to timber harvest, in order to preserve the condition of the area at the time of designation.

It is unwise for the agency to let national initiative eliminate effective tools for preserving the conditions of IRA's as well as managing other areas of the forest. (Organization, Lakeside, CA - #A29963.30100)

BY ACTIVELY MANAGING TO CONTROL INSECTS, DISEASE, AND FIRE

We of the western states have long realized that to do nothing is not an acceptable approach to keeping a forest healthy. As I see new fires starting up in the yearly fire season I can't help but wonder why someone would so passionately fight for a forest then to tie the hands of the people that are trying to ensure its health. We have a park here that was privately donated near Tensed, Idaho that is being hit by the tussock moth the state has tried to control them with pesticides but now we are aggressively but responsibly logging the diseased trees to prevent a major fire that would consume the entire park and possibly a couple of towns. (Individual, Saint Maries, ID - #A1727.30100)

How on earth can the Forest Service ever consider that by letting a forest go by the wayside in favor of not managing timber harvest, if for no other reason eliminating decadent timber stands which create fire hazards, fail to manage a beetle outbreak on a community watershed, etc., as protecting communities, homes and property? This in favor of creating a de facto wilderness called a roadless area. As forest professionals, you know and we know, that this practice of designating large roadless areas is not in the best interest of managing for improved watersheds, lowering fire danger, and in general providing for good forest health. (Elected Official, Monticello, UT - #A4890.10112)

It must be decided how each roadless unit is to be managed in the long run. Units proposed for wilderness will have an entirely different set of constraints than those to be managed for multiple uses and roaded. Maintaining the health of surrounding forest lands and protection of private property is paramount. Harvest of forest products for fuel reduction and forest health is an option in many cases. Modern equipment can often remove high-risk material without roads. Few roads are needed to accommodate harvest today. Also, managing roadless areas to retain their roadless character does not preclude the use of managed fire or application of chemicals for insect control. (Individual, Lewiston, ID - #A2872.30100)

I am writing to say we need to change the Roadless Area Conservation Rules. If we do not revise the Roadless Policy, it will have a very negative affect on Lake County and the rest of Northern Minnesota. Some of the reasons are:

1. The amount of forest managed for forest health has decreased by close to 50 percent over the last few years. The rules will increase the negative affect of no management.
2. Lake County's land base is currently about 58 percent federally owned, and about one million acres of our area is in the BWCAW. We also have a huge amount of specially classified area spread across Northeast Minnesota.

3. In the July 4th storm a couple of years ago, 400,000 acres of forest blew down. Because of the lack of forest management, the loss was greater than it needed to be. (Elected Official, Two Harbors, MN - #A18049.30100)

Native Americans treated, predominately with fire, the country they habituated. There were prairie fires, meadow grass fires as they left the high country in the fall of the year, thinning of the forests by fire for better hunting practices and to regenerate forage for the upcoming season. Fire cycles and fire intensity are escalating under contemporary conditions which have eliminated the cycles that most of our North American landscapes have evolved with. Circumstances require more human involvement, not less. The history and study of natural resources management reveal that the greater task in settling "management" issues is to resolve the political side of the equation. Start with communities and build an ecologically sound vision that can be supported. Start from the ground up. (Individual, Elko, NV - #A23651.30400)

BY TAKING SPECIFIC AREAS OUT OF ROADLESS DESIGNATION TO MINIMIZE INSECTS, DISEASE, AND FIRE

Protecting Forests - How should inventoried roadless areas be managed to provide for healthy forests, including protection from severe wildfires and the buildup of hazardous fuels as well as to provide for the detection and prevention of insect and disease outbreaks?

You must already know this but you cannot have both roadless areas and healthy forests. It is just not possible. The only logical and sane response to this question is that you, the USFS, identify those areas of the forest that are worth managing for the future and take them out of the roadless category. Then you can perform the necessary sanitation logging and pre-disaster thinning that most of these stands so desperately need in order to minimize the impacts of insect, disease and wildfire. (Individual, Montrose, CO - #A370.30100)

BY ALLOWING THE RESPONSIBLE HARVEST OF TREES AND WILDLIFE

I believe that the Clinton-Gore roadless plan is basically flawed. In denying public access to wildlife areas and areas of forestation, it has already resulted in rampant wildfires in the western U.S. as well as booms in certain populations of wildlife that has resulted in diseases and starvation due to overpopulations.

I believe that responsible harvesting of wildlife and logging, results in a healthier wildlife population and less likelihood of diseased and weak trees due to competition with underbrush. Even the news media in the western parts of the U.S. are questioning the wisdom of the roadless plan. (Individual, No Address - #A6805.30100)

BY CLEANING UP WOODY DEBRIS

We are truly insulted by the lack of resolve the Forest Service has in fighting for their right and job to husband and nurture our forest in the manner that they deserve. We get daily reminders of how to protect our houses and ranches from wildfires by picking up excess debris scattered about or left laying by the buildings and other "safety habits" but the Forest Service is letting itself be forced into "a do nothing" and "let it burn" attitude by a bunch of idiots who don't give a rip about anything but their own outlook . . . most of these people have not a clue of "reality". For centuries animals have used caves for nests and dens . . . why in the world would you have to leave a bunch of dry debris all about for the same purpose? We also have so many imported bugs and viruses now established by our country's quest for "more goods" that any "native" ones from 100 years ago . . . for gosh sakes, anyone with a lick of sense would know that trash breeds bacteria and if you don't "clean your house" you are inviting bugs, virus, and bacteria. (Individual, Mazama, WA - #A757.30100)

BY RELYING ON ACCESS OTHER THAN ROADS

No additional roads should be built. Wildfires should be strongly suppressed. Controlled burns should be encouraged. If mandated by threat of disease some selective helicopter logging should be allowed as long as the sale pays for itself in full. (Individual, Kalispell, MT - #A97.30100)

These protected forests could be managed by hand thinning, understory burning or helicopter thinning/logging, but NO roads. (Individual, No Address - #A101.30100)

The issue of Forest Protection is the same whether the forest is roadless or not. There are ways to deal with roadless areas. How are they being handled now? Disease can be treated in various ways, such as from the air or over land. Wildfire protection is somewhat overblown. Treat the fringes of the roadless areas by thinning, therefore rendering wildfire problems less of a hazard. Building roads will not reduce the possibility of wildfire. Roads make for easy access for the public and make the possibility of wildfire greater. (Individual, Coulterville, IL - #A114.30000)

Roadless areas should remain so. In general, they are roadless now because building roads and harvesting timber has not made and does not make economic and environmental sense. If forest managers determine that fuel reduction or remediation of insect infestation is truly necessary, then aerial extraction should be used rather than building roads. (Individual, Bozeman, MT - #A1134.30200)

Some fuel reduction around developments and prescribed burning other areas are acceptable management strategies in roadless areas as long as NO ROADS ARE CONSTRUCTED. (Individual, Ennis, MT - #A2249.30100)

BY WORKING WITH STATE AND LOCAL GOVERNMENTS TO ACTIVELY IMPROVE FORESTS AND RANGELANDS

Roadless area supporters argue that the best way to maintain healthy roadless areas is to keep them roadless. This may be the case for the temperate forests; however, in the arid west accelerating drought conditions combined with an explosion of invasive weeds, insect damage, and catastrophic wildland fires have created a potentially devastating environment. We feel strongly that a blanket ban on road building in inventoried roadless areas will undermine ongoing efforts to reduce fuels, implement site-specific fire suppression, control weeds, and monitor forest/rangeland health. The most likely outcome of such a ban is continued long-term resource deterioration punctuated by catastrophic and perhaps irreparable damage by fire, erosion and weed infestation. Land management agencies must be mandated to work with state and local governments to actively improve our forests and rangelands even if the improvements require access into inventoried roadless areas. (Elected Official, Eureka County, NV - #A20741.30100)

BECAUSE UNMANAGED LANDS AND WILDLIFE WILL SUFFER

It has been proven time and again that lands and wildlife left to, supposedly, their own will not prosper but will suffer. Whether we like it or not, the mere fact that we are living on this planet affects all life. As such it is impossible for that life to just be left totally alone. (Individual, Speedway, IN - #A3928.30000)

1446. Public Concern: The Forest Service should allow helicopters in roadless areas.

TO HARVEST DEAD TREES AND FUELS OR TO PILE AND BURN

In true roadless areas, use helicopters to remove dead trees/fuels, or pile and burn seasonally during the winter. Most private property owners do. (Individual, Prairie City, OR - #A15474.30550)

Ecosystem/Restoration Management

1447. Public Concern: The Forest Service should utilize best management practices.

TO REDUCE THE RISK OF CATASTROPHIC EVENTS

Agencies must utilize best management practices to reduce the risk of catastrophic events. The Agencies should never start fires on windy days, and vertically mulch routes as part of fire restoration projects! (Individual, Santa Ysabel, CA - #A26392.30100)

1448. Public Concern: The Forest Service should restore forest health.

The first consideration of inventoried roadless areas must be the need to restore forest health. Rules governing management of roadless areas must permit restoration. Following restoration, rules governing management must consider realistic methods essential to the long-term protection of the roadless areas. Roadless areas must be distinguished from wilderness areas and must provide the broadest methods appropriate for forest health protection, including timber removal. (Association, Sacramento, CA - #A22614.30100)

1449. Public Concern: The Forest Service should recognize that forest health does not require the destruction of old growth vegetation.

The roadless rule will help protect older forest structural stages on a national level. In my experience, rarely does ecosystem health actually mandate the consumption of the oldest structural stages of vegetation. That type of consumption, in my region, is conducted more for economic and political reasons than ecosystem health, in my opinion. Some analysis using varying scales can portray forest stands that have high percentages of mature structural stages in certain watersheds. However, if the values of those forests that are lost are looked at in a national scope overall, there is still a large deficit in older forest structural stages. (Individual, Penrose, CO - #A21448.60120)

1450. Public Concern: The Forest Service should use conditions that existed just prior to Euro-American contact as a baseline for management.**TO AVOID UNFORESEEN AND NEGATIVE CONSEQUENCES**

Certainly Native Americans “managed” ecosystems to some extent too. It is also true that ecosystems are dynamic, making establishment of “baseline ecosystem conditions” somewhat arbitrary. Nevertheless, the need for establishing baseline conditions that existed prior to intensive, mechanized, large-scale forest management is indisputable - ecosystems are simply too complex for us to ever intensively “manage” over large areas and timescales without unforeseen and often negative consequences. The best we can hope for is to tinker intelligently, at relatively small scales, guided by ecosystems’ range of natural variability rather than the “nature as machine to serve humans” metaphor. This requires some knowledge of what that range of variability is, and establishing some kind of baseline reference conditions. Conditions that existed just prior to Euro-American contact are as good as any to serve as this baseline, and are the most likely to be discernable by scientists. (Individual, Corvallis, OR - #A650.30110)

1451. Public Concern: The Forest Service should consider that permitting states and local jurisdictions to develop lands adjacent to national forests interferes with natural forest health processes.

Natural processes should determine the health of forests in roadless areas. In the long run, nature itself has proven to be the best manager. It is when man tampers with the natural process of destruction and rejuvenation that causes the greatest problems in forest management. For example, permitting states and local jurisdictions to develop lands adjacent to national forests interferes with these natural processes. In the end, the Forest Service spends large sums of taxpayer dollars to fight fires that should burn naturally and insect and disease outbreaks, which are many times imported by adjacent developments. (Individual, No Address - #A9085.30100)

1452. Public Concern: The Forest Service should replant burned or cut timber areas.

We must protect our natural forest resources here in Oregon. I feel bad every time there is a forest fire! There needs to be replanting of burned or cut timber areas. (Individual, Turner, OR - #A14537.31100)

1453. Public Concern: The Forest Service should find a variety of low-resource using, non-polluting alternatives to road-based management practices.

I'm sure there are a variety of low-resource using, non-polluting alternatives to road-based management practices. Electric battery-powered lightweight ATVs strike me as one possibility. These, in conjunction with a series of micro-footprint observation stations, satellite monitoring, and other techniques, should enable you to maintain sound management practices. Try some Yankee ingenuity. (Individual, Chestertown, MD - #A462.30400)

Ecosystem/Restoration Management – Roadless Areas**1454. Public Concern: The Forest Service should protect roadless areas.****BECAUSE ONCE AREAS ARE ROADED, THEY ARE EXTREMELY DIFFICULT TO RESTORE**

Roadless areas must remain roadless! It is extremely hard to restore lands to their preroaded condition. I have an MS in forestry and I never had such an idea proposed to me in any of the forestry classes I have taken. We simply do not know how to practice restoration so completely and the problems caused by roading are extremely difficult to deal with. For proof of this just look at the spread of exotic plant species along roadsides and the millions of dollars we are spending nationally to combat this issue. (Individual, Sandpoint, ID - #A28585.30110)

1455. Public Concern: The Forest Service should not actively manage natural resources in roadless areas.**ALLOW NATURAL ECOSYSTEM PROCESSES TO OPERATE**

Inventoried roadless areas should be left alone. There is no need to “manage” natural forests. If there is a fire, let it burn. Let the forest deal on their own with insects and diseases. The forest managed on their own for millions of years without the assistance of the Forest Service, and there is no reason to think that evolutionary defenses are anything but the most appropriate for our national forests today. (Individual, New Haven, CT - #A616.30000)

We all know the forest health issue is overblown by the timber industry and some Forest Service employees. Even in areas where fuels are at higher levels than average and fires are imminent, I would much rather see the forests burn (even hot, stand replacing burns) than see them roaded and logged. Nature has learned to evolve with and actually depend on natural events such as fire and insects. Nature simply does not handle the constant press disturbances associated with roading, logging and mining.

Not all trees are, or should be healthy. A healthy population of anything depends on some sick and dying individuals. Dead trees make new dirt and are excellent habitat for some birds. Most dead trees do not belong in the mill. (Individual, Grangeville, ID - #A830.30000)

Roadless forest areas should be managed as natural areas and with natural processes permitted to shape the forest. Naturally caused fires should be permitted to burn and only man-caused fires should be considered for human intervention. The same applies to disease. Fire and disease are natural processes. The problem right now, it seems to me, is that we insist on viewing the state of any particular forest in terms of short-term periods (as in our lifetimes) instead of dynamic systems that shape themselves over hundreds and thousands of years. Put another way, what happens to a forest, or how it looks during the next ten years is not important. What is important is what it will look like in a hundred years, or five hundred years. (Individual, Billings, MT - #A277.30100)

Forests managed to do just fine for millions of years without human intervention. Humans entered the Americas only some 15,000 years ago, the blink of an eye in evolutionary terms. The notion that forests now require human cossetting with chainsaws and bulldozers is absurd, and true only to the extent that remediation of the effects of abusive human activities (logging, grazing, mining, road building) and

excessive fire suppression is necessary. Thus, cessation of the activities just mentioned, closure and obliteration of cherry stem roads, stream and stream bank restoration, use of prescribed fire and mechanical thinning of dense, fire-prone reproduction (not mature, fire resistant trees) created by logging or overzealous fire suppression, eradication of invasive exotic species, and any other measures which may be useful in keeping roadless areas in a natural state, or returning them to that state, all should be funded and initiated fully and immediately. (Individual, Dallas, OR - #A3697.90110)

Question #A 3: All roadless areas should be managed to retain their natural ecosystem characteristics and processes to protect their potential to be included in the Wilderness Area system of the National Forest. Therefore, we feel that wildfires should be allowed to burn and insect and disease outbreaks should be allowed to run their course. Healthy forests, as defined by us, include all of these native disturbance components which contribute diversity to a native forest. (Individual, Nine Mile Falls, WA - #A15241.30100)

This question displays an alarming lack of comprehension of even the most basic principles of forest ecosystems and an absolute failure to understand the underlying rationale for the roadless rule. Roadless areas need no management at all! The whole reason we are trying to protect roadless areas is to allow those areas to behave in a natural way. Periodic fires are natural. Without any management at all, these areas will quickly revert to a natural cycle of burn and rebirth. The excessive underbrush that is the result of past management practices will disappear and the severe crown fires that many areas now experience will diminish rapidly. Insect and disease outbreaks are also natural. The severity of these outbreaks is also a result of forest management practices. The natural environment contains predators that keep disease/pest populations in check. The term management, in this instance, is another excuse to allow extractive industries to thwart the will of the people. No management of these areas is required. (Individual, Denver, CO - #A12861.30000)

REMOVE BARRIERS TO NATURAL PROCESSES

Most forests that are unhealthy have become that way because of the arrogance of the US Forest Service. Fire suppression has caused some buildup of hazardous fuels, but grazing and the introduction of non-native species have also increased problems with the health of our forests. Roadless areas should be managed to allow natural processes to dominate the landscape, allowing these to determine what a "healthy forest" is. The Forest Service can remove barriers to natural process by:

- 1) Removing cattle from roadless areas
- 2) Prohibit the use of motorized vehicles in roadless areas
- 3) Monitoring and removing non-native invasive species (native pets are OK)
- 4) Stop suppressing fires unless they imminently threaten adjacent private property. (Individual, Takoma Park, MD - #A16325.30100)

BECAUSE OF THE LACK OF FUNDING

Our forests are stressed from past management practices, logging, road building, weed introductions, pest distributions, fragmentation, genetic isolation. We don't have enough federal funding to "take care of every tree", so it is imperative that we limit the amount of contact we have with the forests. When there was more acreage of forest lands [we] could afford to lose parts to fire and pests and still have "adequate margins of safety" regarding their health. (Individual, No Address - #A17946.30100)

1456. Public Concern: The Forest Service should restore roadless areas damaged by past management practices.

BY ALLOWING NATURAL PROCESSES TO OPERATE

Wild forests do not need to be managed, except to overcome the damage that past "management" has caused. This means that we should consider the option of removing brush undergrowth, but then should allow wildfires to occur when naturally caused. (Individual, Norwalk, CT - #A884.30100)

The whole point of a Roadless Area is maintaining the natural status quo. Therefore, natural forces should be allowed to work in these areas, if there is no immediate danger to human life or property. Fires, insects, and diseases are natural forces, unless human-induced. If these agents are human-induced, a careful but speedy evaluation of the pros and cons of preventative management should occur prior to action. (Individual, Astoria, OR - #A476.30000)

Very few roadless areas have been logged or otherwise intensively “managed”. Many are high altitude and not particularly fire prone. Moreover, fire is an important component of many forest ecosystems and fire suppression has caused more problems than it has solved — witness the dangerously high fuel levels in many “managed” areas, and the fires of the past couple of years in the intermountain west. The USFS has many years of work ahead of it just to get fuel levels in areas that already contain roads back within their natural range of variability. There is also much work to be done to restore some semblance of variability in stand structure and species composition in even aged, single species second and third growth areas. The USFS should concentrate on these areas, rather than promote disingenuous arguments that roadless areas need to be actively “managed”.

Any exceptions to these general conclusions can be handled on a case by case basis, under the NEPA EIS process, with careful review from ecologists who are allowed to conduct their work without political pressure from extractive interests. (Individual, Corvallis, OR - #A650.30310)

TO IMPROVE FOREST HEALTH

Again I would agree with the Roadless Plan which provides for road construction or reconstruction as needed to protect public health and safety. The Plan also allows access for thinning to reduce wildfire risk or restore the ecosystem. Building a road does not solve fire, insect or disease outbreaks. In fact building roads into roadless areas actually increases fire risk as well as the transport of noxious weeds and pests. In addition, previous logging practices of removing large old growth trees and clearcutting has resulted in forests which are more susceptible to severe wildfire and insect and disease damage. Restoration activities should be undertaken to improve forest health. (Individual, Ethel, WA - #A11767.30100)

1457. Public Concern: The Forest Service should close loopholes in the Roadless Area Conservation Rule for stewardship logging and fire suppression.

You must keep the roadless policy, as signed in January 2001. In fact, if anything, you should be making this policy stronger, closing loopholes created for stewardship logging and bogus fire suppression activities. (Individual, Seattle, WA - #A84.10150)

Suffice it to say: the Roadless Initiative, should be accepted—as over a million people have already clearly stated—with the full 58.5 million acres of roadless lands protected from logging and mining. Regarding our roadless national forest lands: NO NEW ROADS SHOULD BE BUILT PERIOD! Is that clear? If not, let me repeat it: NO NEW ROADS SHOULD BE BUILT, PERIOD! This is for Bosworth. NO NEW ROADS SHOULD BE BUILT PERIOD! This is for Veneman. NO NEW ROADS SHOULD BE BUILT PERIOD! This is for Norton. NO NEW ROADS SHOULD BE BUILT PERIOD! This is for Bush and Cheney. NO NEW ROADS SHOULD BE BUILT PERIOD! NOW, IS THAT CLEAR? I hope my words do not “seem rushed,” nor appear ambiguous in any way. I want to be very clear on this. MR. BOSWORTH: I DO NOT WANT TO SEE ANY MORE ROADS BUILT ON FEDERAL ROADLESS LANDS, PERIOD! NO NEW ROADS, PERIOD, FOR ANY REASON, INCLUDING FIRES, LOGGING, AND MINING. NO NEW ROADS, PERIOD. NO NEW ROADS, PERIOD. Is this getting through? Do you understand this time? (Individual, Libby, MT - #A8346.10150)

I am begging you to protect all our national forest roadless areas from commercial logging, road building and mining. I respectfully request that no exceptions or exclusions be created to undermine or weaken the Roadless Area Conservation Rule. (Individual, Hereford, AZ - #A8776.10150)

1458. Public Concern: The Forest Service should consider that human activities cause more damage in roadless areas than natural processes.

Over the last five years, Congress has spent over \$57 million on scientific assessments for the Sierra Nevada Ecosystem Project (SNEP) and the Interior Columbia Basin Ecosystem Management Project (ICBEMP). Both of these studies concluded that commercial logging was the primary reason for increased wildfire intensity and severity. Moreover, these studies revealed that no matter what logging system was used (e.g. thinning, salvaging, or clearcutting), watersheds that were roaded and logged experienced more rapid rates of fire spread, higher fire intensities, and greater fire severity than unlogged, roadless watersheds. Conversely, the SNEP and ICBEMP studies also revealed that roadless watersheds have the highest levels of ecological integrity and the greatest resiliency to wildland fires—precisely because they have experienced less road-building, less logging, and less-efficient firefighting. Claims that roadless areas are more prone to so-called “catastrophic wildfires” because they are unroaded/unlogged are simply ignoring the Forest Service’s own scientific research, and in our opinion, these unfounded claims are merely propaganda intended to serve the short-term economic interests of resource extraction industries, not the nation’s long-term interests in ecological integrity and sustainable economies.

The superb articles published in the Forest Service’s own *Fire Management Today* (Spring 2001, Volume 61, Number 2) documents that the best available science supports strong protection for roadless areas. For example, the article by DellaSala and Frost (2001) summarizes the findings of the scientific literature:

- 1) Timber management activities often increase fuel loads and reduce a forest’s resilience to fire.
- 2) Areas without roads have been less influenced by fire suppression than intensively managed lands.
- 3) Widespread road access associated with intensively managed lands raises the risk of human-caused ignitions.

These comments were made available to the USFS during the original RACR public comment process, so this should not be new information to the CAT. The evidence is fairly clear: roading, logging, grazing, mining, and firefighting are the sources of, not the solutions to, most “forest health” problems in America’s wildlands. (Organization, Eugene, OR - #A30352.30100)

ROADED ACCESS CAUSES MORE DAMAGE

Roads cause far more wildfire danger and ecological damage than they eliminate. It’s campers who can easily get to wilderness areas by car or motorcycle that start fires, as happened in Washington State just this week. A mature forest that periodically has small, fuel-clearing fires is more healthy, and less likely to experience a wildfire, than a clear-cut “managed” forests. (Individual, No Address - #A470.30000)

Additional costs incurred by the American taxpayer include massive environmental damage to the public’s natural resources from eroding forest roads. Forest roads, while providing some limited public access, also provide a conduit for many damaging, illegal, and dangerous activities while greatly increasing the threat of catastrophic fire. It is no coincidence that the majority of human caused forest fires start within 100 yards of forest roads started by ignition from vehicle exhaust systems, burning materials thrown from vehicles, sparks from machinery, abandoned campfires and arson. The most recent fatal forest fire claimed four firefighters’ lives in early July of this year in the Okanogan National Forest in northern Washington State. The fire was started by an abandoned campfire left near a forest road. Forest roads also provide a conduit for invasion of exotic weeds, spread of insect pests, illegal dumping, illegal trespass and rampant poaching all of which are reaching epidemic proportions in various units of our national forest system. (Organization, Richland, WA - #A962.30000)

Forest roads provide a conduit for invasion of exotic weeds, spread of insect pests, illegal dumping, illegal trespass, arson and rampant poaching all of which are reaching epidemic proportions in various units of our national forest system. Failing to preserve our remaining roadless areas from road construction and other industrial activities could be one of the greatest threats to forest health of the 21st century. (Organization, Richland, WA - #A962.30100)

One of my favorite places on earth lies just within the George Washington National Forest. For two years I have hiked, fished, swam, encountered bear and thoroughly enjoyed nature here and I have already seen the negative effects of roads through the forest. With roads/paths made by men and their trucks, the lake has been over fished, water runs down the roads, eroding the mountain. The paths of streams now lie dry. I have also noticed a great amount more human activity due to these roads. This seems to be the most destructive force. Those that only come to these areas because they can drive there do not appreciate the area at all. It is a place to party for many, and often I will come upon my favorite area trashed, beer bottles and bags and just various litter strewn all over the ground. When our natural forests provide a greater challenge for us, it yields greater rewards. It forces the individual to make choices and conscious decisions to help keep these places available to all. (Individual, Harrisonburg, VA - #A4469.30100)

My 13 years working as a smokejumper gave me experience fighting fires in MT, ID, WA, OR, NM, CA, AZ, UT, WY. Some of the most destructive fires were on cut-over land and private owned forests with houses within the forest. Roadless areas are less likely to have fire ignition through careless human activities or arson. (Individual, Bozeman, MT - #A92.30100)

The Forest Service has indicated that logging is needed in the National Forests to protect them from catastrophic fires. Commercial logging does not prevent fires. Logging makes forests more susceptible to fire and disease. The Sierra Nevada ecosystem Project issued a report in 1996 that found, 'timber harvest, through its effects on forest structure, local microclimate, and fuel accumulation, has increased fire severity more than any other human activity.' Forests become drier, have less shade, and accumulate flammable debris in the form of slash piles. (Individual, Puyallup, WA - #A829.30100)

TIMBER REMOVAL CAUSES MORE DAMAGE

Logging, roadbuilding, and other management activities have been the primary degradation factor to forest ecosystems. Commercial logging intended for fuel reduction would likely increase the hazard of severe wildfires and the buildup of hazardous fuels. Recently, Huff et al. (1995) stated:

Intensive forest management annually produces high fuel loadings associated with logging residues. As a by-product of clearcutting, thinning, and other tree removal activities, activity fuels create both short- and long-term fire hazards to ecosystems. The potential rate of spread and intensity of fires associated with recently cut logging residues is high (see for example, Anderson 1982, Maxwell and Ward 1976), especially the first year or two as the material decays. High fire behavior hazards associated with the residues can extend, however, for many years depending on the tree species (Olson and Fahnestock 1955). Even though these hazards diminish, their influence on fire behavior can linger for up to 30 years in the dry forest ecosystems of eastern Washington and Oregon. Disposal of logging residue using prescribed fires, the most common approach, also has an associated high risk of an escaped wildfire (Deeming 1990). The link between slash fires and escaped wildfires has a history of large conflagrations for Washington and Oregon (Agee 1989, Deeming 1990).

Regeneration and several development patterns can have a profound effect on potential fire behavior within landscapes by enhancing or diminishing its spread (Agee and Huff 1987, Saveland 1987). Spatially continuous fuels associated with thick regeneration in plantations can create high surface-fire potential during early successional stages. This was evident in most of the roughly 275 hectares of 1-to 25-year-old plantations burned in the 3500-hectare 1991 Warner Creek Fire in the Willamette National Forest (USDA 1993). The fire moved swiftly through the openings created by past harvests, killing nearly all the regeneration but usually missing adjacent stands >80 years old.

Logged areas generally showed a strong association with increased rate of spread and flame length, thereby suggesting that tree harvesting could affect the potential fire behavior within landscapes.

In general, rate of spread and flame length were positively correlated with the proportion of area logged in the sample watersheds.

Increased rate of spread means that the perimeter of the fire will grow much faster. Generally, a faster perimeter growth makes a wildfire harder to contain. (Organization, Missoula, MT - #A613.30100)

The primary cause of increasing fire intensity and severity is a century of aggressive firefighting, commercial logging, livestock grazing, and road building. Analysis of the 2000 fire season revealed that the majority of burned acres were located in logged and roaded forests, not in roadless or wilderness areas. In its report on last year's fires, the Congressional Research Service concluded,

"Timber harvesting removes the relatively large diameter wood that can be converted into wood products, but leaves behind the small material, especially twigs and needles. The concentration of these 'fine fuels' on the forest floor INCREASES the rate of spread of wildfires."

In 1996 U.S. government scientists issued the Sierra Nevada Ecosystem Project (SNEP) report. The SNEP report found, "Timber harvest, through its effects on forest structure, local microclimate and fuel accumulation, has increased fire severity more than any other recent human activity." The scientists also determined that, "Fire severity has generally increased and fire frequency has generally decreased over the last 200 years. The primary causative factors behind fire regime changes are effective fire prevention and suppression strategies, selection and regeneration cutting, domestic livestock grazing, and the introduction of exotic plants." (Organization, Nevada City, CA - #A4941.30520)

The facts show that forests in roadless areas are much healthier and much less in need of management than forests in roaded and logged areas. The fire danger is also much less in roadless area. Roads and logging actually increase and size and severity of wildfires. Indeed, the team assigned to create a new management plan for Forest Service and BLM lands in the Interior Columbia Basin Ecosystem recently noted: Fires in unroaded areas are not as severe as unroaded areas because of less surface fuel, and after fires at least some of the large trees survive to produce seed that regenerates the area. Many of the fires in unroaded areas produce a forest structure that is consistent with the fire regime, while the fires in the roaded areas commonly produce a forest structure that is not in sync with the fire regime. Fires in the roaded areas are commonly more intense, due to drier conditions, wind zones on the foothill/valley interface, high surface fuel loading, and dense stands. *Evaluation of Environmental Impact Statement alternatives by the science Integration Team, Interior Columbia Basin Ecosystem Management Project, page I-281*

Therefore, the best way to protect roadless areas is to prohibit road building and logging as provided by the Roadless rule. Furthermore, even where road building or logging may be required, the Roadless Rule already allows such activities where necessary to protect the forest, or protect public health and safety from any threats from fire or other "catastrophic events." There is no need to make changes to the Roadless rule in order to protect these interests. (Organization, Boise, ID - #A8240.30100)

Management Exceptions

1459. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule provides resource management exceptions.

TO RESTORE ECOLOGICAL PROCESSES

The Roadless Area Conservation Rule already provides exceptions that allow roadbuilding and logging when needed to address concerns of wildfires and forest health. Roads can be built to protect public health and safety from imminent wildfire threats and other emergencies. The rule also gives local forest managers discretion, on a site-specific basis, to thin small-diameter trees where needed to restore ecological processes, provide habitat for endangered species, and avert catastrophic wildfire. (Individual, Albuquerque, NM - #A817.30100)

The Roadless Rule already provides exceptions that allow roadbuilding and logging when needed to address concerns of wildfires threats and other emergencies. The rule also gives local forest managers discretion, on a site-specific basis, to thin small diameter trees where needed to restore ecological processes and reduce unnatural fuel loads, provide habitat for endangered specie, and avert catastrophic wildfire. The best way to maintain healthy roadless areas is to keep them roadless. Wildfires are much more likely to start in areas with roads. In fact, one of our two most recent devastating fires, were in

Washington, was caused by a spark from an automobile, driving along the road, in a logging induced, fuel-heavy forest. (Individual, Seattle, WA - #A4884.30100)

TO PRESERVE ACCESS RIGHTS

The Roadless Rule permits construction of roads in case of imminent threats of catastrophic events. It allows the cutting and removal of trees to reduce the risk of wildfire. So far 98% of fires in roadless areas have been controlled. Agriculture Department statistics show that most wildfires are ignited by human activities and start in roaded and logged areas.

The Roadless Rule does not affect these access rights. It allows road construction and reconstruction by Forest Service decision "pursuant to reserved or outstanding rights. . . ." The Roadless Rule does not prevent road maintenance or trail construction in roadless areas. (Individual, Porterville, CA - #A3631.30200)

TO CONTROL FIRES AND INSECTS

Right now fire fighters are using bulldozers to control a fire in the Mt. Zirkel Wilderness Area in Northern Colorado. They are using bulldozers in a Wilderness area. Was there any public comment on whether to do this? No. It was just done. The argument that this Roadless Area Conservation rulemaking will impede the control of fires and insects is ludicrous. Right now fire fighters are using motorized vehicles in the Mt. Zirkel Wilderness Area. This rulemaking will not prevent the Forest Service from protecting our forests. In fact, it will do the forest good in some cases to be burned or be ravaged by insects and disease. (Individual, No Address - #A4990.30100)

1460. Public Concern: The Forest Service should consider that the road building and timber removal exceptions to the Rule are too narrow to provide the needed flexibility.

INCLUDE A POLICY STATEMENT THAT ALLOWS LOCAL FOREST SUPERVISORS TO TAILOR FOREST PLANS AND RESPOND TO LOCAL CIRCUMSTANCES

The blanket prohibitions make it difficult for the Forest Service to respond to wildfires, pest infestations, and other catastrophic or unforeseen situations in the national forests. Temporary roads and/or timber management might be necessary in order to prevent destruction of segments of the national forests.

The so-called "exceptions" to the road building and timber harvest prohibitions are too narrow to provide the needed flexibility. Moreover, they will only serve as a point of focus that opponents will use to litigate any road. As a result, the current rule will foster increased litigation. A policy statement that allows local forest supervisors to tailor forest plans and to respond to local circumstances provides the necessary flexibility. (Individual, Eagle, ID - #A17754.30100)

1461. Public Concern: The Forest Service should define specific national criteria for management exceptions requiring roads in designated roadless areas.

Carefully define specific national criteria for consideration of any exception in the designated areas for how fire, wildlife, fish, forest health and any other legitimate management needs requiring roads can occur. (Individual, Lyons, NY - #A1737.30200)

1462. Public Concern: The Forest Service should constrain exceptions to Roadless Area Conservation Rule regulations by specific conditions and restrictions.

INCLUDING TIME LIMITS, SPATIAL LIMITS, DETAILED DESCRIPTIONS, AND MONITORING AND REPORTING

Conditions and Restrictions Should be Required for Each Exception Granted.

Each time an exception is granted, it should be constrained by specific conditions and restrictions. At a minimum, these should include:

1. Time Limits. The activity should be authorized for a period of time that is commensurate with the justification on which is based, with mandatory reviews of conditions giving rise to the exception at appropriate intervals.
2. Spatial Limits. The extent of authorizing activity should be the minimum found to be necessary to address the underlying justification, while enhancing roadless area values.
3. Detailed Description. The exception should be carefully defined in terms of: (1) actions that are authorized; (2) prohibitions on deleterious design/construction/implementation features; (4) restoration requirements (e.g., for roads, funding and requirements for proper removal of temporary roads); and (5) secure funding monitoring effects and for restoration.
4. Monitoring and Reporting. Appropriate monitoring and reporting (including funding) on authorized activities should be required in every case to ensure compliance with conditions and restrictions. (Organization, Washington, DC - #A23283.30200)

Roads/Access – Forest Health Management

Summary

General Comments – Access is a topic of comment to a number of respondents, particularly as it relates to forest health management. One general response is that the Forest Service should address the impacts of new roads in roadless areas on forest fires.

Funding – One tribal representative states that budget constraints and prohibitions on road development and maintenance will render many projects unfeasible and impose unacceptable risk on many roadless areas.

Roads/Access – Respondents urge the Forest Service to allow motorized vehicles and road construction/road access for forest health management—to ensure firefighter and public safety; to carry out forest health treatments; to reduce fire hazards; and to respond to natural hazards (e.g., earthquakes). In addition, an organization asks the Forest Service to comply with Revised Statute 2477 to maintain motorized access for forest health management. According to this group, “Almost all so-called ‘roadless’ areas actually contain an extensive network of RS-2477 roads and rights-of-way. If USFS obeys statute law—especially the RS-2477 savings provisions of FLPMA and the Section 108 prohibitions on redefinition of RS-2477s . . . and refrains from interfacing with county and individual RS-2477 maintenance and repair, the motorized access that is essential for forest health will usually be available.”

Others assert that forest health should not be used as an excuse to build roads in roadless areas. These respondents state that road construction/road access should be prohibited because roads enable the introduction of exotic or invasive plants and animals; because adequate roads already exist for fire suppression purposes; and because roads won’t stop fires. People suggest that in the event a road or temporary access is necessary for forest health management purposes, it should be restored as soon as possible after the event. Additionally, many assert that vehicles should be prohibited to prevent arson and wildfires and the spread of pathogens.

Roads/Access General

1463. Public Concern: The Forest Service should address the impacts of new roads in roadless areas on forest fires.

It needs to be pointed out that the present subject relates to new roads in roadless areas. The question should be limited to roads and not fires in general. It should be how do new roads in roadless areas impact forest fires, for better or worse? (Individual, Chico, CA - #A17483.11140)

Funding

1464. Public Concern: The Forest Service should consider that budget constraints and prohibitions on road development and maintenance will render many projects unfeasible and impose unacceptable risk on many roadless areas.

There are 66 million acres of national forest lands known to be at risk from catastrophic fires and another 58 million acres at risk from insects and disease. Many of these high-risk areas are located in inventoried roadless and unidentified “unroaded” areas and contain valuable spawning streams, critical wildlife habitat, timber, and other resources. Some of the high-risk areas are overly dense stands of trees

that need to be thinned, while others contain excessive accumulations of fuel, especially from dead and dying trees that need to be removed to reduce wildfire potential. Given budget constraints for stewardship purposes that the Forest Service faces annually, precluding further road development or in some cases maintenance of existing roads will render many projects unfeasible and impose unacceptable risk on many roadless areas. Passive management will not solve these problems.

For example, the CNF is presently suffering from a pandemic of spruce bark beetles which has devastated more than 95,000 acres of national forest land on the Kenai Peninsula. An arbitrary ban on road construction in areas along the Seward Highway which qualify as “roadless” (whether inventoried or un-inventoried) would preclude most management options (when economic viability is factored in) presently available to the Forest Service to deal with the extremely high forest mortality that has resulted from this insect problem. At this time, ecological and silvicultural considerations argue strongly against foreclosing options and for an open assessment of all appropriate management techniques. (Tribal Corporation, Anchorage, AK - #A20340.30100)

Allow Roads/Access

1465. Public Concern: The Forest Service should allow road construction/access.

FOR FOREST HEALTH MANAGEMENT

Local resource managers should be given flexibility to identify and implement alternatives which provide for construction of roads in order to access areas susceptible to or actively involved in insect infestation and disease resulting in tree mortality, including those areas designated as Wilderness. Construction of roads necessary for fuels reduction, timber stand improvement, watershed protection and preservation of habitat must be emphasized. Communities and private properties near and adjacent to federal lands should be protected from risks associated with wildfires through a combination of better forest management practices including but not limited to the following:

- * Thinning tree density to a level which can be sustained in the local climate and soil conditions in a healthy condition;
- * Mechanically reducing fuel levels, especially ladder fuels, to a level where controlled burning can be safely reintroduced and, when this has been accomplished, allowing natural fires to reassume their role in keeping fuel levels at a non-dangerous level;
- * Utilizing the expertise of the forest pest management personnel to reduce insect infestation; and
- * Utilizing environmentally sound logging practices to selectively harvest timber to keep tree density at healthy and sustainable levels and ensure an appropriate percentage of old growth. (Elected Official, Markleeville, CA - #A8597.30200)

Prescribed burning is an important management tool, but it has recently been experienced. This proposal that roads can be built into roadless areas when human safety and property are at risk, we applaud. However this is a backwards approach. Restoring ecosystem health will enable the forest to be more resistance to catastrophic stand replacing insect epidemics and fires that are already being experienced. A preventive approach is more appropriate. An obvious flaw in the proposal is the lack of an option to build roads to provide reasonable access to eliminate insect “hot spots” by controlling emerging beetle epidemics before they spread. A question that begs to be asked is, isn’t the health of the forest ecosystem important enough to justify appropriate management which might include reasonable access provided by road construction and reconstruction? We suggest that acceptable conservation and management cannot be accomplished by the preservationist spirit of this presidential political motives proposal. The present social and environmental philosophy of preservation is very different from real preservation and ecosystem sustainability that can only be accomplished by proper conservation and management. Ecosystems need to be managed by good science not political agendas. (Professional Society, No Address - #A27584.30200)

FOR RESOURCE MANAGEMENT

How do you manage a forest without roads? To keep a forest healthy there must be access. Blowdown must be harvested for two reasons. 1. To prevent bug infestation and 2. To reduce the buildup of fuel. Fuel buildup must be kept at a minimum. Bug infestation must be detected and controlled. To manage the fuel buildup you have two options, but you must have access. To detect bug infestation you could use helicopters and satellite photos. Both of these options will mean loss of large amounts of timber before detection is accomplished. On the ground detection is much more viable. But you have to have access. Control can be accomplished by aerial spraying usually. (Individual, Miami, AZ - #A880.30200)

The existing roads have been built at considerable costs and should not be wasted.

The roads are needed for Fire Suppression.

The roads are needed for Rescue, public safety, and security.

The roads are needed for continued reasonable logging, some for timber value when stands are mature, some logging for the health of the forest, some to reduce major fire hazards. (Individual, Missoula, MT - #A4891.30200)

The forest planning process must give recognition to the importance of roads for fire suppression, access for emergency/rescue personnel, public safety, maintenance and service, and insect and disease treatment. Given the dynamic nature of forest conditions, flexibility in management activities is necessary and can only be achieved through exceptions to roadless management prescriptions. (Permit Holder, No Address - #A5285.30200)

Clearly, access to roadless areas is needed to promote the health of the forest and to allow for the harvest of insect- and disease-damaged timber and of wind-damaged timber stands. (Elected Official, Ketchikan, AK - #A17476.30100)

In ending I'll say we must be able to maximize fire fighting efforts in our forests. That translates into 'roads'. Four young firefighters died recently fighting the 30 mile fire here in Washington state. I read in the newspaper that helicopters were delayed going into the area because they needed first to obtain permission from a fisheries bureaucrat to fill their water bags from a particular stream with which to fight the fire. If this is true than virtual murder was committed to supposedly 'protect fish'. First we sacrifice citizen's rights for nature. Now we must sacrifice human life? This mentality in government is intolerable. (Individual, Lake Stevens, WA - #A8688.30200)

FOR FIRE HAZARD REDUCTION

Common sense should be utilized in any management decision. Allow enough roads in every area to quickly and easily fight any fires that occur, with minimal risk to fire fighters. Realize that managed logging to remove fuels, as well as remove dead or dying trees is necessary, and understand that birds and animals adapt and trees grow back, so reasonable logging to provide income for local schools, etc. can and should be done. (Individual, No Address - #A752.30000)

Closing our National Forests by this action causes our forests to be in much greater jeopardy from fire than were they more accessible by roads. It also puts the firefighters in more danger than they would be in were there ways to evacuate them in emergencies and to get equipment and supplies to them as they fight fires. (Individual, Amarillo, TX - #A533.30400)

Our forests are in extreme danger of fires, not to mention the mismanagement of our lands. Fixing this problem will take some time I agree, but how are we going to fight these fires when we have to wait for a key to a gate! We need to open up the roads that have been gated off over the years! Everybody I know cares dearly about our forests. Please open up the roads so we can care for them, our forests are in mostly needed of the sovereign states taking care of their own lands. I repeat – I oppose the Clinton roadless issue. (Individual, Kalispell, MT - #A1135.30200)

Roads are an integral part of protecting communities, homes, and property. All forms of mechanized equipment, vehicles, aerial support, chainsaws, and pumps are required in order to protect communities, homes and property. Some roads should be accessible only to administrators for protecting communities. Basically this means for fire protection and control of insects and diseases. (Individual, Aloha, OR - #A3675.30200)

Since the Gifford Pinchot era it has been recognized that access is key to economical management of the various forest treatments and activities, yet the Forest Service proposes to eliminate reasonable access forever to a major segment of the National Forest system while implying that forest treatments can still be accomplished.

The Forest Service is currently engaged in multiple wildfires in the west, and in almost every instance your own Fire Information Officers' are constantly being quoted as saying that the fire is difficult or impossible to control/contain because of lack of access with resultant inability to rapidly deploy resources coupled with the insufficient availability of airborne (the most expensive) resources, ad infinitum. (Individual, Seeley Lake, MT - #A8075.30200)

Local comprehensive planning should support strategic access for fire fighting; regional plans should recognize roads that serve no mutually held values, and these should be closed. (Individual, Elko, NV - #A23651.30400)

FOR THE USE OF HELICOPTERS FOR FIRE MANAGEMENT

Helicopters play important roles in wildland management and fire response. When conducting operations in remote locations, helicopters require ground support personnel, equipment and vehicles, none of which can move safely and effectively without some form of primitive road access.

These firefighters need primitive roads to permit them to access helicopter staging areas with needed equipment in an efficient manner. More importantly, these firefighters need primitive roads as escape routes if air evacuation becomes impossible. (Business, Alexandria, VA - #A30200.30600)

FOR FIREFIGHTER AND PUBLIC SAFETY

(Only a very small percentage of the population can enjoy a forest without roads.) Most importantly, the lives of our firefighters are at stake—their risks are high enough as it is! (Individual, Loveland, CO - #A22368.30200)

Roads in the forests are needed to save the forests from destructive wild fires. Firefighters drop into remote sites and can be killed if no equipment can reach them through the roads. DO NOT lock up the forests. (Individual, No Address - #A27509.30200)

The forests should have roads just to get at fires. Also to rescue campers or lost people. Please use common sense and not politics. The tree huggers are not realistic and are out of step with the real world. (Individual, Alexandria, VA - #A4984.30200)

FOR PEST MANAGEMENT

Management of problems and pests can best be managed with access. (Individual, Jarbidge, NV - #A8842.30200)

TO ALLOW RESPONSE TO ADDITIONAL HAZARDS SUCH AS LANDSLIDES, EARTHQUAKES, ETC.

There are additional hazards-related discussions and updates needed in the document. Many of the mapped landslides in Wyoming have dammed or nearly dammed streams or rivers. There is a real potential for streams or rivers to be dammed in the future, creating a significant risk to public health and safety. In areas with significant seismic hazards, the risk is amplified. Road access should be provided and maintained to the high hazard areas to facilitate a timely response when needed. It is too late to consider road construction into an area after a 100-300 foot landslide dam has formed, and as a result, the downstream population is placed at risk. This is tied to Section 294.12 of the proposed rule (page A-

27), which states that a road may be constructed or reconstructed if “A road is needed to protect public health and safety in cases of an imminent threat of flood, fire, or other catastrophic event.” These hazards are rarely recognized before catastrophic situations arise. Again, it would be nearly impossible to build a road into a newly formed landslide dam in a timely manner to mitigate a landslide after the fact, due to the subsequent NEPA analysis and associated time frame that is mandated for such analysis. This proposed rule puts the public at increased risk. (Elected Official, Cheyenne, WY - #A22609.30200)

TO ALLOW COST-EFFECTIVE FOREST HEALTH TREATMENTS THAT CAN PROVIDE LONG-TERM PROTECTION OF WATERSHED QUALITY

Any rule should recognize that “protection” of roadless areas does not equate to protection of natural environments. Rather, what is being protected is an environment that has been altered through fire suppression and, in some instances, past lumbering that favored larger diameter trees. In many instances, reduction of fire frequency has resulted in a move toward denser and smaller diameter stands, with a greater component of later-successional species which are less resistant to fire.

Build up of ground and ladder fuels has created an environment prone to catastrophic wildfires. Catastrophic wildfires create concerns for watershed integrity. Intense heat may result in increased hydrophobic soils, so that peak flood flows increase and summer base flows decrease, resulting in streambank erosion, channel widening, and sedimentation. Instream and riparian habitat can be altered to the detriment of aquatic and riparian species. Thus, in many cases, long-term protection of watershed quality can be enhanced through construction of roads that allow cost-effective forest health treatments. (Governor, State of Idaho - #A20141.30400)

TO REMOVE DEAD TIMBER

There should be roads built every 3 or 4 miles where feasible, so dead timber can be harvested. I have traveled many miles in the West and have seen many acres of dead timber and was told it could not be cut! Other roads I have been on have large trees dead too amongst mostly live timber that could be cut and sold as to leave dead stuff for fire problems and help the timber shortage for lumber. (Individual, Turtle Lake, WI - #A6075.30520)

WITH THE RESTRICTION THAT ROADS BE OPEN ONLY FOR FIRE PROTECTION AND EMERGENCIES

Limited and VERY CLOSELY WATCHED harvesting of some of the forests can enhance their life of productivity and longevity. Some roads will have to be made including some in wilderness areas to remove burned, beetle infected, and build up of hazardous fuels. Some of these roads may be left open for future emergencies. The only time they can be used is for fire protection or other authorized emergencies by the Forest Service. These roads will be closed at the entrance by locked gates. Unauthorized trespass will be met with a fine, a term in jail and a ban from all national forests for no less than 5 years. If the penalty is great enough the next time they will think twice before they proceed. (Individual, Rock Springs, WY - #A5695.30200)

In short, new roads should be built only out of necessity such as for Fire control or medical Emergencies.

New roads for safety only seems to make sense. Lets try to make these minimal. (Individual, Salem, MA - #A8694.30200)

BECAUSE OTHERWISE STATE AGENCIES MAY NOT ALLOW THEIR FIREFIGHTERS TO ASSIST WITH FIREFIGHTING EFFORTS ON FEDERAL LANDS

Roads offer access to manage the public lands with prescribed burning, timber harvesting and wildfire control.

Roads are needed for accessibility for fire suppression forces. States have supplied significant firefighting resources on federal lands, but if safety concerns over access are not alleviated this may be greatly reduced in the future people cannot be placed in harms way with no retreat route (no roads). (Individual, West Point, UT - #A5415.30200)

1466. Public Concern: The Forest Service should allow road construction/access.**LOW IMPACT ROADS**

Secondary access should be lower class roads built at much less cost but adequate for erosion control. These should be left open for fire emergency access, with access to the public controlled by locked gates. (Individual, Payette, ID - #A1049.40000)

As the owner of a small scrawler tractor, I know that access can be accomplished if very carefully done by smaller scale machinery and smaller scale vehicles with "roads" that are carefully built in small scale and with major view towards aesthetics, non-devastation of any kind, activities to help clear away the forest burdens. I believe some of the most dangerously overburdened areas, even though "roadless" need to be looked at in terms of dealing with these things. (Individual, No Address - #A5360.30100)

To the extent possible these areas should be maintained as roadless areas. Recreation and biodiversity should be given the highest considerations in management of these areas. These two values are not mutually exclusive as was sometimes suggested by the previous administration and some groups. The Forest Service already has more roads than it can maintain, so road construction in roadless areas should only occur in rare circumstances. If, after local planning, construction of a temporary road or other road is essential to provide for enhancement of wildlife, for firefighting or to improve forest health, new low-impact construction techniques should be employed. (Permit Holder, Knoxville, TN - #A29069.50100)

TEMPORARY ROADS

The prohibition against road building and timber harvest in the new policy runs counter to creating and maintaining healthy forests. Roadless areas would be at great risk for severe wildfires and disease and pest infestations. Local managers need the flexibility to authorize temporary roads for forest health projects. MCFB strongly urges the service to abandon the unofficial policy of "protection through non-management". The unique ecological characteristics of each national forest and its inventoried roadless areas require management direction at the local level with local input and local science instead of a national uniform mandate. As mentioned before this will require updating mapping so roadless areas can be overlaid with mapping of areas with disease or pest problems, severe fuel loads, etc. (Association, Alturas, CA - #A17770.30200)

1467. Public Concern: The Forest Service should include an alternative in the National Environmental Policy Act process that gives direction for road construction.**FOR FOREST HEALTH MANAGEMENT**

One alternative in the NEPA process should be the direction that roads would be built for management of the resources including protection of forests from severe wildfires, the buildup of hazardous fuels, and to provide for the detection and prevention of insect and disease outbreaks. (Individual, McMinnville, OR - #A5106.30100)

1468. Public Concern: The Forest Service should allow the use of motorized vehicles.**FOR FOREST HEALTH MANAGEMENT**

I have several concerns with the plan. First, its implementation would negatively affect the health of acres of national forest lands. The United States General Accounting Office has identified nearly 40 million acres of National Forest lands, some of which are already designated as roadless forest lands, that are at serious risk of catastrophic fire loss and bug infestation. By banning motorized vehicles on national forests, the proposal would limit the ability to fight forest fires and effectively manage our nation's forest lands. In particular, the inability to treat the pine beetle epidemic in the Black Hills National Forest could have dire consequences for my state. (United States Representative, South Dakota, - #A18062.30100)

To provide for healthy forest, leave the roadless areas alone. If there is a need to enter these areas for treatment of localized problems, that can be done by helicopter, draft horse, snowmobile, etc. They are roadless but not wilderness areas, so machines can be used. (Individual, Northfield, MN - #a22395.30100)

FOR FOREST HEALTH MANAGEMENT ONLY, WITH ACCESS PROHIBITED UNLESS AUTHORIZED BY A FOREST PLAN

Access for fire, disease control and salvage should be expressly allowed. All other road access should be prohibited unless otherwise authorized by a forest plan. (Business, Seattle, WA - #A20468.30200)

ALLOW HEAVY EQUIPMENT FOR FIRE CONTAINMENT AND OTHER MANAGEMENT NEEDS

The only tools available to the Forest Service appear to be those used for Wilderness areas. Continue to allow access on existing roads and trails. Heavy equipment use to contain forest fires and other management needs should not be prohibited in so-called roadless areas. Access and road construction should be allowed for other forest management activities. Timber harvest, removal of dead or disease trees should be exempt from the Rule. There is no such thing as a “severe” wildfire, there are just wildfires. There should not be any restrictions with respect to fire control and suppression severe or not. (Elected Official, Lander County, NV - #A27730.30000)

TO FACILITATE FIREFIGHTING IN WILDERNESS AREAS

Maybe more practical to provide access roads which would also facilitate firefighting in Wilderness areas. (Individual, Fernandina Beach, FL - #A16024.30200)

1469. Public Concern: The Forest Service should comply with Revised Statute 2477.

TO MAINTAIN MOTORIZED ACCESS FOR FOREST HEALTH MANAGEMENT

Almost all so-called “roadless” areas actually contain an extensive network of RS-2477 roads and right-of-ways. If USFS obeys statute law—especially the RS-2477 savings provisions of FLPMA and the Section 108 prohibitions on redefinition of RS-2477s . . . and refrains from interfacing with country and individual RS-2477 maintenance and repair, the motorized access that is essential for forest health will usually be available. (Organization, Tonopah, NV - #A20337.20208)

1470. Public Concern: The Forest Service should modify the criteria for roadless designation to allow the construction of new roads for fire and disease management.

BECAUSE THEY ARE LESS DAMAGING THAN ROADS CONSTRUCTED DURING FIREFIGHTING

The wide sweep of human impacts on Forest Service lands makes the traditional criteria for roadless designation less than realistic. We think a substantial case can be made that some degree of access must be provided to all lands, particularly in the West, where there is continuing need for fire and/or insect infestation response and prevention activities. This is particularly true where Forest Service lands pose a threat to private lands or public active-use areas. In some cases this access can be obscured to maintain an unroaded appearance. To us, it seems a better solution to have an engineered alignment available to enter areas rather than having to resort to the heavy-handed approach that is often necessary during an emergency response even though pre-emergency work may violate the contemporary “roadless” definition. (Association, Sacramento, CA - #A15787.25000)

1471. Public Concern: The Forest Service should maintain trails.

FOR FOREST HEALTH

Provisions should be stipulated in the final rule to allow exceptions in the management constraints in order to avoid the build up of hazardous fuels, allow for the suppression of catastrophic fires and to provide for the detection and prevention of serious insect and disease outbreaks. Existing trails should be

maintained to an acceptable standard and where desirable new trails maybe be constructed in order to facilitate management activities and to provide public access. (Individual, Eagle, ID - #A3368.30100)

Do not Allow Roads/Access

1472. Public Concern: The Forest Service should not use forest health as an excuse to build roads in roadless areas.

BECAUSE IT IS COST PROHIBITIVE

Money should not be available to build roads to manage forests from wildfires, buildup of fuels and to provide prevention of insect and disease outbreaks for it would be cost prohibitive plus I see this as an end round to allow logging at an economic loss. (Individual, Sequim, WA - #A16967.17100)

BECAUSE FIRES WILL BURN AREAS REGARDLESS OF THEIR ROADED/ROADLESS DESIGNATION

We know there is great concern among some that roadless areas are high fire hazard areas and that unless they are roaded and logged the accumulation of fuels will lead to catastrophic wildfires which will incinerate already roaded regions. It is true that roadless areas have high fuel loads. But the same is true of already roaded areas, which burn just as fiercely as roadless areas. The Tyee Fire on the Entiat River of the Wenatchee N.F. in 1993 burned just as hot in roaded areas as it did in unroaded ones. After the fire, some of the roaded areas were salvage logged. Result: roaded areas had less of a legacy of large logs and course woody debris with which to start next stands of trees. That meant less soil moisture, less habitat for fungi colonization and less cover for predators of gophers, all of which added up to less healthy trees and a degraded forest. Under some circumstances, fire in roadless areas will spread into managed forests, just as fire in roaded areas sometimes invades roadless areas. But that is no argument for roading roadless areas, unless one thinks the Forest Service can always control fires in roaded areas. The fire seasons of 1960, 1970, 1988 and 2000 showed that neither the Forest Service nor anyone else can stop fires in roaded areas in severe fire weather. Putting roads into roadless areas will do nothing to prevent conflagration fires. (Individual, Portland, OR - #A6269.30200)

Though there is some truth to the idea that fire suppression has, in some areas, created excess of combustible material (“hazardous fuels buildup”) it has been greatly exaggerated, and is certain to be used as an excuse for logging, and escape environmental regulations, if local planners are given new opportunities to override the Roadless Area Conservation Rule. It is easy to demonstrate that extreme drought has much more to do with catastrophic wildfires than excess fuel, and it is very likely that global warming plays a much greater role in the growing number of forest fires. Even tropical rain forests have been the victims of conflagrations in recent years. (Individual, Hatboro, PA - #A17830.30100)

IN THE TONGASS NATIONAL FOREST

Under the Forest Service’s current plans for roadless areas of the Tongass, the level of road building is completely unjustifiable. The Tongass is scheduled to provide half of all Forest Service timber that is cut from roadless areas in the next five years. More than 80 percent of all new roads in roadless areas in the entire Forest Service system will be built in the Tongass.

That level of road building is not justified by the “forest health reasons” mentioned by Chief Bosworth on several occasions when he discussed reasons for building roads into roadless areas. The two most commonly used “forest health” excuses for continuing to log roadless forests in the Lower 48 do not apply in the Tongass. The Tongass is still dominated by old-growth stands, so it does not require thinning or treatment to mimic original forest condition and improve wildlife habitat. And because it is a rainforest, with an average of roughly 100 inches of rain a year, fuel loading and fire suppression are not an issue. (Organization, Sitka, AK - #A30486.45623)

1473. Public Concern: The Forest Service should prohibit road construction.

BECAUSE ROADS CAN SPREAD DISEASE AND NOXIOUS WEEDS

Here in California we have a fungus that is quickly adapting to attack and kill more and more species of trees. It is a close relative to the Port Orford cedar disease that has nearly eliminated the species in the western US, and which has been spread on the tires of logging equipment. The more roads, the more areas threatened by diseases known and unknown. (Individual, Sebastopol, CA - #A122.31200)

Building more roads will INCREASE the spread of disease and reduce forest health. Vehicles, including logging trucks and equipment, can spread disease. Two examples are the Port Orford Cedar root disease and Sudden Oak death in California. The Forest Service's own literature backs this up. (Individual, McKinleyville, CA - #A1269.31200)

Exotic weeds are already a major problem in roaded areas of our National Forests. If we continue to build roads in the National Forests here in Western Montana, the result will be to completely destroy the unique and wonderful character of this region, and to destroy its value and appeal for people like myself. (Individual, Lakeside, MT - #A3729.31300)

I am using Geographic Information Systems to predict the likelihood of an area containing Port Orford Cedar becoming infected by *Phytophthora lateralis* (Port Orford Cedar Root Disease). My study area is located within the Smith River National Recreation Area. The Port Orford Cedar in this area is heavily infected by *P. lateralis*.

Vehicles traveling along roads are known to be the main source of new infections. The disease does not occur where roads do not exist. The same scenario applies to many other exotic pathogens and plant species (Yellow Star Thistle). (Individual, Arcata, CA - #A1098.31221)

Disease and insect damage is even less an issue in roadless areas. Many of the major timber infestations occur in the monoculture tree farms which replace the forests that were clearcut earlier. When specific diseases do manage to invade the wilderness and roadless areas, it's often because they are brought in on the wheels of off-road vehicles. The Roadless Area Conservation Policy adequately evaluated the issue and found, "The percent of area at risk in inventoried roadless areas is about the same as the percent of area at risk for all NFS lands." (Roadless Policy FEIS, Vol. 1, p. 3-119) Further, "Invasion of nonnative species, is one of the most important issues in natural resources management today, with more than 6000 species originating outside the United States. Since roads provide an entry way for nonnative species, inventoried roadless areas can act as strongholds against invasion of these species." (Roadless Policy FEIS, Vol. 1, p. 3-126) (Individual, Eugene, OR - #A15583.31200)

It is the presence of roads, rather than roadlessness, that threatens the health of the forest in other ways as well. Thus, the spread of non-native, invasive plants is greatly enhanced by roads, even those that are unpaved and rarely traveled. A prime example is *Microstegium vimineum* (Japanese grass) that has recently become a real threat to native plant diversity throughout the eastern U.S. (Organization, Oak Ridge, TN - #A8073.30100)

"Invasion of non-native species into North American ecoregions is one of the most important issues in natural resource management today . . . Unfortunately, the ability of natural resource managers to eliminate invasive species, once they have become established is often very limited." (DEIS 3-47) A multitude of negative impacts to native species and ecosystems results from these invasions; invasions that are usually the result of human disturbance or facilitation. "Without any of the ground disturbance and ecological edges associated with timber harvest and combined with a 75% reduction in road construction and reconstruction, this alternative [#4] would provide the greatest assurance that these areas would retain current levels of resistance to the introduction and establishment of many non-native invasive species." (DEIS 3-91) This writer's personal experience has revealed cut-over sites and road

edges overrun with invasive species such as the Asian tree-of-heaven on the GW - JNFs (see, e.g., the Icy Hopper timber sale area adjacent to the Thunder Ridge Wilderness Area on the Glenwood Ranger District of the JNF). (Individual, Staunton, VA - #A29325.31300)

BECAUSE ROADS AND DISTURBANCES ENABLE EXOTIC PLANTS AND ANIMALS TO ENTER PREVIOUSLY UNDISTURBED AREAS

I am keenly aware of the impact of roads of enabling invasive species to make "inroads" into previously undistributed, uninfested areas. Much of the distribution of red imported fire ants can be traced to colony movement along roadsides and power line easements. I feel that making new roads into roadless areas is asking for more trouble than benefits. A good case in point is the health, economic and ecological costs of the fire ant in the southeastern United States alone; they are tremendous. Then consider that most ecologically damaging species, both plants and animals, are dispersed and thrive in disturbed areas such as roadsides. It is high time that we figure in the long-term costs of ecological damage in our cost/production/benefit decisions. (Individual, College Station, TX - #A26846.31220)

Biological Invasion: Roads enable invasive plants and animals, many of which are non-native, to expand their ranges to the detriment of native plants and dependent species. Exotic species often thrive in the environments created by roads and can also be inadvertently transported by vehicles. Roads create open edges to forest which make species more vulnerable to pest epidemics, invasion by nonnative species, and nest parasitism. Examples include; weeds, such as spotted knapweed; aggressive brood parasites, such as the brown-headed cowbird; and pathogens, such as cedar root rot. (Organization, Boise, ID - #A20853.30100)

BECAUSE BOAT TRAILERS CAN INTRODUCE EXOTIC SPECIES TO WATERSHEDS AND LAKES

I am writing to express my concern over the possibility that more roads would be built near the BWCA. I am a cabin owner on a remote lake which has no road to it and I like it that way.

The BWCA should have a sizeable no road buffer zone around it preserved for several reasons. Roads that cross water would allow the access of boat trailers which are the main route that exotic species such as Eurasian Milfoil are introduced. I believe canoes are not a significant source of these exotics but trailers are. (Individual, Clear Lake, IA - #A8885.45621)

Wild areas are becoming increasingly rare and once a road is cut the signs of the road remain for centuries.

One of my concerns is keeping lakes which are remote from having road access. Efforts to keep Eurasian Milfoil and other exotic species from permanently altering lakes throughout the midwest are basically failing.

Boats on trailers are the source of exotics and keeping roads from remote lakes which can only be accessed by canoe is about the only way to prevent such introductions. (Individual, Clear Lake, IA - #A8886.45622)

BECAUSE ADEQUATE ROADS EXIST AND ARE NOT NEEDED FOR FIRE SUPPRESSION

As a professional wild land fire fighter, I never did not make it to the fire I was dispatched to suppress, for lack of a road. In those areas where wildfire burned with no road access, we walked or were ferried in by helicopter, and on occasion, teamed up with smokejumpers that had parachuted in. Saying we need to build roads into roadless areas for the sake of preventing severe wildfires is a scare tactic used to inflame the uneducated public. (Individual, Gridley, CA - #A3712.30200)

This is another red-herring, I suspect, the implication being that we need these roads in order to get in proper fire suppression tools. We don't. (Individual, No Address - #A49.30200)

As a 15-year Montana firefighter, I can testify that the Roadless Area Conservation Plan is no hindrance at all to wildland firefighting, whose personnel, resources and techniques are well adapted to firefighting without roads.

The FS's mandate is resource protection—preservation of ecosystems and habitat—fire creates these rather than destroys them.

Please adopt the plan in its present form! (Individual, Billings, MT - #A6512.30400)

Roadless areas have prospered without roads for millennia. There is no evidence that roads are necessary to ensure their continued health. The Forest Service does almost all of its insect and disease surveys aerially; thus roads are quite unnecessary for that purpose. So-called “severe” wildfires are generally quite natural stand-replacing fire events that have been occurring in our forests for thousands of years. Forest types in most roadless areas have not been adversely affected by fire suppression during the last fifty years. These forests do not burn frequently and when they do burn usually do so in stand-replacing fires. Thus there is no ecological justification for road construction or silvicultural activities in these forest types. (Individual, No Address - #A12607.30200)

BECAUSE FOREST SERVICE PERSONNEL CAN ACCESS ROADLESS AREAS BY OTHER MEANS

The best way to manage for healthy roadless areas is to access on foot, by horseback or on appropriate occasions by mountain bike and helicopter. In areas in need of “heavier” temporary restorative approaches temporary snow roads or airstrips can be established, the work performed, and the road or airstrip restored back to its natural habitat. (I used a mountain bike very successfully in conducting ecological inventories and identifying or adjusting avoidance, mitigation and restoration measures). The existing rule already provides exceptions for roadbuilding and logging to address wildfires and forest health. According to the Forest Service, only 2% of inventoried roadless areas are at combined risk of insects, disease, and fire, and about 98% of fires in roadless areas have been ecologically managed without the need to construct roads. This is because roadless areas have been naturally self-sustaining and have not been impacted by the often heavy impact of man. (Individual, Watsonville, CA - #A6767.30100)

Detection—of whatever—certainly does not require a road. Most Forest Service employees ought to be capable of walking or riding a horse to determine the status of ecological variables in roadless areas. Fires that might threaten values outside of roadless areas can be detected as they are now—by lookouts or by aerial patrol. (Individual, West Glacier, MT - #A5946.30100)

Roads are not needed to help manage healthy forests. Hazardous fuel build up could be controlled by control burns. These burns can be applied by forest service rangers, who can hike into roadless areas or be dropped off by helicopter. (Individual, No Address - #A17702.30200)

BECAUSE HELICOPTERS CAN BE USED FOR CONTROLLED BURNS AND AIR TANKERS CAN BE USED FOR FIRE SUPPRESSION

The protection from “severe wildfires and the buildup of hazardous fuels” can also be managed without the use of roads. The field ecologists and biologists already walking the woods could identify such problems. In such cases controlled burns using helicopters, and air tankers for suppression would be a viable alternative to road-building.

If roads were to be built into areas that are in danger of severe wildfires, it makes them more accessible to careless individuals who may start fires. Electrical storms start enough fires, introducing a human element is not necessary. (Individual, Walla Walla, WA - #A17698.30200)

BECAUSE ROADS WON'T STOP FIRES

Here are 2 more Montanans who would very much like to keep our remaining “roadless” areas, roadless. Also, it's very interesting to drive through the Bitterroot Valley in western Montana and look at the land that burned so bad last year. The one thing that really shows clearly through the destroyed timber is all the logging roads! Now “they” really did a great job of stopping those fires didn't they! (Individual, Victor, MT - #A21302.10150)

AS A GOOD WAY TO MANAGE WILDFIRES

You have asked us to respond to ten questions. Among these is the question of wildfire control. Preventing road construction is a good way to manage wildfires. When roads are not maintained, as more and more of our roads in the National Forests have become, they become built up with brush and tinder. These roads make fires fiercer and spread more quickly. They provide minimal access for firefighters. Roads also promote logging, which generally culls the largest, fire-resistant trees and leaves behind highly inflammable debris. Fire management goals will be best served by protecting our roadless areas. (Individual, Claremont, CA - #A15513.30400)

In terms of the goal for protecting roadless areas from severe fires, logging roads have a paradoxical effect: they are places where wildfires can be contained, but are also places where wildfires are often ignited. A significant portion of human-caused wildfires are, in fact, ignited alongside roads, and as a general rule increased road access results in increased risk of human-caused wildfires. Thus, while to some extent roads may help to suppress wildfires, roads can also hinder the agency's efforts to prevent wildfires. The link between arson fires and logging roads is particularly strong, an arson is the most difficult kind of human-caused wildfire to prevent. Unfortunately, forest arsonists are rarely captured or convicted, and the vast network of logging roads carved into the National Forests has greatly increased the burden on fire prevention and law enforcement patrols. The net effect is less protection of wildlands from severe fires due to the increase in number and frequency of human-caused ignitions, often during extreme fire danger situations.

In terms for fuels management, logging roads break up continuous fuel beds with wide swaths of non-combustible dirt and gravel; however, highly flammable vegetation (e.g. grass, brush, conifer saplings) often grows in the exposed, disturbed sites alongside roads. This accounts for many wildfires being easily ignited by the exhaust or cigarette butts tossed from passing motorists. More significantly, most National Forest roads travel through and to logged areas. Commercial logging produces large amounts of flammable dead surface fuels.(e.g. "slash" and "cull" logs), followed by revegetation from grass and brush, or replanting with young conifer saplings.

The best available scientific research has demonstrated that wildfires tend to spread more rapidly, with higher intensity and greater severity, when they burn through roaded and logged landscapes compared to unlogged roadless areas. Fires entering plantation zones and other intensively managed areas are prone to sudden "blow ups," creating major conflagrations such as occurred on the 1994 Tye Fire in Washington State. (Organization, Eugene, OR - #A21798.30100)

1474. Public Concern: The Forest Service should obliterate any roads or temporary access required for forest health management as soon as possible after the event.

Wildfire protection: Emphasis should be on immediate detection of lightning strikes and fire fighting from air. One of the USFS fire chiefs told me that roads were not necessary to fight fire in this day and age. I believe this to be true. Roads that are bladed for required fire fighting should be obliterated immediately after the fire. (Individual, Buffalo, WY - #A19769.30200)

I nevertheless believe that fire suppression is appropriate when necessary to prevent a fire from expanding in size to consume more than, say, 20% of the available roadless area or forest. In pursuit of such a goal, the bulldozing of fire lines and other damage associated with fire fighting is acceptable—but only if all evidence of fire fighting is required to be obliterated within the next year. A significant portion of the fire fighting budget should be reserved for this purpose. Likewise, for catastrophic fires that consume more than, say 20% of the available forest, limited replanting should be allowed when, on a case-by-case basis, it is found to be necessary. Once again, however, any temporary access ways created for that purpose should be obliterated within a year. The creation of these temporary access ways does not alter the general rule that developed roads should never be established in roadless areas. (Individual, Pendleton, OR - #A30482.30400)

Healthy forests are not laced with roads. Inventoried roadless areas should be managed under the emergency conditions stated in the promulgated Rule, allowing new roads when there are certain risks to public health and safety from insects, disease, and fire. Only a tiny amount of roadless areas are subject to these combined risks—less than 2% according to the USFS. These areas should be managed in a way that reduces the risks WITHOUT road-building. If a road is absolutely essential because of some circumstance, it should be reclaimed immediately after a treatment is completed, so that the deleterious effects of forest roads on surface hydrology (erosion/excess sedimentation, habitat segmentation, weed invasion, enhanced fire danger, etc.) will not severely degrade the area. (Individual, Sebastopol, CA - #A2353.30100)

Access into and across roadless areas managed as roadless is needed to reduce insect and disease damage on both national forest land and other adjacent forestland. After salvage harvest activities, roads and other temporary infrastructure can be retired. (Business, Seattle, WA - #A20468.30200)

1475. Public Concern: The Forest Service should prohibit vehicles in roadless areas.

TO PREVENT ARSON AND WILDFIRES

As for wildfires, keeping both off-road and on-road vehicles out of the forest is among the best ways of preventing arson and wildfires started by man and/or machine. (Individual, Clayton, GA - #A15320.30100)

Many fires are started by people going out on the roads in vehicles, and then leaving unattended campfires, throwing lit cigarettes out their car windows, sparks may come from their muffler, or arson is not an uncommon occurrence. Arsonists are not known to hike deep into the wilderness to start their fires, and in fact often do their satanic deed by throwing flaming material out their car window.

This leaves the roads to administer the rest of the fires that are caused by weather. Consider for the sake of assumption that these fires are in fact a manifestation of weather. Then try to tell me that you can stop the rain!

Fire is a great political football because people want so desperately to believe in certainty and politicians don't get elected by telling people that certainty is an illusion in many cases. (Organization, Arcata, CA - #A21665.30430)

Logging exacerbates fire risk. Road building allows easier access to the backcountry by meth lab operators and other irresponsible individuals whose activities are fire hazards. So-called salvage logging removes the trees that should remain, while destroying wildlife habitat. The Rules as written provide for emergency road building and forest health. (Individual, Seattle, WA - #A17886.30500)

As for wildfires, keeping both off-road and on-road vehicles out of the forest is among the best ways of preventing arson and wildfires started by man and/or machine. Mother Nature did a pretty good job of managing forests for hundreds of thousands of years, I think a light touch from the hand of man would be a fine approach to forest management - it's cost effective too. Also, the build up of "hazardous fuels" is mostly a problem due to forests having been previously altered by logging (slash left on the ground after logs removed) and it is mostly a western forest issue. The Southern Appalachian roadless areas near me are the few areas in the Southeast that have NOT been logged extensively, so the "fuel build-up" is less of a factor in these forests than almost anywhere else in the entire national forest system. (Individual, Atlanta, GA - #A26430.30100)

TO PREVENT THE SPREAD OF PLANT PATHOGENS

On the Six Rivers and Klamath National Forest off-road vehicle use is a primary vector for spreading the plant pathogens that kill the endemic Port-Orford cedar. (Organization, Arcata, CA - #A21665.31200)

Timber Removal

Summary

General Comments – Timber removal is a topic of comment to a number of respondents, particularly as it applies to forest health. Several people ask that the Forest Service not allow volume and revenue targets to drive silvicultural decisions because, they believe, commercial harvesting usually takes the most fire-resistant trees.

Adequacy of Analysis – Some respondents urge the Forest Service to acknowledge that fuel buildup and undergrowth is a natural part of forest progression and forest ecology. They state that fuel buildup and undergrowth are not a result of timber harvest and that other contributing factors should be considered. At the same time, organization states, “Before any actions are taken to thin and clear, a thorough analysis should be performed which gives the benefits and harms of the actions.” According to another group, scientific evidence does not support the hypothesis that intensive salvage, thinning, and other harvesting activities reduce the risk of catastrophic fire.

Funding – Several respondents comment that funding should be allocated for timber removal for forest health management. One individual urges the Forest Service to fund thinning projects. Another individual states, “The increased costs of fuel treatments must be addressed. Eliminating such large tracts of land from motorized fuels and firefighting efforts is a disaster in the making. On one hand we have the agency saying we must greatly increase fuels treatments and now on the other we have the agency virtually eliminating cost effective fuel treatments since motorized access to large areas will be eliminated.” One individual suggests that “previous harvesters should be fined to recover any future loss due to severe wildfires and buildup of hazardous fuels, as well as any insect or disease damage.”

Timber Removal – Respondents assert that timber removal should be allowed to reduce wildfire and insects and disease. According to one individual, “There is NO QUESTION that timber harvest has to be returned to the equation to provide for healthy forests which will protect them from insects, diseases, and catastrophic fires.” Respondents also add that timber removal is necessary to restore natural fire regimes and to ensure firefighter safety. People suggest a number of conditions they say should be imposed on timber removal. Suggestions include harvesting only trees that are 24 inches on the stump, trees less than 14 inches in diameter or 50 years old, mature trees which have not yet lost their commercial value, and old growth. People also recommend certain types of removal—including clear cutting, salvage removal, selective timber harvest, and fuel thinning—each type subject to several suggested conditions. Several people also suggest firewood collection be allowed in order to reduce fuel loads and fire hazards.

Other respondents assert that the Forest Service should not use forest health as an excuse to remove timber. These respondents say that timber removal should be prohibited because it increases fire severity and risk. Some specifically request that clear cutting be prohibited. Others suggest that salvage timber harvest be prohibited after fire or insect and disease outbreaks. Additionally, some respondents request that thinning be prohibited in moist or high elevation forests because, they assert, it is cost prohibitive, because silvicultural activities do more harm than good, and because these areas should not be disturbed.

Timber Harvest General

1476. Public Concern: The Forest Service should not allow volume and revenue targets to drive silvicultural decisions.

BECAUSE COMMERCIAL HARVESTING USUALLY TAKES THE MOST FIRE-RESISTANT TREES

This suggestion should not be construed to support commercial sawlog extraction: the attempt to combine salvage logging with commercial logging in the past has usually taken the fire-resistant live green trees and left the brush which creates the fire hazard in the first place. Volume and revenue targets should not be permitted to drive silvicultural decisions, as they did under the 1996 Salvage Rider. (Individual, No Address - #A4777.30500)

The General Accounting Office noted, 'Most of the trees that need to be removed to reduce accumulated fuels are small in diameter and have little or no commercial value.' The report found that Forest Service managers were tending to focus logging on areas with high-value commercial timber rather than on areas with high fire hazards and would include more large, commercially valuable trees in a timber sale than those simply necessary to reduce the accumulated fuels. So called logging for fire protection became logging for the economic value of the timber. (Individual, Puyallup, WA - #A829.30100)

Prohibit the use of commercial timber sales for hazardous fuels reduction projects. Commercial logging removes the most ecologically valuable, fire-resistant trees, yet leaves behind highly flammable small trees, brush, and logging debris. The financial incentives for abusive logging under the guise of "thinning" must be eliminated. (Organization, Nevada City, CA - #A4941.30520)

Adequacy of Analysis

1477. Public Concern: The Forest Service should recognize that fuel buildup and undergrowth is natural for forest progression and forest ecology.

DO NOT PLACE BLAME ON COMMERCIAL TIMBER REMOVAL

Protecting Forests: The current Roadless Area Conservation Rule adequately addresses issues of fire management. With all the current rhetoric on fires and fire management, it is important to look at the facts in an unbiased way. Yes, the number and intensity of fires have been increasing since the 1950s, and the 1990s was one of the worst decades for fires in recent history. But, when you look at the locations of the fires, it is clear that fires increased in forests and in areas of sage brush, manzanita, chaparral, etc.—ecosystems that do not have trees! The increase in fires can not be blamed on limitations placed on commercial logging. The forest industry is trying to use this highly emotional issue for their own political agenda and profit. (Individual, Reno, NV - #A5109.30400)

CONSIDER OTHER FACTORS THAT CONTRIBUTE TO FUEL BUILD UP

Fire is a natural thing in forest ecology. Though it is true that there is an increase in combustible substance, as a result of over zealous fire suppression, the degree to which this is responsible for the recent increase in forest fire, is very questionable. In the year 1910 there were more big hot fires, more acres burned, and more fire fighters killed than in any year since, and that was before fire suppression. The 1910 fires were caused by drought, and drought caused by global climate change may well be the major factor in the increase in fires today. After all there have been enormous and unprecedented fires in tropical rain forests in recent years, and this certainly has nothing to do with "Hazardous fuels buildup." (Individual, Hatboro, PA - #A8834.30310)

1478. Public Concern: The Forest Service should analyze the benefits and harm of thinning and clearing projects.

BEFORE UNDERTAKING ANY ACTION

Inventoried roadless areas should be given as little vegetation management and protection from diseases as possible. Before any actions are taken to thin and clear, a thorough analysis should be performed which gives the benefits and harms of the actions. Benefits might be a reduction of fire risk to neighboring communities and more suitable habitat for a rare species. Harms might be degradation of habitat for wildlife and loss of aesthetic values. (Organization, Blue Jay, CA - #A29236.31200)

1479. Public Concern: The Forest Service should consider that scientific evidence does not support the hypothesis that intensive salvage, thinning, and other harvesting activities reduce the risk of catastrophic fire.

Scientists have doubts about the efficacy of intensive [management] as fire-proofing methods. DellaSala, et al. (1995) state:

Scientific evidence does not support the hypothesis that intensive salvage, thinning, and other logging activities reduce the risk of catastrophic fires if applied at landscapes scales . . . At very local scales, the removal of fuels through salvage and thinning may hinder some fires. However, applying such measures at landscape scales removes natural fire breaks such as moist pockets of late-seral and riparian forests that dampen the spread and intensity of fire and has little effect on controlling fire spread, particularly during regional droughts . . . Bessie and Johnson (1995) found that surface fire intensity and crown fire initiation were strongly related to weather conditions and only weakly related to fuel loads in subalpine forest in the southern Canadian Rockies . . . Observations of large forest fires during regional droughts such as the Yellowstone fires in 1988 (Turner, et al. 1994) and the inland northwest fires of 1994 . . . raise serious doubts about the effectiveness of intensive fuel reductions as “fire-proofing” measures. (Organization, Missoula, MT - #A613.30500)

Funding

1480. Public Concern: The federal government should fund Forest Service thinning projects.

TO REMOVE FUEL BUILD UP

I feel that the Federal Government needs to better fund the Forest Service to allow removal of underbrush that tends to turn into the very fuel that sustains major wildfires. (Individual, Colorado Springs, CO - #A22203.30100)

1481. Public Concern: The Forest Service should address the increased costs of fuel treatment.

The increased costs of fuel treatments must be addressed. Eliminating such large tracts of land from motorized fuels and firefighting efforts is a disaster in the making. On one hand we have the agency saying we must greatly increase fuels treatments and now on the other we have the agency virtually eliminating cost effective fuel treatments since motorized access to large areas will be eliminated. (Individual, Alturas, CA - #A28581.17220)

1482. Public Concern: The Forest Service should fine previous timber harvesters.

TO RECOVER ANY FUTURE LOSS DUE TO SEVERE WILDFIRES, BUILDUP OF HAZARDOUS FUELS, AND ANY INSECT OR DISEASE DAMAGE

Previous harvesters should be fined to recover any future loss due to severe wildfires and buildup of hazardous fuels, as well as any insect or disease damage. (Individual, Boise, ID - #A674.30700)

Allow Timber Removal

1483. Public Concern: The Forest Service should allow timber removal.

TO REDUCE FIRES, INSECTS, AND DISEASE

I support reopening the forests to logging and reopening of closed roads to protect our forests from wild fires and using the forests for wood production. Without the loggers cutting old timber and clearing heavy brush that has almost made all of our remaining forests a fire hazard and severely reduces the usage of the forests. The Forests were in much better condition while logging was the rule and I would hope that good logging practices will help our forests recover from the last ten years of attack by environmental wackos. (Individual, Young, AZ - #A1083.90510)

There is NO QUESTION that timber harvest has to be returned to the equation to provide for healthy forests which will protect them from insects, diseases, and catastrophic fires. Areas in high altitudes, areas adjacent to streams or areas which would be subject to extreme erosion should not have logging or road building in them. However, harvest of all dead and dying timber outside the above categories should be immediately put into a sales program that forbids appeal by any and all environmental groups. (Individual, Whitefish, MT - #A5102.30100)

As a former USFS employee on the Davy Crockett and Angelina Ranger Districts in the National Forests in Texas, I can tell you that I am well aware of the areas that have already been set aside in the RARE I and RARE II programs, and it is a travesty as to what has happened to those areas due to the "no management" policies. We have seen both the designated Four Notch and Indian Mounds wilderness areas obliterated by Southern Pine Beetle infestation, and grow back in briar patches that even my dog has no desire to explore.

When we should be harvesting these trees in an effort to control mortality due to insect infestations, we are instead allowing the dead and dying trees to rot, and entering healthy, less mature forests, for timber harvesting to supply our nation's needs. (Individual, No Address - #A5081.30100)

Management to achieve this type of forest [uneven aged] should be by regulated harvest and stocking control over most of the existing non-Wilderness, presently roadless areas, but may be by prescribed burning. The latter is dangerous if not preceded by a thinning harvest, and if dead, unconsumed timber is left following the burn, those downed and standing dead trees will and to the fuels, available and ready to burn, for decades, even a century or more, to come. We cannot set up our forests to experience severe wildfires such as we experienced in Yellowstone Park in 1988. These large, very hot fires are just to damaging to the soils and to the watersheds where soil erosion and stream course damage exceed anything normally experienced from proper forest harvest and management. (Individual, Evergreen, CO - #A19178.30400)

It appears that the current management of the forest involves a leave-alone policy in terms of downed and dead trees. The other strategy that appears to be applied is controlled burning. While nature allows for the forest to develop wildfires of all sizes as well as the development of insect and disease outbreaks, it seems that a policy of letting nature be nature in this case may not be entirely in the interests of the environment. Having experienced the ash fallout and smoke from the Yellowstone fire of the late 1980s while living in Billings, MT, and the recent bout of fires here in Southern Oregon, I must say that a significant amount of air pollution and carbon dioxide emissions are produced by these fires which can't be good for the environment, particularly the air quality. It seems that a controlled harvesting of downed and dead trees would be appropriate to manage the risk of out-of-control wild fires. This would have to be balanced with the need to prevent soil erosion, particularly on hillsides. (Individual, Klamath Falls, OR - #A6931.30500)

Harvest of forest products for fuel reduction and forest health is an option in many cases. Modern equipment can often remove high-risk material without roads. Few roads are needed to accommodate harvest today. Also, managing roadless areas to retain their roadless character does not preclude the use of managed fire or application of chemicals for insect control. (Individual, Cloquet, MN - #A8272.30100)

Maybe you'll just have to drop the idea of "roadless" as a primary "value" to be protected. As fuel loads are the primary factor in the intensity and spread of fire, the wood must be extracted in some manner. And HRV data literally screams "removal." There is no way to precipitate a natural fire when base fuel loads are profoundly unnatural. Again, Moose Fire.

It is my guess that once the Moose fire is controlled, the burned timber is going to be in the billion-board-foot range. That is a TERRIBLE waste, ten years of wood at the old ASQ, and 20 years worth at the latest, litigated and never-met ASQ. We no longer have the local mill capacity to absorb even a small part of that timber...we might get a third of it in two years IF the remaining sawmills converted fully over to that wood.

First, wood is often too heavy to be flown, and ground-based equipment is often the only economic option.

Second, ground based equipment such as forwarders are specifically designed to reduce soils compaction.

Third, many forests have a climactic interval called "winter." It is very possible to build ice roads such as on the North Slope for haulage. (Individual, Whitefish, MT - #A20672.30110)

TO RESTORE A NATURAL FIRE REGIME

The Forest Service should restore a more natural fire regime wherever possible and where necessary cut down ladder fuels (brush and small diameter trees) and allow decomposition. Roads are not necessary to accomplish these activities. (Organization, Auburn, CA - #A20801.30310)

Your studies have concluded that commercial logging (removal of larger trees) in over-dense stands actually INCREASES the risk of catastrophic fires and that the best way to deal with these areas is through cutting of the smallest trees and restoration of a natural fire regimen. (Individual, Roseville, CA - #A10567.30100)

TO ENSURE FIREFIGHTER SAFETY

I suspect it could be argued that the failure to selectively harvest the timber lands with controlled burning of slash piles and various forest debris could have contributed heavily to the exploding fire front which claimed the lives of my friends. (Individual, Kalispell, MT - #A8758.30550)

There is no guarantee that removing dead trees will prevent forest fires, But there is no doubt that responsible logging can greatly reduce the impact of wildfires.

Studies conducted by the forest service have shown that areas that have burned take 100 years longer to recover and become productive than areas that have been logged and restored as per government guidelines.

It seems to make a lot more sense to have someone pay to cut down the dead trees and use them to provide jobs and building material, than to pay someone to try to extinguish the same trees when they have become a wildfire and a threat to life and property.

There has been a rumor going around here that 4 firefighters lost their lives to save a sucker fish because of the stringent guidelines in the roadless rule. If this is in fact a true story, we are in a sorry state. People are more important than trees, fish, birds, or any "rare or old-growth species". (Individual, Centerfield, UT - #A12776.30320)

BY REMOVING 24" TREES ON THE STUMP AND USING THE MONEY TO PAY FOR ROAD REPAIR

Have a forester go in and mark the trees to be cut. Cut only 24" on the stump and use the money to help pay for road repair—this will also help the fire access. Can also do this on military installations. (Individual, Normandy, TN - #A11315.30200)

BY REMOVING TIMBER LESS THAN 14 INCHES IN DIAMETER OR 50 YEARS OF AGE

Little if any mechanical treatment should be needed in most roadless areas, and then only to protect large overstory trees or to provide defensible burn perimeters. Any tree removal should be of younger, small-diameter trees, less than about 14 inches in diameter or 50 years of age, and they should be left on the site or burned in piles if necessary. The existing roadless rule gives local forest managers discretion, on a site-specific basis, to thin small-diameter trees where needed to restore ecological processes, provide habitat for endangered species, and avert catastrophic wildfire. (Organization, Seattle, WA - #A21694.30100)

BY REMOVING MATURE TREES BEFORE THEIR COMMERCIAL VALUE IS GONE, ACCOMPANIED BY CONTROLLED BURNING TO REDUCE FUEL

Healthy forests can exist in a climate of forest management, if older trees are removed before their commercial value is gone. Removal can be done by helicopter or nearby roads. Burning should be a forest management tool, that could be used following all lumber cutting to clear underbrush and trimmings, as well as prescribed burning on non-timber usable lands. Diseased and insect infested trees should be removed, either by burning or commercial timber removal which would be followed by burning of underbrush and tree trimmings. (Individual, Layton, UT - #A30536.30100)

Forest management includes harvesting mature timber that has commercial value before it reaches the dead and dying stage where removal is not cost effective. (Individual, Princeton, WV - #A18086.30200)

As a nation we are worried about global warming and air pollution. How can we justify letting millions of acres of a valuable resource go up in smoke? How can we justify spending billions of dollars fighting fires when we could have generated money from timber harvest? (Individual, Moyie Springs, ID - #A30047.30300)

BY REMOVING OLD GROWTH

As you know old growth timber should be harvested to be utilized and to prevent forest fires. (Individual, Buffalo, WY - #A15052.30520)

BY REMOVING EVERY SIXTY YEARS AND CLEARING UNDERBRUSH EVERY TWENTY YEARS

In regards to the management of roadless areas, we believe that careful harvesting and cutting is needed to ensure a healthy forest. A forest that is cut occasionally is actually healthier than one that is not harvested. This is because excess wood and brush build up, making it a prime target for a forest fire as seen in the west these past few years. If fire prevention techniques included clearing out the underbrush of a forest, they would not have become powder kegs of disaster.

Therefore, we believe that underbrush should be taken out every twenty years and cutting should be done every sixty years. (It takes approximately 60 years to grow a forest suitable for cutting). During these "cleanings," the wildlife should also be tested for disease and any foreign species (such as the gypsy moth) that is detrimental to the native flora and fauna. Also, current practices involving endangered species and damage to the ecosystem should be followed. In essence, we support that the land [should be] managed for the current goals of sustained yield and multiple usage. (Individual, Harrisonburg, VA - #A30138.30510)

BY ALLOWING SMALL SCALE TIMBER REMOVAL

The only logging I wish to see would be by small-scale family operations for the purpose of thinning and fire reduction, and disease control, with essentially no new roads. I would favor helicopter logging. Local forest planning can address these issues, with public input. (Individual, Manhattan, MT - #A671.90510)

If they are “declared” roadless, even though unofficial routes exist, they should be left open (depending on individual circumstances) for recreational use and fire suppression (within reason) but highly disruptive uses (such as logging) should be banned. The only exception to logging would be sales of SMALL trees (poles, firewood, etc.) on a small scale. This would probably do more good than harm. (Individual, Sandia Park, NM - #A26171.30100)

BY IDENTIFYING AND REMOVING TIMBER THAT CAN BE HARVESTED WITHOUT ENVIRONMENTAL HARM

For many years I have used the Flathead Forest for my primary recreation and feel that I am familiar with it. There is a lot of land that should never be roaded for various reasons. Much of it is too steep and too high to be suitable for timber production. But it seems that the land has been adequately protected by existing laws and regulations. There is no question that much of it is more valuable for recreation, watershed, wildlife, etc. But in our area, and I assume in others, there is land that was included in the original Roadless Inventory that was roadless for no other reason than that it was burned in the early 1900s and is just now maturing into merchantable timber. Even though it is difficult to do, an attempt should be made to identify these lands that can be logged without environmental harm. Typically, it is a dense lodgepole forest, of little use for much of anything, certainly a poor place for recreation or wildlife production. But it is an ideal site for a large, extremely hot fire. (Individual, Bigfork, MT - #A1079.45400)

Use sustainable and lower impact logging such as selective logging and the use of draft horses rather than machines. Encourage local, independent loggers if you want to reduce the fuel load. Kick the timber corporations out of our forests. (Individual, Bozeman, MT - #A27944.30520)

Remember, man is limited in his physical abilities and needs access to do his work. We now have low soil impact machines and new harvest systems, that can do the job. We have the technology, but we need the roads to be effective and safe. (Individual, Sula, MT - #A3022.30100)

BY EMPLOYING SUSTAINABLE TIMBER HARVESTING TECHNIQUES FOR FOREST HEALTH

If roadless areas have not previously been logged (which is generally the case), there should not be any significant fuel buildup. It is clearcutting that creates the undergrowth that builds up to hazardous fuels in the first place. If all national forest logging was done sustainably (i.e. selective removal with minimal to no road building rather than clearcutting) we would not have nearly the level of fire problem that we do at present. Private companies that have historically engaged in selective removal, leaving large as well as small trees behind, have had significantly less problem with wildfires than lands that have been clearcut. Insects and the diseases that they carry are similarly much less of a problem in a healthy forest since natural predators keep the insects in check. Clearcutting throws the ecosystem out of balance, destroying the habitat of some, but not all species, and leaving other species without any predation. This leads to problems with disease as well as overpopulation of particular species, such as some disease carrying insects. (Individual, Sunnyvale, CA - #A20760.30100)

WITH HELICOPTERS

The Forest Service must also modify the policy so that it adequately addresses the very real forest health crisis that threatens millions of acres of our National Forests. Careful but active forest management, guided at the local level, is the best way to ensure that these forests are truly protected for the long term. Some logging should be done in roadless areas to reduce the build-up of bark beetles and to harvest dead and dying trees. This will reduce the fuel build-up that could sustain a major forest fire. In roadless areas, the only way this can be accomplished is with helicopter logging. This is expensive and often results in a deficit sale. The expense of this type of logging is nothing compared to the expense of a major forest fire. Local forest level decisions, supported by accurate, site-specific information, are the best way to conserve national forests. (Association, Princeton, ID - #A27994.30100)

The Helicopter Logging sector provides an efficient and valuable means of harvesting timber, in addition to providing invaluable service in all aspects of Forest Management—especially in the ancillary Firefighting role, to which it finds itself applied every year. The availability of the firefighting services

we provide may be severely compromised if the foundation of our business is removed by the curtailment of timber harvesting operations. (Business, Juneau, AK - #A30599.30910)

If there is to be logging for bug kill, etc., the logging should be aerial. (Individual, Missoula, MT - #A6141.31223)

We strongly believe that we keep the option open to carry out forest health projects in roadless areas. In most cases this can be carried out economically with aerial work and leave the area roadless. In some areas the distance might be too far to a road or the values of the material you are removing so low the normal timber sale process will not pay for the work. This is the situation in which areas were ignored for too long and the fuel loading was allowed to build to the dangerous reels it is at today. In these cases the work can still be done by aerial means or prescribed fire, (very dangerous now), but the government will have to pay for the work with general funds rather than sale of products. This is too bad and did not have to happen, but often agencies like the USFS are led off their mission by political agendas. (Business, Portland, OR - #A10558.30100)

WITH HORSES

If wise forest management requires some logging due to fuel build up near homes, for instance, selective logging by horse teams creates jobs and minimizes negative impacts on area communities, wildlife, and forest users. It does not require creation of new roads, and is possible on steep land difficult and excessively expensive to build roads on. (Elected Official, Bozeman, MT - #A27736.30200)

1484. Public Concern: The Forest Service should reduce the basal area index of stands of trees.

TO MAKE TREES MORE RESISTANT TO INSECTS AND DISEASE

Roadless Proposal will significantly reduce USFS ability to restore Forest Ecosystems Health. Restoring forest ecosystem health can be accomplished by improving the resistance of trees to insect attack. This is accomplished by reducing the "basal area index" of stands of trees. Stands with the appropriate basal area index will have healthier trees enabling them to be more resistant to attack from endemic populations of beetles. Appropriate thinning of timber stands has the same effect as thinning carrots or apples. Thinning provides more sunlight, space, water and nutrients to those remaining, which allows these individual trees to be stronger, healthier and more resistant to insects and disease. Too many individuals in too close to each other weakens all of the individuals and creates conditions for rapid disease spread. Such is the condition of our forest ecosystems. Tree mortality from insect epidemics are rampant on most national forest in the west, particularly those in Utah. Elimination of fire and reduction in appropriate amounts of timber harvest have increased the amount of biomass by as much as 25% in just the last 10-15 years. Options within this Roadless proposal to eliminate timber harvest as a management tool are not appropriate. It appears that national presidential political motives not scientific motives have singled out the timber industry and are attempting to eliminate it as a management tool for the USFS. (Professional Society, No Address - #A27584.30200)

1485. Public Concern: The Forest Service should allow clear cutting.

IN LESS THAN FIVE ACRE, WIDELY DISPERSED PARCELS

Any clearcutting should be in small, less than 5 acres, widely dispersed parcels. (Individual, Kalispell, MT - #A19138.30100)

1486. Public Concern: The Forest Service should allow salvage removal.

FOR FOREST HEALTH

Protecting forests: Forests are subject to largely unpredictable catastrophes in the form of windfall, fire, and insect attack. Management should have the flexibility to do prompt salvage when needed for fire

hazard abatement or prevention of spread of insect infestations, particularly in the vicinity of private or state lands or national forest land in other categories. (Individual, Olympia, WA - #A811.30100)

Furthermore, there should be direct provision for salvage harvest in any area where a fire occurs and salvage is feasible or in areas where insect damage has created a non-functioning forest environment and increased the danger of catastrophic wildfire. (Association, Murphy, ID - #A18024.31220)

Now after seeing the two months of raging infernos a recent poll shows almost 90% of the locals think the fire killed timber should be removed, even in the roadless areas, in order to reduce fuel loading for the future. Of course much of the fire could have been prevented if forest health programs had been carried out. So in summary, take charge of forest health and use all the tools you have at your disposal to take good care of our roadless areas. (Business, Portland, OR - #A10558.30100)

Another reason to continue logging in the Manti-LaSal National Forest is because millions of Engleman spruce pine trees have been killed by the "spruce beetle." It has been estimated that 350 million feet of Engleman spruce are dead. Carl Alsup, Operations Manager, at Satterwhite Log Homes, said "right now there is enough dead pine trees in the Manti LaSal National Forest to keep us in business for forty years." There is nothing to kill the beetle or prevent it from killing the pine-trees. The only solution is, two to three weeks of -20F or -30F degree weather. The beetle is continuing to spread north through the mountain range, causing devastating amounts of pine trees to die. Keeping the roads open will help the loggers get into areas where they can harvest the dead timber. Removing this dead timber will help allow for regrowth and get rid of the dead Engleman spruce pine trees. (Individual, Manti, UT - #A20336.31223)

AS SOON AS POSSIBLE AFTER A FIRE

In case of a wildfire in a National Forest, the Forest Service needs to expedite the sale of the dead and dying timber. In other words, allowing salvage operations to begin as soon as possible and no later than sixty days after the fire. The following spring, re-planting of the burned area needs to begin. (Individual, Kamiah, ID - #A5419.30400)

TO UTILIZE THE TIMBER BEFORE IT ROTTS

The use of fire burned timber has not been fully utilized and needs to be sold for lumber before it rots and becomes useless. (Individual, Kalispell, MT - #A20334.31120)

I am writing to support a change in the Forest Service's Roadless Area Conservation Rule. Our forests are renewable resources, and should be used, not just "locked away" for the trees to die, the bugs to eat them, and fires to destroy untended and over-grown areas. Trees are a useful product. Old trees, dead trees, infected trees should be culled and selectively logged -- so they can be used, not wasted -- and new seedlings should be planted to allow regeneration and regrowth of this renewable and useable resource. (Individual, Kamas, UT - #A8901.30100)

TO THIN OLD GROWTH

I am deeply concerned that the ecological objectives of the Northwest Forest Plan will not be met if the current trend of decreased budgets and facility consolidations continues. There are millions of acres of second-growth forests within late successional and riparian reserves that, according to scientists at the PNW Research Station, will not develop the old-growth characteristics needed in these areas without being thinned.

In April 2001 . . . the PNW Research Station concluded:

"Future projections for young, dense forest stands in late successional reserves strongly suggests that they are not likely to develop late successional old-growth habitat or biodiversity conditions through passive management. Without active management, substantial stand-resetting events (fire, blowdown, insects) will likely be required to establish trajectories that lead to late successional old-growth habitat and biodiversity conditions." (Individual, No Address - #A2312.30100)

[The PNW Research station] has identified millions of acres within late successional reserves that are in need of thinning. He identified 152,000 acres on the Olympic National Forest, 122,000 acres on the Gifford Pinchot National Forest, 370,000 acres on the Shasta-Trinity National Forest, as well as 300,000 acres on the Siuslaw National Forest. (Individual, No Address - #A2312.30100)

WITHOUT CREATING NEW ROADS

I have no problem with some thinning where appropriate for new wildlife areas and to help the forest regain a healthy status after years of fire suppression. However, any thinning efforts must not create new roads. Where tree thinning is allowed, it is important to cut the small, weak trees and leave the larger healthy trees in the forest. A market may need to be created for less desirable wood—I can't believe it's not useful. (Individual, Silverthorne, CO - #A28101.30530)

WITH ENVIRONMENTALLY FRIENDLY TECHNIQUES

Inventoried roadless areas can be managed to provide for healthy forests by using the least intrusive management strategies available today. For example, thinning operations may be conducted in snowy seasons using rubber-tired tractors for skidding that not only leave no trace, but reduce fire loads and encourage a healthy mosaic of a diversity of tree species. Best of all, thinning in this way benefits the small operators in the tiny towns of the West and adds to a diverse, sustainable economy. (Individual, Pinedale, WY - #A26289.30530)

IN AREAS WHERE INSECT AND DISEASE OUTBREAKS WILL BE INTENSE

In Southeast Alaska, the issue of protection involves insect and disease damage that is endemic to this region. Occasionally there are localized outbreaks that are identified by the State and Private arm of the Forest Service in cooperation with the state extension service. In locations where outbreaks are or will become intense, access to them should be provided for salvage operations. Over the relatively long forest rotations contemplated for a cool climate forest such as the Tongass NF these proactive salvage operations will have an impact little different than areas of blowdown largely because the Tongass NF was largely formed by blowdown due to storm events. (Business, Seattle, WA - #A20468.31223)

1487. Public Concern: The Forest Service should allow selective timber harvest.

Forests need to be selectively harvested. Harvested areas provide barriers to fires that would otherwise spread at a rapid rate. Harvested areas provide a safe-haven for animals when fire occurs. (Individual, Aptos, CA - #A16303.30520)

As a forty plus year professional forester, I want to express my concerns with the attempt to create more roadless areas in the National forests.

First and foremost is the overwhelming need to address the forest health and fire risk issue on USFS lands. Anyone who views the National forest with an objective eye can see the dead, down and dying overstocked forests that have been created by decades of fire protection with no fuel management. This is an unnatural condition that has allowed shade tolerant species to overstock the eastside pine forests and severely overstock westside forests, and is leading to severe bug kill like the Spruce Budworm epidemic that is creating a fire trap on White Pass in the Gifford Pinchot Forest in Washington and most of Oregon's eastside forests.

The only answer to this problem is fuel removal through selective thinning that leaves the best most vigorous trees, followed by controlled burning to eliminate the slash and understory debris. This process can restore a healthy forest that can survive light burns, but to be economically feasible roads are necessary to carry out the thinning job. These roads can be blocked off for vehicle traffic for several years between thinning entries, but still available to fight fire, if necessary.

We have seen many examples of the USFS simply letting forests be destroyed by fire when no road access was available. This is a senseless waste of the forest resources, wildlife habitat and the economy of many Western State communities. (Association, Longview, WA - #A10556.30200)

TO KEEP FORESTS THINNED AND FIRE FREE

“I believe logging should be your first priority to keep forests properly thinned and fire free. (The proper phrase for the type of logging I am talking about is called, ‘select logging,’ not ‘clear cutting.’ It appears some who work for you don’t know the difference). If you must have roadless areas (and frankly I don’t see the need), loosen the laws to allow some roads to be built for a specific purpose and then remove them. This can be done without harming the environment.” (Individual, No Address - #A834.30000)

TO REMOVE DEAD AND DYING TIMBER

There are thousands of acres in which SELECTIVE logging practices can be employed as a thinning process to clean up the dead and dying as well as small timber which can provide material for pulp and studs. Destruction of roads to establish a bogus wilderness is ludicrous.

Non-appealable sales for selective logging and cleanup of underbrush and small timber is all that will be needed. (Individual, Whitefish, MT - #A5102.30100)

Selective cutting of diseased or dying trees with chipping of slash should be practiced. (Individual, Kalispell, MT - #A19138.30100)

TO PROVIDE BARRIERS TO FIRES AND PROVIDE A SAFE HAVEN FOR WILDLIFE

The best way to maintain healthy roadless areas is by establishing roads—not establishing roadless areas! Roads become firebreaks, and allow emergency equipment to gain access. Forests need to be selectively harvested. Harvested areas provide barriers to fires that would otherwise spread at a rapid rate. Harvested areas provide a safe haven for animals when fire occurs. (Individual, Cottage Grove, OR - #A23450.30100)

1488. Public Concern: The Forest Service should thin fuels.

AS NECESSARY

Roadless areas should be thinned as necessary to prevent fires, or be allowed to burn when Mother Nature starts a fire - just be sure to build a large fire break around it. (Individual, Helena, MT - #A150.30400)

What about the wilderness and parks? In most, the trees are thick and there isn’t much feed so the animals come down to the logged areas. The elk, deer, wolf, bear and lions will move—in that order so there aren’t that many animals in the wilderness. If the logger moves into an area, the elk and deer move with them. When they get deep snow in West Yellowstone, the elk, deer, buffalo and antelope come into the town of Gardner, Montana. They lay under your window of the motel, cross the street and cars have to stop for them. They walk down the sidewalk and people walk around them. Then, in the spring just before calving, they all leave town. So, if they thinned all these wilderness areas, all animals would adjust and it would be better for the people and the animals. A good environmentalist is one who takes care of the trees by thinning as well as logging marketable trees. This allows for new growth for the next generation of trees. (Individual, Bonner, MT - #A958.30530)

RACR permits thinning of small diameter trees when this is truly necessary to restore forest health and ecosystem quality. Such thinning and removal can occur in roadless areas using horses or helicopters, if deemed ecologically advisable. (Individual, Macomb, IL - #A15592.30400)

TEN PERCENT EVERY TEN YEARS

Thinning of no more than 10% every 10 years is an acceptable practice for some areas where harvesting is desirable. (Individual, Olympia, WA - #A441.30530)

YEAR-ROUND

Forest thinning should be practiced intensively, year-round. Clinton ignored three (3) studies warning to reduce National Forest fire-load build-up . . . resulting in the terrible fires of 2000.

Build roads...thin timber . . . cull constantly . . . harvest with common sense . . . consult loggers, lumber industry. (Individual, Port Angeles, WA - #A652.30530)

THIN TREES AND BRUSH LESS THAN TEN INCHES IN DIAMETER

By thinning trees and brush < 10 inches in diameter. (Individual, Penn Valley, CA - #A12007.30510)

ALLOW RESTORATION THINNING PROGRAMS

In the Intermountain West and in the Pacific Northwest, what is needed are restoration thinning programs to restore abuses caused by "local decisions" to high grade and log old growth respectively. In the area of the Northwest Forest Plan the thinning of LSRs is only 15% of annual requirements. The time window on these thinnings is a decade or two at the most. Thinning and restoration programs would take many more local jobs. The logging companies, however, covet the big fat pumpkin old trees, and the local National Forests are glad to oblige. They cut the old trees, build more roads, same old ruin more views, damage more watersheds, deceive the public with buffer strips and on and on. You cut trees in roadless areas where I hike and destroy alpine vistas I love. I'm sick and tired of this sort of local "help" which destroys my national forests. Show me that you can do some real restoration work and preserve what is left in our inventoried roadless areas and unroaded areas. (Individual, Corvallis, OR - #A13493.30130)

PILE THE BRUSH AND BURN IN THE WINTER

Roadless areas should be thinned with the brush piled and burned in the winter after the snow. The areas that are set aside for no logging should be cleaned of brush and burned. (Individual, Forest Ranch, CA - #A5944.30531)

TO REDUCE UNNATURAL FUEL LOADS IN ROADED AREAS

So we've determined that clearcuts are out, and moist or high elevation forests don't need thinned. Therefore, it is critical to understand that the entire thinning argument must be confined to the drier ponderosa pine and Douglas fir forests. Now if there is one thing the Forest Service must have learned by now, it's that they can't manage wilderness. Decades of active management through fire suppression, logging, grazing, and road-building have produced the forest health crises Western politicians are so fond of speaking of. Therefore, the Forest Service must *stay out* of roadless areas so they don't destroy those too. I recognize that past mismanagement has produced "unnatural" fire regimes, but the impact is much more intense in roaded, logged, and heavily grazed areas near roads. Therefore, I support thinning to reduce unnatural fire loads, but only in roaded areas. Roadless, wild forests still have the most natural fire regimes in the forest and active management will only muck things up. New forest plans must allow natural fires to burn through wild forests in order to restore natural fire regimes and abandon their war-like attitude toward natural fires. (Individual, Pullman, WA - #A6234.30530)

Protecting Forests. The inventoried roadless areas should be managed with no additional roads allowed. Any timber harvest should use roadless methods only. Precommercial thinning should be encouraged as long as slash is disposed of, otherwise increased fuel loading will exacerbate the already critical situation. Prescribed fire should be utilized wherever it is safe to do so. (Individual, Salmon, ID - #A8830.30100)

Except perhaps for lightning fires, fires are more likely to begin in populated, developed, and disturbed areas. Fires don't usually cause devastating damage in roadless areas due to water retention of large trees, multi-layered canopies so fires don't often burn the tree crowns, and because there is no logging slash, further drying by herbicide spraying, or pioneer brush and conifer plantations in the area because roadless areas are quite undisturbed. Most of the very serious damage done to ancient forest/roadless areas by fire are due to firestorms which enter these areas from over-managed areas in the region. So, appropriate brush management and targeted trimming and thinning in the urban/wild interface is the key. Plans to thin currently roadless areas will INCREASE rather than decrease FIRE RISK in those areas and in adjacent areas!!! (Individual, Los Angeles, CA - #A17161.30430)

IF STUDIES INDICATE THINNING IS BENEFICIAL

Selective thinning of small diameter trees and brush may be appropriate in areas of high fuel buildup. Scientific studies are in process to see if this procedure is helpful. Widespread thinning should not take place until the results of scientific studies indicate that this is a beneficial process. (Individual, Gallatin Gateway, MT - #A19100.30530)

WITHIN A HALF MILE OF MAJOR DEVELOPED AREAS

Limited thinning of trees within a half mile of major developed areas might be acceptable, if the thinning is done to lower fire risks and not to provide logs for the timber industry. It's ridiculous to log generally throughout the forest to "protect" developed areas. That's simply another logging-oriented scam. Another major natural event which should be considered is protecting private property and streams from land and mud slides caused by logging activities, such as those which occurred in the Bitterroot last summer. That means keeping logging activity off steep hillsides, including such oxymorons as erosion preventing logging and other erosion causing activities. (Individual, Libby, MT - #A14047.30530)

IN THE URBAN INTERFACE AREA

The only forests that should be intensively managed (thinned) are those on the urban-natural fringe. Only employ thinning on the boundary (within a mile or so) of private structures. (Individual, Hampton, VA - #A16453.30530)

IN WILDERNESS AREAS

After logging, the grass comes in and grows feed for the animals and a new crop of trees come up. But this only lasts for so many years. The new trees get so tall and shade the grass and then the grass dies. So the grass is gone. Then, the animals move to a new logged area. So everything goes hand in hand. Trees that grow up with space around them have branches from the ground up. Therefore, the tree has lots of taper. The trees that grow close enough together to shade the lower branches, the lower branches die. These trees have a lot less taper. If the wilderness were logged and thinned out, there would be better feed for the animals and it would be better hunting. And, there would be roads to care for the forest. (Individual, Bonner, MT - #A958.30100)

1489. Public Concern: The Forest Service should allow firewood collection.

TO REDUCE FUEL LOADS AND FIRE HAZARDS

Try to have firewood seekers remove the fallen trees first, reducing fuel for forest fires! (Individual, Laramie, WY - #A7315.30510)

Do not close existing roads!! Allow for private citizens to cut firewood! This helps keep fuel load down. (Individual, Fillmore, UT - #A11442.30510)

Firewood permits should be given free to the public in areas where dead trees pose wildfire dangers. Local convicts can cut firewood for the elderly and disabled. (Individual, Prairie City, OR - #A15474.30510)

And there should be more open options on firewood gathering of dead and/or fallen timber. This in itself would assist in the removal of wildfire ground fuel and would be of help in fighting forest fires. (Individual, No Address - #A29887.30510)

Species and spacing uses mechanical methods or prescribed fires to thin thick stands of less drought-tolerant, less insect-resistant species. Fire must only be used after thinning and reduced fuel loadings have created enough areas or strips across the landscape so that catastrophic fires are less likely. It is critical to prioritize species and spacing the fuel reduction work. Roadless areas represent the lowest of all priorities and least appropriate areas for this kind of work for many reasons. (Individual, Olympia, WA - #A20849.30500)

ALLOW FARMERS, RANCHERS, AND LOW-INCOME PEOPLE TO HARVEST, AT NO COST, DISEASED, DAMAGED, OR EXCESS TREES FOR FIREWOOD RATHER THAN USING CONTROLLED BURNING AS A FUEL REDUCTIONS TOOL

There must not be any more controlled burns. If the forest gets too thick, twice a year the Forest Service should go in and plainly mark all diseased, damaged or excess trees. This should be done when the snow melts and before it flies again. Farmers, ranchers and poor people should be allowed in to cut free firewood under the supervision of the Forest Service. Or the Forest Service should do it themselves. This will cost some money, but it's cheaper than fighting a huge conflagration. If you cut it and gave away free firewood that would promote good will. (Individual, San Diego, CA - #A1614.30000)

Management is the key to forest problems. Right now the Forest Service personnel are so busy doing paperwork they don't have time to go out and manage the Forest areas that need help. Look at the fires all over the West in the past several years. All that wood is burned up - it might have been used for something? My elderly neighbor who can't afford too much now can't get the wood she has gotten in the past because of restrictions in the Manti LaSal National Forest. (Individual, Spring City, UT - #A21137.30100)

1490. Public Concern: The Forest Service should allow hand removal of woody debris and small diameter understory trees.

Inventoried roadless areas should be managed using site-specific analysis. Fire and fuels treatment methods should be used that protect the roadless values while also reducing the fire hazard. Methods such as hand removal of woody debris, prescribed fire and preferably hand-removal (rather than mechanical) of small-diameter understory trees can be used on a site-specific basis to deal with both fire hazards (restoring a low-intensity fire regime) and forest health issues. (Individual, Pearblossom, CA - #A28121.30400)

1491. Public Concern: The Forest Service should create defensible fuel zones.

WITH PROFITABLE TIMBER SALES CONDUCTED WITH OVER-THE-SNOW EQUIPMENT

Break up the damned fuels! Sure, the interface fuels are first priority, but here on the FNF [Flathead National Forest], despite a request from the community, staff hasn't even begun scoping on a fuels management strategy for the forest. There are drainages out there with such severe fuel and disease vectors that heavy management **MUST** be started with an eye toward creating defensible fuel zones. If these zones can be created with profitable timber sales conducted with over-the-snow equipment, it should be done, and done yesterday. (Individual, Whitefish, MT - #A13242.30510)

Do Not Allow/Restrict Timber Removal

1492. Public Concern: The Forest Service should not use forest health as an excuse to remove timber.

DO NOT CLAIM HARVESTING IS NEEDED TO REDUCE INSECT INFESTATION

Insect infestation is not an excuse to log. Insect infestation tends to occur in forests that are not healthy. Forests that have been fragmented by roads, reduced by logging and weakened by grazing have less chance of combating an alien insect invasion. Healthy, intact forests are very resilient and generally do not have a problem with insects. (Individual, Sequim, WA - #A4527.31210)

DO NOT CLAIM HARVESTING IS NEEDED TO REDUCE FUEL BUILDUP AND UNDERGROWTH

Fire and insects are a natural part of the forest ecology. Insect and disease outbreaks have been increased as a result of past logging replaced by genetic monoculture. Forests are at their strongest when they are left alone. Forests that have been logged in the past often do have dense undergrowth which is prone to causing more intense fires. This is not 'hazardous fuels'. Instead it is the natural progression of forest ecology. Old growth forests are much more bug and fire resistant than second growth forests that have never been previously logged and therefore dense undergrowth should not be an issue. Clearly, this is a

public relations attempt to promote cutting the trees to save them. (Individual, No Address - #A6761.30100)

Another paradox: applying effective fire suppression/exclusion results in an increase in fuel hazards and potential fire severity, and a decrease in biological diversity and ecological integrity. The forests most in need of vegetation and fuels treatments to reduce fire hazards, insect and disease outbreaks, and restore biological diversity are not roadless areas, but rather, areas that have already been roaded and logged. Building roads allegedly for the purpose of “forest health restoration” or “fire hazard reduction” only makes sense if mechanical thinning as a tool for fire hazard reduction is highly controversial, scientifically unsubstantiated, and fundamentally experimental in nature. Unfortunately, it appears that mechanical thinning is becoming yet another euphemism for industrial-scale commercial logging—one of the prime management activities that degrade ecosystems and cause forest health/fire hazard problems.

In some instances, it has been demonstrated that commercial thinning treatments intended to reduce fire hazard have actually had the opposite effect. Although gross tonnage of fuels may have been reduced, there has been a net increase in hazardous fine fuels accumulating on the surface and available for burning—primarily logging debris or “slash.” Also, changes in microclimate from tree removal serves to increase solar radiation and wind penetration, which in turn increases site flammability following thinning treatments. (Organization, Eugene, OR - #A21798.30500)

1493. Public Concern: The Forest Service should prohibit timber removal.

BECAUSE TIMBER REMOVAL INCREASES FIRE SEVERITY

Opponents will also claim that the roadless policy will impede the ability to control wildfires. The catastrophic and unnatural wildfires in the western states this past year were due primarily to a bad drought, past wildfire suppression activities, and past timber and grazing practices. Many scientific assessments have [blamed] commercial logging [for] an increase in wildfire intensity and severity. In a report to Congress, the Sierra Nevada Ecosystems Project stated, “timber harvesting through its effects on forest structure, local microclimate, and fuels accumulation has increased fire severity more than any other recent human activity”. The ecosystems of the roadless areas are more resistant to catastrophic and unnatural wildfires than the intensely managed and altered ecosystems of roaded areas. (Individual, Pittsburgh, PA - #A5752.30430)

The new scam about needing roads and logging to protect the world from forest fires is simply another deception cleverly contrived by Forest Service policy makers. It’s obviously designed to justify logging and road-building where it should not be, just as the pine beetle and other insects have been your blank check for massive mayhem over the past 3 decades.

Once again, let me be clear: logging is logging. It’s not fire prevention. **STAY OUT OF ALL ROADLESS AREAS, PERIOD.** In fact, many existing roads should be obliterated, allowing increases in the size of appropriate and justifiable roadless areas. That would be fair. (Individual, Libby, MT - #A8346.30100)

Conservation and taxpayer groups have urged the Forest Service and policy makers to adopt the following recommendations: . . . Prohibit the use of commercial timber sales for hazardous fuels reduction projects. Commercial logging removes the most ecologically valuable, fire-resistant trees, yet leaves behind highly flammable small trees, brush, and logging debris. The financial incentives for abusive logging under the guise of “thinning” must be eliminated; (Organization, Portland, OR - #A12004.30400)

PROHIBIT COMMERCIAL TIMBER REMOVAL

Prohibit the use of commercial timber sales for hazardous fuels reduction projects. Commercial logging removes the most ecologically valuable, fire-resistant trees, yet leaves behind highly flammable small trees, brush, and logging debris. The financial incentives for abusive logging under the guise of “thinning” must be eliminated. (Organization, Santa Fe, NM - #A22092.30520)

1494. Public Concern: The Forest Service should prohibit even age management.

Lower canopy fires are necessary for a productive forest: hazardous fuels do need to be dealt with in a responsible manner, this means no clearcutting or cutting resembling clearcutting in any way. (Individual, Akron, OH - #A17697.30100)

BECAUSE IT INCREASES WILDFIRE RISK

The primary argument against protection of roadless areas is threat of wildfire, and hence the need for logging to reduce wildfire risk. However, it's important to dissect this argument. First, clearcutting greatly enhances wildfire risk. Clearcutting removes the largest and most fire resistant trees, increases wind and solar radiation by removal of canopy, disturbs soil moisture holding capacity, leaves highly flammable layers of slash on sun-baked forest floors, disturbs the genetic, age, and species structure of the forest, and guarantees a monoculture future of young, dense, skinny trees. So clearcutting is obviously out, and we must be talking exclusively about thinning. (Individual, Pullman, WA - #A6234.30400)

First, no massive clearcuts. Such destructive logging practices make forests especially vulnerable to wildfires (clearcuts burn very hot) and disease by upsetting what had been a dynamic, healthy, balanced ecosystem. Do not let timber corporations do the job of forest "management", because environmentally-destructive, industrial-strength logging. (Individual, Bozeman, MT - #A27944.30100)

BECAUSE THE BROKEN MOSAIC BOUNDARIES OF CLEAR CUTS INCREASE THE MORTALITY OF BENEFICIAL SPECIES AND ALLOW INSECT ENCROACHMENT ON SURROUNDING AREAS

Broken mosaic boundaries of logging clearcuts increases mortality of all beneficial species and allows insect infestation to encroach on the surrounding forested boundaries. (Individual, Nampa, ID - #A5378.31200)

1495. Public Concern: The Forest Service should prohibit salvage removal.

As far as authorizing "emergency" salvage sales to control insect and disease outbreaks, or for storm damage, I am totally opposed to these actions! (Individual, Clemson, SC - #A26858.30100)

Nor should there be logging by any method to fight fires or to detect or prevent insect or disease outbreaks. Nor should there be salvage logging after a fire; salvage logging exacerbates the damage done by a fire. (Individual, Salem, OR - #A13948.30100)

The practice of salvage logging is highly controversial and cannot be scientifically justified. "The value of salvage sales as ecology therapy is extremely questionable. By removing most of the coarse organic debris from the site, salvage sales actually abort natural healing processes, instead of aiding them." (Jeffrey St. Clair 1991) IN 1976 Congress created a revolving fund for salvage sales as part of the National Forest Management Act. The Forest Service can funnel all of the receipts from salvage sales back into the salvage sale fund where it can be used to design and build roads, and prepare and administer new salvage sales. Of course the agency is also permitted to keep a large slice for overhead, often totaling nearly 50 percent of the sale's bid value. Since the Forest Service can keep 100 percent of the receipts of salvage sales, almost all sales are by definition below-cost." (Jeffrey St. Clair) "Salvage sales often cost more than the revenues they can generate, because the sales are net cash generators, because one hundred percent of the receipts are deposited in the fund for preparing and administering future salvage sales," (Congressional Research Service, 1994) "Management activities that reinforce negative effects or undermine positive effects of fires must be avoided if streams are to recover. In particular management activities that add to the risk of increased sedimentation or that remove ecologically important large wood from the watershed present a substantial and long-term threat to the recovery of streams. In this regard, logging and roadbuilding represent one of the most significant forces threatening to retard streams and watershed recovery." (Letter from five ecology professors to President Clinton on post-fire salvage logging). "The extent of a forest fire depends more upon the moisture content of live and dead fuel at the moment of ignition than it does on the amount of fuel accumulating on the forest floor. Wind speed also plays a critical role. In fact, three of the biggest fires of 1994, Tye,

Boise River and Blackwell, burned hottest and fastest in previously logged areas.” (Ron Mitchell, Idaho Sporting Congress, 1995) (Individual, Roanoke, VA - #A23081.30100)

Fire is also an integral part of the forest ecosystem; it is the Forest Service’s long-term policy of fire suppression has resulted in forests with uncharacteristic fire potential. Fires in roadless areas must be allowed to burn to prevent catastrophic fires in the future. While portrayed as a means of preventing fire, logging an area actually increases the likelihood of higher intensity fire in that area. Logging cannot mimic fire because it is a fundamentally different process than fire. In addition, in terms of ecological destruction, logging has more severe and long-lasting deleterious effects on soils than fire; this in turn leads to adverse impacts on aquatic habitat and the forest ecosystem as a whole. This is particularly true of “salvage logging” on previously burned areas. Logging and road construction in roadless areas will not prevent these and other areas from burning, but it will certainly eliminate roadless areas as anchors and refugia for fish and wildlife. Similarly, salvage logging will not prevent additional future fire and only exacerbates the impacts from fire, impeding the forest’s ability to heal. Salvage logging or any post fire fuel reduction should not be allowed should a fire occur in a roadless area. (Executive Director, Inter-Tribal Fish Commission, Portland, OR - #A20331.30300)

The Bitterroot National Forest has recently claimed that their risky and unproven post-fire salvage logging proposal in burned areas there will reduce the risk of future wildfires - while at the same time the Forest Service talks about the need to restore fire into these fire-dependant forests. Numerous scientific studies have found that post-fire salvage logging hinders a forest’s natural recovery process and has no ecological benefits. For example, a recent scientific report, “Wildfire and Salvage Logging,” states that while “there is little reason to believe that post-fire salvage logging has any positive ecological benefits? there is considerable evidence that persistent, significant adverse environmental impacts are likely to result from salvage logging.”

Furthermore, science does not support the Forest Service’s claim that post-fire logging will reduce the possibility of a reburn. A 2000 Forest Service report found “no studies documenting a reduction in fire intensity in a stand that had previously burned and then been logged.” (Individual, Staunton, VA - #A30027.31100)

1496. Public Concern: The Forest Service should prohibit thinning.

IN MOIST OR HIGH ELEVATION FIR, HEMLOCK, SPRUCE, AND CEDAR FORESTS

Now, thinning is needed to counteract nearly a century of fire suppression conducted by the Forest Service. However, 100 years without fire is well within the natural range of variability for moist or high elevation fir, hemlock, spruce, and cedar forests. These moister forests are actually adapted to high intensity fires. Due to their high moisture levels, these forests only burn during seasons of great drought, which of course produce catastrophic wildfires. Thus, Forest Service fire suppression over the past several decades has likely had little impact on these moist forests so thinning is not necessary. (Individual, Pullman, WA - #A6234.30530)

BECAUSE THINNING TO REDUCE OVERGROWN FORESTS IS COST PROHIBITIVE

The subject of “Forest Health” can fill volumes. Most thoughtful people who have taken the time to ascertain the condition of the forests in the Southwest Region conclude that the forest is generally overgrown, prone to cataclysmic fire events, and unhealthy. The trees in the LNF are especially stressed due to the overgrown condition. Excessive mortality of trees due to bark beetle attacks and mistletoe incidence are the rule rather than the exception. The question then arises as to what to do to improve the health of the forest?

Thinning is cost prohibitive. Estimated costs often exceed \$1000 per acre. (Individual, Ruidoso, NM - #A17775.30100)

BECAUSE SILVICULTURAL ACTIVITIES DO MORE HARM THAN GOOD

Silvicultural activities will do more harm than good and are an excuse to high-grade these forests, making them more fire prone. Removing brush and small diameter trees is a money-losing proposition

and will create a higher fuel load in slash and brush re-growth from increased sunlight. The fire integrity of the forests will decrease even further if high-grading is done to pay for the removal of the low-grade, high fuel load materials. This integrity will be further compromised by the continuing maintenance costs once silvicultural activities are started and the fact that ten to twenty or so years from now when future maintenance is required there will be even fewer trees and even more brush and dog-hair, an even higher cost proposition to deal with. Just as with the \$10B road maintenance backlog, a similar and larger backlog will develop in maintaining these forests in a “low-fuel-load state”. This whole situation is a tar baby that once started will be rued and paid for by future generations. (Individual, Corvallis, OR - #A8027.30100)

BECAUSE ROADLESS AREAS SHOULD NOT BE DISTURBED

As the original rule stands, roadbuilding for fire control and forest health is allowed, which is reasonable in case of emergencies. However, the best management of roadless areas, in response to question three, is to leave them roadless and not disturb them, even for seemingly good things such as “forest thinning” for “fuel reduction” or insect control. (Individual, Bethesda, MD - #A16909.30100)

Fire Management

Summary

General Comments – A number of people comment on the topic of fire management and believe that it should be addressed in a national roadless rule. Several respondents urge the Forest Service to address fire management relative to the national fire plan, the interagency fire policy, and the federal/state strategy. One individual suggests that the Forest Service review the recommendations of the General Accounting Office on reducing wildfire threats and take immediate action. Additionally, one association requests the Forest Service consider that national grasslands are also at risk of fire.

Others suggest the Forest Service implement various fire policies such as the 1995 Wildland fire policy, the national fire strategy, and the national fire plan. Several respondents add that the Forest Service should change traditional Smokey the Bear fire suppression policies. Others request that the Forest Service work with other public land management agencies—including the National Park Service and the Bureau of Land Management—to set sound, consistent policies for fire management.

Adequacy of Analysis – Respondents comment about the analysis of fuel management, and the impacts and risks of wildfire. People ask the Forest Service specifically to consider that roadless areas do not have a higher risk of wildfire; that there is no causal link between uncontrolled wildfires and the presence or absence of roads; that the majority of roadless areas are not situated in areas of high fire risk; and that fire frequency increases as road density increases. One individual asserts that the Forest Service should conduct more studies about how to control fires, including controlled burns. Others ask the Forest Service to consider various contributing factors to fire severity and intensity such as human activity, wind, weather, slash piles, and tree species.

One individual requests that firefighting practices be evaluated. Others request that the Forest Service analyze the appropriateness and need for prescribed fire, the effectiveness of restoration projects, and the need for effective vegetation management on the national grasslands. Additionally, people ask the Forest Service to evaluate the impacts of no management versus the impacts of roading or other management activities; to conduct ecological assessments for all fuel reduction projects; and to categorize inventoried roadless areas in accordance with fire regime, condition class, vegetation, and risk of disease.

Funding – Several respondents believe the Forest Service should reevaluate the costs and funding associated with fire management. Suggested costs and funding to be analyzed include fire suppression costs, controlled burning funds, and firefighting funds. A few people assert that tax dollars should not be used to fund firefighters and their equipment that are brought in from distant places rather than the local area, or for fire suppression and timber removal in remote areas located far from residents. One business remarks that the Forest Service contract with an independent organization to analyze expenses associated with fire management if roads are destroyed. At the same time, an individual suggests the Forest Service provide funding to conduct controlled burns and non-commercial thinning, and ensure that emergency funds are spent in areas where wildfire truly threatens communities. Finally, one individual recommends that the Forest Service take legal action against organizations which have blocked fuel load removal in order to recover costs for fires that have resulted from such lack of action.

Education – Several people suggest that the Forest Service educate the public about fire safety; about the reasons for controlled burning; about the role of fire and disturbance in forests; and about what is needed to support firefighting efforts.

Management – A number of respondents assert that the Forest Service should actively manage forest resources to prevent fires and reduce fire hazards. To that end, people suggest a number of fire management strategies, including monitoring and grazing. One county commissioner suggests that the Forest Service should control fire size and frequency on public lands to approximately that of pre-settlement conditions by reducing fuel loads. Reducing fuel loads, numerous people suggest, can be accomplished through prescribed and controlled burning—in areas outside of wilderness or roadless areas, in forests which border communities, in late fall, every four to five years, or at low-risk times of the year. Some recommend carrying out prescribed burns only after preventative steps to reduce fuel loads are taken, such as harvesting, thinning, and grazing; and using techniques that adhere to local fire management plans and that contain monitoring provisions to assess the usefulness of the burns.

Others request that the Forest Service construct firebreaks—by using roads as firebreaks; by decommissioning some roads and managing the remaining as a defensible perimeter against wildland fire; by clearing dead timber and thinning stands next to private property to an appropriate width; by creating a boundary around roadless areas with multiple use, motorized trails; or by maintaining fire lanes but closing them to all but foot traffic. One special use permit holder suggests allowing ski areas located on the fringes of roadless areas to help provide defense zones which allow for development while decreasing fuel loads. Others recommend maintaining existing fire trails.

Some people also assert that the Forest Service should suppress forest fires. One individual states, “Protecting forests is something you know nothing about, or the let burn policy in Yellowstone would never have been followed. First put fires out as soon as possible before they get out of control.” Suggestions for suppressing forest fires include using chemicals, allowing fires to burn to a certain landscape feature before suppressing them, and enlisting military aircraft converted into water tankers. Some say the Forest Service should concentrate firefighting efforts in urban interface areas because these areas are already roaded and pose the greatest threat to life and personal property (see also the subsequent main section on protecting communities). Finally, some recommend that the Forest Service specify the criteria under which the Roadless Area Conservation Rule exceptions would apply for management activities needed to reduce the threat of wildfire.

Others assert that the Forest Service should acknowledge that wildfire is a component of a healthy forest. These people state that fires should not be suppressed—because natural fire maintains diverse forests and wildlife habitat; because fire rejuvenates ecosystems; because firefighting is a waste of money, dangerous, and harms the environment; and because dead timber is a critical part of the forest ecosystem. These respondents say that fires should only be suppressed under certain conditions—in the event of insect or disease infestation that is uncontrollable by natural means, or in the event the fire is human-induced.

Others believe that fire should be reintroduced into forest ecosystems. According to one organization, “The most effective fuels treatment that would both protect roadless areas from future severe fires [and] insect and disease outbreaks while at the same time [restore] areas altered by past fire exclusion would be a program of prescribed burning and wildland fire use. Fire reintroduction has been the longstanding call among scientists, ecologists, and conservationists. It is the most ecologically beneficial and least economically costly management treatment to manage roadless areas.” A few people request that the Forest Service avoid artificial fires, backburning, and prescribed burning. Finally, one individual urges the Forest Service to allow a categorical exemption for restoring burned areas, including needed road building, salvage logging, soil preparation, seeding, planting, riparian restoration, and follow-up work to help the survival of seedlings.

Fire Management General

1497. Public Concern: The Forest Service should address fire management.

BECAUSE FIRE IMPACTS REGIONS DIFFERENTLY

The effect of fire on the inventoried roadless areas as stated on page 3-41 of the DEIS, overlooked the fire patterns in the various physiographic regions. As a result of this variation, forest fires disproportionately impact the intermountain and eastern Oregon lands more than other areas. In eastern Oregon these fires have had catastrophic environmental impact on the roadless areas. Any roadless policy needs to address fire management. (Elected Official, Roseburg, OR - #A17667.30400)

1498. Public Concern: The Forest Service should address fire management in a national roadless rule.

RELATIVE TO THE NATIONAL FIRE PROGRAM

The DEIS (3-12) also noted that under the proposed action an increase in fire suppression costs will occur as a result of increase in fire size and frequency. With the history of major catastrophic fires in eastern Oregon associated with roadless, natural areas, and the Wilderness areas, it is our position that the proposed roadless management strategy is not well advised. If it is adopted, then we strongly recommend that clear direction be incorporated relative to fire response activities and the national fire program. (Elected Official, Roseburg, OR - #A11811.30410)

RELATIVE TO THE FEDERAL INTERAGENCY WILDLAND FIRE POLICY, THE NATIONAL FIRE PLAN, AND THE 10-YEAR FEDERAL/STATE STRATEGY TO ADDRESS FOREST ECOSYSTEM HEALTH

This is a question that should be answered through planning at the forest level, but with some guiding principles at the national level. These guiding principles can easily be gleaned from the federal interagency wildland fire policy, the National Fire Plan, and the 10-year federal/state strategy to address forest ecosystem health in the West. Human intervention to minimize wildfire risk should be prioritized at the urban/wildland interface, but not at the expense of ignoring threats to private property from wildfires in roadless areas. Considering fuel buffers between roadless areas and private property is appropriate, but such strategies should be developed at the local level. (Association, Washington, DC - #A17887.30100)

Regarding protection from the buildup of hazardous fuels and severe wildfires, the Forest Service should continue to implement the National Fire Plan (NFP) and periodically evaluate and adjust the plan. The NFP contains a comprehensive 10-year strategy that includes fire fighting, rehabilitation and restoration, hazardous fuels reduction, community assistance, research, and accountability. The Forest Service has made addressing wildland fire in the urban-wildland interface a priority and this should continue. (Federal Agency, Washington, DC - #A28843.30410)

BECAUSE THE EFFECT OF FIRE VARIES BY AREA

The effect of fire on the inventoried roadless areas as stated on page 3-41 of the DEIS, overlooked the fire patterns in the various physiographic regions. As a result of this variation, forest fires disproportionately impact the intermountain and eastern Oregon lands more than other areas. In eastern Oregon these fires have had catastrophic environmental impact on the roadless areas. Any roadless policy needs to address fire management. (Elected Official, Roseburg, OR - #A11811.30400)

Management of healthy forests can occur without roads -- by definition that has historically been the case in the proposed areas. Fire management is complex and very situation dependent. Making a blanket statement on how to protect resource values and homes from wildfire is not possible. Clearly, local managers will need to retain some ability to make decisions based on resource values, knowledge of current fire ecology, location of private property, fire crew and public safety, weather, and a host of other factors, but this flexibility is included in the proposed initiative. (Individual, Seattle, WA - #A17843.30100)

1499. Public Concern: The Forest Service should review the recommendations of the General Accounting Office on reducing wildfire threats and take immediate action.

I believe that the recommendations of the GAO [general accounting office] on Reducing Wildfire Threats should be reviewed and actions immediately taken in the interest of protecting lands. Fire suppression has not worked and has backfired with devastating consequences. Taxpayers for Common Sense also published From the Ashes noting that untouched forests have the greatest resiliency and harvests promote fires. (Individual, Olympia, WA - #A20844.30400)

1500. Public Concern: The Forest Service should consider that national grasslands are also at risk for fire danger.

BECAUSE FIRES THREATEN HOMES, RANGE IMPROVEMENTS, OIL AND GAS STRUCTURES, VEGETATION AND WILDLIFE HABITAT, AND OUTLYING FARM AND RANCH STRUCTURES

The agency myopia regarding fire on the National Grasslands is also confirmed in the Roadless Administrative Record. There the Forest Service rates the National Grasslands as low for fire risk, although more than 60,000 acres burned in less than two days. The fire damage risk is greater in North Dakota, because there are many homes, range improvements, and oil and gas structures also located on the National Grasslands. A fire will not just burn vegetation and wildlife habitat, but could ignite oil pipelines, burn homes and outlying farm and ranch structures, and range improvements. (Organization, Denver, CO - #A21358.30400)

1501. Public Concern: The Forest Service should prohibit fires in dry areas.

Local forester input would be very useful on this subject, prohibitions should be established that would best protect depending on the potential risk of damage to a particular area, i.e. no fishing in endangered species areas, fire bans in dry areas, no bikes in erosion prone areas, etc. (Individual, No Address - #A8998.90000)

BAN OUTDOOR BURNING WHEN THERE IS A LACK OF MOISTURE

We think outdoor burning, such as county fire bans, should be enforced earlier when there is lack of moisture. (Individual, Bayfield, CO - #A13395.30400)

1502. Public Concern: The Forest Service should consider that the Roadless Area Conservation Rule will not likely result in an increase of wildfires in California.**IN ADDITION, CONTINUED IMPLEMENTATION OF THE NATIONAL FIRE PLAN AND THE CALIFORNIA FIRE PLAN WILL INCREASE PROTECTION OF FORESTS AND COMMUNITIES**

Protecting forests and communities—CDF knows these two goals as interconnected. The Rule as adopted on January 12, 2001 provides adequate authority for CDF and the USFS to take the steps necessary to protect forests, communities, and public safety from wildfire and other natural disasters. CDF is pleased that the Rule responded to our concerns in this area, especially by creating flexibility for the Forest Service to construct new fire roads and reduce fuels with tree removal and other means when needed (see Section 294.12(b)(1) and Section 294.13(b)(1)(ii)).

CDF's experience has shown that more than 90% of wildfires are caused from human ignitions. Therefore, the Rule will not likely result in an increase of wildfires in California. In addition, continued implementation of the National Fire Plan, in conjunction with the California Fire Plan, will increase protection of both forests and communities, especially those in the urban-wild land interface. (State Agency, Sacramento, CA - #A18110.30400)

*Fire Management General – Management Strategies***1503. Public Concern: The Forest Service should implement various fire policies and plans.****IMPLEMENT THE 1995 WILDLANDS FIRE POLICY**

Issue #A1, The 1995 Wildlands Fire Policy is being Ignored. I repeatedly read about and have seen in the field first hand, our non-function natural processes that have resulted from aggressive wildfire suppression efforts over the last 40 years. I am reminded of this issue by the tragic accident that occurred on the Thirtymile Fire. In our area of the Northern Rockies, we are located in a fire adapted ecosystem where fire performs beneficial ecological functions. In spite of this, we aggressively suppress all fires, in all places, under all conditions.

We spend billions of dollars and put people in harms way each year for what reason? What are we trying to protect? There are a few times when we should proceed with initial attack on a fire start. There are many, many more times when we should allow fire to assume its natural role and monitor its behavior. In spite of the 1995 Federal Wildlands Fire Policy, such an evaluation and fire planning prior to initial attack is never occurring. I am certainly not advocating a 'let burn' policy, but true proactive fire management.

Any ecologist can clearly show why all wildland fire is not bad. Certainly we do not wish to see public inhaling structures damaged by fire. We know there are very effective ways to treat nearby such structures in the defensible zone to reduce risk.

The fire organization has evolved over the years to take on a culture of their own. Many do not work well with or listen to other resource specialist's needs. You ask a fire manager if it was a bad fire year, and their reaction might be 'yes it was bad, there were no big project fires.' Too much emphasis is placed on the fire excitement and overtime, and not enough on what is best for the firefighter's safety, or the resource needs.

I know this is a very sensitive issue. The recent tragic deaths of four young firefighters in Washington State is terrible. As you know, much has been written in the media about firefighter experience and tactics related to this incident. The media is playing the blame game.

I read all the related articles hoping to find the real questions asked and answered. Only now, have these questions been asked. It is unfortunate that the questions (see the Portland, Oregonian article enclosed) were asked by Andy Stahl representing FSEEE. It is too bad these questions were not asked by the USFS. For what reason were these firefighters in that location and what were they attempting to protect? What in the area was so valuable as to justify risking human lives to protect it?

National direction is desperately needed now!! (Individual, Grangeville, ID - #A1578.30410)

IMPLEMENT THE NATIONAL FIRE STRATEGY

The Forest Service under the Bush Administration should maintain the roadless rule as written. Hopefully this administration will focus its attention upon implementing the National Fire Strategy and protecting human communities in the urban/wildland intermix in the American West. Reducing forest fuels and restoring forested landscapes for future generations is critically important to the American people and to the credibility of the Forest Service. It is not the time to be fighting over logging roadless land such as the Tongass or in California but a time to work collaboratively on solving the wildfire risks to our national forests and communities. We urge you to support the Roadless Area Conservation Rule and protect these pristine areas as roadless. (Organization, Placerville, CA - #A22653.10150)

IMPLEMENT THE NATIONAL FIRE PLAN

Full implementation of the National Fire Plan must be the land management direction for the next ten years on national forests. Until the hazardous fuel conditions are adequately corrected through various fuel reduction or forest restoration projects, no further restrictions should be imposed on management practices or access to any national forest lands. Every effort must be made to work with communities and adjoining property owners to resolve the hazardous fuel problem in the shortest and most efficient time period possible. (Professional Society, Chico, CA - #A29719.30410)

Only through the implementation of a National Fire Plan through cooperative efforts like the County Fire Safe Councils, will hazardous fuel get reduced across the total landscape and watershed of the west. (Professional Society, Chico, CA - #A29719.30410)

Building upon these thoughts, the success of the National Fire Plan provides an exemplary framework for roadless area value management to be based upon. There is not another issue that exemplifies this "working together" ethic that is vital and necessary for development of a successful roadless policy. Most recently the Ten-Year Strategy on how to address catastrophic wildfire threats across the country was signed by two cabinet secretaries and leading western governors. The CWSF [Council of Western State Foresters] feels that the Forest Service should seriously consider collaborating with stakeholders at local, state and national levels according to the process developed and recommended within the Ten-Year Strategy. (Professional Society, No Address - #A29920.30410)

1504. Public Concern: The Forest Service should change traditional Smokey the Bear fire suppression policies.

TO SOLVE WILDFIRE PROBLEMS

The Roadless Rule is based on scientific information that roadless areas are in fact the most resistant to severe wildfires, insects and diseases. Changing the Forest's traditional Smokey-the-Bear fire suppression policies will do more to solve severe wildfire problems than any other option. (Individual, Reno, NV - #A5741.30100)

The reason that we have fuel loading problems today is that we have been suppressing fires for a century, allowing unnatural fuel buildups to occur. This has led to a dramatic increase in large and intense wildfires throughout the nation, a fact that has been well documented in a series of Congressional Research Service reports. There is a saying in Wyoming: when you find yourself in a hole, stop digging! A hundred years of Smokey the Bear got us into this mess; no amount of fire suppression will ever get us out. Instead, we need to implement a nationwide let-burn policy in all of our roadless areas, to allow natural cycles of small, low-intensity fires to return on our forests. (Individual, Laramie, WY - #A10590.30310)

Forests are dynamic entities not static objects, hence they can be managed by never preserved. Overcoming the impact of 100 years of Smokey Bear fire control is not only desirable, but also necessary. VERY careful and limited controlled burning has a place and so does road building and logging. Stands to remain unlogged must be placed in a condition where natural ignition can be permitted without undue

risk of catastrophic wildfire . . . No one said it would be easy. (Individual, Ellensburg, WA - #A17772.30100)

Much of the controversy surrounding management of national forest resulted from aggressive clear-cutting practices, the road building associated with those activities and Smokey the Bear fire policy that has promoted a fuel buildup that can lead to catastrophic fire. The Idaho Outfitters and Guides Association strongly recommends reconsideration of those practices and that they not be executed in remaining roadless areas unless essential for forest health. Where large tracts of trees have been destroyed by disease or weather, the agency should have flexibility to reduce fuel loads, if necessary, in these areas if the prevailing conditions present a significant threat to the ecosystem and/or surrounding communities. (Permit Holder, Boise, ID - #A29589.30100)

Inventoried roadless should be managed to protect its roadless characteristics, which includes keeping motorized vehicles and pioneered roads out. Whether or not unroaded areas are inventoried, severe forest fires happen. They happen in roaded areas too. The build-up of hazardous fuels can be addressed by changing the failed fire suppression policies. Prescribed fire, though very limited in practical use, is a desirable option. We have fire management policies in wilderness that when applied, work quite well. We have inventory and control programs for insects and disease in wilderness. Use those same policies in inventoried roadless. (Organization, Helena, MT - #A20598.30100)

1505. Public Concern: The Forest Service should specify, to the extent possible, the roadless areas in which fire reduction management exceptions would apply.

IN THE FOREST PLAN REVISION PROCESS

The current roadless area conservation rule allows for management activities to reduce threats from wildfires.

We suggest that it is the role of Forest Plan revision to specify-to the extent possible-in which roadless areas this exception would apply and the thresholds that would trigger these management activities. It would be expected that these thresholds would be different for various land units identified within GIS analyses. (Civic Group, Roanoke, VA - #A1713.30400)

Regarding the management of inventoried roadless areas to provide for the detection and prevention of insect and disease outbreaks, the Forest Service should make clear that insects and diseases are part of a healthy forest. We note the exceptions of exotic and non-native species such as the gypsy moth and believe that provisions can be made for the well-justified control of these invaders. There are also periodic epidemics of native insect and diseases that may warrant control measures. The efficacy of various pest and disease control methods should be established through research, reviewed for environmental impacts, and implemented using integrated pest management protocols on a case-by-case basis, with periodic review and evaluation. The role of insects and diseases in a natural forest ecosystem should include an assessment conducted in the early stages of plan revision or included as part of the Analysis of Management Situation of a revised plan.

The current roadless area conservation rule allows for management of insect and diseases under certain conditions. We recommend that it is the role of the Rule to determine the minimum standards which would be applied, and the role of the forest plan revision to specify, to the extent possible, in which roadless areas these exceptions would apply and the thresholds that would trigger these management activities. (Individual, Asheville, NC - #A22623.31200)

Carefully define specific national criteria for consideration of any exception in the designated areas for how management requiring roads can occur for fire, wildlife, fish, forest health, and any other legitimate need. (Individual, Galloway, OH - #A8213.30200)

1506. Public Concern: The Forest Service should work with all federal agencies, including the National Park Service and the Bureau of Land Management, to set sound and consistent policies for fire management.

IN NATIONAL PARKS, WILDERNESS AREAS, AND ROADLESS AREAS

A complaint of logging industries is that leaving tracts of land roadless leads to the possibility of destructive wildfires. However, fire is a natural element that ensures the health of forest ecosystems. Exceptions include situations where fire puts pressure on endangered species that are already under great stress from man's activities. All Federal agencies including the National Park Service, the BLM, and the USDA Forest Service should work together to set sound and consistent policies for fire management in National Parks, Wilderness Areas, and the Roadless Areas of the National Forests. One important start is to inventory the plants and animals in the forest and the pressures on their survival. (Individual, State College, PA - #A15450.30400)

1507. Public Concern: The Forest Service should employ the same forest management strategies in roadless areas that are used to protect communities and private property from fires beginning on other lands.

BECAUSE FOREST FIRES OFTEN BEGIN ON DEVELOPED PRIVATE LANDS

If there is a correlation between the initiation of forest fires and the degree of roadlessness, the Forest Service should bring this information forward. I have seen no study that would support the contention that wildfires are more or less likely to be initiated on roadless versus public lands. In the area of the Gallatin National Forest, at least two of the dozen or so fires of the past two seasons have started on developed private lands. I would argue, therefore, that the same strategy that is employed to protect communities and private property from fires beginning on other types of land should be employed. (Individual, Bozeman, MT - #A17508.30430)

Adequacy of Analysis

1508. Public Concern: The Forest Service should evaluate wildfire risks.

CONSIDER THAT ROADLESS AREAS DO NOT HAVE A HIGHER RISK OF WILDFIRE

One of the most common arguments that have been raised by roadless area protection opponents is the fact that there will be increased wildfires if there are no more roads or logging in these areas. In the following paragraphs I have included some research that proves the fact that roadless areas do not have a higher risk of wildfire.

Throughout the Northern Rockies, many logging activities are justified as a means of controlling potential future wildfires, as a means to reduce build-up. Wildfire is controlled by other factors other than just fuels build-up or vegetational age. In fact, weather and climate are the most important factors.

Logging generally removes the larger trees, leaving the small fine fuels, which are very good at carrying a fire. Logging simply changes the intensity of fire in a stand of trees, not its spread from stand to stand. Logging does little to stop fire spread, rather it just changes the intensity.

A Forest Service report, "Forest Resources of the United States" (1994), revealed that tree mortality in the West due to both fire and disease increases in logged areas. The worst rate were on private lands where logging levels are highest and where the least natural forest remains. For example, in western forests from 1986-1991, mortality due to fire and disease on private lands increased 20 percent, while it increased only 3 percent on National Forests and decreased 9 percent on other public lands.

"Fires in unroaded areas are not as severe as in roaded areas because of less surface fuel, and after fires at least some of the large trees survive to produce seed that regenerates the area. Many of the fires in unroaded areas produce a forest structure that is consistent with the fire regime, while the fires in the roaded areas commonly produce a forest structure that is not in sync with the fire regime. Fires in the roaded areas are commonly more intense, due to drier conditions, wind zones on the foothill/valley

interface, high surface fuel loading, and dense stands.” (Evaluation of EIS alternatives by the Science of Integration Team, ICBEMP, page I-281)

“Logging areas generally showed a strong association with increased rate of spread and flame length, thereby suggesting that tree harvesting could affect the potential fire behavior within landscapes. As a by-product of clearcutting, thinning, and other tree-removal activities, activity fuel creates both short- and long-term hazards to ecosystem. Even though these hazards diminish over time, their influence on fire behavior can linger for up to 30 years in dry forest ecosystems of eastern Oregon and Washington.” (Huff, M.H., R.D. Ottmar, E. Alvarado, R.E. Vihaneck, J.F. Lehmkuhl, P.F. Hessburg, and R.L. Everett. 1995. Historical and current landscapes in eastern Oregon and Washington. USDA Forest Service Pacific Northwest Research Station Gen. Tech. Rep. PNW-GTR-355.) (Organization, Bozeman, MT - #A15467.30511)

The existing Roadless Rule presently accounts for protection of public and private lands from severe wildfire and insect and disease outbreaks. This is accomplished through the Rule’s exception which provides that “a road may be constructed or reconstructed in an inventoried roadless area if . . . [a] road is needed to protect public health and safety in cases of an imminent flood, fire, or other catastrophic event that, without intervention, would cause the loss of life or property.”[Footnote 9]

Despite the Roadless Rules above-cited exception, I know that many opponents of the Rule nonetheless claim with great vehemence that the Rule will greatly reduce the Forest Service’s ability to undertake fuel management and will therefore result in many terrible wildland fires on national forest land. This position, however, ignores much of the analysis contained within the Final Environmental Impact Statement. **In fact, according to the FEIS, the roadless rule will have no effect on the frequency and intensity of catastrophic fires on inventoried roadless areas.** [Footnote 10]

A necessary starting point to any discussion on how the Roadless Rule might impact fuel treatments in inventoried roadless areas in the Forest Service’s acknowledgement in the FEIS that “in inventoried roadless areas, very little fire hazard reduction work has occurred in the past and little work is planned for the future.”[Footnote 11] This is because:

Regardless of whether there is a prohibition on timber harvest in inventoried roadless areas, the highest priorities for fuel management work will continue to be on NFS lands outside of roadless areas where natural resource values or potential threats to human communities are the highest. [Footnote 12]

In fact, because of the much higher prioritization established for the treatment of National Forest Service lands that are roaded, the FEIS assumes that, across all for the Rule’s considered alternatives, including the “no action” alternative, “fire hazard reduction work would not begin in inventoried roadless areas for at least 20 years, the estimated time it would take to address the extremely hazardous fuel situations that exist outside roadless areas.”[Footnote 13] This 20-year forecast for the initiation of any wide-scale fuel management activities in inventoried roadless areas, however, may overstate how soon such projects may actually begin. As the FEIS further explains, “Some agency personnel think the 20-year timeframe is overly optimistic, and that it would take a much longer period to correct the hazardous fuel situations in roaded landscapes.”[Footnote 14]

An analysis of the fire risk faced by the Roadless Rule’s inventoried roadless areas is further illuminating. Within inventoried roadless areas, 19 million acres face a low risk of wildland fire, 14 million acres face a moderate risk of fire, and 8 million acres face a high risk. [Footnote 15] It is critical to note, however, that these risks rankings do not describe the probability of a fire occurring. Rather, the classification scheme refers to “the potential harmful effects to key ecosystem components and human communities . . . that can occur once a wildland fire ignites and burns.”[Footnote 16]

Understanding this nuance of the risk characterization scheme is key because it indicates that extensive roadbuilding in “high risk” forests to promote mechanical forest treatment is actually counterproductive; roadbuilding should be banned from such fire-sensitive areas because “[a] **human-caused wildfire is nearly five times more likely to occur on essentially roaded lands than on essentially unroaded lands.**” [Footnote 17]

This point cannot be emphasized enough: fires are actually more likely to occur in roaded areas than in unroaded areas, meaning that a concern for reducing catastrophic wildland fire actually weighs in favor of the existing roadless rule.

Further, in instances where mechanical treatment is necessary to reduce unnatural fuel buildups, the Roadless Rule still provides “a full array of fuel treatment options,”[Footnote 18] the implementation of which is expected to produce no change in the number of large wildland fires or acres burned when compared with the status quo. [Footnote 19] (Individual, No Address - #A5948.30400)

CONSIDER THAT THERE IS NO CAUSAL LINK BETWEEN UNCONTROLLED WILDFIRES AND THE PRESENCE OR ABSENCE OF ROADS

As study after study has proven, there is no causal link between uncontrolled wildfires and the presence or absence of roads. Scenic America believes that maintaining existing roadless areas under the rules and regulations set forth in NFMA will protect forest health. (Organization, Washington, DC - #A22098.30100)

CONSIDER THAT THE MAJORITY OF ROADLESS AREAS ARE NOT SITUATED IN AREAS OF HIGH FIRE RISK

Speaking specifically to roadless lands in California and the Sierra Nevada, the majority of the lands proposed for protection are not situated in areas of high fire risk. Most of the areas in the Sierra Nevada are in high elevation areas with low fire return rates and relatively high moisture content vegetation. Only a very small percentage of the roadless lands carried under the January 12th rule are in high fire risk areas. In the limited amount of roadless area acres where severe fire risk is an issue, the January 12th rule provides for exemptions, road-building and logging when needed to address concerns regarding wildfire and forest health and imminent threats to public health and safety. There is local area discretion that allows land managers to thin small diameter trees to restore ecological processes (such as regular fire cycles), improve habitat for endangered species, and reduce fire hazard. (Organization, Placerville, CA - #A22653.30100)

Most forest fires are started by careless campers, vandals, and sparks from vehicles. Keeping an area roadless will do much to protect it. Most roadless areas are in remote areas and danger to homes and property is all too often overstated. (Individual, Sacramento, CA - #A8271.30000)

The vast majority of land area in all national forests is already accessible by roads and trails. Many areas are also not fire and disease prone. For example, the Tongass National Forest is virtually free of any fire danger and disease risk. Where disease and fire are risk factors for communities, adjacent property, or forest infrastructure, procedures may easily be developed and implemented to systematically address case specific problems while ensuring the fullest possible compliance with the letter and intent of the policy. (Individual, Douglas, AK - #A13479.30200)

How should inventoried roadless areas be managed to provide for healthy forests, including protection from severe wildfires and the buildup of hazardous fuels as well as to provide for the detection and prevention of insect and disease outbreak?

The quick answer to this is that remote roadless areas generally do not need active management and fire protection. The best way to manage these forests is to leave them alone.

The national forests of the interior West have been subjected to a century of fire suppression and high-grading of timber, which have left the forests at increased risk of catastrophic fires and disease outbreaks.

Roadless areas, by their remoteness and inaccessibility, have been least affected by this misguided policy. Today they contain the healthiest forested landscapes in the mountain west. A comparison of the relatively inaccessible Selway-Bitterroot country in Idaho and Montana - having ubiquitous fire sign and park-like stands of large ponderosa pines and Douglas-fir - with the heavily roaded Wallowa-Whitman National Forest’s overstocked, doghair stands choked with grand fir understories, says it all. (Organization, Seattle, WA - #A21694.30100)

CONSIDER THAT FIRE FREQUENCY INCREASES AS ROAD DENSITY INCREASES

Roads have had a profound effect on fire frequency, severity, occurrence, size, and fire regimes throughout the western United States (Habeck, 1990). Fire occurrence increases as road density increases because man-caused fire risk also increases. (Individual, Las Vegas, NV - #A5694.30430)

1509. Public Concern: The Forest Service should conduct more studies about how to control fires.**SO THAT FIRES DO NOT GET OUT OF HAND AS A RESULT OF THE MANY VARIABLES THAT CAN AFFECT THEM**

Instead of building roads to allow better access to fires we should design a plan where we either attempt to clear out the dead wood that fuels fires or have controlled burns that can have a very positive effect on the environment. However, fire is difficult to control and more studies need to be done about how to control a fire so that it does not get out of hand as a result of the many variables that can affect a fire such as wind. (Individual, No Address - #A30364.30400)

1510. Public Concern: The Forest Service should consider the impact of human activities on fire intensity and severity.

It is important to note that Forests in unroaded, unlogged areas are the least altered from historic conditions, have the greatest ecological integrity and most fire resilience, and are at lower fire risk than areas that have been intensively managed. This is because roadless areas have not been subject to logging and concomitant activities that offer increase hazardous loads of highly-flammable small-diameter surface and ladder fuels, have not been as altered by fire suppression, especially compared to roaded and logged lands, and present the lowest risk of human-caused ignitions. Logging in wildlife habitat. It also takes massive federal subsidies because roadless area timber sales are some of the biggest money losers due to roadbuilding costs.

The primary cause of increasing fire intensity and severity is a century of aggressive firefighting, commercial logging, livestock grazing, and road building. Analysis of the 2000 fire season revealed that the majority of burned acres were located in logged and roaded forests, not in roadless or wilderness areas. In its report on last year's fires, the Congressional Research Service concluded,

"Timber harvesting removes the relatively large diameter wood that can be converted into wood products, but leaves behind the small material, especially twigs and needles. The concentration of these 'fine fuels' on the forest floor increases the rate of spread of wildfires."

In 1996 U.S. government scientists issued the Sierra Nevada Ecosystem Project (SNEP) report. The SNEP report found,

"Timber harvest, through its effects on forest structure, local microclimate and fuel accumulation, has increased fire severity more than any other human activity."

The scientists also determined that,

"Fire severity has generally increased and fire frequency has generally decreased over the last 200 years. The primary causative factors of fire regime changes are effective fire prevention and suppression strategies, selection and regeneration cutting, domestic livestock grazing, and the introduction of exotic plants." (Organization, Santa Fe, NM - #A22092.30100)

There will probably be less protection necessary, because roadless areas are by definition undeveloped; and because they haven't been logged, they will most likely have less slash and other fuels to carry a fire. Case in point: the Clear Creek Fire near Salmon, Idaho in the summer of 2000, burned hottest and with the most devastation in the Panther Creek drainage, an area that was heavily roaded and had been heavily logged over. That's a pretty typical scenario. So much for the popular fiction that roading and logging reduce fuels and the hazard of fire.

Besides, the Clinton Roadless Initiative took this very unlikely scenario into consideration and made generous allowances for such an eventuality, with loopholes big enough for an unscrupulous forest

supervisor to drive a dozen log trucks abreast though. This “issue” is a straw dog. (Individual, Leadore, ID - #A28841.30000)

1511. Public Concern: The Forest Service should consider other factors which may increase fuel loads and fire hazards.

WIND

June 2001. 40 acres of my timber in forest crop program was flattened by tornado winds. Now I have a helluva job to clean this mess you and I can see what a terrible fire hazard it is. (Individual, Turtle Lake, WI - #A6075.30400)

The July 4th blowdown of approximately 50% of the BWCAW’s forest should have been a more than adequate warning that un-managed forests can be devastated at a much greater percentage than managed forests, and that designated roadless areas that experience this type of devastation are forest fire catastrophes waiting to happen. (Elected Official, Two Harbors, MN - #A15552.30100)

In exceptional cases where insects and fuels do become a hazard, an environmental impact statement for proposed action can be prepared. This was done in the Boundary Waters Canoe Area Wilderness after a 1999 storm left ten times the normal fuel buildup. (Organization, Minneapolis, MN - #A22652.30600)

WEATHER

Severe wildfires burn catastrophically according to the fire weather, not the absence of roads. Roads can create vectors for flammable exotic plants that increase damage to native plants and animals during fire events. Roads encourage the misuse of DFPX construction and backburn fire suppression attempts. I am currently commenting on a fire salvage operation that is being conducted on land burned by fire suppression attempts (backburning off of a road) that never even connected with the main body of the wildfire. Forests that have not been pierced by roads tend to have more old growth (fire resilient) stands. Forests have evolved for millions of years with fires and without roads. The increase in catastrophic fires is due primarily to timber harvest and its effect on forest structure (SNEP). (Organization, Chico, CA - #A25114.30300)

SLASH PILES

Slash piles on lands where trees are gone contribute to fires. (Individual, Spokane, WA - #A13986.30550)

As for “the buildup of hazardous fuels”, in the Intermountain and Great Basin West, and probably in much of the rest of the country, it’s too cold and dry for logging and thinning slash to be left on the forest floor and expected to decompose. Slash and other logging / thinning debris will just lay there and contribute to an even bigger fire hazard unless it’s chipped and scattered on site or completely removed from the forest - neither of which, are very economically viable propositions. (Individual, Dillon, MT - #A28767.30550)

In terms of forest protection, I fail to see how building more roads protects the forest. From experience, the forests on both private and public lands that have an infrastructure of roads are no less resistant to insect attacks, disease or wildfire. These roads only serve the purpose of allowing “pre-salvage operations” - allowing healthy trees to be harvested on the grounds that they would likely die anyway. Cutting out damaged stands (i.e. bug spots) does not necessarily halt the spread - sometimes it creates a larger threat - the presence of fresh slash. Additionally, humans serve as vectors of disease and wildfire-increasing human presence in these areas via roads may actually increase the threat of damage from insects, disease and wildfire. (Individual, Nickelsville, VA - #A30521.30100)

SOME TREE SPECIES HAVE A NATURALLY SEVERE FIRE REGIME

Forests were protecting themselves long before the FS showed up. Protecting the Forests for human values is what we are really talking about. I am suspect of plans that want to save forests from severe

wildfires. Some forest types (lodgepole pine, subalpine fir) only burn severely under natural conditions. That is what they do. Douglas fir/Ponderosa pine forests, at least here in Washington are overstocked with dog-hair stands, and are prone to “unnaturally” severe fires. But, these low elevation forests are already roaded and have been for decades. What is left in the roadless area is the hard to get stuff. If it was easy to build a road there it would have been done 30 years ago. Those roadless areas that are in need of thinning to get back to a low intensity fire regime should be helicopter, or horse logged. Yes, really. (Individual, Carlton, WA - #A30322.30100)

In forest systems that are naturally characterized by infrequent high intensity fires (e.g. Rocky Mountain spruce/fir and lodgepole pine forests, Pacific Northwest Westside forests, higher elevation Sierra Nevada forests), fires should be left to burn naturally in roadless habitats. In these systems, stand replacing fires help to recycle nutrients, open seeds of some pine species, and increase habitat heterogeneity at the landscape scale (maintain a healthy mixture of forest and meadow habitats that support many important plant and wildlife species). (Individual, Davis, CA - #A30523.30310)

Roadless areas should be managed to be sustainable. I would also add that in some forest types such as Rocky Mountain lodgepole pine and sub-alpine fir-spruce periodic stand-replacement crown fire are ecologically appropriate. These ecosystems are adapted to stand-replacement fires every 50-150 years or so. Removing fires of this type in these ecosystems will reduce forest health. It is another matter when talking about ponderosa pine and mixed conifer forests. These ecosystems have been drastically altered by fire suppression, livestock grazing, and past harvesting. They are in dire need of restoration and the majority of these areas are already roaded. (Individual, Berkeley, CA - #A30558.30300)

Adequacy of Analysis – Management Strategies

1512. Public Concern: The Forest Service should evaluate its firefighting practices.

[From ATT 3]

WILDLAND FIREFIGHTING PROBLEMS

Is the Forest Service doing all that they can to suppress our large wildfires?

When wildland fires escape initial attack capabilities of our local crews, a team is called in to take over the fire. Some team managers do not believe in fighting fire at night, or in putting retardant on the fire before noon. Almost all firefighters would agree that fighting fires at night is most effective because, in general, temperatures are lower, humidity is higher, wind speed has lessened, and the level of fire activity has decreased.

Putting the fire crews on the line around mid morning, and waiting until afternoon for retardant drops when the fire has escaped and is crowning, are not conducive to trying to control the fire. These practices have increased the cost in money and resource loss considerably. Retardant in the early morning would cool down hot spots and aid in line building so that fire might not escape during the afternoon.

The same team members who delay retardant drops till afternoon use the excuse that fire fighting is more dangerous at night. I have yet to see any statistics that prove this. This excuse also fails to explain why they do not encourage retardant drops in the morning, before the fire is crowning and carboniferous cumulus clouds have obscured visibility.

The same team members that wait till mid morning to fight the fire also want to evacuate private property owners, leaving their homes and land possibly unprotected. Citizens are intimidated by federal, state and county law enforcement officers and leave, only to return to the new Black Forest and the charcoal remains of their structures.

The Forest Service has policies such as the Minimal Impact Suppression Tactics, which encourage firefighters to construct firelines much too narrow to stop a fire and do not permit bulldozers and other heavy equipment in certain areas. Under the Clinton Administration proposed Roadless Initiative, not only are new roads [not] permitted in vast areas, but firefighting equipment such as engines cannot

utilize existing roads that have been there for decades. Old time firefighters would turn over in their graves if they could be aware of what is happening today.

Environmentalists have succeeded in stopping logging on federal land, and are now at work trying to stop state and private harvest units. They mislead the public into believing that logging units enhance forest fires, when the fact is that they greatly reduce the probability that a fire will turn into an inferno. With the removal of ladder fuels and a great many mature trees left, these almost resemble picnic grounds, and they certainly deter the spread of fires. Older harvest units (clear cuts), which contain young trees with much higher fuel moisture, protect stands of timber uphill and down wind from them. Pictures on the website show how these 15 year old clear cut units in Magpie and Hellgate Gulches on the Cave Gulch Fire have helped efforts to control wildfires.

Some environmentalists do not want retardant dropped on fires to help control the spread of wildfires because the retardant contains chemicals. Retardant is a fertilizer, ammonium phosphate, which will increase regrowth in the years after the fire.

Environmentalists also say that because fires have been suppressed in the past, this has led to major fires now. The year 1910 is still the worst fire season on record, but no one says that this was the result of earlier fire suppression attempts. Anyone who would advocate letting a wildland fire burn during a drought fire season, risking loss of life and property, is not rational. (Individual, East Helena, MT - #A20422.30400)

1513. Public Concern: The Forest Service should fairly and fully consider the effects of fuel management.

Concerns for fire suppression and potential have been raised from both outside and within the agency. Some claim that roading and logging of roadless areas is necessitated by these concerns. But it must be remembered that “uncertainty exists among fire researchers concerning whether the number of acres burned annually by wildfires is always reduced by timber harvest . . . whether timber harvesting also reduces the final size of large wildland fires is debatable. Timber harvesting ‘opens’ up a forest [so] . . . after a fire starts, it can sometimes spread faster and become bigger.” (DEIS 3-156; see also 3-106). As for roadless areas, “since the amount of land area at risk to large wildland fires is so large compared to the small amount of road that could be built into those same areas, the effects in the near future to the fire suppression program are expected to be negligible. . . . the effect of timber harvesting is insignificant, as is the combined effect of no timber harvesting with no road construction, to the overall fire suppression program. . . . The direct effect on the wildland urban interface [WUI] is minimal because there are few populated areas adjacent to inventoried roadless area boundaries” (id.). There are numerous problematic issues even if one assumes that building a road into an area would limit future wildfires (DEIS 3-158).

One fact is foremost regarding this issue of fires vis-a-vis roadless areas: “Areas that are more highly roaded actually have a higher potential for catastrophic wildfires than inventoried roadless areas.” (DEIS 3-157). “Building a road into a high risk from catastrophic fire forest would increase the incidence of human caused fires.” (DEIS 3-158).

In Virginia on the GWNF a mean average of only about 4 fires per year are attributed to lightning (SAA Report 5 page 96). On the JNF approximately 90% of the fires will be human caused (1996 Analysis of the Management Situation page 2-48). Keeping all this in mind, it is unreasonable for the agency to conclude that air quality would be diminished by an increased risk of catastrophic wildland fires resulting from a prohibition on road construction and timber harvest (DEIS 3-46).

Because of the amount of acres the FS claims is at moderate or high risk from catastrophic fires (DEIS 3-101) coupled with the small amount of acreage in roadless areas that could potentially be treated for fuel management objectives (DEIS 3-104-106), it is entirely unreasonable for the agency to find that a prohibition of logging and roading “would seriously hamper the Forest Service’s goal of reducing the threat from catastrophic forest fires.” (DEIS 3-107). And it must be remembered that the potential risk for fires is much less in the generally much moister Eastern National Forests. The final EIS needs to substantiate that hundreds of thousands of acres are at moderate to high risk in the Southern and Northeastern NFs; the figures given appear to be greatly overestimated, particularly for Virginia and West Virginia (DEIS 3-103).

In addition, a fundamental tool for reducing fire hazard is the reduction or disposal of the small diameter and fine fuels (DEIS 3-100). Yet this is often not the on-the-ground reality. Logging predicated on reducing fire potential usually removes the fuels that least facilitate a fire's intensity and rate of spread (the large diameter boles) while the more hazardous small fuels remain on site. A perfect example of this in Virginia was the recent Hagan Hall emergency salvage sale on the Clinch Ranger District of the JNF. The affects of fuel management are not fully and fairly considered in the DEIS. (Individual, Staunton, VA - #A29325.30400)

BEFORE A FINAL DECISION ON MANAGING AREAS AS ROADLESS IS MADE

As stated above, roadless areas adjacent to Mammoth Lakes have been subject to decades of fire suppression, allowing fuel loading to increase to dangerous levels. A detailed assessment of fuels management should be completed before a final decision on managing as roadless is made. The Rainbow Fire of 1992 demonstrated how vulnerable the community is to wildfire beginning in roadless/wilderness areas. (Manager, Town of Mammoth Lakes, CA - #A19393.30110)

1514. Public Concern: The Forest Service should adequately analyze the appropriateness and need for prescribed fire.

IN THE UNIQUE SETTINGS OF THE ROADLESS AREAS

The limited extent of fire suppression and management activities in roadless areas may render prescribed burning unnecessary. The EA fails to adequately analyze the appropriateness and need for prescribed fire in the unique settings of the roadless areas. Rather, the EA analyzes the vegetation conditions over the entire project area. Frost (199) addresses the lesser alteration of the vegetation conditions in roadless areas:

An analysis of scientific literature on the relationship between fire and forest management reveals that forests in roadless areas are the least altered from historic conditions and present a lower fire hazard than forests in managed areas, because they have: 1) not been subject to timber management activities that often create increased fuel loads and reduce resilience to fire, 2) have been less influenced by the effects of fire suppression than previously managed lands, and 3) the lowest risk of human-caused ignitions. (Organization, Missoula, MT - #A613.30300)

1515. Public Concern: The Forest Service should fully analyze restoration projects designed to address catastrophic wildfires.

Restoration projects that are designed to address catastrophic wildfire risks must be analyzed fully within the context of the Roadless Rule, and such projects must ensure that adequate safeguards are taken to preserve the roadless and Wilderness qualities of the IRAs, including restrictions on types and sizes of trees to be thinned, limitations on sizes of openings, use of prescribed burns, total rehabilitation of forwarder or skid trails and general attention to site specific analyses that do not gloss over the biological differences exhibited between roaded and unroaded lands. (Organization, Denver, CO - #A8824.31100)

TO ENSURE ADEQUATE SAFEGUARDS ARE TAKEN TO PRESERVE ROADLESS AND WILDERNESS QUALITIES OF INVENTORIED ROADLESS AREAS

Restoration projects that are designated to address catastrophic wildfire risks must be analyzed fully within the context of the Roadless Rule, and such projects must ensure that adequate safeguards are taken to preserve the roadless and Wilderness qualities of the IRAs. (Organization, Littleton, CO - #A8829.30400)

1516. Public Concern: The Forest Service should address the cumulative impacts of the fire suppression program on national forests, and how it has impacted roadless areas.

Should the Forest Service still deem it necessary to re-open discussion of the Roadless Rule, the following issues and concerns [should] be addressed along with the 10 questions in the ANPR.

The cumulative impacts of the fire suppression program on National Forests, and how it has impacted roadless areas must be addressed. (Business, Spokane, WA - #A22047.30100)

1517. Public Concern: The Forest Service should reassess vegetation management on the national grasslands.

BECAUSE INCREASING VEGETATION HEIGHT AND SHRUB STRUCTURE ON THE UPLANDS AFFECTS FIRE CONTROL AND SUPPRESSION

While the 2000 fire season forced the Forest Service to rethink its forest management strategy, there has been no comparable reassessment of vegetation management on the National Grasslands. The HAND comments addressed the concern about increasing vegetation height and shrub structure on the uplands would affect fire control and suppression. The transportation, OHV, and roadless policies all directly interfere with fire suppression and control by restricting access and prohibiting cross-country access. The catastrophic fire in 1999 on the Little Missouri National Grassland proves that the risk is real. However, the Forest Service has declined to change the proposed upland vegetation objectives, which will increase fuel loading, and reduce grazing, which would otherwise control fuel loading. Again, the Forest Service needs to comprehensively address this issue and to date it has failed to do so in North Dakota. (Organization, Denver, CO - #A21358.30100)

1518. Public Concern: The Forest Service should evaluate the impacts of no management versus the impacts of roading or other management activities.

It is essential that roadless areas be accurately mapped, including those areas at risk of wildfire and insects and disease so that management options can be accurately assessed. In our opinion, the draft and final environmental impact statements for the previous rule did not adequately address wildfire risk. It is imperative that the Forest Service requires that the risks and impacts of “doing nothing” be documented as well as an analysis of the risks or impact of roading or other management activities. In the final decision, the standards for no management on federal forest lands should be as stringent as any standard for management activities. (Association, Rockville, MD - #A13306.30100)

1519. Public Concern: The Forest Service should conduct ecological assessments.

FOR ALL FUEL REDUCTION PROJECTS

Conduct ecological assessments for all fuel reduction projects. The Forest Service should identify restoration priorities before any fuels reduction activities commence. This assessment should involve the public and provide an array of alternatives—not just commercial thinning — to address needs. For many areas, removing roads, invasive species, and cows, combined with prescribed burning, would be the best prescription for ecological restoration. (Organization, Missoula, MT - #A17234.30920)

1520. Public Concern: The Forest Service should categorize inventoried roadless areas in accordance with fire regime, condition class, vegetation, and risk of disease.

AREAS AT GREATER RISK OF ECOSYSTEM DAMAGE FROM CATASTROPHIC FIRES SHOULD BE PRIORITIZED FOR APPROPRIATE TREATMENT

Inventoried Roadless Areas (IRAs) should be categorized in accordance with fire regime and condition class and risk of disease, using the best available information. IRAs at greater risk of ecosystem damage through catastrophic fires should be prioritized for appropriate treatment, including commodity harvest if no other management tool appears feasible. IRA management guidelines should also include provisions for allowing temporary roaded entry into roadless areas in the event of catastrophic wildfires or tree-killing insect and disease outbreaks, so that commodity values can be captured and rehabilitation work performed at a reasonable cost. (Governor, State of Idaho - #A20141.30100)

THEN CREATE A MANAGEMENT PLAN TO OBTAIN AND MAINTAIN DESIRED FUTURE CONDITIONS

[Q10] I believe they all need to be inventoried and classified by the types of vegetation and fire regimes. Those that are adapted to low frequency, stand replacement regimes need to be differentiated from those that once experienced frequent, low-moderate intensity fire regimes. Once this is done then a management plan can be created to obtain and maintain desired future conditions. I think Wildland Fire Use (old prescribed natural fire) will be very important in these areas. There [would] certainly be constraints by managing wildland fire in many areas [that] would be appropriate. [In] other areas that once had high frequency, low-moderate intensity fire regimes, some mechanical treatments may be appropriate before re-introducing fire. We presently have millions of acres of roaded national forests with fuel hazard problems, I believe we should start to work in these areas. This work alone will take decades. I believe that active management is needed in all forested areas of the US. Some areas may use mechanical methods more, others such as many roadless areas should manage wildland fire to obtain the desired future conditions. Developing more partnerships with state, local, and public groups is good but it will not provide a fast solution to this problem. (Individual, Berkeley, CA - #A30558.30400)

1521. Public Concern: The Forest Service should consider that thinning has not been shown to systematically reduce the intensity of wildfires.

Assertion: roadless area decisions should protect forests from wildfire, insect, and disease impacts (p. 4). In fact, road building is associated with increased fire starts and the spread of harmful invasive species and pathogens. Roadless areas are among the lands least in need of remedial management. And the silvicultural management restricted by the Roadless Rule, thinning, has not ever been shown systematically to reduce the intensity of subsequent fires. (Organization, Olympia, WA - #A20145.30100)

1522. Public Concern: The Forest Service should allow public review of the Wildland Fire Management Policy.

The Wildland Fire Management Policy must be publicly reviewed and cleansed of all the Clinton-Gore-Babbitt holistic forest agenda. The idea of allowing natural or manmade wildland fires to burn for the reduction of hazardous surface, litter and canopy fuels is insanity. We have 35,000,000 in this state and utilization of fire for the reduction of fuel is out. (Professional Society, Chico, CA - #A29719.30410)

*Funding***1523. Public Concern: The Forest Service should evaluate costs and funding associated with fire management.****FIRE SUPPRESSION COSTS**

Suppressing fires and cutting trees ostensibly to save forests also burn the taxpayer. A new report published by taxpayers for Common Sense finds that mismanagement of National Forests made the 2000 fire season the most expensive fire year in history. The government spent a record \$1.6 billion fighting the worst wildfires our nation has seen in decades. According to the taxpayer group, federal policies "encourage spending unlimited amounts of money attempting to put out every fire. This increases firefighting costs and jeopardizes firefighters' lives by subjecting them to unnecessary risks." The report also criticizes Congress for having made little effort to control firefighting costs, which has increased by 50 percent over the last two decades. Congress gives federal agencies bottomless emergency budgets for firefighting, with little auditing to examine how they spend money. In reality, Congressional funding priorities have exacerbated the wildfire situation by impeding natural fire regimes and subsidizing commercial logging on public forests. The Forest Service's funding has become a vicious cycle. Taxpayer money is used to log the National Forests to benefit timber companies, which contribute to the escalating risk of catastrophic wildfire. Then, huge additional sums of taxpayer money are spent trying to put the fires out. (Oppenheimer 2000) (Organization, Nevada City, CA - #A4941.30900)

As noted above, logging roads are typically high risk/high hazard areas since they are sites of frequent human ignitions and dense flammable fuels. However, it is acknowledged that roads can, at times, help fire suppression efforts because they provide the cheapest, safest means of transporting large numbers of firefighters (although traffic accidents are a major source of serious injuries and fatalities on wildfires). Roads also provide access for heavy equipment such as bulldozers, water trucks, and fire engines. Roads also provide a ready-made fireline for backfire/burnout operations which, ironically, can increase the total amount of burned acreage. Indirect attack strategies automatically sacrifice acreage to the wildfire, especially if large backfires are ignited; thus, another paradox: wildfires often increase in size in the act of trying to contain and control them.

The USFS created standing crews of smokejumpers, hotshots, helitacks, and helirappellers for the purpose of initial and extended attack fire suppression in roadless areas. The speed, mobility, and versatility of aerial-based fire suppression forces are making them more attractive to fire managers. While it can cost thousands of tax dollars to purchase and maintain a fire engine, it can only be used efficiently by a small crew (approximately 3-5 workers) and its use is largely restricted to a single District on a single Forest. The same amount of money invested in aircraft and associated crews and equipment can be mobilized to protect whole Regions or can be dispatched nationally or internationally depending on the need, and can be more easily shared among other federal, state, and local fire protection agencies. Consequently, given modern technology and the huge number of helicopters and fixed-wing aircraft available for fire suppression duty, roads are not necessary in order to suppress fires. (Organization, Eugene, OR - #A21798.30200)

FIRE SUPPRESSION COSTS AND CONTROLLED BURN FUNDING

The American taxpayer simply cannot continue to afford the high prices of controlling wildfires through aggressive suppression efforts. This is because years of suppression has built up fuel loads beyond where they can be safely burned, even under controlled conditions. The best way to bring this fuel loading back into balance with historical conditions is with controlled burning, because logging and thinning do not address the standing log volume that represents much of the risk. However the Okanogan National Forest states that their requested Congressional budget for controlled burns is 90% short of what they requested as necessary. (Organization, Winthrop, WA - #A20338.30420)

FUNDING FOR FIREFIGHTING

Laverty should know that pre-settlement fires, wilderness fires, the Bitterroot fires on logged-over lands, and even controlled fires have all burned so hot that "some places will take centuries to recover." In the post-firescape of the Scapegoat Wilderness, stark, with nearly all snags still standing since 1988, some reproduction grows as thick as grass while other areas show little or no generation of any flora. But his excessive caveat, "devastating," gets not only outlays for smokejumping, hot-shot crews, air-tanker support, and large standing armies of firefighters, but now, rural-urban fire protection and forest-wide controlled burning.

Fire is money. The fire suppression problem your agency moans about was created mainly by funding for fire suppression, now a bigger money maker than logging. Now the agency claims that bio-mass loading threatens the old-growth communities that it prefers to destroy by overcutting.

The National Fire Plan is primarily a logging plan. Sixty percent of its funding, according to Laverty, will pay for fire protection in the rural-urban interface, another big FS money-maker. This funding would be more equitably spent buying interface lands for parks and recreation spaces that would be turned over to counties for fire protection. (Individual, Corvallis, MT - #A5960.30400)

It is also obvious to me that making some decisions will mean that large wildfires may inevitable. That also must be a factor in the decision process and not an excuse to get Congress to buy a bigger fire engine and crew. The place of fire as an ecological perturbation and the phenomenon's about it must be accepted in the western US, but the money thrown at it in the name of control must be re-evaluated. (Individual, Cambridge, ID - #A11714.30300)

THE USE OF FUNDS APPROPRIATED FOR FUELS REDUCTION PROJECTS IN THE WILD-URBAN INTERFACE ZONE

Last year Congress appropriated an additional \$120 million for fuels reduction projects in the urban-wildland interface zone. Instead of directing resources to protect communities, however, the Forest Service is using emergency monies for large-scale commercial timber sales in the nation's most pristine forestlands, including roadless areas, old growth forests, and habitat critical to imperiled species—areas far from homes and businesses and at least risk of catastrophic wildfire. In testimony before congress, the agency admitted that only 25 percent of the acres treated were in urban-wildland interface areas. (Organization, Nevada City, CA - #A4941.30900)

CONSIDER THAT REDUCED ACCESS INCREASES FIREFIGHTING EXPENSES

Idaho was hit extremely hard during the summer of 2000 by forest fires; the roadless areas hampered access to the areas for fire suppression. The control of the fires could have been faster and more effective had the fire crews been able to reach the areas effected. The cost to the state and the federal government would have been much lower with more adequate access to the fires. Reducing road access, by implementing the "roadless" policy, would make fire fighting even more difficult and expensive in the future. (Elected Official, Council, ID - #A20732.30200)

On the Rogue River NF (RRNF), there are areas mapped in the Applegate Valley and down into the Ashland (Bear Creek) drainage. There are areas identified in the Plans which do not allow road construction; they therefore do not need to be considered here. They should be reconsidered in the next round of forest plans for the RRNF. There are far more areas shown as allowing road construction that are "inventoried". These should have NO additional restrictions placed on them.

On Aug 9, 2001 a dry lightning storm ignited the Quartz fire in this area. It quickly grew to 5000 acres on USFS, BLM and private lands, and destroyed 2 homes. The single greatest impediment to effectively fighting this fire was access; the roads (especially on USFS) were not adequate. This \$10+ million fire probably cost twice as much to control due to sustained use of air attack as it would have with adequate roads. The area burned is not an inventoried area but was burning towards one. With the weather conditions we had, if it had burned east and into the Wagner Butte roadless area, there would be no stopping it until it burned down to the city of Ashland. There was unbroken fuel and no roads to gain access. Fortunately this did not happen as the weather moderated.

Much of the area you show in light gray on the maps in the Applegate have this same fuel type, and they will indeed burn in the future. Is restricting access responsible management? I don't think so. Who will benefit? Not any local residents. Is this how I want my public lands managed? Absolutely not. (Individual, Medford, OR - #A27917.30200)

CONSIDER THAT THE MAJORITY OF FIREFIGHTING FUNDS ARE SPENT ON PROTECTING STRUCTURES IN DEVELOPED AREAS

The Forest Service spends the vast majority of its firefighting budget on protecting homes and other structures in developed areas, not in fighting fires in roadless areas. (Individual, Dutton, MT - #A17073.17100)

1524. Public Concern: The Forest Service should not use tax dollars to fund firefighters and their equipment.**BROUGHT IN FROM DISTANT PLACES RATHER THAN THE LOCAL AREA**

I am asking a study be originated showing the forest service fire expense for transportation of individual labor from distant places such as California, Australia and equipment from the Midwest and East while refusing to hire individuals and equipment who have made a lifetime livelihood locally for themselves and their families from our timberlands. People who have the vested interests in protecting the forest from fire destruction. My personal opinion is that the Forest Service action to eliminate qualified local firefighters and their equipment from the fire line is criminal and the tax payers should not be required to fund any such irresponsible actions. (Individual, Kalispell, MT - #A8758.30910)

USE THE MONEY FOR OTHER PURPOSES

Economically, I am concerned that limited taxpayer dollars be put to better use than fire suppression in roadless areas. There are certainly many highly constructive (e.g., cancer fighting, land protecting, education supporting, etc.) programs in vital need of these funds, which are currently wasted on fire suppression that results in unhealthy forests and the use of toxic chemicals to combat fire. Furthermore the equipment that is used in such fire suppression operations results in noxious weed invasions and the need for expensive measures to control them. Fire suppression in roadless areas is just as bad economically as it is ecologically. (Individual, Davis, CA - #A30523.30910)

1525. Public Concern: The Forest Service should not use tax dollars for fire suppression and timber removal.

IN ROADLESS AREAS LOCATED FAR FROM RESIDENTS

Fire plays a vital role in western forest and rangeland ecosystems. As a natural disturbance agent responsible for recycling nutrients, regenerating plants, and sustaining diverse wildlife habitats, fire is necessary for the continued productivity of these ecosystems. Certainly, efforts should be made to protect communities in the urban/wildland interface zone, defined as the area "where combustible homes meet combustible vegetation." But pouring taxpayer dollars into suppressing fires and logging in roadless forests located far from residents makes little sense. (Individual, Oklahoma City, OK - #A17236.30300)

1526. Public Concern: The Forest Service should contract with an independent organization to analyze expenses associated with fire management if roads are destroyed.

As lifetime resident of an area relying on the timber I have been vitally concerned with the proposal for the treatment of Federal roadless areas. My purpose in this letter is to ask and if necessary demand that the USDA Forest Service immediately enter into a contract with a qualified, independent, impartial organization capable of providing the following information:

The expense of destroying forest roadways created by logging contractors added to the cost of creating fire lines through the timber lands versus rights-of-way through timber regrowth involving old roads . . . always in place not requiring a great deal of forest destruction. It seems to me that it is far less expensive to utilize an unmaintained road right-of-way as a fire line when needed as opposed to creating an entire new fire line often destroying much of the timber in its path not yet on fire. Added to the cost of destroying roads, creating new fire lines should be destruction of culverts in place. (Individual, Kalispell, MT - #A8758.30200)

1527. Public Concern: The Forest Service should consider that as fuel loads increase in roadless areas, firefighting costs also increase.

New roadless areas will experience an increase in the forest fuel load. This will mean an increase in fire fighting costs for the Forest Service and the Minnesota DNR. Areas experiencing forest fires can only be accessed from the air. (Elected Official, Two Harbors, MN - #A15552.30100)

1528. Public Concern: The Forest Service should provide funding to conduct controlled burns and non-commercial thinning.

TO REDUCE WILDFIRE

Provide them with funding to conduct controlled burns and non-commercial thinning if you really want to reduce wildfire. (Individual, No Address - #A29646.30100)

Fire plan funding to treat fuels is a great program and needs to be continued. (Organization, Wenatchee, WA - #A22628.30410)

1529. Public Concern: The Forest Service should take into account the effects of a national roadless rule on the costs of fire management.**NEGATIVE EFFECTS**

Fires cause the loss of many of our natural resources for use, which in turn lose us dollars, extreme amount of dollars are used for fire control and management—and an undetermined cost occurs in the costly price of lives lost. (Individual, Lloyd, MT - #A27949.75600)

In reality, Congressional funding priorities have exacerbated the wildfire situation by impeding natural fire regimes and subsidizing commercial logging on public forests. The Forest Service's funding has become a vicious cycle. Taxpayer money is used to log the National Forests to benefit timber companies, which contribute to the escalating risk of catastrophic wildlife. Then, huge additional sums of taxpayer money are spent trying to put the fires out. (Individual, Washington, DC - #A30150.75610)

1530. Public Concern: The Forest Service should ensure that emergency funds are spent in areas where wildfire truly threatens communities.

Ensure emergency funds are spent in areas where wildfire truly threatens communities and mandate environmental safeguards for fuels reduction projects. (Organization, Nevada City, CA - #A4941.30900)

1531. Public Concern: The Forest Service should continue its current fire plan funding to treat fuels in the wild-urban interface.

Assistance for addressing the current wildfire risk in the wildland-urban interface is essential. The public benefits from reduced suppression costs and losses far outweigh the cost of this assistance. The current fire plan funding to treat fuels is a great program and needs to be continued. (Organization, Wenatchee, WA - #A22628.30410)

1532. Public Concern: The Forest Service should take legal action against organizations which have blocked fuel load removal.**TO RECOVER COSTS FOR FIRES THAT HAVE RESULTED FROM SUCH LACK OF ACTION**

It's my perception that the Wilderness advocates are unrelenting, they have no inclination to compromise, and they have the finances to sue to get their way. How does any individual or organization work with that type of attitude? I believe the Forest Service must work with those who will, and adapt a tougher stance against those who won't come to the table and compromise. I'd like to see the Forest Service sue the organizations that have stymied fuel load removal for the cost of the fires that have ultimately occurred for lack of action in this regard. (Individual, Centerfield, UT - #A25652.15000)

*Education***1533. Public Concern: The Forest Service should educate the public.****ABOUT FIRE SAFETY**

Since so many forest fires are started by campfires, all those entering should have a fire safety lesson. (Organization, Cookeville, TN - #A5451.30610)

ABOUT THE REASONS FOR CONTROLLED BURNING

Adequate knowledge of local conditions together with scheduled controlled burns should be implemented. Due to the over suppression of forest fires in the past, there is the possibility of controlled burns getting out of control but this should not stop the practice. The public should be better educated on the reasons for controlled burns. (Individual, Tucson, AZ - #A4938.30420)

ABOUT THE ROLE OF FIRE AND DISTURBANCE IN FORESTS

The Forest Service clearly needs to help educate the public as to the role of fire and disturbance in our forests. (Individual, Missoula, MT - #A6143.30310)

As far as wildfire and disease outbreak, any ecologist worth his/her salt knows that fire is a natural forest event, and that fire is one of the ways that nature cleanses herself of disease and rebuilds herself. I believe that forest education about fire and some other measures to protect humans should be taken. We can not stop forest fire. It is impossible. And we saw in Florida a couple years back that if we abandon controlled burning and other forest management practices, the buildup of fuel will cause catastrophic fires. We are trying to make nature stop doing what it has been doing for millions of years; we will not win that war, no matter what politicians say. (Individual, Baton Rouge LA - #A30621.30300)

ABOUT WHAT IS NEEDED TO SUPPORT FIREFIGHTING EFFORTS

I do not know exactly what would be needed to support firefighting efforts and would appreciate being educated about that matter. (Individual, No Address - #A26070.30610)

Active Management

1534. Public Concern: The Forest Service should use various techniques for fire prevention.

IF REQUIRED BY MANAGEMENT OBJECTIVES

As far as wildfire is concerned it has been a part of the natural forest regime as far back as we can find evidence in the charred remains of preexisting forest on the Olympic Peninsula. Henderson et al, did studies of old fire occurrences as part of their basic work for the preparation of the Forest Plant Associations of the Olympic National Forest R6-ECOL-TP 001-88 1989, and found that there were very few fires of appreciable size in the east side of the Forest 480, 680 and 750 years ago, while much of this area had burned several times in the past 700 years. If management objectives for the area identify prevention of severe wildfires as an objective then a regime of preventive measures can be prescribed. Many techniques are available. Most of these were identified in the Regional Forest Fire Planning effort in Region 6 in the mid 1970s which was never completed. It is possible that written copies of the plans and atlases that were prepared then are still in existence in some archive somewhere.

With the current interest in wildfire suppression and the recent deaths of the 4 firefighters on the Okanogan-Wenatchee Forest there will probably be a one, possibly two year, spurt of interest in wildfire and prevention, but as has happened previously it'll probably pass away until we have to relearn the lesson again in 5-10 years. (Individual, Olympia, WA - #A278.30610)

MONITORING

If enough monitoring is set up, wildfires can be detected early and hopefully controlled away from populated areas. (Individual, Rego Park, NY - #A5996.15161)

GRAZING

On the National Grasslands, the Forest Service plan for roadless areas needs to include provisions to manage coulees, etc. so that wildfires can be effectively controlled quickly. The only way to effectively manage for healthy grasslands is with livestock grazing. (Association, Watford City, ND - #A29131.30500)

The catastrophic fire in 1999 on the Little Missouri National Grasslands proves that the fire risk is real. However, the Forest Service has refused to change the proposed upland vegetation objectives, which will increase fuel loading, while reducing grazing. Reasonable, efficient livestock grazing is a proven method of controlling fuel load and should be maintained. At the same time, sound scientific data has also demonstrated that livestock grazing adds to the healthy plant growth of rangeland.

The HAND group comments earlier addressed these concerns about increasing vegetative height and shrub structure on the uplands and the impact on fire management. However, it was ignored.

The roadless policies all severely restrict fire suppression and control by restricting access.

Those same policies and regulations also hamper grazing associations' efforts to control and eradicate noxious weeds, which can be a problem on the National Grasslands if not properly managed. (Association, Bismarck, ND - #A30187.30560)

Several actions are available for management of healthy forests: prescribed burning, limited grazing (proper charges should be levied against ranchers for this to help offset Forestry Service Costs) and even logging of diseased or dead trees can be used for this purpose. These actions must be balanced based on the health of the land, not the pocketbook of the interested parties. (Individual, Boulder, CO - #A5288.30100)

We believe the rules must be flexible enough to allow road building in areas so excess vegetation can be mechanically treated or to manage fires once they start. In addition, the agency has failed to consider the use of livestock as a means to control vegetation. Livestock have proven effective in controlling vegetation. Any new rules for roadless area should consider how we compensate our ranching families who can help protect this tremendous resources, (Association, Sacramento, CA - #A23478.30500)

Grazing cattle on the forest cuts down on the risk of forest fires. The cattle get rid of the dead grass and overgrowth that could be fuel for fires. (Individual, Manti, UT - #A20336.30560)

The lands need to be managed with excellent data on long term affect and renewal of these lands, wildlife and present use. We have already seen to many pendulum swings from one group to another. The Idea that all fires are bad is an example. Fire is part of a healthy forest and forest renewal. We get horrible fires because they have been prevented them for so long and limited grazing thus allowing deadfall and dead grass to build up. These could be avoided by responsible grazing, controlled burns and wildlife management. It is well known that hoof action on meadows and grazing renews meadows and keeps them alive. Without animals the meadow dies. Ranches are not the enemy. Most realize this and do not allow their range to be over-grazed. (Individual, Oak City, UT - #A40530.30100)

1535. Public Concern: The Forest Service should control fire size and frequency on public lands to approximately that of pre-settlement conditions.

BY REDUCING FUEL LOADS THROUGH THINNING, GRAZING, AND PRESCRIBED BURNING, AND BY MAINTAINING NATURAL AND ENGINEERED FIREBREAKS

The overall goal is to reduce the cost and requirements of federal fire suppression activities on all public lands, including roadless areas, while also reducing the risk of suffering a catastrophic fire. With this goal in mind and with the exception of urban interface lands, land management agencies should be required to control fire size and frequency on public lands to approximately that of pre-settlement conditions. This goal can be accomplished by reducing fuel loads through thinning, grazing and prescribed burning, and by maintaining natural and engineered firebreaks. Considering how this might apply to roadless areas in Nevada, resources might be focused on managing invasive weeds (i.e., cheat grass), reducing the density of invasive juniper stands, reducing the density of dry forage, and identifying and improving the quality of natural fire breaks. (Elected Official, Eureka County, NV - #A20741.30500)

1536. Public Concern: The Forest Service should reduce fire hazards.

BY EMPLOYING YOUNG PEOPLE

This need for fuel unloading where fire has previously been suppressed, offers a wonderful opportunity to provide lots of jobs for our young people that will help them to develop and maintain discipline and strong healthy bodies. So much hard work on the hazardous fuel loading that has resulted where fire was

suppressed needs to be done making the forest ready for the natural reintroduction of the fire regimes of the various areas. No roads or heavy equipment are needed for this, and the huge amount of money fighting fires could be used instead more and more for this as catastrophic wildfires consequently would diminish. This would be a much better bargain in terms of dollars spent, the health of the forest, and of the people participating.

The California Conservation Corps is a good example of such a cadre. When allowed to remain in, or once returned to their wild stage, fire and insects will no longer pose such large and grave dangers. This was recently born out by a huge fire nearby in a Wilderness which was a 'good burn' and only in areas which were back-burned was the fire hot and destructive. (Individual, Saint Paul, MN - #A19042.30410)

BY ACTIVELY MANAGING TO REDUCE FIRE HAZARDS

We should continue to be involved in the management so we do not have a forest that looks like Yellowstone. That is beautiful country and it is a shame that the timber that was lost by fire is not used for fire wood or a milling process that could produce lumber and clean up which will help the new growth and bring that forest back quicker then to let the wood turn into dirt. Bottom line is that the forest will change we need to manage it to provide the best output for the forest and again benefit the economy and put people to work. (Individual, Elko, NV - #A4853.30300)

With regard to federally-owned forests, a joint industry-government scheme should be developed to allow some road building and maintenance, harvesting of recently fallen trees, and cutting of mature growth. This would reduce the amount of fuel in the forests so that fires could be localized. It would help revitalize the economy in areas depressed by government prohibitions on lumbering, and would further restore woodlands where fallen trees are infested by insects. Overgrown forests fed the devastating fires at Los Alamos and throughout the West that may cost over \$500 million. (Individual, Peachtree City, GA - #A402.30410)

What they are not doing well is keeping the federal lands in these areas clear of hazard fuels. I have often asked why they do not. One answer has been that it is the fault of the environmentalists-that the fallen dead trees must remain to provide habitat. The other answer I have heard (from a FS employee, management), unique to our area, is that because there is a proposal to build a ski resort here, the FS cannot clean up the forests in the area because that forest activity would add to the cumulative effects which might prevent the development of the resort. Thus, our lives and properties are at risk for the sake of a resort which might or might not be built and which many locals do not want. We need action, not excuses. (Individual, Klamath Falls, OR - #A5118.30510)

BY DEVELOPING A FIRE MANAGEMENT PLAN

Green forests where fires have been suppressed for long periods do provide more fuel for future blazes. Yet a "let it burn" policy isn't practical in a nation where the deepest point of wilderness is no more than 30 miles from a road. Growth within and surrounding our national forests requires maintaining a wise fire control policy that takes into consideration forest health, climate patterns (both long and short term), forest type (i.e., dry lodgepole vs. wet cedar), best containment, and after-the-fact management. (Individual, West Yellowstone, MT - #A1045.30400)

Direct the Forest Service to create fire management plans for National forests. Fuels reduction monies should be used for fire planning and preparedness. Fire management plans would enable land managers to allow certain remote wildland areas to burn under carefully prescribed conditions to maximize ecological benefits. Such plans would encourage the agency to manage fires at a reasonable cost, while prioritizing firefighter safety and protection of natural resources. (Individual, Davis, CA - #A6615.30410)

BY ALLOWING THE CLEARING OF UNDERBRUSH DURING THE INTERIM

It stalls a process that is absolutely necessary if we are to save our forests, the wildlife within it, and the millions of Americans who depend on well managed forests to ensure their properties are not destroyed, and cannot afford delay in clearing out the underbrush to reduce fires. This work could be done RIGHT

NOW since the existing rule fully allows for such clearing. The rule was finalized after extensive input from experts on wildfire, who explained that “roading” and “clearcut” logging actually increase the likelihood and severity of these events. (Individual, Olympia, WA - #A5377.30100)

BY ALLOWING MANY SMALL BURNS

The most catastrophic fires are not natural events but are caused by people, especially large-scale logging and tree plantations that screw up the age distribution, so reducing conventional logging and plantations is the first priority. Learn from the Indians and Nature, who did lots of small burns, resulting in a mosaic with low brush loads that is highly resistant to catastrophic fires. The more relevant unasked question is, how should communities be protected from unnatural events such as landslides, erosion, sedimentation, water quality degradation, habitat damage, poisons, and loss of fishing livelihoods, all caused by conventional logging and mining? (Individual, Oakland, CA - #A28134.30100)

BY CLEARING FUEL IN AREAS 40-100 METERS SURROUNDING COMMUNITIES

The current proposed Roadless policy allows roads to be built in roadless areas to protect life or property. All the current research points to the areas within the first 40-100 meters surrounding a community as the place where clearing to prevent fires should be concentrated. (Individual, Davis, CA - #A11711.30400)

IN ALREADY ROADED AND ACCESSIBLE AREAS ADJACENT TO ROADLESS AREAS

The fire occurrence data in DEIS, Vol I, 3-157, states that larger and more frequent fires occur outside roadless areas. In fact, it states that a human-ignited wildland fire is nearly four times as likely to occur outside of a roadless area. Given this information, I would suggest that roadless areas would best be protected by implementing husbandry prescriptions and fuel load reduction treatments deemed appropriate by the Forest and District on already roaded and accessible areas adjacent to roadless areas. The FS would use its already existing fire prevention and suppression plan as well. (Individual, Klamath Falls, OR - #A4970.30500)

BECAUSE FIRES OFTEN DO MORE HARM THAN GOOD

FIRES: Yellowstone Park after the 1988 fire! They said it was good for it to burn, but it is good only for just a few years. The new trees will get tall, shade the grass and the grass will die. The dead trees will fall down and it will be hard for the animal to get through, leaving lots of fuel close to the ground. When the next fire goes through, it will get the ground so hot, it will sterilize it. Then trees may not grow back for years. If it takes a long time to grow back, erosion will take place. (Individual, Bonner, MT - #A958.30300)

1537. Public Concern: The Forest Service should use prescribed burning techniques as a tool to reduce fire danger.

Given the limited logging, roadbuilding, fire suppression, and other management that has occurred within roadless areas, the fire regimes within roadless areas are still largely within natural patterns. Hence, little fuel reduction should be necessary. As small diameter fuels (less than 3 inches in diameter) are the primary vector of fire spread, these fuels can be effectively treated with prescribed fire if deemed necessary. As prescribed fire may differ markedly from natural fire, the impacts of prescribed fire should be thoroughly considered (Tiedemann et al 2000). (Organization, Missoula, MT - #A613.3420)

This lesser alteration in IRAs often results in lesser fire intensity, According to the Interior Columbia Basin Assessment:

Frost (1999) outlines the characteristics of roadless areas that may result in prescribed burning being appropriate:

Nevertheless, there are numerous roadless areas in various parts of the country that could legitimately benefit from proactive fire/fuels management using prescribed fire. What is needed are: 1) a standardized set of guidelines for identifying and prioritizing roadless areas based on their fire hazard and risk at the national or regional level, and 2) a subsequent step down process for planning fire

treatments at the local level that allow fire to play a much more important role while at the same time minimizing risks to ecological values.

Development of a comprehensive set of criteria for prioritizing roadless areas for prescribed fire treatments is largely beyond the scope of this paper. However, the following list of roadless area attributes provides an initial starting point:

- majority of area covered by dry forest types that historically were characterized by low intensity/high frequency fire regimes.
- high levels of horizontal and vertical continuity of fuels across large, contiguous areas (e.g. high stand densities and/or highly flammable fuel loads).
- long interval since last major fire (e.g. missed more than two severe natural fire cycles).
- topographic and elevational homogeneity (e.g. gentle terrain), where fire fighting efforts have more likely influenced fire behavior and also allow for relatively low-risk fire treatments.
- absence of significant natural barriers to the spread of fire (e.g. rocky terrain, non-forested vegetation, waterways, etc.)
- close proximity to the wildland-rural interface, major population centers, transportation routes, residential developments and other infrastructure (where fire risk is high) absence or low density of threatened (Organization, Missoula, MT - #A613.30420)

IN AREAS OUTSIDE OF WILDERNESS OR ROADLESS AREAS

We already have a let burn policy for wilderness areas - may we not extend that to roadless areas, where conditions permit? In other areas, why not implement burn programs, guided by foresters and scientists to achieve a desired future condition? Where necessary (feasible) firebreak swathes (not roads) could provide suppression opportunities. (Individual, Craig, AK - #A778.30400)

IN LATE FALL

I strongly support prescribed burns done in very late fall, the huge fire in New Mexico proved that timing is essential in doing the burns without destroying a forest. (Individual, Boise, ID - #A64.30420)

Prescribed fire to reduce fuel loads is the only practical answer. I first experienced the results of "let burn" and "loose herding" in 1979 on the Galligher Peak and Mortar Creek fires. Both became expensive disasters. Since then I have seen several similar situations including Yellowstone in 1988. My best recommendation is prescribed fire in the fall when winter has a chance of preventing a catastrophe and be prepared to face the consequences when it does not work as planned. (Individual, Moscow, ID - #A5380.30420)

IN FORESTS WHICH BORDER COMMUNITIES

Forestland bordering communities and subdivisions should offer periodic prescribed (controlled) burns, emphasize local education to encourage ground cleaning and brushing around homes. (Individual, Bayfield, CO - #A13395.30400)

EVERY FOUR TO FIVE YEARS

I believe that small burns should be performed every 4 to 5 years to keep the forests healthy and the fuels low. Now that many of the large fuel supplies were burnt, the time is right to keep up with the prescribed burning practice. (Individual, Boise, ID - #A209.30420)

AT LOW-RISK TIMES OF THE YEAR

The best way to maintain healthy wild forests is to keep them roadless, which allows natural processes to proceed. A century of aggressive fire suppression has resulted in a serious build-up of fuel in many parts of the West. But cutting down all the trees is like cutting off the nose to spite the face. Prescribed burns at low-risk periods of the year would help to reduce the build-up of fuels without destroying the forests that the curative methods are supposed to protect. The Forest Service's own figures show that less than 2% of the inventoried roadless areas are at risk for insects, disease or fire. Recent studies have also demonstrated that most of the fires start in developed areas, not in the roadless areas. (Individual, Seattle, WA - #A17841.30100)

WITH GUIDELINES ESTABLISHED IN THE FOREST PLANNING PROCESS

Prescribed fire for forest health, fuel reduction and wildlife should be allowed. Guidelines should be decided at the forest plan level. (State Agency, Social Circle, GA - #A22054.30420)

ONLY AFTER PREVENTATIVE STEPS TO REDUCE FUEL LOADS ARE TAKEN, SUCH AS HARVESTING, THINNING, AND GRAZING

Forests should be harvested, grazed, and thinned to keep the fuel load in check. Prescribed burning can be done ONLY after those fire-preventative steps are taken. Site-specific clearcutting should be used to prevent the spread of insect infestation or disease. "Inventoried" roadless areas should be "opened" to access to take those necessary steps. In many areas that I am familiar with, logging companies must "close" their roads after a timber sale, which includes cutting water-bars and seeding grasses to prevent erosion. (Organization, Three Rivers, CA - #A28739.30200)

TO REDUCE THE ECOLOGICAL IMPACTS OF FIRES AND FIREFIGHTING

For the prevention of insect and disease outbreaks, to minimize the impact of these outbreaks, and to reduce the potential for large-scale wildfires, the best option is prescribed burning. Rather than spending money building roads so that privately owned timber companies can profit off of national timber, use the money to hire ground crews to burn the forest bit by bit. The only way to limit fuel buildup is to burn periodically. Simply removing the smaller trees won't work because brush will still accumulate without them. Burning will also keep both endemic and epidemic pest and disease outbreaks to a minimum. You don't need roads and fire breaks to prevent fires. You need people setting many small-scale, prescribed fires under appropriate weather conditions. Fires are inevitable. Preventing fires is no justification to fragment millions of acres of habitat unnecessarily with superfluous roads.

Another reason to implement the proposed roadless rule is that fighting fires also causes ecological disturbances. Bulldozed firebreaks can lead to erosions, invasive foreign weeds can take hold there, wetlands are destroyed, and fire retardant dropped from airplanes can harm frogs and other amphibians. So, fighting the fires doesn't work, and suppressing the fires doesn't work, so prevent the fires by designing a prescribed burning scheme, hire adequate, experienced staff to carry it out, and implement it. That will result in significantly fewer large-scale wildfires and the taxpayers will probably save money in the long-run from the decrease in the exorbitant costs associated with fighting fires.

It is important to note that as of August 30, 2001, only 1/7 (14%) of all lands burned this spring and summer were part of the National Forest System. Therefore, the Forest Service should have fought only 14% of all fires this year. This compares with the figures for the last 5 years that less than 1/5 (20%) of all land burned in the Western United States was in National Forests. Being that such a small percentage of the fires actually occur on federal property, fire is clearly not the widespread problem that the media is making it out to be. With an adequate prescribed burning regime in place and staff to carry it out, the fire issue should be relatively minor, rendering the notion that we have to cut the forests to prevent fires and pest outbreaks moot, as it ought to be. (Individual, No Address - #A29243.30100)

USE TECHNIQUES THAT ADHERE TO LOCAL FIRE MANAGEMENT PLANS AND THAT CONTAIN MONITORING PROVISIONS TO ASSESS THE USEFULNESS OF THE BURNS

We support active management of roadless areas in the form of carefully designed prescribed burns that adhere to local fire management plans, and that contain monitoring provisions to assess the usefulness of the burns. (Organization, Seattle, WA - #A21694.30100)

1538. Public Concern: The Forest Service should carry out controlled burns.**TO MANAGE FOREST HEALTH**

Insect outbreaks are part of a natural cycle in many forest systems. In systems where natural fire regimes are still operating, low to moderate intensity fire can itself help prevent or lessen the impact of insect outbreaks. By reducing the number of younger trees, thereby decreasing drought stress, some forest communities can both reduce catastrophic fires and the frequency and severity of insect infestations. Using controlled fire and developing appropriate let-burn policies for roadless areas should be the preferred ways to manage for forest health. (Individual, Seattle, WA - #A11805.31200)

IN STRIPS OF FOREST THAT HAVE PREVIOUSLY BEEN HARVESTED, SIMILAR TO A CROP ROTATION MANAGEMENT ACTIVITY

During this summer's season of wildfires, there is talk of controlled burns to burn up years' worth of accumulated brush and wood fuels which make massive wildfires more likely. Given that fighting these massive wildfires is very expensive, why not compromise with controlled burns in strips that have first been logged, giving the loggers the job of gathering unwanted fuels in piles to burn in lieu of buying the timber. These strips then become firebreaks against future wildfires. As these strips regenerate, other strips can be similarly harvested, etc. such that over time a healthy forest results somewhat like the beneficial effects of crop rotation on a farm. This is just one idea. There must be many sensible formulas such that man, with roads, can save the forests. Man can best protect the forest environment through involvement, not deliberate neglect. (Individual, Leamington, UT - #A8030.30531)

IN AREAS WHERE FIRES HAVE BEEN ARTIFICIALLY SUPPRESSED

Protecting forests means allowing fire to work its natural role. Controlled burns should be planned where fires have been artificially suppressed. (Individual, Seattle, WA - #A17999.30310)

IN AREAS WHERE THE RISK FOR EXTREME TEMPERATURES AND INTENSIVE VOLUMES OF SMOKE HAVE BEEN ADDRESSED

In the case of forests, we have been waging a divisive discussion for many years between philosophies of fighting fire [or "lighting fire"]. Reduction of fuels is a must. Start with the least invasive tools first, and proceed to controlled burning when the risk for extreme temperatures and intensive volumes of smoke have been addressed. (Individual, Elko, NV - #A23651.30500)

WHERE POSSIBLE, OTHERWISE THIN TIMBER WITHOUT BUILDING NEW ROADS

As [is] pretty generally known, most forest areas in the western USA (some coastal forests being a partial exception) have naturally coexisted with low-intensity fire for millennia. Fire has controlled fuel buildup, moderated insect and disease problems, etc. Fire control over the last century has created fuel buildups, and encouraged insect and disease problems. Where possible, the obvious solution is the use of intelligent "controlled burning". Where this is, for whatever reason (such as proximity to roadless area borders) not possible, mechanical thinning should only be considered if it can be done without the building of roads, and in a way which replicates as nearly as possible the effect of low intensity fire (e.g., preserving larger trees, recycling nutrients). I believe the rules under suspension are quite consistent with these principles. (Individual, Seattle, WA - #A17261.30400)

Protecting Forests: Controlled burns and other management approaches can be executed without the building of new roads into existing roadless areas. (Individual, No Address - #A26689.30100)

1539. Public Concern: The Forest Service should construct firebreaks.

Adequate "Fire Breaks" should be established to ensure the fires can be contained in a reasonable area. (Individual, Tucson, AZ - #A4540.30400)

ONLY IF REALLY NECESSARY

I support a roadless policy that allows for fire lanes to be dug *if necessary only* - that is, if winds and drought/weather conditions suggest that fire left uncontrolled will spread to populated or popular recreational regions. The Forest Service should determine necessity realistically - will throwing out a shovel brigade really stop this blaze, or is the act one of futility? (Individual, West Yellowstone, MT - #A1045.30600)

BY USING ROADS AS FIREBREAKS

Roads are important fire breaks. They allow fires to burn out rather than consume an area. They allow us to fight the fire if called for. (Individual, No Address - #A6738.30540)

BY DECOMMISSIONING SOME ROADS AND MANAGING THE REMAINING AS A DEFENSIBLE PERIMETER AGAINST WILDLAND FIRE

The existing road system is expensive and unsustainable. The process should consider which roads can be decommissioned, and how to manage the remaining roads as a defensible perimeter against wildland fire. Pulpwood thinning of the settled areas near remaining roaded areas is the best way to restore ecological processes which naturally limit fire hazard. (Individual, No Address - #A4777.30500)

BY CLEARING DEAD TIMBER AND THINNING STANDS NEXT TO PRIVATE PROPERTY TO AN APPROPRIATE WIDTH

I have a suggestion only on the problem of wildfires and fires started outside the National Forest. I grew up right after WW II in a small village in the Black Forest of Germany. When I was 5, my mother took me into the forest and we made bundles of branches for kindling. We were not alone. Everybody did it. The forest floor was clean, no dead wood, like the immediate surroundings of a popular camping place in the woods here in this country. My suggestion is to clear dead wood and thin the stand of forest next to communities and private property to a depth that will constitute an effective fire break. You should employ for that task the many unemployed loggers and others that typically are found around the Klamath National Forest. (Individual, No Address - #A5286.30500)

BY CREATING A BOUNDARY AROUND ROADLESS AREAS WITH MULTIPLE USE, MOTORIZED TRAILS

Inventoried roadless areas are subject to the greatest threat of wildfires and insect and disease outbreaks due to their limited accessibility. I would suggest that all such areas are boundaryed by multiple use, motorized trails. This would create a firebreak immediately, and also allow for easier access to keep an eye on the health of the forest. As far as the buildup of hazardous fuels, allow citizens to collect firewood from these established border trails to further promote the cleanup of the fuels and help to maintain the firebreaks. (Organization, No Address - #A26800.30100)

BY MAINTAINING FIRE LANES BUT CLOSING THEM TO ALL BUT FOOT TRAFFIC

I believe fire lanes must be available and maintained but closed to all but foot traffic. (Individual, Stewartstown, PA - #A7563.90110)

BY ENCOURAGING VOLUNTEERS TO ASSIST WITH FIRE BREAK MAINTENANCE

Not the least of these effects is that wildfires are fought with much lowered effectiveness without proper access for fire crews. Clearly, the Forest Service does not have the resources to maintain millions of miles of firebreaks if the support of recreational users is denied. Roads SAVE wilderness!! (Individual, Ypsilanti, MI - #A9112.30200)

OUTSIDE OF ROADLESS AREAS

If firebreaks are required, they should be constructed outside the roadless areas. (Individual, No Address - #A30493.30540)

1540. Public Concern: The Forest Service should allow ski areas located on the fringes of roadless areas to help provide defense zones.**WHICH ALLOW FOR DEVELOPMENT WHILE DECREASING FUEL LOADS**

It is the local Forest supervisor who is in charge of protecting the particular forest. Activities and planning actions must therefore occur at the local level. There are several management practices that would provide for healthy forests, especially related to the buildup of hazardous fuels and the occurrence of severe wildfires. One such technique is to allow the ski areas located on the fringes of roadless areas to help provide defense zones that allow for development while decreasing the fuel loads. The vegetative treatments in the ski areas have created a defendable space resulting in interruption of fire spread and reduction of fire intensity. (Permit Holder, Mammoth Lakes, CA - #A21901.12125)

1541. Public Concern: The Forest Service should maintain existing fire trails.**IN THE SHAWNEE NATIONAL FOREST**

In Illinois in Shawnee National Forest please maintain existing fire trails also. (Individual, Decatur, IL - #A11052.30200)

1542. Public Concern: The Forest Service should suppress forest fires.

Protecting Forests is something you know nothing about, or the LET BURN POLICY IN YELLOWSTONE would never have been followed. First put fires out as soon as possible before they get out of control. (Individual, Ogden, UT - #A280.30320)

Forests and communities should be protected from fire by adequate access to control the fires before they reach uncontrollable size. Go back to the Smokey Bear days when all fires were controlled at the shortest possible time and small size. (Individual, Payette, ID - #A1049.30400)

We are now suffering a bad wildfire in our own back yard due to careless campers and are told by the "enviro" part-timer in our neighborhood . . . "just let it burn" . . . why, for pete sakes? What good does it do to lose thousands of dollars worth of inventory (lumber) and food for animals (deer, bear, and whatever and even mice!) and maybe giving our neighbor, Canada, the world's biggest forest fire? How many lost head of livestock and human lives do you "work into your 'let it burn' agenda before you see reality?" People pay fees to graze livestock and that is lost revenue, also. (Individual, Mazama, WA - #A757.30430)

Obviously "roadless areas" prevent any detection or possible abatement of fuel buildup, insect or disease outbreaks and severe wildfires. Wildfires should not be considered a "natural" remedy for any of the above. The temperatures at which they burn sterilize huge amounts of otherwise productive and scenic land to say nothing of the absorption of carbon monoxide and production of oxygen. Once these lands are destroyed by fire, the very necessity of human life is extinguished with the fire. (Individual, Three Forks, MT - #A697.30200)

BECAUSE LETTING FORESTS BURN IS NOT RESPONSIBLE LAND MANAGEMENT

Allowing millions of acres to burn is not "responsible" environmentalism because:

1. The smoke pollutes the air
2. With winter snow and rain, streams become polluted because of soil erosion
3. Wildlife is displaced or killed
4. Much timber is ruined even for salvage logging. (Individual, Rocklin, CA - #A6215.30100)

BY USING CHEMICALS TO EXTINGUISH FIRES

Carbon dioxide as in the case of Nevada and other states can even cause fires. Lightning storms, especially dry lightning can tear a forest up real quick. Yet in many areas we're prevented from utilizing chemicals to extinguish fires, as if the smoke the fire creates is more environmentally friendly. (Individual, Jefferson, OR - #A775.30400)

BY ALLOWING FIRES TO BURN TO A CERTAIN LANDSCAPE FEATURE BEFORE SUPPRESSING THEM

A century of fire suppression has made roadless (and other) forests unhealthy. Enormous fuels have accumulated. The Forest Service should consider procedures used in some national parks of fire management that allows fires up to a certain point - a drainage, to a ridge, etc., before suppression. Fire plans in roadless areas should be designed to reintroduce a natural mosaic of different stand age classes across the landscape as the prime objective, rather than mere suppression. (Individual, Lolo, MT - #A111.30400)

BY ENLISTING MILITARY AIRCRAFT CONVERTED INTO WATER TANKERS AS A SUPPRESSION TOOL

To help minimize the destruction of State and Federal Forests due to wildfires, I propose the following solution. Re-activate a wing of the now decommissioned B-52s, converting them into water tankers that would be strategically stationed in airstrips across the United States. These planes and their water would be available to any State or Federal forest fire in the country on a moment's notice. The United States Armed Forces or each individual State's National Guard could man the planes. The "bombing runs" or water drops would simulate combat conditions for the pilots. Minimizing the loss of grasslands and forests and giving our military personnel much needed experience, under less than ideal conditions. (Individual, Kamiah, ID - #A5419.30400)

How many cargo planes does the US armed services have? Many. What if a water tank were made for 9,000 of them? Some could even take on water by skimming the great lakes, oceans, etc. What if 9,000 cargo planes, 1 mile apart, dumped oceans of water on a wildfire, first light until dark, dark until first light. Non stop. Non stop. I say the blasted fire would be put out!!! Then they could put out the other one and all of them fast. (Individual, Jackson, MI - #A7273.30400)

1543. Public Concern: The Forest Service should concentrate firefighting efforts in urban-forest interface areas.**BECAUSE THESE AREAS ARE ALREADY ROADED AND POSE THE GREATEST THREAT TO LIFE AND PERSONAL PROPERTY**

Wild fires are much more likely to start in areas with roads, due to increased public access. The highest risk of wildfires is in the urban interface, where homes and private property run a high-risk of destruction. Incidentally, in the state of Washington, a spark from a vehicle engine in a roaded, logging induced, fuel-heavy forest, caused one of the two most devastating fires in recent times. The Forest Service should concentrate its fire fighting efforts in those areas, which are already well supplied with roads and pose the greatest threat to life and personal property. (Organization, Seattle, WA - #A21702.30200)

The agency should make clear that access to roadless areas to prevent or address forest fires, fuels buildup, insect or disease outbreaks or other urgent priorities will require management flexibility and that exceptions to a roadbuilding ban are needed for such access. More intensive forest fire prevention activities should be allowed in roadless areas near or adjacent to urban interfaces, private lands or other public lands, such as ski areas, where there has been extensive investment of private capital in improvements that could be threatened by severe wildfires. Any national directives on roadless area management should contain an explicit exemption for activities in roadless areas needed to prevent or address forest fires, fuels buildup, insect or disease outbreaks, or other safety issues. (Permit Holder, Denver, CO - #A15385.30200)

1544. Public Concern: The Forest Service should enlist prisoners to clean up dead and dying timber and brush and to construct and maintain trails.**MATERIALS COLLECTED COULD BE USED TO OPERATE A CO-GENERATION POWER PLANT**

We expect our military personnel to live in whatever kind of conditions that the situation requires. Yet, we let our national criminals live in better conditions and with more benefits than our military and most of the civilian population of the United States. With that in mind, why couldn't we take the majority of our able-bodied State and Federal nonviolent offenders and place them in a so called "CCC" camp. Whose responsibility it would be to go through, literally picking and cleaning up all of the dead and dying combustible material, from all of our State and Federal lands. However, this "CCC" camp would also include the responsibilities of building and maintaining the forest trails for everyone's enjoyment. They would live in conditions that were no worse than those that we expect our military men and women to live in without complaint.

This combustible material could then be used as fuel in a Co-Generation power plant. This would help to alleviate the present and future energy shortages of the United States of America. With the available

technology, the emissions of the Co-Generation power plant would be minimal, eliminating any environmental concerns. (Individual, Kamiah, ID - #A5419.30500)

I think that prisoners from state pens should be utilized to clean out underbrush, so that the forest fires would be less. (Individual, Harrisonburg, OR - #A19453.30600)

1545. Public Concern: The Forest Service should specify the criteria under which the Roadless Area Conservation Rule exceptions would apply.

FOR MANAGEMENT ACTIVITIES TO REDUCE THE THREAT OF WILDFIRE

The Forest Service should make clear that under some circumstances healthy forests might be subject to wildfires, even severe ones, and build up of fuel loads. This would be an appropriate discussion in regional assessments or Analysis of Management Situation conducted as part of a Forest plan revision. The current roadless area conservation rule allows for management activities to reduce threats from wildfires. The language in the current rule allows for:

(1) The cutting, sale, or removal of generally small diameter timber is needed for one of the following purposes and will maintain or improve one or more of the roadless area characteristics as defined in #A294.11.ii. To maintain or restore the characteristics of ecosystem composition and structure, such as to reduce the risk of uncharacteristic wildfire effects, within the range of variability that would be expected to occur under natural disturbance regimes of the current climatic period.

We suggest that it is the role of Forest Plan revision to specify, to the extent possible, in which roadless areas this exception would apply and the thresholds that would trigger these management activities. It would be expected that these thresholds would be different for various units identified via GIS analysis. (Individual, Asheville, NC - #A22623.30410)

The prior Roadless Rule policy allowed for some road construction and some logging in roadless areas when faced with an imminent threat to public and health and safety, and allows hazardous fuels treatments within roadless areas. The Commission supports the reservation of this level of active management for the occasions presenting a true hazard to life or property, or risk of *catastrophic* fire. We are concerned, however, that this exception will be taken advantage of and used to allow logging and road construction for ulterior motives where risks are only slight. For this reason, exceptions must be stated narrowly and explicitly. (Executive Director, Inter-Tribal Fish Commission, Portland, OR - #A20331.30400)

Ecosystem/Restoration Management

1546. Public Concern: The Forest Service should acknowledge that wildfire is a component of a healthy forest.

Regarding the management of inventoried roadless areas to provide for healthy forests, the Forest Service should make clear that under some circumstances healthy forests might be subject to wildfires - even severe - and build up of fuel loads. This would be an appropriate discussion in regional assessments or analysis of management situation conducted as part of a Forest plan revision. (Civic Group, Roanoke, VA - #A1713.30300)

The Forest Service should try to get over its aversion to fire. It's not a disaster—it's a natural process; fire enhances habitat for deer, elk, and other wildlife recycles nutrients, etc. Many Forest Service employees know this, but the agency can't seem to avoid a knee-jerk anti-fire position. (Individual, Missoula, MT - #A90.30300)

Fire plays a vital role in western forest and rangeland ecosystems. As a natural disturbance agent responsible for recycling nutrients, regenerating plants, and sustaining diverse wildlife habitats, fire is necessary for the continued productivity of these ecosystems. Certainly, efforts should be made to

protect communities in the urban/wildland interface zone, defined as the area “where combustible homes meet combustible vegetation.” But pouring taxpayer dollars into suppressing fires and logging in roadless forests located far from residents makes little sense. (Organization, Nevada City, CA - #A4941.30300)

1547. Public Concern: The Forest Service should not suppress forest fires.

BECAUSE NATURAL FIRE MAINTAINS DIVERSE FORESTS AND WILDLIFE HABITAT

Five years ago, I published several studies of fire ecology of a roadless area. My findings from the Northern Rockies indicated that large roadless areas can be important for facilitating fire as a natural and important process in maintaining diverse forests and wildlife habitats. By limiting human-caused ignitions, structures and other developments, fire management can actually be less challenging in these areas. There are many other virtues of large roadless areas such as water quality, solitude, wildlife refugia, and so on. The Forest Service’s Interior Columbia Basin Assessment further stresses the ecological integrity and value of these areas. (Individual, Portland, OR - #A3912.30300)

We believe that the long-term management strategy for both fire prevention and forest health needs to incorporate a natural fire element. (Organization, Seattle, WA - #A21904.30430)

BECAUSE FIRE REJUVENATES ECOSYSTEMS

Current threats to the health of our nation’s forests can almost without exception be traced to poor past management practices. The decades long effort to suppress forest fires has led directly to the “tinder box” we now face. There is however a clear and timely demonstration of the best response to naturally occurring forest fires - let them burn. The fires in Yellowstone in 1988 have led to a widespread rejuvenation of that Park’s ecosystem. (Individual, Green Valley, AZ - #A5089.30300)

BECAUSE NATURAL FIRE REGIMES SHOULD BE RESTORED

Fire hazards are invariably more severe where selective logging and fire suppression have led to the buildup of a brushy understory of fire-prone species like white fir. The Forest Service should move further in the direction of restoring natural fire regimes, with less aerial suppression of fires in roadless areas, and a greater concentration on prophylactic measures within a perimeter defined by a reduced road system. (Individual, No Address - #A4777.30310)

Wildfire suppression should be similar to that already followed on wildlands in Alaska. Naturally occurring fires should be left to burn unless threatening towns. Wildfires are not a big issue in much of coastal Alaska’s forests. (Individual, Seldovia, AK - #A8803.30400)

BECAUSE FIREFIGHTING IS A WASTE OF MONEY, DANGEROUS, AND HARMS THE ENVIRONMENT

Roadless areas and other designated wildernesses should be left to burn under natural conditions. Fighting fires in remote areas is a waste of money, is too dangerous, and does more harm than good to the environment. (Individual, Lehi, UT - #A568.30400)

BECAUSE DEAD TIMBER IS A CRITICAL PART OF THE FOREST ECOSYSTEM

Management should be left to natural processes whenever possible. Fire management should only be done near inhabited areas, if at all. Deadwood is a critical part of the forest ecosystem, and should be allowed to exist. (Individual, Winthrop, WA - #A19642.30310)

EXCEPT IN THE EVENT OF INSECT OR DISEASE INFESTATION THAT IS UNCONTROLLABLE BY NATURAL MEANS

Fire suppression should stop completely, except in the event of insect or disease infestation that is uncontrollable by natural means. (Individual, New Haven, CT - #A8987.30910)

EXCEPT IN THE EVENT IT IS NOT POSSIBLE TO CONTROL THE FIRE, THEN RELY ON MORE AIR-POWER

Keep them roadless, thus avoiding some of the problems (such as fire) that are intensified by roads. Fires have been controlled in these areas in the past, and can continue to be controlled. (Most roadless-area fires should be left to burn. Where that is not possible, much heavier reliance on massive air-power than

has been practiced would greatly improve fire control.) Insect and disease outbreaks are part of the natural forest cycle and should be left alone in roadless areas. (Individual, Santa Fe, NM - #A11703.30100)

EXCEPT IN THE EVENT THE FIRE IS HUMAN INDUCED

As for fire concerns, let natural fires burn, fight human started ones. We may have some huge fires due to the history of forest mismanagement in the short run, but after awhile the forests' natural fire responsibilities will resume. (Individual, No Address - #A21323.30310)

IN REMOTE AREAS

The FS needs to develop fire plans right away for roadless areas which will allow most wildfires to burn when not threatening human lives or property. Suppressing wildfires in remote areas is ridiculous, expensive, and counter productive. (Individual, Idaho Falls, ID - #A27528.30400)

The vast majority of roadless areas are in inaccessible areas, mostly at higher elevations. These forests do not need to be protected from wildfire. Higher elevation forests usually have stand-replacement fire regimes. These are typified by "severe" wildfires that occur every century or more. Fire suppression has not been occurring for long enough to result in any kind of "unnatural" fuel buildup in these forests. There is no reason to be fighting fires in these areas, and there is no evidence that either roads or silvicultural thinning would help us fight fires there if we wanted to do so. Nor do forests need to be protected from insect outbreaks, as these are also natural occurrences. The best way to protect forest health in roadless areas is to prevent the construction of roads. Roads have profound negative impacts on wild lands. They fragment habitats, cause erosion, and rapidly promote the spread of invasive weeds. (Professional Society, Missoula, MT - #A29308.30100)

The Roadless Rule already provides exceptions that allow road building and logging when needed to address wildfire concerns. Because roadless areas are typically located far from communities and residences, wildfires in roadless areas pose relatively little risk. This is especially true in Alaska's two national forests. (Organization, Sitka, AK - #A30486.30100)

The greatest fuel loading and fire hazard areas and areas closest to homes should get highest priority. Roadless areas are often the furthest from residences (since there are no roads in these areas). There is already a Forest Service program to let fire burn in wilderness when private property and commercial timber outside of those areas is not threatened, since it is part of the natural ecological process. Since larger trees in areas of frequent fire are often fire resistant and will survive, since these areas are furthest from civilization, they are at higher elevations, they have colder temperatures and higher humidity, fuels are not so dry, fires often do not get so large and burn themselves out more quickly, and smoke is not such a public health concern in these locations. It is more difficult and expensive to fight fire in roadless areas (no roads, further from towns, supplies, etc.). (Individual, Olympia, WA - #A20849.30400)

IN WILDERNESS AREAS

Wilderness (and not merely wilderness already contained in designated wilderness areas), however, should be allowed to burn naturally as much as possible. (Individual, Seattle, WA - #A26276.30310)

PROHIBIT FIREBREAKS AND RETARDANT DUMPING

National fires need to be allowed in Roadless wilderness without damaging fire breaks bulldozed and retardant dumping. (Individual, Talent, OR - #A23553.30300)

1548. Public Concern: The Forest Service should reintroduce fire into forest ecosystems.

The most effective fuels treatment that would both protect roadless areas from future severe fires, insect and disease outbreaks while at the same time it restores areas altered by past fire exclusion would be a program of prescribed burning and wildland fire use. Fire reintroduction has been the longstanding call among scientists, ecologists, and conservationists. It is the most ecologically beneficial and least

economically costly management treatment to manage roadless areas. It is fully in accordance with the letter and spirit of the National Fire Plan, the USFS Cohesive Strategy, the 1995 Federal Wildland Fire Management Policy, and the 2001 Review and Update of the Federal Wildland Fire Management Policy. In most cases on most roadless areas, careful fire management planning can devise the prescriptions necessary to apply both prescribed and wildland fire use for all needed fuels treatments. In contrast to road-dependent mechanical thinning treatments, roads are unnecessary for prescribed burning or wildland fire use. The economics of fire-based fuels management would thus be even more attractive since the costs of constructing and maintaining roads are moot. To burn or not to burn is really not an issue dependent on more research or policy reform—it is mainly a matter of Forest Service managers harnessing the will to make the right decisions regarding wildland fire use and prescribed burning. (Organization, Eugene, OR - #A21798.30200)

Some Roadless Wilderness areas need to have fire reintroduced gradually if the past fire suppression has created inferno type conditions, low intensity burns could be encouraged. All with proper study of the growing field of fire ecology. (Individual, Talent, OR - #A23553.30300)

Rely Principally on the Reintroduction of Fire. What has been missing from these systems is fire. Fire should be introduced through liberal application of controlled burns, and with a reduction in the suppression of natural fires. Even at that, it will take years to catch up with the backlog of built-up fuels. Meanwhile, catastrophic fires will occur. Well, let's face it. Some areas have always burned catastrophically. For the next few decades, until the built-up extra fuels are reduced, more areas than usual will burn catastrophically. In the end, this is a natural cure for an unnatural situation. Except for fires that threaten to consume a disproportionate amount of the available forest (see below), even catastrophic fires should be allowed to burn without fire suppression. In the end we will get a natural system again - free from the residue of past mismanagement. What this approach requires, of course, is humility and patience - two attributes rarely demonstrated in our national character. (Individual, Pendleton, OR - #A30482.30300)

1549. Public Concern: The Forest Service should manage fire in roadless areas following wilderness fire management policies.

BY EXTENDING THE "LET BURN" POLICY TO ROADLESS AREAS

The idea that areas established for the purpose of maintaining them in a natural condition need to be managed to protect them from natural disturbance is, with a few exceptions, misguided and unjustifiable. Protection of roadless areas is not expected to increase either the number of large fires or the acreage burned over the next 20 years. The majority of lightning-caused fires, and the great majority of human-caused fires, occur outside of wilderness and roadless areas (FEIS, table 3-20, 3-21), and the median size of large fires is not appreciably different between inventoried roadless and roaded areas (FEIS, Table 3-22). Where feasible, fire management in roadless areas should follow wilderness fire management policies. Where "let-burn" policies are in place they should be extended to roadless areas. Aggressive fire suppression (including use of ground-based mechanized equipment) should be undertaken only when fires threaten life or property outside of roadless area boundaries.

Prescribed burning to simulate natural fire regimes (including low-impact actions to reduce fuel loading) should be allowed in roadless areas. Use of mechanized equipment for fuel suppression requiring the construction of temporary roads for access should not be allowed. More intensive proactive steps to reduce fuel loading and fire risk (including mechanized or commercial thinning) should focus on areas where there is the highest threat to human settlements and property (the wildland-urban interface). Most of these areas will be well outside inventoried roadless areas (FEIS, pg. 3-87), and their treatment is likely to occupy forest managers for several decades. Where roadless areas are in close proximity to settled areas exceptions may be made that allow more active fire risk reduction steps in roadless areas.

No actions should be taken in roadless areas to suppress natural insects, diseases or other pests. Exceptions may be made to control outbreaks of exotic pests that are not well-established in the region, and where treatment may reasonably be expected to limit the establishment of these pests. However, these instances are likely to be relatively rare. (Organization, Boston, MA - #A23083.30100)

1550. Public Concern: The Forest Service should ban the use of fire in roadless areas.

Protecting forests from fire is not totally possible, bans on fire use in these roadless forest is one way to go. Anyone caught building a fire is to be fined excessively. (Individual, Boulder, CO - #A3478.30400)

1551. Public Concern: The Forest Service should avoid artificial fires, backburning, and prescribed burning.

We should use hand clearing and avoid artificial fires and backburning which has repeatedly gotten out of control and done more damage than good. Dead and diseased trees should be removed when necessary and non invasive methods such as horse logging should be employed when possible. (Individual, Marion, NC - #A4691.30400)

Most of the forested area that burned in 2000 was managed timberland - areas that have been logged or thinned in the past - not pristine old growth or roadless wildlands! Fight fires, end prescribed burns! (Individual, Bozeman, MT - #A8444.30100)

The forest health problem cannot be ignored. Prescribed fire to reduce fuel is not a feasible program for portions of the forest which are accessible by roads; and it certainly is even less feasible in roadless areas. In the first place, prescribed fire fails to accomplish significant fuel reduction most of the time. In the second place, the federal agencies have a miserable record in controlling prescribed fire. And in the third place prescribed fire is unacceptable because of its unreasonable cost when weighed against benefit. These problems plume the smoke and its disastrous affect on human health and air quality make massive prescribed fire programs unacceptable. (Individual, Townsend, MT - #A20588.30420)

Protecting forests the same protection or even more should be provided roadless areas for they are middle ground on the forest system; highest being wilderness; second being roadless and third being open access. Whatever actions needed to protect the areas should be taken; even if it seems to violate the rules for roadless areas; ex: if a road on fire break needs to be bulldozed to fight a fire or provide for spraying or harvest of diseased tress; it should be done, better to destroy a few than let the whole area be decimated. I am totally against LET BURN and CONTROLLED-BURN policies. (Individual, Ogden, UT - #A2288.30100)

BECAUSE FORESTS IN THE SOUTHEASTERN UNITED STATES DO NOT HAVE A FUEL LOAD

The Forest Service needs to move beyond the idea that fires are bad and evil. Yes, fires are bad when they endanger lives and communities. But some fires should be allowed to burn and some forest ecosystems depend on fire to regenerate. On the other hand, the cove forests in the southeastern United States are moist forests and have a very low risk for fire. The southeastern forests don't have a "fuel load"; we have leaf litter and the leaf litter helps keep the soil moist. The moisture in our forests is what makes them so diverse. I am very discouraged to see the Forest Service doing prescription burns in the Pisgah and Cherokee National Forests. These forests are not dependant on fire. The only reason the Forest Service is burning is to reduce competition of hardwood understory trees, like non-commercial value Dogwoods. We need to spend tax-dollars to reduce the threat of wildfire in and around homes, not miles away from communities in roadless areas. (Individual, Asheville, NC - #A30306.30300)

1552. Public Concern: The Forest Service should protect roadless and roaded areas.**BY DESIGNING RESTORATION PROJECTS TO MANAGE POTENTIAL CATASTROPHIC WILDFIRES**

On the Pike and San Isabel, several areas which have fire-suppressed forests in the wild-urban interface are being considered for restoration projects which would specifically deal with potential catastrophic wildfire. These projects can be designed to protect roadless and roaded areas alike within the parameters of the Rule. (Organization, Denver, CO - #A8824.30100)

1553. Public Concern: The Forest Service should allow a categorical exemption for restoring burned areas.

INCLUDING NEEDED ROAD BUILDING, SALVAGE LOGGING, SOIL PREPARATION, SEEDING, PLANTING, RIPARIAN RESTORATION, AND FOLLOW UP WORK TO HELP THE SURVIVAL OF SEEDLINGS

With fires burning in the West, and hundreds of thousands of acres needing restoration in the aftermath, one could hope for a change of public sentiment to allow for: A categorical exemption from legal challenges to needed restoration of burned over areas, including but not limited to needed road building, salvage logging, soil preparation, seeding, planting, riparian restoration, and follow up work to help the survival of seedlings. (Individual, Yreka, CA - #A17133.31100)

Other

1554. Public Concern: The Forest Service should utilize burned timber as biomass energy.

Burned timber must be utilized as Biomass energy rather than laying waste other than set aside amount of downed trees for habitat. (Individual, Jefferson, OR - #A775.31100)

Insects, Disease, and Noxious Plants

Summary

General Comments – A number of respondents comment about insects, disease, and noxious plants. One individual urges the Forest Service not to weaken the Roadless Area Conservation Rule because the Rule, this person states, will aid federal, state, and local efforts to combat the spread of noxious weeds. Likewise an organization states that “protecting roadless areas is one of the most important ‘weed control’ policies because of the intimate connection between roads and the spread of invasive plants.” One business suggests that the Forest Service should implement standards for insect and disease control “so that an outbreak is controlled and potential usable losses are utilized before they become unsuitable;” and an association requests that the Forest Service recognize that roadless area transportation regulations and policies interfere with local grazing associations’ work in controlling noxious plants.

Adequacy of Analysis – Some respondents suggest that the Forest Service should evaluate the role of insects and disease in a forest ecosystem. Others recommend insect and disease outbreaks be examined—on foot, on horseback, with the use of aircraft, with regular surveys, by enlisting aid from the public, or by establishing an entomological collection station. Several respondents suggest that the Forest Service evaluate all sources that contribute to the noxious plant problem, including roads, people, equestrians, wildlife, and natural processes. A county agency asks that the Forest Service reevaluate insect and disease risk. This agency states, “We suggest that this issue be reevaluated and specific direction be incorporated as to insect and disease response within the unroaded and roadless areas.” Additionally, one individual suggests the Forest Service expand its studies of ecosystem interactions because few places are in danger of insect and disease epidemics.

Funding – Several people suggest that funding be directed to the management of insects, disease, and noxious plants. One individual states, “Funding should increase for research and development of biological means of preventing and controlling insects and disease.” Another person recommends that the Forest Service reallocate money earmarked for timber removal in order to hire a staff large enough to recognize forest health problems early on. Finally, an

organization asks the Agency to acknowledge the financial contributions made by off-road vehicle users to noxious plant abatement programs.

Management – A number of respondents assert that the Forest Service should actively manage resources to control insects, diseases, and noxious plants. Suggestions include reintroducing fire, prohibiting monocultures, using chemicals and other solutions, using aerial applications, and implementing and enforcing U.S. Department of Agriculture recommended initiatives. A federal agency suggests the Forest Service concentrate its efforts in roaded areas identified as suitable for logging.

Other people urge the Forest Service to acknowledge that insects and disease are a component of a healthy ecosystem and that they play a vital role in biodiversity and nutrient recycling. Some suggest the Forest Service should control insects, disease, and noxious plants with natural remedies like species diversity and natural predators. Others state that wildfires should be allowed to destroy insects and disease. Several individuals recommend that pesticides and herbicides should not be used.

A number of respondents urge the Forest Service to only control exotic or non-native insects and diseases. According to one person, “Disease and insect outbreaks of natural origin should be allowed to run their course. More active management may be needed if the pathogens or insects are exotic species brought in by man.” Additionally, several people say that the Forest Service should not use forest health as an excuse to harvest timber because it is not needed to prevent insects and disease and because insects and disease rarely rise to epidemic levels.

Insects, Disease, and Noxious Plants General

1555. Public Concern: The Forest Service should not weaken the Roadless Area Conservation Rule.

BECAUSE THE RULE WILL AID FEDERAL, STATE, AND LOCAL EFFORTS TO COMBAT THE SPREAD OF NOXIOUS WEEDS

In forest ecosystems, most noxious weeds are restricted to sites near roads, logging operations and other disturbed sites such as power line corridors. It is clear that weakening the Roadless Area policy will directly counter Federal, state, and local efforts to combat the spread of noxious weeds. This will not only threaten and damage native biodiversity and ecosystem processes, but will also result in the need for expensive and controversial weed eradication measures in areas that do not currently contain roads and logging activity. Thus the consequences of weakening the Roadless policy from its current version will be both environmentally and economically harmful to our public lands and the taxpayers who support their proper stewardship. (Individual, Davis, CA - #A5401.31300)

1556. Public Concern: The Forest Service should ensure that its policies support rather than hinder the campaign to minimize damage caused by invasive exotic plants.

Current efforts are not adequate to control these invaders [exotic and invasive plants]. The Forest Service spends approximately \$5 million annually on invasive plant control, yet this funds control efforts on only 100,000 of the more than 6 million acres invaded by exotic plants. It is hardly surprising that noxious weeds continue to spread across our western public lands at a rate estimated at 4,600 acres per day—that is, they cover a new area the size of Delaware every year. Again, this figure is surely an underestimate because it doesn't include many of the species invading our forests and grasslands.

Clearly, the Forest Service must ensure that its policies support rather than hinder the important campaign to minimize damage caused by invasive exotic plants. Protecting roadless areas is one of the

most important “weed control” policies because of the intimate connection between roads and the spread of invasive plants. Weeds’ spread is greatly facilitated by human activities that disturb the soil, open the canopy, and injure vulnerable native vegetation. Road building directly disturbs vegetation, creates disturbed soils in which invasive plants often have advantage, changes water courses and opens the canopy to light. Weed propagules are often transported on the construction equipment or in fill or gravel.

The impact of roads is not short-term, but permanent. Roads open the area to heavier human use of all types—and those activities themselves contribute both further disturbance of soils and vegetation and modes for transporting weed seeds to these welcoming sites. Weed propagules can be carried on any truck, car, all terrain vehicle (ATV), logging equipment, boat, and livestock. Hikers, mountain bikers, and horseback riders also transport seeds. The increased presence of people also increases the likelihood of unplanned fires—which, again, can open opportunities for plant invasions.

Finally, weeds are spread from centers of infection by wildlife, wind, and water. These centers are often established by deliberate planting of the invasive species, including unwise choices for revegetation of disturbed, overgrazed, or burned areas. The link between roads and invasions is less clear for most exotic insects and fungal pathogens. In some cases, however, roadbuilding is directly linked to damaging infestations; the most prominent example is Port-Orford-cedar root disease, caused by *Phytophthora lateralis*. (Organization, Missoula, MT - #A17234.31320)

1557. Public Concern: The Forest Service should implement standards for insect and disease control.

AS PART OF THE FOREST PLANNING PROCESS

Standards for insect and disease control should be a part of forest planning so that an outbreak is controlled and potential usable losses are utilized before they become unsuitable. (Business, Eureka, MT - #A17220.31220)

1558. Public Concern: The Forest Service should consider that roadless area and transportation regulations and policies interfere with local grazing associations’ work in controlling noxious weeds.

WHICH ARE A PERSISTENT PROBLEM ON THE NATIONAL GRASSLANDS

The roadless and transportation regulations and policies also interfere with local grazing associations’ work in controlling noxious weeds, which are a persistent problem on the National Grasslands. The transportation and OHV policies will directly prohibit cross-country access for this work, again more evidence that the Forest Service has failed to assess the cumulative impacts on other programs. (Organization, Denver, CO - #A21358.31300)

1559. Public Concern: The Forest Service should not require horses to be diapered.

BECAUSE DEER AND ELK ALSO SPREAD SEEDS IN THE FOREST

Diapering horses is a really stupid idea as they do no more spreading seeds than deer or elk that eat hay out of the farmer’s field and transport seeds back to the forest. Generally the seeds in the farmer’s field are far less troublesome than the ones already on the forest. (Individual, Oak City, UT - #A40530.31313)

Adequacy of Analysis

1560. Public Concern: The Forest Service should evaluate the role of insects and disease in a forest ecosystem.

How should inventoried roadless areas be managed to provide for healthy forests, including protection from severe wildfires and the buildup of hazardous fuels as well as to provide for the detection and prevention of insect and disease outbreaks?

The role of insects and diseases in a forest ecosystem should [be] included [as] an assessment conducted in the early stages of plan revision or included as part of the Analysis of Management Situation of a revised plan. (Civic Group, Roanoke, VA - #A1713.31210)

1561. Public Concern: The Forest Service should examine insect and disease outbreaks.

BY ENLISTING THE AID OF HIKERS/VOLUNTEERS TO MONITOR AND REPORT OUTBREAKS

As part of a philosophy to encourage Americans to exercise and see their magnificent country, could we not support a modicum of trail building and enlist the aid of hikers/volunteers to monitor and report insect/disease outbreaks? (Individual, Craig, AK - #A778.31220)

It is my belief that the management of the “12 Mile Canyon” habitat has been an example of great management of federal lands. The roadless areas here are grazed by the deer, elk, and cattle of the local herds. Build up of hazardous fuel levels is rare due to this grazing.

The use of horse back rangers, herders, and local people well educated to the needs of the forest could detect early infestations and bring the need for management changes to the local board’s attention. Under these conditions the need for controlled burns would be minimized and the proper utilization of the land to maintain herds of wild animals, and summer feed for the local cattle optimized.

In the past unilateral decisions made by government employees to limit the grazing of local cattle whose owners have purchased very expensive permits for that grazing, and then been denied the use of those permits, has been a very bad area of contention and frustration among local citizens. This is especially true when the deer and Elk herds are allowed to multiply to the point of overrunning the ability of the hunters and the predators to keep the herds in balance. (Individual, Gunnison, UT - #A25755.30560)

The detection and prevention of insect and disease outbreaks can be discovered by scouting parties. Me along with many of my fellow colleagues would love to work as a scout for the summer. This would be a great way for college kids to get experience in the field as ecologists or biologists.

Once an infestation is found the use of controlled burns or pesticides could be applied. Controlled burns could be used by scouts and pesticides could be applied by plane or helicopter. Both possibilities do not need roads to be carried out. (Individual, No Address - #A17702.31200)

BY EXAMINING OUTBREAKS ON FOOT, HORSEBACK, OR WITH THE USE OF AIRCRAFT

Walking is an essential part of a Forest Service ranger’s duties. Examination of deadwood and underbrush accumulation, and detection of “insect and disease outbreaks” can be done on foot. Controlled burning, where deemed necessary, could be given approval under emergency protocols and accomplished by pedestrian personnel. Infestations could be controlled by crop dusting airplanes, and all activities outside areas under Wilderness designation could be supported by helicopter. (Individual, No Address - #A117.30600)

Disease detection and prevention might also be undertaken on foot or horseback and with the use of airplanes and helicopters. (Individual, Klamath Falls, OR - #A5118.30100)

In the case of detecting insect and disease outbreaks, I suggest the forest service continue its current preferred practice of aerial observation. (Individual, Clayton, GA - #A15320.30100)

Dead and diseased timber must be removed to prevent the buildup of potentially deadly fuel. The best way to discover insect-infested and diseased timber is to send Forest Service rangers into the field to look for insect-infested and diseased timber. This use of personnel can also help with enforcement issues and increase visitor contacts. (Individual, Fort Collins, CO - #A20609.30550)

BY ESTABLISHING AN ENTOMOLOGICAL COLLECTION STATION AT THE BORDERS OF NATIONAL FOREST SYSTEM LANDS

Entomological collection stations should be established at the borders of FS lands to detect in-flux of harmful insect vectors, or other forest disease transmission vehicles. Reduction of “natural event” fires should be limited to certain wilderness areas which directly impact populated areas and should be restricted to techniques which do not require construction of roads. Impact analysis of development of such areas should be included in all environmental assessments for new projects. Natural “burns” are part of the natural cycles of events. If forests are allowed to fully develop and mature, natural fires will be largely limited to the forest understory and will be self limiting. (Individual, Stone Mountain, GA - #A19230.30100)

WITH REGULAR SURVEYS

Of course regular surveys to detect insect and disease are a must. But I think this is being done now. The problem is that there has not been prompt action when outbreaks occur. This is generally due to obstructionists’ actions and lawsuits. (Individual, Portland, OR - #A28106.30100)

AND THEN ACT ACCORDINGLY

Regarding insects and disease outbreaks, carefully study the cause and then act appropriately such as removing climax tree species, planting/encouraging seral tree species and perhaps planting resistant tree species. (Individual, Coeur d’Alene, ID - #A4798.31220)

1562. Public Concern: The Forest Service should fairly evaluate all sources that contribute to the noxious plant problem.**INCLUDING HIKERS, MOUNTAIN BIKERS, EQUESTRIANS, WILDLIFE, AND NATURAL PROCESSES**

Motorized recreation is not the only contributor to the noxious weed problem. In fact, the mechanisms for transport of noxious weeds is greater for other visitors including hikers, equestrians, and visitors with llamas than it is for motorized recreationists. These transport mechanisms include hair, fur, manure, shoes, and fabrics. The smooth metal and plastic surfaces on motorized machinery do not have a surface texture that will pick up and hold noxious weed seeds. Additionally, motorized recreationists practice the “Wash your Steeds” policy. However, restrictions for concerns associated with noxious weeds are only placed on motorized recreationists.

The document must make a fair evaluation of all sources that contribute to the noxious weed problem including hikers, mountain bikers, and equestrians. The document must also fairly evaluate how natural processes and wildlife spread noxious weeds. The environmental document must include a balanced discussion of the noxious weed problem. The discussions, decisions and measures used to mitigate noxious weeds should be applied impartially to all visitors. (Organization, Helena, MT - #A13226.31313)

Weeds are spread from centers of infection by wildlife, wind, and water. These centers are often established by deliberate planting of the invasive species, including unwise choices for revegetation of disturbed, overgrazed, or burned areas. The link between roads and invasions is less clear for most exotic insects and fungal pathogens. In some cases, however, road building is directly linked to damaging infestations; the most prominent example is Port-Orford-cedar root disease, caused by *Phytophthora lateralis*. (Organization, Portland, OR - #A12004.30100)

INCLUDING ROADS

Roads are also the vector for noxious weeds to invade wildlands. Roads act in two ways to encourage the spread of invasive species. One way is simply easy movement of seeds into intact systems via cars and people. The road itself is a disturbance to the system which facilitates the germination of several weed species. Finally, since roads are impenetrable to water, it tends to run off to the side of the road creating a gradient of water availability from the road. Invasive species which normally would not survive in various conditions are able to thrive along roadsides due to the increase in water. These invasive species may also contribute to the fuel load, increasing the threat of wildfires in roaded areas. (Individual, San Francisco, CA - #A7044.31310)

1563. Public Concern: The Forest Service should reevaluate insect and disease risk.

AND INCORPORATE SPECIFIC DIRECTION FOR INSECT AND DISEASE RESPONSE WITHIN THE UNROADED AND ROADLESS AREAS

As with the increased risk of fire, the DEIS (3-12) acknowledges that insect infestation and disease will continue to be a problem on the roadless and unroaded areas. While the DEIS indicates this risk is particularly high on 7 Million acres of inventoried roadless areas, based on our knowledge of the local roadless and unroaded areas it is our opinion that this value is significantly understated. We suggest that this issue be reevaluated and specific direction be incorporated as to insect and disease response within the unroaded and roadless areas. (County Attorney, Grant County, OR - #A17667.30100)

1564. Public Concern: The Forest Service should expand its studies of ecosystem interactions.

BECAUSE FEW AREAS ARE IN DANGER FROM INSECTS AND DISEASE

In addition, few roadless areas are under serious danger from insects and disease. Many insects and disease are a natural part of the forest ecosystem. The forest service should continue and expand its studies of ecosystem interactions. (Individual, Greensboro, FL - #A18256.30100)

Funding

1565. Public Concern: The Forest Service should direct its funding to the management of disease, insects, and noxious plants.

Management of roadless areas should be done in concert with the natural order—natural wildfires, for instance, burn off much of the “hazardous fuels” (i.e., forest detritus), and should be monitored, but otherwise left alone. Most of the department’s funding should go towards the management of diseases, which are often not so “natural” in regards to their origins in relation to the forest. Also, climate changes are shifting advantages to various blights not seen before, as well as influencing insect populations. These must be controlled. (Individual, Anchorage, AK - #A518.30100)

Current efforts are not adequate to control these invaders. The Forest Service spends approximately \$5 million annually on invasive plant control, yet this funds control efforts on only 100,000 of the more than 6 million acres invaded by exotic plants. It is hardly surprising that noxious weeds continue to spread across our western public lands at a rate estimated at 4,600 acres per day -- that is, they cover a new area the size of Delaware every year. Again, this figure is surely an underestimate because it doesn’t include many of the species invading our forests and grasslands. (Organization, Portland, OR - #A12004.31320)

INSECTS AND DISEASES OF LIVESTOCK AND MAMMALS

Also, additional funding is needed to allow for the study of infestations by insects and diseases of livestock and other mammals. (Individual, Colorado Springs, CO - #A22203.30100)

1566. Public Concern: The Forest Service should increase funding for research and development of biological means of preventing and controlling insect and disease.

Funding should increase for research and development of biological means of preventing and controlling insect and disease. (Individual, Gallatin Gateway, MT - #A19100.31220)

1567. Public Concern: The Forest Service should reallocate money earmarked for timber removal to hiring a staff large enough, and capable enough, of recognizing forest health problems early on.

Insects and disease outbreaks can be detrimental to forests and their ecosystems. However, if they are caught early enough they can be treated on a smaller level. The threat is easily neutralized this way.

This is why local officials should reallocate resources currently earmarked for logging, and roadbuilding. This currently amounts to over 200 million dollars annually. The funds should be reallocated toward hiring a staff large enough, and capable enough of recognizing these problems early on.

Roads are not needed to combat these problems, they can be treated chemically, if necessary, from the air. They are also best identified by hiking through the woods, and not from the steel cage, and air-conditioned comforts of an automobile. (Individual, Walla Walla, WA - #A17698.31220)

1568. Public Concern: The Forest Service should acknowledge the financial contribution made by off-road vehicle users to noxious plant abatement programs.

In Montana, OHV owners as part of their vehicle registration contribute \$1.50 to a noxious weed abatement program. Non-motorized visitors do not contribute to any weed abatement program. The environmental document does not have a balanced discussion of the noxious weed problem. The discussions, decisions and measures used to mitigate noxious weeds should recognize the minor impact that OHVs have on the noxious weed problem and also credit OHV visitors for contributing to a program to control noxious weeds. (Organization, Helena, MT - #A13226.31320)

Active Management**1569. Public Concern: The Forest Service should control insects, disease, and noxious plants.****TO REDUCE FIRE HAZARDS**

Large stands of trees all over the Black Hills are being killed by the beetles. Before we have another major fire this needs to be controlled. (Individual, Custer, SD - #A4729.30100)

TO SAVE GAME RANGE

The other major oversight the Kootenai and all of region 9 has been guilty of is the ignoring of knapweed for so many years. There is absolutely no justification for having hundreds of thousands of acres of game range destroyed by this and other pests. (Individual, Libby, MT - #A8286.31300)

BY PRESCRIBING AND IMPLEMENTING TREATMENTS THROUGH THE FOREST PLANNING PROCESS

Disease and Insect Infestation: The preferred alternative for stewardship of roadless areas. Specific treatments would be prescribed and implemented through local forest planning. (Individual, Klamath Falls, OR - #A4970.31220)

BY REINTRODUCING FIRE TO ROADLESS AREAS

I believe the Forest Service has made significant progress in allowing fire to return to "inventoried" roadless areas and other unroaded areas such as designated wilderness areas. The fire plan for the existing Selway Bitterroot Wilderness area is an excellent example of such a plan. I see no reason why similar approaches cannot be taken for the inventoried roadless areas. The final rule allows for prescribed burning and even some logging to protect ecological integrity.

As far as insect and disease outbreaks go, I think that reintroducing fire into roadless areas will help to reduce the potential threat of insect and disease outbreaks. As I am sure you are aware, insects and disease are important factors in maintaining ecological health of the system. Many wildlife species, for example, are dependent on insect and disease outbreaks for their very survival. A healthy forest is not necessarily insect and disease free. As you will recall the findings of the Interior Columbia River Basin

study suggest that inventoried roadless areas contain some of the most ecologically intact areas in the entire basin. I am sure this is true in other roadless areas across the country.

Passing the roadless rule is not going to change the natural processes that have been ongoing in these areas for thousands of years. The existing roadless areas are the areas where we have the best chance of maintaining the beneficial effects of natural ecological processes such as fire, disease and insects. Yes, we can never return completely to historical conditions due to significant alterations that we humans have already made across the landscape. However, within the roadless areas we have our best chance to come close and maintaining these processes without threatening human development. (Individual, Moscow, ID - #A4871.30100)

BY IMPLEMENTING REASONABLE FIRE POLICIES IN ROADLESS AREAS

In the 1980s the Forest Service spent millions of dollars in studies of the Douglas-fir tussock moth and the spruce budworm. Research showed that the predominant characteristic of stands with outbreaks was that the trees were on poor site classes and would probably not have been significant stand components if fire regimes had been maintained. Thus, disease was a function of fire management policies and poor silvicultural decisions. If reasonable fire policies were implemented on roadless areas, disease outbreaks would probably be reduced dramatically. (Individual, Bozeman, MT - #A17508.30400)

BY PROHIBITING SINGLE-SPECIES REPLANTING

Stop single-species replanting if you really want to reduce insect/disease outbreaks. (Individual, No Address - #A29646.30100)

Managing for prevention of insect outbreaks can be handled by planting a greater diversity of trees. (Elected Official, Bozeman, MT - #A27736.30200)

Pristine areas like the "Roadless Areas" are resilient, and they can and have withstood these insect invasions, for thousands of years, long before humans arrived on the continent. Insects usually attack trees that are stressed by climate changes (e.g. droughts) that are perfectly normal. There are two unusual insect infestations: those caused by exotic, introduced species for which there are no natural enemies, and in monocultures such as tree plantations where only one species is planted. Insect outbreaks affect a single species. Monoculture can lead to the loss of an entire forest. Needless to add that "Roadless Areas" are complex ecosystems comprising of varying age class (not a sterile monocultural well logged even aged tree farm), that can naturally withstand insect infestations. It is habitat fragmentation that jeopardizes forest health. The primary reason for that would be roads, followed by logging or other forms of material extraction. Thus a weakened ecosystem would be susceptible to insect and disease invasions. (Individual, Seattle, WA - #A26287.30100)

WITH PROPER FOREST MANAGEMENT AND PROTECTION PRACTICES TO PREVENT THE SPREAD TO ADJOINING PRIVATE LANDS

We recommend that considerations be given to adjoining landowners when insect or disease infestations occur on National Forest lands. The Forest should be allowed to apply the proper forest management and protection practices to control these infestations and prevent their spread to adjoining private lands. (Association, Jackson, MS - #A4824.31220)

The Department is of the opinion that the Forest Service must preserve management options in roadless areas. Neither fire, insects or disease stop at property boundaries. The Forest service should not employ national roadless policy that limits forest land managers from making timely decisions on these issues. Protection efforts must focus on the specific needs of each roadless area. A minimal network of unimproved, unclassified roads to provide access for protection purposes may be needed in some roadless areas while not in others. As stewards of public land we have an obligation to prevent the spread of insects, disease and fire onto private property. Living next to a National Forest should not be a potential liability. (State Agency, Madison, WI - #A28775.30100)

There are options that place more focus on how the areas surrounding unroaded areas are managed. For example, if fuel buildup, dangerous wildfire conditions or insect/disease outbreaks are a problem within an unroaded area, efforts could be intensified on adjacent land ownerships to lower their risks (e.g., fuel reduction, structure protection measures, management increase resistance to insects/diseases of concern). Evacuation and communication systems and plans in adjacent areas may also be appropriate if fuel buildup within roadless areas is a problem. (State Agency, Saint Paul, MN - #A30025.30100)

It is a joint responsibility of the Forest Service and communities and landowners to keep trees and brush in a narrow strip, on both sides of the roadless areas boundary, thinned to the point where fires can be controlled. (Individual, San Simon, AZ - #A30339.30400)

Management plans and activities of the national forests should include recognition of risks, such as wild fire, insects, and diseases, to adjacent private lands and communities, the input of national forest neighbors should be considered in the development of those plans. (Individual, Rocky Mount, NC - #A30042.30200)

WITH ADVICE FROM PROFESSIONALS

Insect pests and disease need to be treated, if at all, on the advice of qualified biologists, those not employed by paper or pulp industries. (Organization, Cookeville, TN #A5451.31220)

I am not a professional forester, so detection and prevention of insect and disease outbreaks is out of my scope. However, within parameters established by budgets and cost benefit analysis, perhaps scheduled field studies by silviculturists, entomologists, and/or aerial surveys would suffice. (Individual, Vista, CA - #A4838.30310)

The best way to manage roadless areas is as follows:

In consultation with disinterested (i.e. not working for industry or the Forest Service) biologists, work to eradicate damaging invasive species such as tamarisk and cheatgrass. (Individual, Dallas, TX - #A18002.30200)

WITH THE IMPLEMENTATION AND ENFORCEMENT OF U.S. DEPARTMENT OF AGRICULTURE RECOMMENDED INITIATIVES

Implement and enforce USDA recommended initiatives to prevent the spread of introduced diseases. ROADS and logging disturbance are one of the best ways to spread invasive species, another reason to keep roadless areas roadless. Disease outbreaks will have to run their course, experience shows that logging is not a solution. (Individual, Woods Hole, MA - #A12805.31210)

WITH MULTIPLE METHODS

Weed control/using multiple methods that are integrated should receive priority also. (Individual, No Address - #A101.31300)

You have requested comments on how roadless forest areas should be managed to protect them from severe wildfires or insect outbreaks. We submit that Nature has its own built-in protections if allowed to work and, thus, the Forest Service should try to replicate them as nearly as possible. For example, fire is a natural component of natural forests. In many instances, you can allow wildfires to burn themselves out, and that way the build-up of hazardous fuels is avoided. The same is true of most insect and disease outbreaks. We now, in the southeast, have outbreaks of the Southern Pine Beetle and have noted plots in the national forests that have been completely killed by them. However, those were artificial plots where the trees were planted within a yard of each other. They were, consequently, stressed when not thinned (and they were not) and so became obvious dessert for the beetles. The answer is to provide for natural revegetation and not artificial stands that are subject to insect outbreaks. [Footnote 2: There are certain infestations, however, that require attention because they are the result of impacts from outside sources. One is the Gypsy Moth, and a lot of research has gone into what types of protection are the best. It

appears that use of the virus known as Gypcheck and a fungicide (*Entomophaga maimaiga*) are preferable because they are target-specific to the Gypsy Moth. Other preferable treatments are biological controls such as mating disruptions and sterile insect releases. Use of broad-spectrum insecticides like Diflubenzuron are not desired because they affect many beneficial moths and butterflies, including even the Monarch butterfly. A similar problem is noted with *Bacillus thuringensis* since it is also not target-specific to the Gypsy Moth. Thus, some treatment may be necessary on natural areas because of invasions by this non-native insect pest.] (Organization, Birmingham, AL - #A21582.30100)

WITH CHEMICALS AND OTHER SOLUTIONS

Insect and disease breakouts should be fought with chemical or other solutions when they are caused by alien species or when they arise as an effect of environmental damage (e.g., we should fight insect species that become immune to natural defenses as a result of their exposure to genetically engineered organisms). (Individual, Norwalk, CT - #A884.31220)

A problem: Our pine trees are being slaughtered by beetles. In some areas around Dale Hollow Lake (East of Celina) are dying in large patches and other areas Is there some way to spray to stop these beetles? (Individual, Celina, TN - #A11902.31210)

WITH AERIAL APPLICATIONS

Insect and disease control can be accomplished by spraying from airplanes not sitting at desks. (Individual, Ogden, UT - #A280.31220)

During the 1950s when the FS hired temporary employees in the summer to go into the forest to spray for pine beetles and insects and they walked into the forests. Horses can also be used. Couldn't this be done again? Why do we need roads every where? (Individual, Ogden, UT - #A1166.31221)

IN ROADED AREAS IDENTIFIED AS SUITABLE FOR LOGGING

Concerning insect and disease outbreaks, the Forest Service might consider a strategy that focuses its workforce on detecting and preventing outbreaks in roaded areas that are identified as suitable for timber production. Focusing on these areas rather than spreading limited resources over both roaded and unroaded areas would be a better use of limited resources. We believe that concentrating resources in these areas and gaining the economies of scale would provide better protection in roaded areas. (Federal Agency, Washington, DC - #A28843.31200)

OUTSIDE OF ROADLESS AREAS

The roadless areas should be left alone as much as possible, to provide a natural environment for the benefit of wildlife and protection of water, soil and air resources. Insect and disease outbreaks should be fought OUTSIDE of the roadless areas. (Individual, No Address - #A30493.30100)

EXCEPT IN LARGE-SCALE TRACTS OF LAND

Forests need to be big enough to sustain the heavy loss of big beetle kills, so that subsequent big fires can kill beetle larvae, or the root rot, and burn in a mosaic that encourages self seeding. It is simply not possible to recreate such natural forces through harvest. Period. Certainly in areas of human habitation, beetle kill and root rot, etc. needs to be contained, but not in large-scale tracts. These dynamic pestulances have occurred for millennia, and result in more genetically resilient ecosystems. We shouldn't have to protect forests from beetle infestations and fires—forests have been taking care of themselves just fine, until we reduce their size to unhealthy proportions. (Individual, No Address - #A30491.30100)

AT THE LOCAL LEVEL

The second example in NW Montana involves the Douglas Fir beetle, which is becoming epidemic in selected locations. How do our Forest Managers confront this challenge when some parcels are considered off limits? Is it acceptable to not have a forest protection plan for the whole forest? Can we allow an epidemic to start in a roadless area, only to spread to adjacent lands (both public and private)?

Again, the place to address these issues is at the Forest and District level, not by National Rule making. (Permit Holder, Whitefish, MT - #A20669.31200)

1570. Public Concern: The Forest Service should allow even age management only in areas experiencing an onslaught of pests.

A practical solution is a timber harvest program such as the one used by the Mescalero Apache Tribe. This is a European type of sustained yield silvaculture. Clear cuts are seldom employed except in areas where almost all the trees are experiencing an onslaught of pests. (Individual, Ruidoso, NM - #A17775.65230)

Ecosystem/Restoration Management

1571. Public Concern: The Forest Service should acknowledge that native insects and diseases are part of a healthy ecosystem.

BECAUSE THEY ARE VITAL TO ECOLOGICAL SUSTAINABILITY AND BIODIVERSITY

Besides wilderness lands, roadless areas represent the most ecologically intact and healthy forests managed by the agency. They do not require protection from insects are an integral part of what makes them functions and serve as habitat for a biologically diverse array . . . of native species. There is simply no ecological or scientific need for hands on insects or disease management in roadless areas. The agency obsession with protecting individual trees or stands of trees is antithetical to ecosystem sustainability and detrimental to the conservation of biodiversity on public lands. (Organization, Missoula, MT - #A17234.31210)

Insect infestation and disease should be left untreated. (Individual, Bozeman, MT - #A6250.31220)

The answer to this question is known to all professional biologists like myself; the best management is **no** management. Insect and disease outbreaks are natural and necessary occurrences that contribute to the diversity of forest habitats and form the basis for many important forest cycles. The fact that they interfere with timber production is not a forest health issue, it is a corporate profits issue. Healthy, functioning forests require fire, insect and disease outbreaks, and blowdowns to function as ecosystems, and the public interest lies in protecting these ecosystems, not maximizing the profits of a few private, special-interest groups. (Individual, Laramie, WY - #A10590.30100)

The SPB is not a pest on Federal Land but a beneficial insect needed to provide food and habitat for other wildlife. The SPB is only a pest to timber growers which should not be the primary purpose of our public lands as it has in the past. (Individual, Augusta, GA - #A4688.31210)

BY EXPLAINING THE ROLE INSECTS PLAY IN FOREST NUTRIENT CYCLING AND RENEWAL

The rule should address the essential role that insects play in forest nutrient cycling and renewal. Emphasizing individual tree health subverts the goal of ecosystem management integrity and long-term sustainability of forests and their myriad biotic components of a healthy forest. Decaying and dead trees are essential components of a healthy forest. (McClelland and McClelland 1999). Further:

Pathogens help decompose and release elements sequestered within trees, facilitate succession, and maintain genetic, species and age diversity. Intensive control measures, such as thinning, salvage, selective logging, and buffer clearcuts around affected trees remove crucial structural features. Such activities also remove commercially valuable, disease-resistant trees, thereby contributing to reduced genetic vigor of populations (Castello et al. 1995). (Organization, Missoula, MT - #A613.31210)

BY NOT ASSUMING ROADLESS AREAS ARE IN AN UNHEALTHY STATE

[Question 3] This is an embarrassing question because it presupposes roadless areas are in an unhealthy state and that only Forest Service managers via its entourage of loggers, cattle and sheep men can bring these sick and ailing roadless areas back to health. That whole concept verges on ecological illiteracy

and it is troubling to see the “new” Forest Service head back in that direction. It is preposterous to suggest roadless areas as a class of landscapes suffer from such ailments—maybe some do, not all!

More to the point, the question isn’t how we intervene in roadless areas, but the importance of not intervening in roadless areas to assure old and dying trees are part of the system and to assure fires burn the way integral forests “intended” fires to burn—the same with pathogens. These are as normal as the sun and moon and the sky.

Given that, where intervention is necessary, and we believe it is in some cases, but not uniformly and across the board as this question suggests, the NRAC rule defined exception after exception, most built on sound ecological principles and underpinned by meaningful policy and policy making. (Organization, Hyrum, UT - #A13496.30100)

1572. Public Concern: The Forest Service should control insects, disease, and noxious plants.

WITH NATURAL REMEDIES

Insect and disease outbreaks should be controlled as much as possible with natural remedies, and any non-natural solutions should be weighed against long-term effects. For example, we shouldn’t wipe out a noxious weed at the expense of other plants and animals in the area. (Individual, Shawnee Mission, KS - #A96.50300)

WITH SPECIES DIVERSITY AND MULTI-AGE STANDS

Species diversity and multi-age stands of trees are two ways that the impacts of disease and insect infestations can be decreased. Epidemic size outbreaks might be better treated with some of the savings from decreased fire control. (Individual, No Address - #A405.31220)

BY PROHIBITING ROAD CONSTRUCTION IN ROADLESS AREAS

Protecting roadless areas is one of the most effective strategies for curtailing invasions by exotic or alien species of plants—also called invasive weeds. The Forest Service estimates that 6 million acres are already infested. (The invasion is actually probably much more extensive, since these data do not include cheatgrass or many of the shrubs and vines invading eastern forests.)

While little data are available on weed infestations in National Forests in the east, they are clearly extensive. Forest Service monitoring data show that just one of the probably 100 exotic plant species invasive in these forests, Japanese honeysuckle (*Lonicera japonica*), is found on 16 million acres of public and private forest in just six states of the southeast. Privet (*Ligustrum* spp.) occupies 2.4 million acres of these forests. Purple loosestrife is a pervasive problem in ditches and wetlands of the northwoods.

These weeds have severe ecological impacts. Clearly, the Forest Service must ensure that its policies support rather than hinder the important campaign to minimize damage caused by invasive exotic plants. Protecting roadless areas is one of the most important “weed control” policies because of the intimate connection between roads and the spread of invasive plants. Weeds’ spread is greatly facilitated by human activities that disturb the soil, open the canopy, and injure vulnerable native vegetation. Road building directly disturbs vegetation, creates disturbed soils in which invasive plants often have advantage, changes water courses and opens the canopy to light. Weed propagules are often transported on the construction equipment or in fill or gravel.

The impact of roads is not short-term, but permanent. Roads open the area to heavier human use of all types—and those activities themselves contribute both further disturbance of soils and vegetation and modes for transporting weed seeds to these welcoming sites. Weed propagules can be carried on any truck, car, all terrain vehicle (ATV), logging equipment, boat, and livestock. Hikers, mountain bikers, and horseback riders also transport seeds. The increased presence of people also increases the likelihood of unplanned fires—which, again, can open opportunities for plant invasions. (Organization, Plymouth, MN - #A7116.30100)

BY ENCOURAGING A PROLIFERATION OF SONGBIRDS AND OTHER NATURAL PREDATORS THAT FEED ON INSECTS

While there may be limited justification for harvesting trees in order to serve stewardship purposes, the first line of defense in forest health should be the use of natural elements. A forest that has a mosaic of composition and structure is less likely to have severe disturbances than one that is or resembles a plantation. Also, a proliferation of songbirds, and other species that feed on insects, needs to be encouraged. Removing dead trees from a forest removes the habitat essential for cavity nesters that feed on insects (e.g., woodpeckers). (Organization, Anchorage, AK - #A17358.30100)

How should inventoried roadless areas be managed to provide for healthy forests, including protection from severe wildfires and the buildup of hazardous fuels as well as to provide for the detection and prevention of insect and disease outbreaks? . . . Natural predators for insects. (Individual, Ellijay, GA - #A8020.30100)

BY CLOSING ROADS

A root rot fungus is wiping out the rare and valuable Port Orford cedars in this area; the die-off is most intensive along roads, where vehicles carry the fungus spores from infected areas to healthy ones. Local Forest Service officials need to close many of these roads, but local pressure from motorcycle and other vehicle groups is apparently more than they can stand up to; wet-season restrictions are posted, but the roads are still there and the trees are still dying at a shocking rate. (Individual, Medford, OR - #A12075.90310)

1573. Public Concern: The Forest Service should allow wildfires to destroy insects and disease.**RATHER THAN USING TIMBER REMOVAL TO DESTROY THEM**

The best (and least expensive) way to kill destructive insects and diseases is to allow wildfires to destroy them. Logging slash, in fact, serves as nurseries for diseases and insects such as bark beetles. (Individual, Fairbanks, AK - #A13293.31320)

1574. Public Concern: The Forest Service should not use pesticides and herbicides.

Pesticides and herbicides should never be used as they pollute the environment and poison both humans and wildlife. (Individual, Marion, NC - #A4691.31220)

Pesticide use should be banned in inventoried and non-inventoried roadless areas. (Individual, New Haven, CT - #A8987.31220)

As far as pest prevention is concerned - spraying a forest with herbicides may be more detrimental to the forest ecosystem as a whole versus letting nature take its course. (Association, No Address - #A17699.31321)

1575. Public Concern: The Forest Service should control only exotic or non-native insects and diseases.

Regarding the management of inventoried roadless areas to provide for the detection and prevention of insect and disease outbreaks, the Forest Service should make clear that insects and diseases are part of a healthy forest. We note the exception of exotic or non-native species such as the gypsy moth and believe that provisions can be made for the well-justified control of these invaders. There are also periodic epidemics of native insects and diseases that may warrant control measures. (Civic Group, Roanoke, VA - #A1713.31210)

Disease and insect outbreaks of natural origin should be allowed to run their course. More active management may be needed if the pathogens or insects are exotic species brought in by man. (Individual, Painted Post, NY - #A357.31220)

Forest Service managers should let nature take its course concerning native disease and past outbreaks.

Forest Service managers should make every effort to prevent and/or counter any non-native disease or pest outbreak. Such efforts should include determination and introduction or enhancement of naturally occurring resources, including safe and controllable non-native resources, to counter non-native disease and pestilence. (Individual, Saint Louis, MO - #A629.31220)

We submit that Nature has its own built-in protections if allowed to work and, thus, the Forest Service should try to replicate them as nearly as possible. For example, fire is a natural component of natural forests. In many instances, you can allow wildfires to burn themselves out, and that way the build-up of hazardous fuels is avoided. The same is true of most insect and disease outbreaks. We now, in the southeast, have outbreaks of the Southern Pine Beetle and have noted plots in the national forests that have been completely killed by them. However, those were artificial plots where the trees were planted within a yard of each other. They were, consequently, stressed when not thinned (and they were not) and so became obvious dessert for the beetles. The answer is to provide for natural revegetation and not artificial stands that are subject to insect outbreaks. [Footnote 2: There are certain infestations, however, that require attention because they are the result of impacts from outside sources. One is the Gypsy Moth, and a lot of research has gone into what types of protection are the best. It appears that use of the virus known as Gypcheck and a fungicide (*ntomophaga maimaiga*) are preferable because they are target-specific to the Gypsy Moth. Other preferable treatments are biological controls such as mating disruptions and sterile insect releases. Use of broad-spectrum insecticides like Diflubenzuron are not desired because they affect many beneficial moths and butterflies, including even the Monarch Butterfly. A similar problem is noted with *Bacillus thuringensis* since it is also not target-specific to the Gypsy Moth. Thus, some treatment may be necessary on natural areas because of invasions by this non-native insect pest.] (Organization, Birmingham, AL - #A21582.30100)

1576. Public Concern: The Forest Service should protect roadless areas.

TO CURTAIL INVASIONS BY EXOTIC OR ALIEN SPECIES OF PLANTS

Protecting roadless areas is one of the most effective strategies for curtailing invasions by exotic or alien species of plants—also called invasive weeds. The Forest Service estimates that 6 million acres are already infested. (The invasion is actually probably much more extensive, since these data do not include cheatgrass or many of the shrubs and vines invading eastern forests.) The grasslands and meadows of the northern Interior West suffer some of the most damaging exotic plant invasions of anywhere on Earth. About one-third of the Intermountain Region is infested by cheatgrass (*Bromus tectorum*). Yellow starthistle (*Centaurea solstitialis*) covers more than 12 million acres in ten states and two Canadian provinces. Spotted knapweed covers 7.2 million acres in nine states and two provinces, including 4.7 million acres in Montana (Beck 1993).

These weeds have severe ecological impacts. Cheatgrass is one of the weeds considered to be an “ecosystem changer.” Wildfires fueled by cheat have virtually eliminated native sagebrush and rabbitbrush depended on by wildlife, including mule deer, antelope, raptors, songbirds, rabbits, and native lizards. Among the more than 1,000 exotic plant species in 5 states in the Pacific Northwest and northern Interior West, some are even less useful for wildlife than is cheatgrass. Knapweed invasions have severely damaged the value of foothill grasslands in western Montana’s Missoula and Bitterroot Valleys for winter elk range, for example. While research on the impacts of the vines and shrubs in the eastern forests has so far been limited, it has shown that Japanese honeysuckle impedes regeneration of both managed and natural forests. Research in Ohio found that robins and wood thrushes raised fewer young in nests placed in certain exotic shrubs than in those located in native shrubs. Others have shown reduced numbers of soil invertebrates beneath exotic shrubs. (Organization, Nevada City, CA - #A4941.31310)

Current efforts are not adequate to control these invaders [exotic and invasive plants]. The Forest Service spends approximately \$5 million annually on invasive plant control, yet this funds control efforts on only 100,000 of the more than 6 million acres invaded by exotic plants. It is hardly surprising that noxious weeds continue to spread across our western public lands at a rate estimated at 4,600 acres per day—that is, they cover a new area the size of Delaware every year. Again, this figure is surely an underestimate because it doesn't include many of the species invading our forests and grasslands.

Clearly, the Forest Service must ensure that its policies support rather than hinder the important campaign to minimize damage caused by invasive exotic plants. Protecting roadless areas is one of the most important “weed control” policies because of the intimate connection between roads and the spread of invasive plants. Weeds' spread is greatly facilitated by human activities that disturb the soil, open the canopy, and injure vulnerable native vegetation. Road building directly disturbs vegetation, creates disturbed soils in which invasive plants often have advantage, changes water courses and open the canopy to light. Weed propagules are often transported on the construction equipment or in fill or gravel.

The impact of roads is not short-term, but permanent. Roads open the area to heavier human use of all types—and those activities themselves contribute both further disturbance of soils and vegetation and modes for transporting weed seeds to these welcoming sites. Weed propagules can be carried on any truck, car, all terrain vehicle (ATV), logging equipment, boat, and livestock. Hikers, mountain bikers, and horseback riders also transport seeds. The increased presence of people also increases the likelihood of unplanned fires—which, again, can open opportunities for plant invasions.

Finally, weeds are spread from centers of infection by wildlife, wind, and water. These centers are often established by deliberate planting of the invasive species, including unwise choices for revegetation of disturbed, overgrazed, or burned areas. The link between roads and invasions is less clear for most exotic insects and fungal pathogens. In some cases, however, roadbuilding is directly linked to damaging infestations; the most prominent example is Port-Orford-cedar root disease, caused by *Phytophthora lateralis*. (Organization, Nevada City, CA - #A4941.31320)

1577. Public Concern: The Forest Service should not use forest health as an excuse to harvest timber.

DO NOT CLAIM HARVESTING IS NEEDED TO PREVENT INSECTS AND DISEASE

Diseases and pests cannot all be prevented, nor should they be, and they are likely to be worse in areas that have been heavily cut, where new young trees are stressed by overcrowding and poorer soil because of erosion. For example, one argument for clearcutting is that it prevents the spread of dwarf mistletoe. Many mature forests have an occasional tree infested with mistletoe, but this does not kill them, and the majority of trees remain healthy. One forest service official admitted to me that the only reason that dwarf mistletoe needs to be controlled is to enhance timber production. So without timber harvest, forest health is not impaired by mistletoe. Even where trees do die of diseases and infestations, the dead trees have important functions in replenishing the soil and providing wildlife habitat. (Individual, Laramie, WY - #A30702.30000)

BECAUSE INSECTS AND DISEASE RARELY RISE TO EPIDEMIC LEVELS

The correct answer here, except in a very few rare and narrowly defined situations, is to let nature take its course. Contrary to popular opinion, nature does know best. I fear that alleged insect and disease outbreaks and fire hazard reduction will continue to be just the excuses the Forestry Circus, local economic interest, and their political toadies want and need to go in and continue to “manage” the forests.

A single bark beetle or tussock moth does not an epidemic make! Insect and disease levels rarely rise above endemic levels, contrary to the preachings of the timber industry, its wholly-owned politicians, and Forestry Circus pre-sale foresters, silviculturalists and others with vested interests in trying to make us believe otherwise. As for “the buildup of hazardous fuels”, in the Intermountain and Great Basin West, and probably in much of the rest of the country, it's too cold and dry for logging and thinning slash to be left on the forest floor and expected to decompose. Slash and other logging/thinning debris will just lay there and contribute to an even bigger fire hazard unless it's chipped and scattered on site or

completely removed from the forest—neither of which, are very economically viable propositions.
(Individual, Leadore, ID - #A20898.30100)

Protecting Communities (Question 4)

Question 4: Protecting Communities, Homes, and Property. How should communities and private property near inventoried roadless areas be protected from the risks associated with natural events, such as major wildfires that may occur on adjacent federal lands?

This section includes two subsections: Private Property Protection and Responsibility for Protecting Private Property.

Private Property Protection

Summary

General Comments – Several respondents question the need to focus attention on private property protection. One organization states that there is no need to revise the Roadless Area Conservation Rule with respect to private property protection because “few concentrated populations of either individuals or communities occur near inventoried roadless areas. Due to these population densities, a fire spreading from an inventoried roadless area would have little opportunity to endanger human life or property.” Similarly, a group says that in some regions there is no need to protect communities from forest fires as they may be dominated by “fire resistant” ecosystems.

Other general comments include the recommendation that the Forest Service provide accurate maps depicting the location of “private lands within and adjacent to high-risk roadless areas,” and the suggestion that the Forest Service formulate a limited management plan to address fuels reduction in stands of trees close to towns.

Adequacy of Analysis – Several respondents question the adequacy of analysis relative to private property protection. One association requests that the Forest Service “conduct a formal, localized risk assessment of the consequences of prohibiting active management within these areas.” One individual suggests that “commercial logging is not necessary in our roadless areas to reduce fire risks,” and “management of the surrounding public lands to reduce fire risks should only happen after a complete inventory is made of communities at risk.”

Management – Respondents’ comments regarding implementation of the Roadless Area Conservation Rule are reflected in their management suggestions for protecting private property. Some people assert that “private property should be protected in accordance with the existing roadless rule,” as it already “allows for activities that would reduce the threat to lands . . . from catastrophic fire, insect or disease on nearby roadless areas.” Others suggest further that the Forest Service use the basic “fire fighting policies it has in place now . . . but it should not include building roads into roadless areas.” Similarly, some recommend not allowing commercial timber removal in roadless areas, maintaining that the Forest Service should not allow timber removal in the name of fire prevention for private property. Furthermore, another individual encourages the Forest Service to reconsider its policy to temporarily suspend

wilderness standards regarding wildfire suppression when communities adjacent to National Forest System lands are threatened.

Other respondents assert that local decisionmaking will lead to more effective protection of private property. One county elected official requests that “areas that are to be protected but not recommended as Wilderness should be allocated to a recognized land use category that allows for a locally specific complement of land management activities.” An association concurs, and requests that the Forest Service “retract policies that interfere with local fire suppression and control.” Several individuals state that the Forest Service should allow management activities in general which “reduce the risks of catastrophic wildfires and insect and disease infestation.” Another person suggests there be a different management policy for whole functioning communities on or near National Forest System lands.

In the context of management related to private property protection, several respondents question the integrity of the Forest Service. One respondent asserts that the Forest Service is not being open about its policies: “We have had to expend considerable effort to attempt to pry information from Forest personnel about roads and other topics relating to our properties.” One organization states that the Forest Service should “confine their interests to National Forests within their boundaries and not extend their power to private lands.” Additionally, an association questions the Forest Service’s intentions when it establishes a “roadless area” near private land holdings, and requests that “the appropriateness of such a designation” be carefully scrutinized.

A further management suggestion is that the Forest Service should balance private development with “the need for wide open spaces” and the need to protect “critical winter wildlife habitat.” Finally, a few respondents ask the Forest Service not to “risk anyone’s life to preserve property” and “not [to] take heroic measures to protect houses with wooden shingles.

Land Use Ordinances/Building Codes – The commenting public makes several suggestions to the Forest Service about how to discourage residential development near public land, how to revise building codes, and how to work with the homebuilding industry and with private property owners to reduce fire related damages to private property. A number of individuals who comment on the subject of development near public land state that “residential development” should be kept “away from public lands.” One person recommends strongly discouraging new settlement “in areas that carry risk of natural disasters such as forest fires.” This can be done by discouraging “developers from building in areas that are prone to recurring natural disasters,” or by making “such developments less qualifiable for recovery insurance.” Another suggestion for protecting private property from fire is to revise building codes to set construction standards that minimize likelihood of fire damage “not unlike that which has taken place in states where hurricanes and floods occur.” One organization suggests that the Forest Service “work with the homebuilding industry to ban roofs that put people at high risk from fires.” Finally, one individual suggests that the Forest Service secure conservation easements from private property owners located near roadless areas “which will put the interests of protection and preservation of natural forest values first.”

Urban-Forest Interface – Many of the comments relating to the urban-forest interface state that the buffer zones and firebreaks should be created and maintained. The first step, according to one group, would be to identify urban-forest interface areas and develop appropriate prescriptions for the management of these areas. One individual suggests that roadless areas should be “a buffer between Wilderness and the urban interface.”

Others request buffer zones or firebreaks between roadless areas and private property. For example, one individual states, “A buffer zone around such roadless areas should be established with incentives limiting the amount of future development in that area.” Another respondent suggests working “with local communities, and property owners to provide ‘fire breaks.’” The commenting public offers many suggestions for buffer zone requirements, such as a minimum width of 500 feet. Another individual suggests that “minimally urbanized areas should be maintained as buffer zones between roadless areas and human communities. Creation of carefully selected ‘unmanaged zones’—areas where disease prevention, fire suppression, and insect control are not practiced—should be implemented in conjunction with accompanying buffer zones where more standard management practices exist, thus allowing the buffer areas to serve as transition zones from roadless areas to more urbanized regions.” Finally, in cases where there may be “an unreasonable threat to private land,” the land should be purchased by the government and then used “as a buffer zone.” Some respondents assert that communities and private property owners should take the initiative for constructing their own buffer zones. One business owner suggests that “ski areas located adjacent to communities” may function as buffer zones against fire.

Some respondents question the advisability of creating buffer zones as a means of fire management. One individual asserts that buffer zones may not always be appropriate, stating that “this ‘buffer zone’ investment should only be employed where the adjacent private property values warrant.” This individual further states that in the case of low-value land, a land exchange may be more appropriate. Another individual remarks that “roadless areas must not be fragmented by road building or firebreak building.” Finally, one organization suggests that “wildland fuel reduction for reducing home losses may be inefficient and ineffective.” Instead buffer zones may “be a high priority for extensive vegetation management due to high aesthetic, watershed, erosion, or other values, but not for reducing potential home loss.”

Urban-Forest Interface Funding – One individual asserts that the Forest Service is improperly using funds earmarked for “fuels reduction projects in the urban-wildland interface zone. Instead of directing resources to protect communities, . . . the Forest Service is using emergency monies for large-scale commercial timber sales in the nation’s most pristine forestlands, including roadless areas, [and] old growth forests.”

Public Collaboration – The public offers many suggestions on how the Forest Service should work with local, state, and federal agencies to plan for and combat wildfire and other natural disasters near private property. Several respondents assert that the Forest Service should work “with local and federal agencies to plan for emergencies;” and in the event of a wildfire, “the Forest Service should cooperate with state and local agencies to bring the fire under control.” Another individual states that “the decision on whether to initiate aggressive fire management in non-roadless areas should be a component of the local fire management plan.” Several individuals encourage the Forest Service to develop an “educational plan that is given to every resident in these surrounding areas and work with these communities to get them involved with the care and protection of the forest and their own properties.” One business suggests that education take place in the form of “fire protection and prevention seminars.” Some individuals advise the Forest Service “to work with other federal agencies to implement better land use planning. Because local communities have failed so miserably at land use planning in this regard, federal guidelines are needed.” Others suggest that public collaboration include keeping a log of

nearby property owners in order to “send them a list of emergency phone numbers,” and that “private inholders should be seen as potential partners in forest and wildlife habitat stewardship.”

Private Property Protection General

1578. Public Concern: The Forest Service should consider that there are few concentrated populations of either individuals or communities near inventoried roadless areas.

DUE TO THESE LOW POPULATION DENSITIES, A FIRE SPREADING FROM AN INVENTORIED ROADLESS AREA WOULD HAVE LITTLE OPPORTUNITY TO ENDANGER HUMAN LIFE OR PROPERTY

In Colorado, there are few roadless areas near the wildland/urban interface, where this issue becomes important. This is also true nationally:

few concentrated populations of either individuals or communities occur near inventoried roadless areas. Due to these population densities, a fire spreading from an inventoried roadless area would have little opportunity to endanger human life or property.

USDA Forest Service, 2000, p. 3-103.

Note also that of 112,722 fire starts on national Forest System lands from 1986-1996, only 16,611 of them began in roadless areas (USDA Forest Service, 2000, p. 3-104).

Note further that 43.5% of all national forest fire starts in this period were human-caused, but only 13.64% of human caused fires originated in roadless lands (ibid., calculations made from Tables 3-18 and 3-19, pp. 3-104, 105). This indicates that human-caused fires are far more likely to start outside roadless lands. Stated another way, roadless areas have fewer people and thus fewer fire starts. (Organization, Denver, CO - #A12008.30430)

1579. Public Concern: The Forest Service should consider that the Roadless Area Conservation Rule will have no impact on protecting communities from forest fires.

NEAR THE SAN JUAN NATIONAL FOREST

Large forest fires are rare in the San Juan National Forest. Most roadless areas on the San Juan are located at higher elevations and many are dominated by fire resistant spruce-fir ecosystems. The combination of deep winter snow pack, late snowmelt, and late summer monsoon storms makes for a wet forest ecosystem that is not very prone to large fires. Most large fires in our area have occurred on low elevation lands under private and tribal jurisdiction. The Roadless Rule will have no bearing on protecting communities from forest fires in our region. (Individual, Durango, CO - #A11655.30100)

1580. Public Concern: The Forest Service should provide accurate maps depicting the location of private lands within roadless areas.

The Forest Service must analyze potential impacts on communities and private property and must give these national forest neighbors meaningful opportunities to comment on decisions about roadless areas and the wildland/urban interface that might place them at increased risk. Therefore, it will be essential that the Forest Service produce accurate maps of the location of communities and private lands within and adjacent to high-risk roadless areas and the interface. We feel that the GIS database for the roadless areas did not have a complete inventory of private and state lands, so the public did not have an adequate opportunity to assess the proposed decisions. (Association, Augusta, ME - #A13312.35110)

1581. Public Concern: The Forest Service should formulate a very limited management plan to address fuels reduction in stands of trees close to towns.

There is a need to clear underbrush and the like from those stands close to towns and a limited (very limited) management plan to address those issues should be formulated. (Individual, Seattle, WA - #A26276.30310)

*Adequacy of Analysis***1582. Public Concern: The Forest Service should conduct a formal risk assessment of the consequences of prohibiting active management within roadless areas.**

The members of AFRC believe that the Forest Service must conduct a formal, localized risk assessment of the consequences of prohibiting active management within these areas. This was not done in the last assessment of the roadless areas. What are the risks of wildfires and insect and disease infestation, on these and adjoining lands if no active management is undertaken? Each roadless area is unique. Forest types, stand conditions, values at risk, management objectives and the context of the area in relation to the surrounding lands are among the factors that must be considered. This argues strongly for the use of the forestland management planning process. (Association, Portland, OR - #A19004.35210)

1583. Public Concern: The Forest Service should complete an inventory of communities at risk.**WITH THE COOPERATION OF OTHER FIREFIGHTING ORGANIZATIONS**

Forest Service research has shown that the most effective fire protection plan for communities adjacent to both roadless and non-roadless areas is by managing the immediate vegetation within several hundred feet of structures. Management of the surrounding public lands to reduce fire risks should only happen after a complete inventory is made of communities at risk with the cooperation of other fire fighting organizations. Such management should focus on prescribed burns and proper removal of forest fuels. In the Forest Service's own National Fire Plan it was found that "the removal of large, merchantable trees from forests does not reduce fire risk, and may, in fact, increase such risk." In fact, U.S. Forest Service chief fire specialist Denny Truesdale has stated that the woody materials that need to be removed from our forests to prevent catastrophic fires are shrubs, twigs and saplings less than 3 inches in diameter—not mature trees. These Forest Service reports concur with the goals of the roadless rule as it stands. Commercial logging is not necessary in our roadless areas to reduce fire risks. (Individual, Bend, OR - #A27922.30200)

*Management***1584. Public Concern: The Forest Service should protect private property in accordance with the Roadless Area Conservation Rule.****BECAUSE IT ALLOWS ACTIVITIES TO PROTECT ADJACENT LANDS**

Communities and private property should be protected in accordance with the existing Roadless Rule. It allows for activities that would reduce the threat to lands owned by states, tribes, private companies, or individuals from catastrophic fire, insect or disease on nearby roadless areas. (Individual, Spruce Pine, NC - #A17504.20000)

1585. Public Concern: The Forest Service should continue to use the same basic fire-fighting policies it has in place now for protecting communities and homes.

WITH THE EXCEPTION OF ROAD BUILDING

The Forest Service can continue to use the same basic fire fighting policies it has in place now for protecting communities and homes but it should not include building roads into roadless areas to fight fires or to “salvage” timber in those areas. It is a well-known fact that fire is an essential part of the long-term health of a forest and nature must be allowed to take its course wherever possible. (Individual, Tenakee Springs, AK - #A5083.35210)

1586. Public Concern: The Forest Service should not allow timber removal in the name of fire prevention for private property.

People living immediately adjacent to roadless areas have made that choice to be near wilderness and thus should be responsible for their own plan for dealing with fires, etc., through such things as the creation of defensible space on their property. It is not the responsibility of federal agencies to have to create buffer zones between them and federal land. The argument for “thinning” of forests in roadless areas is nothing more than a ruse on the part of timbering interests to gain access to the timber for their own gain. (Individual, Missoula, MT - #A5325.35000)

Protecting Homes and Property: The construction of homes near forests should never be used as an excuse to approve more logging. The homes should be constructed in a defensible manner, and the owners should accept the risks just as people who choose to live in flood plains live with floods, people in California live with earthquakes, people on the Gulf Coast live with hurricanes, etc. (Individual, Reno, NV - #A5110.35230)

1587. Public Concern: The Forest Service should reconsider its policy to temporarily suspend wilderness standards regarding wildfire suppression.

WHEN COMMUNITIES ARE THREATENED

In the Eastern U.S., we have wilderness areas that adjoin private property and communities. Wilderness standards regarding wildfire suppression can be temporarily suspended by the regional forester when communities are threatened, however this can take valuable time and is certainly not the best situation if it can be avoided. The trade-offs between wilderness or backcountry management and efficient fire suppression must be carefully weighed through roadless area evaluations and face-to-face discussions with our communities of interest. Again, interests in Washington DC, whether they are the Wilderness Society, the Heritage Forest Campaign, the American Pulp and Paper Association, or the Forest Service Washington Office cannot, and should not answer this question. (Individual, No Address - #A5341.35000)

1588. Public Concern: The Forest Service should assign a land use category to protected areas which allows locally specific management activities.

TO PROTECT COMMUNITIES IN THE URBAN-FOREST INTERFACE ZONE

Management restrictions imposed on areas Congressionally-designated as wilderness present a tremendous challenge to rural communities located on the urban interface, where the threat of wildfire conflagrations is high and the ability to reduce or minimize those hazards is almost non-existent, given the prohibition to the use of mechanical treatment and other prescriptions not permitted in Wilderness areas. A perfect example of this is the Mokelumne Wilderness in Alpine County, where wilderness boundaries border residential and vacation homes in Shay Creek near Grover Hot Springs State Park in a boxed-in canyon. Insect infestation and tree mortality compounded by drought conditions in recent months makes this area highly susceptible to wildfire conflagration, threatening life, expanding these areas. Immediate attention should be given to reducing the threat of wildfire plan. Areas that are to be

protected but not recommended as Wilderness should be allocated to a recognized land use category that allows for a locally specific complement of land management activities. (Elected Official, Markleeville, CA - #A8597.25340)

1589. Public Concern: The Forest Service should retract policies that interfere with local fire suppression and control.

Unlike other states, North Dakota counties do not look to the Forest Service as the primary fire fighter, but the agency needs to retract policies that interfere with local fire suppression and control. (Organization, Denver, CO - #A21358.35120)

1590. Public Concern: The Forest Service should allow management activities on national forests.

TO ENSURE THE PROTECTION OF PRIVATE LANDS

Management of national forests, or lack of, should not pose additional risks to adjacent private lands or communities. Therefore, management activities should be accomplished that reduce risks of catastrophic wildfires and insect and disease infestation. The Forest Service must analyze potential impacts on communities and private property and must give these national forest neighbors meaningful opportunities to comment on decisions about federal lands that might place them at increased risk. (Individual, Longview, WA - #A6016.35000)

1591. Public Concern: The Forest Service should establish different wildfire management policies for areas where there are whole functioning communities on or near national forests.

In cases where whole functioning communities exist on or near National Forest land, wildfire management should be different. These local communities and the federal government (Forest Service) should collaborate to provide solutions for protection. This solution should be limited to actions that pose little to no ecological harm. (Individual, Akron, OH - #A17697.35220)

1592. Public Concern: The Forest Service should be forthcoming with information regarding management of private property and surrounding areas.

My family and I remain very concerned about how "Roadless" rules will affect our private properties, access to them, and potentially diminish their value. Also related to these serious concerns is our historical experience, in which we had difficulty in obtaining road information from the Forest Service. We feel that we have had to expend considerable effort to attempt to pry information from Forest personnel about roads and other topics relating to our properties and to the Inyo National Forest management of their immediate surroundings. We believe that our concerns and experiences may not be unique and may apply to other owners of inholdings within National Forests. (Individual, Lancaster, CA - #A18019.35000)

1593. Public Concern: The Forest Service should not seek to manage private lands.

We believe the government should manage our land fairly and confine their interests to National Forests within their boundaries and not extend their power to private lands. (Organization, Concord, CA - #A6998.12100)

1594. Public Concern: The Forest Service should scrutinize the appropriateness of roadless designations near private property.

Establishment of a "roadless area" near private land holdings should be severely scrutinized as to the appropriateness of such a designation under those site-specific conditions. (Association, Cody, WY - #A41559.40000)

1595. Public Concern: The Forest Service should balance private development with open space and critical wildlife habitat.

The need for wide open spaces has always been important. Allowing for private individuals to buy and build homes on property that is located on the forest and critical winter wildlife habitat grounds has exploded in recent years. There should be a way to accommodate both. We allow subdivisions to be built in the cities. Rules or laws should contain the amount of land that is improved upon in these critical areas. (Individual, Annabella, UT - #A30323.53100)

1596. Public Concern: The Forest Service should not risk human life to save private property.

Do not risk anyone's life to preserve property. Do not take heroic measures to protect houses with wooden shingles. (Individual, Dallas, TX - #A18002.35113)

Land Use Ordinances/Building Codes

1597. Public Concern: The Forest Service should encourage development of land use ordinances which keep residential development away from public lands.

As in the case of farms, protecting the forests from their neighbors will be a challenge, and will require the enactment of strong land use ordinances which keep residential development away from public lands. (Individual, Dallas, OR - #A3697.70110)

1598. Public Concern: The Forest Service should discourage settlement in roadless areas due to natural disaster risks.

We need, however, to strongly discourage new settlement in areas that carry risk of natural disasters such as forest fires. Every time such settlements happen, we have to compromise our wild areas a little more, in order to pick up the pieces for people who know better and are too irresponsible to care. (Individual, No Address - #A49.35000)

Protecting Communities: It is impossible to change the course of the power of nature, the best way to protect communities is to carefully plan and restrict proximity to the current roadless areas. (Individual, Aurora, CO - #A538.35000)

If people choose to move into those regions, there probably is no way to protect them. The best course is to discourage developers from building in areas that are prone to recurring natural disasters. (Individual, Gaithersburg, MD - #A5191.35130)

BY MAKING PRIVATE DEVELOPMENTS LESS QUALIFIABLE FOR RECOVERY INSURANCE

One suggestion is to make such developments less qualifiable for recovery insurance. (Individual, Astoria, OR - #A476.35000)

1599. Public Concern: The Forest Service should revise building codes.

TO SET A STANDARD FOR CONSTRUCTION IN FIRE-PRONE AREAS

Building codes should be revised so as to set a standard for construction in these areas considered as fire prone, not unlike that which has taken place in states where hurricanes and floods occur. The Federal Emergency Management Agency should also become engaged along with the private insurance industry. (Individual, Coulterville, IL - #A114.35000)

TO PROHIBIT CEDAR SHINGLES FOR ROOFING

Change building codes so people can't use cedar shingles for roofing in the wildland/urban interface. (Individual, No Address - #A26979.35220)

1600. Public Concern: The Forest Service should work with the homebuilding industry to ban roofs that put people at risk from fires.

The Forest Service should also work with the homebuilding industry to ban roofs that put people at high risk from fires. (Organization, Seattle, WA - #A19395.35210)

1601. Public Concern: The Forest Service should alleviate fire danger to private property through integration of diverse biological systems into the building material's infrastructure.

By protecting forests we will indirectly protect communities, homes and property through the stabilization of the atmosphere. Unstable atmospheric or ocean-atmospheric turbulence can devastate entire communities, homes and properties. The threat of bush fires on property is of trivial concern. Such concern may be alleviated through correct integration of diverse biological systems into the material infrastructure. (Individual, Curtain Act, Australia - #A29708.35000)

1602. Public Concern: The Forest Service should require property owners to consent to a conservation easement on their property.**TO EMPHASIZE PROTECTION AND PRESERVATION OF NATURAL FORESTS**

Property ownership implies motivation for maximum economic benefit. With that in mind, property ownership is most often incompatible with the goals and values of Roadless Area Conservation, unless that ownership consents to an effective conservation easement in perpetuity, which will put the interests of protection and preservation of natural forest values first. (Individual, Goldendale, WA - #A21668.35300)

*Urban-Forest Interface***1603. Public Concern: The Forest Service should identify urban-forest interface areas and develop appropriate management prescriptions for them.****TO REDUCE THE RISK FROM WILDFIRE**

In the Forest Plan, urban-forest interface areas should be identified and appropriate prescriptions developed for the management of these areas. The Forest Service is developing fire management plans to reduce the risk from wildfire in many urban-forest interface areas. Roadless areas should be included as an integral part of the fire plan and updated annually and published in the Federal Register. However, fire plans should be consistent with Forest plan direction. If fire plan proposals go beyond plan direction, plan amendments should be considered. (Civic Group, Roanoke, VA - #A1713.30400)

1604. Public Concern: The Forest Service should protect roadless areas as a buffer between wilderness and the urban-forest interface.

The roadless forests are a wild wilderness I can't visit easily these days as back packing becomes more physically difficult. They are a buffer between Wilderness and the urban interface—they are easily accessible year round for recreation, whereas the higher Wilderness is in deep snow half the year. We go hiking, camping, backpacking, canoeing, bird watching, wildlife viewing. We go there to be in touch with Nature. My grandkids are growing up in these forests as my daughter did and I did. (Individual, Peshastin, WA - #A22973.45100)

1605. Public Concern: The Forest Service should establish buffer zones between private property and roadless areas.

Future developments in such areas: A buffer zone around such roadless areas should be established with incentives limiting the amount of future development in that area. (Individual, Astoria, OR - #A476.35000)

If you follow some ‘safe and sane’ logging practices, so called ‘breaks’ could be developed between ‘roadless’ areas, and private property. (Individual, No Address - #A834.35000)

Where feasible, fire roads could divide federal from private properties (not roads for transit, but to minimize fire spread). (Individual, Whitefish, MT - #A924.35000)

Work with local communities, and property owners to provide “fire breaks”, and educate them as to the dangers involved. (Individual, Tucson, AZ - #A936.35000)

Buffer zones near inhabited areas are appropriate in these areas. This may include areas of cutting/roads 1-3 miles around inhabited areas. **JUST DON’T DEVELOP THE BUFFERS** or they will not be effective and will have to be expanded. This is simple logic. It is our ever-expanding development that creates these problems, not the existence of undeveloped forest. (Individual, Arlington, MA - #A1152.35000)

THAT ARE 500 FEET WIDE

The IRA land adjacent to local communities and private property should be managed to provide vegetative transition zones, which are narrow “fireproof” buffers about 500 feet wide. These zones would be logged, thinned, and burned to remove and reduce the connective fuels that endanger the communities and/or private property. (Individual, Libby, MT - #A2301.35200)

IN THE FORM OF A REVERSE GREENBELT

Land use planning/zoning laws should be in place to prevent the concentration of developments adjacent to roadless areas. At a minimum, there should be some requirements for some buffers so that when wildfires do occur, the developments won’t be in such grave danger. Perhaps a “reverse greenbelt” between developments and roadless areas would be useful so essentially a fire line is maintained at all times. (Individual, Olympia, WA - #A26693.35110)

BY MAINTAINING MINIMALLY URBANIZED AREAS AS BUFFER ZONES

Roadless areas should be managed in such a way that does not “protect” forests from the very natural elements of fire, insects, and disease. Recognizing the full realization of such a plan would be extremely difficult, forests should begin to be managed from a “macro” perspective—understanding and managing external factors that contribute to the proliferation of potentially detrimental elements. Examples include the poorly conceived agricultural practices that stimulate the spread of plant disease and/or explosion of insect populations: as well as tradition of fire suppression that leads to dramatic fuel loading, such as that seen in the Tahoe Basin.

Typical roadless areas are already surrounded by regions that are largely rural, with minimal incursions. Such minimally urbanized areas should be maintained as buffer zones between roadless areas and human communities. Creation of carefully selected “unmanaged zones”—areas where disease prevention, fire suppression, and insect control are not practiced—should be implemented in conjunction with accompanying buffer zones—where more standard management practices exist—thus allowing the buffer areas to act as transition zones from roadless areas to more urbanized regions. This transition zone would provide a measure of protection to both human communities and to the roadless areas. (Individual, Reno, NV - #A27290.30100)

BY PURCHASING INHOLDINGS

If there is an unreasonable threat to private land then offers should be made by the federal government to buy this land up, acknowledging the risk run by holding the property and to employ it as a buffer zone. (Individual, Lexington, KY - #A1077.35200)

IF THE ADJACENT PRIVATE PROPERTY VALUES WARRANT SUCH PROTECTION

This “buffer zone” investment should only be employed where the adjacent private property values warrant, and there’s a mutual fuel-reduction effort done. If a low-value, small piece of private property is involved, then a land exchange proposal is more appropriate. (Individual, Libby, MT - #A2301.35200)

1606. Public Concern: The Forest Service should allow private communities to construct buffer zones.**TO PROTECT PRIVATE PROPERTY**

Communities near roadless areas should build firebreak areas, clearing brush, planting lawns, etc. Private property owners should do the same. (Individual, No Address - #A23569.35230)

1607. Public Concern: The Forest Service should consider ski areas located adjacent to communities as modifications supporting and complementing fire protection.**IN THE URBAN-FOREST INTERFACE**

The very nature of this category requires local jurisdiction. It is inconceivable that this issue could be properly handled, addressed, or otherwise considered at a national level. A more intensive vegetative management strategy surrounding communities is a necessity. Ski areas provide such an opportunity especially for those areas located adjacent to communities. Ski areas located adjacent to communities should be considered strategically placed modifications supporting or complementing fire protection measures in the Urban Wildland Intermix Zone. (Business, Mammoth Lakes, CA - #A30296.35000)

1608. Public Concern: The Forest Service should not fragment roadless areas by constructing buffer zones.

Roadless areas must not be fragmented by road building or firebreak building, but other firefighting techniques should be approved. (Individual, Port Angeles, WA - #A6179.35230)

1609. Public Concern: The Forest Service should recognize that extensive vegetation management in forest-urban interface areas does not reduce potential home fire losses.

Extensive wildland vegetation does not effectively change home ignitability. The evidence suggests that wildland fuel reduction for reducing home losses may be inefficient and ineffective. Inefficient because wildland fuel reduction for several hundred meters or more around homes is greater than necessary for reducing ignitions from flames, and ineffective because it does not sufficiently reduce firebrand ignitions.

To be effective, given no modification of home ignition characteristics, wildland vegetation management would have to significantly reduce firebrand production and potentially extend for several kilometers away from homes. To reliably map wildland-urban interface home fire loss potential, home ignitability must be the principal mapping characteristic.

The 1995 USDA Forest Service Strategic Assessment of Fire Management describes a costly, intensive and extensive wildland urban interface (WUI) hazard mapping and mitigation effort specifically for reducing home fire losses. As described, this approach is not necessary.

A WUI area could be a high priority for extensive vegetation management due to high aesthetic, watershed, erosion, or other values, but not for reducing potential home fire losses. (Organization, Spokane, WA - #A18013.35200)

1610. Public Concern: The Forest Service should focus on other management activities besides urban-forest interface activities.**IN REGION 5**

Protection of home and property has been focused on urban interface in Region 5. In my opinion no protection for property and communities of rural nature has been provided for. They are being squeezed out by regulation and financial strangulation. I believe that many decisions that have been made in the recent past would not pass the test of being what a prudent man would do if [this] were his land. (Individual, Carson City, NV - #A21959.35130)

Urban-Forest Interface – Funding

1611. Public Concern: The Forest Service should stop its misuse of the emergency fuels management funding earmarked for the urban-forest interface zone.

ABUSE OF EMERGENCY FUNDS

Last year Congress appropriated an additional \$120 million for fuels reduction projects in the urban-wildland interface zone. Instead of directing resources to protect communities, however, the Forest Service is using emergency monies for large-scale commercial timber sales in the nation's most pristine forestlands, including roadless areas, old growth forests, and habitat critical to imperiled species—areas far from homes and businesses and at least risk of catastrophic wildfire. In testimony before Congress, the agency admitted that only 25 percent of the acres treated were in urban-wildland interface areas. (Individual, Washington, DC - #A30150.75610)

Public Collaboration

1612. Public Concern: The Forest Service should work with local agencies to plan for and combat natural disasters near private property.

How should communities and private property near inventoried roadless areas be protected from the risks associated with natural events, such as major wildfires that may occur on adjacent federal lands? By working with local and federal agencies to plan for emergencies. (Individual, No Address - #A850.35000)

In the unlikely event that adjacent property is threatened by wildfire on Federal lands, the Forest Service should cooperate with state and local agencies to bring the fire under control. (Business, Palmer, AK - #A942.35200)

Communities and private property near roadless areas have a certain risk from wildfire — as they always have. We are not changing their risk level by NOT building more roads. Continued cooperation between the federal government and local entities should continue to reduce fire-loss risk. If fuel reduction is deemed necessary it should be done by aerial means. (Individual, Bozeman, MT - #A1134.35200)

THROUGH LOCAL FIRE MANAGEMENT PLANS

Private property is protected through the state forest fire protection program. The decision on whether to initiate aggressive fire management in non-roadless areas should be a component of the local fire management plan. (Individual, Lolo, MT - #A111.35200)

THROUGH AN ESTABLISHED EDUCATIONAL PLAN

The Forest Service should have an Educational Plan that is given to every resident in these surrounding areas and work with these communities to get them involved with the care and protection of the forest and their own properties. The Forest Service has done a superb job of protecting communities this year. (Individual, Lopez Island, WA - #A15240.35110)

THROUGH FIRE PREVENTION SEMINARS

The Forest Service should put on fire protection and prevention seminars with state, tribal and local leaders and fire personnel, involving homeowners and developers in risk areas. (Business, Mc Bain, MI - #A12006.30610)

BY CONSULTING OFFICIALS IN NEW MEXICO AND MONTANA

The Natural Resource Conservation Service employs an on-the-ground “work with” attitude that was once the norm within the Forest Service. The idea should be to cooperate with how local communities and/or states interact with healthy forests not after the fact of catastrophic natural events, but in

preparedness of such events. Areas in New Mexico such as Otero County and in Montana around the Bitterroot that have first hand experience with this point should be able to give the WO Forest Service employees real life scenarios on what property owners and the service can do in relation to forest management protocols. (Individual, Rock Springs, WY - #A15658.35210)

1613. Public Concern: The Forest Service should work with other federal agencies to implement better land use planning.

The US Forest Service needs to work with other federal agencies to implement better land use planning. Because local communities have failed so miserably at land use planning in this regard, federal guidelines are needed. (Individual, Victor, ID - #A20625.35210)

1614. Public Concern: The Forest Service should keep a log of nearby property owners.

IN ORDER TO SEND THEM A LIST OF EMERGENCY CONTACTS

It is their job to protect themselves really. They chose to live there. Give them what a lot of agencies have, keep their name and phone number on a permanent log that is updated every 2 years, send them a list of emergency phone numbers. (Individual, Yelm, WA - #A17978.35230)

1615. Public Concern: The Forest Service should view private inholders as partners in forest stewardship.

Private inholders should be seen as potential partners in forest and wildlife habitat stewardship. (Individual, Brimley, MI - #A3659.15111)

Responsibility for Protecting Private Property

Summary

Responsibility of the Forest Service versus Private Property Owners – Numerous respondents state that the Forest Service should take steps to protect private property from natural disasters. To that end, people suggest a number of actions the Forest Service could take—coordinating efforts with residential and rural firefighting teams; employing science-based management decisions; revising regulations and legal authority as necessary to secure timely measures; establishing quick response procedures; providing adequate maps of roadless areas; conducting an inventory of communities located near roadless areas; allowing forest management decisions to be made at the local level; enlisting the aid of the National Guard; enlisting the aid of Forest Service research stations; constructing roads for access; thinning dense stands near communities; carrying out prescribed burns; maintaining a ‘defensible space’ from the boundary of private property to the forest; prohibiting structures within 200 feet of private property boundaries; clearing hazardous materials near communities; creating jobs that enable people to remove fuelwood; and providing local water access for fire hoses.

A number of individuals also suggest the Forest Service should educate private property owners regarding the dangers that exist in roadless areas and the steps they should take to protect their property. One person suggests the Forest Service use *Living with Fire* as a guide in its education efforts, while another person suggests hiring displaced timber workers to train private property owners.

In addition to taking steps to protect private property and educating private property owners, one person suggests that forest managers should be held accountable for “decisions [regarding development in roadless areas] that create dangerous situations.”

Of those who specifically address the question of whether the Forest Service or private property owners should bear the responsibility for private property protection, most say it is private property owners that should bear the major responsibility. A typical comment is the following: “People should not build communities or buy property so near a national forest that they endanger their lives and property. If they do, they do so at their own risk.” Some suggested actions private property owners can take include clearing a safe area around their property, providing fire lookouts, establishing fire and rescue departments, and developing fire management plans and stricter building and zoning codes.

Financial Responsibility – Several respondents say the Forest Service should bear the financial responsibility for damages to private property. One individual states, “If the Forest Service acts irresponsibly and allows disease or insects to spread they should be ready to pay for the damage it does to the private property owner.” Another person concludes that the, “USFS must pay property owners full value for private property damaged by fire or other calamity originating in nearby National Forests, or if the property owner so requests, must rebuild damaged or destroyed property to original condition at USFS expense.” Still another respondent suggests that “the Forest Service should establish a trust fund to replace, in-kind, these property amenities.”

Some individuals suggest ways the Forest Service can help fund fire prevention efforts. One individual suggests that “the best way to protect people from wildfires is to develop a program where people are provided funding to clear out the fuels around their home.” Another individual recommends that “communities should get a royalty from the extractive industry to fund a safe community.” Finally one individual suggests that in the event of a natural disaster, federal funds should be used to “move people temporarily to safe areas . . . and to provide financial assistance in permanently relocating them to safer areas.” This individual states that it is more “cost effective . . . to adapt to nature” than to waste energy fighting it year after year.

Other respondents assert that private property owners, not taxpayers, should bear the financial responsibility for fire protection. According to one individual, “People who own private property near roadless areas should accept that fires are a risk of the location they have chosen.

Taxpayers’ dollars should not be spent to protect a handful of homes, or to stop a wildfire that is natural in occurrence.” Similarly, another individual states that “people who want to have a fire break between their house and an adjacent national forest should put one in their own land at their own expense, not go whining to the government to waste our tax dollars and our land to protect them from natural and predictable events.” To that end, one person suggests that “private property owners should be assessed an annual fee and a service charge when they call for assistance.” Another suggests that states raise property taxes for homes near forested areas to cover firefighting costs. According to others, private insurance companies should be encouraged to either increase rates or refuse coverage for homes built in locations at risk of wildfire, or offer reduced rates to those that meet fire danger reduction standards.

Responsibility of the Forest Service

1616. Public Concern: The Forest Service should protect private property from natural disasters.

Homeowners who have built homes on private property and who pay taxes for fire protection should have their homes protected, regardless of location. Otherwise, they are being denied their rights. (Individual, Salt Lake City, UT - #A806.35000)

Because of the increased risk from wildfires caused by unmanaged fuel loads, the Forest Service has the obligation to fight both fires and epidemics near private property to assure they do not spread to private land. (Individual, Sandpoint, ID - #A5438.35210)

Communities private property near inventoried road areas should be protected from the risks associated with natural events, such as major wildfires that may occur on adjacent federal land by, again, using helicopters. (Individual, No Address - #A536.35000)

AFTER DETERMINING THE RISK INVOLVED

Each situation is different and needs to be evaluated as such. What the risk involved is, needs to be determined before communities' private property are protected from wild fires. (Individual, Vancouver, WA - #A389.35000)

THROUGH COORDINATION BETWEEN RESIDENTIAL AND RURAL FIRE-FIGHTING TEAMS

Coordination between residential and rural firefighting teams is in order too. (Individual, Olympia, WA - #A20844.35000)

THROUGH SCIENCE-BASED MANAGEMENT DECISIONS

The Forest Service, at the local level, must make science-based management decisions that minimize the risk of catastrophic wildfires on neighboring forests, inholdings, and communities. Some of these decisions may require temporary roads. The January 2001 RACR could overly restrict science-based solutions to local problems. (Individual, Logan, UT - #A13482.35110)

BY REVISING REGULATIONS AND LEGAL AUTHORITY AS NECESSARY TO SECURE TIMELY MEASURES TO PROTECT PRIVATE RESOURCES

When it is necessary to respond to catastrophic events such as lethal, stand replacement fires, flash floods, water contamination, or others, time is of the essence. After a catastrophic event has occurred, is not the time to attempt resolution through arguments, appeals, and lawsuits. I believe that revision of regulations and modification of legal authority are necessary to secure timely measures to protect both private and public resources. (Individual, Colfax, WA - #A5421.35000)

BY ESTABLISHING QUICK RESPONSE PROCEDURES

I am an owner of land adjoining the Gallatin National Forest. In 1994 over half (about 1200 ac.) of my ranch was burned by fires sweeping from the Federal Land (The Black Butte Fire in Sweetgrass County, Montana). It was disappointing and disastrous that when the fire was just starting the local Big Timber Volunteer Fire Dept. was not able to drive to the fire and could have put it out, but were ordered not to, as it was on federal land and there was a liability issue. As a result, because of slow response by the federal government, and firefighters who did not know which township they were in, and abandonment of the initial fire with no safety net of a hand or machine line (all the crew left to save a barn.), the wind changed, and 11,000 acres burned, mostly private land.

The above explanation is to show that roads and quick response, even if it means deputizing local forest fighters could save private property. (Individual, Bozeman, MT - #A8826.30400)

BY PROVIDING ADEQUATE MAPS OF ROADLESS AREAS

Forest managers do have a responsibility to manage our national forests. But in carrying out those responsibilities, they must consider the impact those policies have on those living in close proximity to our national forests. Providing accurate mapping of roadless areas is a key ingredient to ensuring that communities and forests can coexist safely for all concerned. (Organization, Huntsville, AL - #A13542.35113)

BY CONDUCTING AN INVENTORY OF COMMUNITIES LOCATED NEAR ROADLESS AREAS

The Forest Service, working in concert with other fire fighting organizations, should first determine where such communities and property exist. Without such an inventory it is difficult to determine appropriate strategies and attendant costs. (Individual, No Address - #A12607.35200)

BY ALLOWING FOREST MANAGEMENT DECISIONS TO BE MADE AT THE LOCAL LEVEL

The USFS can best protect communities and private property near inventoried roadless areas by considering both economic and physical impacts of management decisions. Many communities and individuals depend on the sustainable use of these lands for their livelihood, and the USFS must give these national forest neighbors meaningful opportunities to comment on decisions about federal lands that may place them in economic or physical peril. Again, forest management decisions made on the local level are best suited to protecting adjacent rural communities, as they are more likely to have sufficient management flexibility to respond to emergencies and changed conditions. (Association, Sacramento, CA - #A3681.35110)

BY ENLISTING THE AID OF THE NATIONAL GUARD

How should communities and private property be protected from wildfires on adjacent federal lands?

Through trained Forest Service personnel, available army reserves and national guard, local fire service, police, etc. paid for with proceeds from the Emergency Management System, State and Federal reserves from sales of natural resources, insurance policies on projects that are casual, and use permits of resource lands. (Individual, Lacey, WA - #A17762.35000)

BY ENLISTING THE AID OF FOREST SERVICE RESEARCH STATIONS

The Forest Service Research Stations can play a role in reducing problems in the interface between roadless areas and neighboring state, tribal, community or private developments by conducting scientific research in ways to reduce risks. (Individual, Asheville, NC - #A22623.35210)

BY ALLOCATING RESOURCES

Fire fighting resources should be allocated heavily in favor of protecting forests close to towns and private property. Most of these areas are roaded and not covered under this plan. (Individual, Lehi, UT - #A568.35000)

BY MANAGEMENT ACTIVITIES

I believe that some thinning of areas near private property is prudent along with controlled burns to reduce the fuel load. (Individual, Missoula, MT - #A113.35000)

Protecting property, communities and homes are important. The underbrush and small trees should be thinned to reduce possibility of the ladder effect that causes crown fires that are almost impossible to control. (Individual, Coulterville, IL - #A114.35000)

Communities and private property near roadless areas are the areas most in need of fire protection work such as thinning, etc. (Individual, Coram, MT - #A539.35000)

Management of national forests should not pose risks, if possible, to adjacent private lands or communities. Therefore, management activities should be accomplished that reduce risks of catastrophic wildfires and insect and disease infestations. The Forest Service must analyze potential impacts on communities and private property and these communities and private owners must be provided opportunities to comment on decisions about federal lands that might place them at increased risk. (Individual, Thousand Oaks, CA - #A891.35000)

BY CONSTRUCTING ROADS FOR ACCESS

The Roadless Area Conservation Rule already provides exceptions that allow road building and logging when needed to address concerns of wildfires and forest health. Roads can be built to protect public health and safety from imminent wildfire threats and other emergencies. (Individual, Logan, UT - #A939.35000)

In instances where human life and property is threatened by keeping an area roadless, build roads. (Individual, Fayetteville, AR - #A1015.35000)

Roads can still be built to protect life or property. (Individual, Duluth, GA - #A3724.35000)

I understand how difficult it is to balance this issue, however, I also understand that the protection of communities and other private property should be but one factor in determining the way an event is dealt with. If this is at the expense of an area remaining roadless, so be it, an adequate number of temporary roads should be constructed to fight the fire, or insect infestation, or whatever. These roads can then be decommissioned and restored to their natural state at a later date or utilized as recreational infrastructure. We should be clever enough to remain somewhat fluid in how all our public lands are utilized, if a particular tract is no longer suitable for so-called "roadless" status perhaps it should be allowed to be used for other purposes. (Individual, El Dorado, KS - #A5117.35000)

BY CONSTRUCTING TEMPORARY ROADS FOR ACCESS

National Forests should be managed to be assets to the community, not liabilities. Protection of communities and other private property should be the primary factor in determining the way a fire is fought. If required to accomplish such protection, a minimum number of temporary roads should be constructed to fight the fire. These roads can be decommissioned and restored to their natural state later. Then, mitigation measures that address flash flood, mudflows and water contamination should be implemented quickly following wild fires. (Individual, Edgewood, NM - #A5638.35000)

BY THINNING DENSE STANDS NEAR COMMUNITIES

How should communities and private property near inventoried roadless areas be protected from the risks associated with natural events, such as major wildfires that may occur on adjacent federal lands?

Thin unnaturally dense stands near communities, but do not remove old-growth timber, only underbrush and small trees. (Individual, Dallas, TX - #A18002.30530)

BY REINTRODUCING FIRE

Owners of land adjacent to the national forest assume some risks as well as receiving a great deal of benefit. In many cases these landowners purchase this land just for the fact that it does lie adjacent to the national forest. Roding the existing roadless areas would not necessarily protect these lands and in many cases would actually detract from the values that the adjacent landowners have sought out. Roadless lands actually offer us our best opportunity for emulating natural fire processes without the threats to human habitation and other costly human development. By allowing the reintroduction of fire into these systems we can protect nearby landowners to a reasonable level. (Individual, Moscow, ID - #A4871.35100)

BY PRESCRIBED BURNS

To protect homes from the unlikely event of a forest fire near roadless areas, perhaps the Forest Service can create a program for prescribed burns in those areas where excess fuel loads appear to be a problem. This may also maintain forest health. (Individual, Colorado Springs, CO - #A17259.35000)

BY MAINTAINING A 'DEFENSIBLE SPACE' FROM THE BOUNDARY OF PRIVATE PROPERTY TO THE FOREST

The Forest Service should maintain a "defensible space" on the public lands from the boundary of the private land back into the forest.

They should consistently encourage private landowners to maintain their own defensible space around their structures. (Association, Cody, WY - #A41559.35100)

BY ZONING AND PROHIBITION OF STRUCTURES WITHIN 200 FEET OF PRIVATE PROPERTY BOUNDARIES

Pre-emptive measures should be taken to prevent damage on private properties. Some examples are, through zoning, and no structures should be erected within 200 feet of property boundary. (Individual, No Address - #A5395.35000)

Protection of adjacent lands can be achieved through intelligent planning and zoning of private and public lands. (Individual, Missoula, MT - #A6193.35000)

BY CLEARING HAZARDOUS MATERIALS 200 METERS FROM COMMUNITIES

Forest treatment beyond the immediate area surrounding houses has little effect on community protection from wildfire. However, an intensive zone 200 meters (660 feet or one-eighth of a mile) around communities can provide a defensible space and a potential fire line for firefighters. Treatment of the buffer areas should include the removal of ladder fuels (primarily smaller trees) and general fuels reduction. A light treatment for up to a .5-mile from urbanized areas may be appropriate. Larger trees, especially those in the ponderosa pine forests, have shown resistance to fire. (Organization, Chico, CA - #A25114.35200)

BY CLEARING HAZARDOUS MATERIALS 40-100 METERS FROM COMMUNITIES

The current proposed Roadless policy allows roads to be built in roadless areas to protect life or property. All the current research points to the areas WITHIN the first 40-100 meters surrounding a community as the place where clearing to prevent fires should be concentrated. (Individual, Nevada City, CA - #A11787.35000)

BY CREATING JOBS THAT ENABLE PEOPLE TO REMOVE FUELWOOD

If necessary, in roadless areas close to habitations, jobs could be created by sending people in without roads to remove fuel-wood. (Individual, Sitka, AK - #A15506.35200)

BY PROVIDING LOCAL WATER ACCESS FOR FIRE HOSES

I believe that building regulations would address this problem. For instance, homes in these areas would benefit from not having wooden roofs. There should be a perimeter of non-dense forest around the home, but not necessarily a clear-cut. There should be local water access for fire-hoses. (Individual, Klamath Falls, OR - #A6931.35200)

FOR HOMES THAT EXISTED PRIOR TO INCLUSION IN THE NATIONAL FOREST SYSTEM

In cases where communities or individual homes existed prior to their neighboring lands being included in the National Forest system, reasonable efforts should be taken to assist in maintaining buffer zones to inhibit the spread of fires into inhabited territory. (Individual, New Haven, CT - #A616.35000)

ON THE LITTLE MISSOURI NATIONAL GRASSLANDS

We live adjacent to the Little Missouri National Grasslands and expect the Forest Service to be a good neighbor and manage it properly so it does not jeopardize our personal property and personal safety. A response plan should be implemented to effectively deal with the potential for wildfires, disease, etc. (Association, Watford City, ND - #A29131.35000)

AT THE BRUNDAGE MOUNTAIN SKI RESORT

The forest planning process may need to provide exceptions to roadless area prescriptions in order to provide for circumstances of this nature. In many cases, such as ours, ski resorts are private improvements located on federal lands that need fire protection. Indeed, the Forest Service has historically provided fire suppression in the event of natural fires within and adjacent to Brundage Mountain and we would like to see this practice continues. (Permit Holder, McCall, ID - #A15317.35210)

1617. Public Concern: The Forest Service should educate private property owners regarding the dangers that exist in roadless areas.

Communities must protect themselves economically, the only thing the forest service can do is to educate the public about various perils. (Individual, Fruita, CO - #A1680.35113)

AND THE STEPS THEY SHOULD TAKE TO PROTECT THEIR PROPERTY

People in these areas should be educated about how to protect the area they live in, how to minimize the risk of dangerous fires and what to do and who to call if a fire should break out. (Individual, Shawnee Mission, KS - #A96.35113)

Ideally people should be supplied with a notice warning them about the increased risk of fire due to their choice of location before they buy a home. All property owners should receive documentation on how to best protect their property such as using fire resistant roofing materials, type and closeness of vegetation near their homes, etc. Determine levels of protection depending on density of population. An isolated home, regardless of value, should not be given the same level of protection as a densely packed community. The bottom line is always risk vs. reward. (Individual, Tucson, AZ - #A4938.35113)

I also have to ask the question of what communities and homeowners can do to protect themselves from the ravages of fire. They should treat their community and private properties by thinning and removing small trees and all underbrush from their properties at a minimum of at least 500 feet or more. Roofs and gutters should be free of flammable material such as leaves and pine needles. Nothing flammable should be close to a structure. (Individual, Coulterville, IL - #A114.35000)

Remind homeowners that they are responsible to harden their properties against wild fires. They must: a) use metal or tile shingles, b) use metal or concrete containing siding, c) keep brush away from their homes, d) keep trees away from homes, e) keep water on-hand to fight fires. (Individual, Olympia, WA - #A441.35000)

A landowner who purchases or acquires property anywhere near federal forests and grasslands should know the risks and take measures to reduce wildfire damage to their property. USFS research by fire physicist Jack Cohen shows clearly that structures can be most effectively and efficiently protected from fire by working within the structure's defensible space zone. This is within 25 meters from the house. (Individual, Grangeville, ID - #A830.35000)

The Forest Service should also have an aggressive program to work with local home owners on ways to protect their homes, like removing dead and dying trees, maintaining a "green area" within 30-50 feet of the home, and having a metal roof. (Elected Official, Fremont County, ID - #A4942.35200)

BY USING LIVING WITH FIRE AS A GUIDE

According to the Forest Service, protection from wildfire is best achieved by managing the vegetation immediately surrounding structures. The Forest Service could therefore provide education to nearby property owners on ways to protect themselves with roof sprinklers, and defensible space. In Minnesota, wildland firefighting agencies developed a guide for homeowners called Living With Fire. The guide describes the forces that determine wildfire behavior and lists specific steps to creating an effective defensible space around homes. (Individual, Grand Marais, MN - #A15355.35113)

BY HIRING DISPLACED TIMBER WORKERS TO TRAIN LANDOWNERS

Hire displaced timber workers to train folks living in the wildland/urban interface how to reduce fire hazards around their homes. (Individual, No Address - #A26979.35220)

1618. Public Concern: The Forest Service should protect federal property with private improvements from natural disasters.

SKI RESORTS

Federal property with private improvements, like those at ski areas need protection from risks associated with natural events just as private property owners do. The agency should have the flexibility to prevent and control fires in adjacent areas and should consider a less rigorous ban on road building in roadless areas adjacent to private property and communities. (Permit Holder, Denver, CO - #A15385.35210)

1619. Public Concern: The Forest Service should hold forest managers accountable for decisions that create dangerous situations.

Forest Service managers are not thinking coherently about development and fires. For example, the Targhee National Forest is attempting to create a private inholding at Grand Targhee resort through a

federal land exchange. This private inholding would be completely surrounded by forests, 7 miles within the forest boundary by road and many more miles from county fire-fighting equipment. When others and I raised the issue of risk to this new development from wildfire, the Targhee simply dismissed our concerns both during the EIS process and in our appeal of the decision to privatize Grand Targhee. Forest managers lack accountability for decisions that create dangerous situations. Regional foresters just close their eyes to the problem. (Individual, Victor, ID - #A20625.35210)

Responsibility of Private Property Owners

1620. Public Concern: Private property owners should be responsible for protecting their property from natural disasters.

People should not build communities or buy property so near a national forest that they endanger their lives and property. If they do, they do so at their own risk. National forests were not created to accommodate communities or private property owners. They were created to preserve the national interest by providing unspoiled, undeveloped natural areas for all Americans, not just the few who financially profit from their proximity to national forests. (Individual, Ennis, MT - #A102.35000)

Property owners near roadless areas should accept the risk of living in such a vulnerable area and take responsibility for their own. Better yet, they should be encouraged to live in town. (Individual, Bozeman, MT - #A284.35000)

Communities and private landowners can fend for themselves. They need to be proactive in preventing risk and fire danger for themselves. They are aware of the risks when involving themselves in nearby roadless areas. (Individual, Missoula, MT - #A394.35000)

BY DIGGING TRENCHES AROUND THEIR PROPERTY

Private property owners (by definition) should be responsible for protecting their properties by modifying their own lots if they so desire. Many private residences bordering forests in the upstate NY area use lot-edge trenching to prevent fire spreads. Such trenches should be suggested to land owners, but should be done on the private lands, by the lot owner. (Individual, Rochester, NY - #A8831.35230)

BY PROVIDING FIRE LOOKOUTS

Communities and private properties near inventoried roadless areas can best protect themselves by maintaining adequate fire stations and lookouts, and access to dependable water resources. There is always fire danger associated with living near or in the forest. The potential for harm or destruction can never be entirely eradicated. Proper creation and maintenance of firebreaks, a sound emergency and fire protection plan, and a dependable water source, provide as much protection as possible to create in forests. (Individual, Chewelah, WA - #A5453.35230)

BY ESTABLISHING FIRE AND RESCUE DEPARTMENTS

Local communities should be properly protected from the hazards associated with living in these areas by proper management. If item number three is carried out properly, the only danger will be acts of nature. The communities should be properly insured and have a well-maintained fire and rescue department. This can be accomplished by their individual mechanisms. (Individual, Boulder, CO - #A5288.35000)

BY DEVELOPING FIRE MANAGEMENT PLANS AND STRICTER BUILDING AND ZONING CODES

Local communities must have their own fire management plan. More responsibility, accountability for fire prevention and invasive species must be placed on the owners of private lands. Local laws need to coincide with these responsibilities such as no wood roof in the forest, no building in a flood plain, etc. (Organization, Reno, NV - #A5987.35220)

1621. Public Concern: The Forest Service should allow private property owners to clear a safe area around their property.

Private property owners should be allowed to clear a safe area around their property, if desired, to provide protection from wildfires. (Individual, Albuquerque, NM - #A10497.10135)

UP TO 100 YARDS AWAY

I do have some green timber left. Because of the rough terrain, I would have to enter the forest perhaps 100 yards to reach a point where I could come back into my property in order to harvest the trees. I think permission should be given to private forest owners, to do this. (Individual, Bozeman, MT - #A8826.40000)

*Financial Responsibility***1622. Public Concern: The Forest Service should pay for damages to private property if they allow disease or insects to spread.**

Spraying can be done at the first outbreak of insects or disease to minimize the spread to forests and private lands. If the Forest Service acts irresponsibly and allows disease or insects to spread they should be ready to pay for the damage it does to the private property owner. (Individual, Oak City, UT - #A40530.30600)

1623. Public Concern: The Forest Service should pay private property owners for property damaged by wildfire.

USFS must pay property owners full value for private property damaged by fire or other calamity originating in nearby National Forest, or if the property owner so requests, must rebuild damaged or destroyed property to original condition at USFS expense. This USFS insurance requirement also must include death, damage and injury caused to people, property or livestock, by wild animals and diseases which emerge from National Forest land. (Individual, Fredericktown, MO - #A11981.35230)

1624. Public Concern: The Forest Service should provide funding to private property owners.**TO CLEAR FUELS AROUND THEIR HOME**

The best way to protect people from wildfires is to develop a program where people are provided funding to clear out the fuels around their home. This is best seen in the Conservation and Local Economy Alternative provided on the Bitterroot National Forest in response to their Burned Area Draft Environmental Impact Statement. Non-Commercial thinning in the urban/rural interface should be determined by local scientists. (Individual, Missoula, MT - #A21068.35100)

1625. Public Concern: The Forest Service should provide royalties from extractive industries to communities near roadless areas.

Private landowners elected to buy land there next to a forest should take precautions to protect their own lands. Communities should get a royalty from the extractive industry to fund a safe community. (Individual, Mesa, AZ - #A99.35230)

1626. Public Concern: The Forest Service should use federal funds to relocate private property owners to safe areas.**IN THE EVENT OF A NATURAL DISASTER**

Regarding the threat to people and property posed by natural disasters, such as wildfires, we should use federal funds to move people temporarily to safe areas in the case of such events, and to provide financial assistance in permanently relocating them to safer areas. Our experience with the Mississippi floodplain has shown that it is cost effective, as well as simply wise, to adapt to nature, rather than waste

our energies countering elemental realities that will return year after year. (Individual, Washington, DC - #A27348.35210)

1627. Public Concern: Private property owners, not taxpayers, should bear the cost of fire protection.

Homeowners and other property owners within National Forests should bear some if not all of the expense associated with fire protection of their own property, as are property owners in other parts of the country. Local people must be treated respectfully as neighbors, but they are not landlords. (Individual, Skokie, IL - #A529.35230)

The best way to prevent the urbanization of roadless areas is to require risky property owners to assume the risks. We don't need another Federal welfare program for landowners such as coastal and wetland settlers receive! (Individual, North Little Rock, AR - #A814.35230)

People who own private property near roadless areas should accept that fires are a risk of the location they have chosen. Taxpayers' dollars should not be spent to protect a handful of homes, or to stop a wildfire that is natural in occurrence. (Individual, Portland, OR - #A967.35230)

Communities are not typically adjacent to national forest roadless areas, so they do not require special protection from fire and other events. Private lands are, in fact, private. Special fire protection, and the resultant costs, should be left to the individuals and/or corporations who own those lands. (Individual, Bozeman, MT - #A3673.35230)

People who want to have a fire break between their house and an adjacent national forest should put one in their own land at their own expense, not go whining to the government to waste our tax dollars and our land to protect them from natural and predictable events. (Individual, West Lebanon, NH - #A4836.35130)

1628. Public Concern: The Forest Service should charge private property owners an annual fee and service charge for assistance.

I think private property owners should be assessed an annual fee and a service charge when they call for assistance. (Individual, Las Vegas, NV - #A5429.35200)

1629. Public Concern: States should raise property taxes for homes near forested areas.

TO COVER FIRE FIGHTING COSTS

The states should develop a way to better prepare their landowners for inevitable fires. They could, for example, develop a property tax scheme that would charge higher taxes for homes near forested areas to cover the higher fire fighting costs for those areas. They could also mandate fire insurance for all homeowners in a forested area. (Individual, No Address - #A29243.35120)

1630. Public Concern: The Forest Service should encourage private insurance companies to either increase rates or refuse coverage for homes built in locations at risk of wildfire.

There should be free market solutions to many of the problems created by homes being built in locations that are subject to high wildfire danger. Private fire insurance should either be very expensive or simply not available to those who wish to build in locations that have a very high risk of being destroyed by wildfire, either through remoteness or through their lack of typical fire protection such as distance from a fire department and access to water supplies, etc. At the very least there should be a determination by

local fire officials as to whether or not the structures can be defended without jeopardizing either men or equipment prior to an emergency. (Individual, West Yellowstone, MT - #A6043.35130)

1631. Public Concern: The Forest Service should encourage fire insurance carriers to offer reduced rates to those that meet fire danger reduction standards.

Encourage fire insurance carriers to offer reduced rates to homes that meet fire danger reduction standards. It's just crazy to offer the same rates to people with flammable and inflammable siding and roofs! (Individual, Olympia, WA - #A441.35000)

The Forest Service could seek the cooperation of insurance companies to reduce premiums for owners who reduce risk. National forest land in the urban interface should be made as fire resistant as practical to do so. (Individual, Missoula, MT - #A4987.35200)

Other

1632. Public Concern: Organizations opposed to access to roadless areas should protect communities and private property and assume liability for any loss.

Protection of nearby communities and private property should be provided by the Sierra Club and all others opposed to any trespassing of inventoried roadless areas, and be held libel for lost lives and lost property. (Individual, Fremont, MI - #A10610.35000)

Protecting Access to Property (Question 5)

Question 5: Protecting Access to Property. What is the best way to implement the laws that ensure states, tribes, organizations, and private citizens have reasonable access to property they own within inventoried roadless areas?

This section includes five subsections: Protecting Access to Property General, Access to National Forest System Lands Through Private Property, Maintenance of Routes through National Forest System Lands to Private Property, Legal Considerations, and Land Exchanges/Purchases.

Protecting Access to Property General

Summary

General Comments – One individual suggests that in order to preserve access to private property, property boundaries must first be established; hence, the U.S. Department of the Interior and Bureau of Land Management should survey the boundaries of private and federal property to establish adjoining boundaries. Beyond this technical suggestion, a number of respondents urge the Forest Service to ensure access to private property—through the forest planning process, through special use permits, or on a case-by-case basis. One association requests that any revisions to regulations not result in undue delays in access decisions, stating that “it has taken over two years for the Forest Service to issue a Road Use Permit to allow the use of three miles of existing Forest Service road on the Medicine Bow NF to access a timber sale in a State of Wyoming section inside an inventoried roadless area.”

Others ask the Forest Service to notify private property owners when considering changes that could affect access to their property; to ensure that properties for sale are guaranteed access; to address access to parcels not presently accessible by road; and to oversee local residential access decisions in order to ensure compliance with statutory federal residential requirements, protections, and planning processes.

Some individuals also ask the Forest Service to spell out conditions of ingress and egress in forest plans, and to require private property owners to prevent interloping along routes of ingress and egress to their property. Additionally, one person comments that “property ownership does not bestow [on] owners a right to conduct activities on their lands in conflict with, or to the detriment of, adjacent ownerships,” and urges the Forest Service not to allow such activities.

Roadless Area Management – A number of comments about access relate directly to roadless area management—specifically in connection with the Roadless Area Conservation Rule. Both a state agency and a professional society ask the Forest Service to address, on a forest-by-forest basis, the potential impacts of roadless area management on access to other public and private lands. At the same time, several individuals make a point of saying that the Rule would have no impact on access to state and private inholdings because access is already protected by existing

law. Some point to the provision in the Rule which provides exceptions to the prohibitions on road construction when necessary to maintain access to inholdings, and urge the Forest Service to retain that provision.

Others assert that the exceptions allowed in the Rule are not sufficient, and so urge the Forest Service to address the Rule's adverse impacts on private property access, or to revise the Rule to ensure that reasonable access routes to private property are maintained.

1633. Public Concern: The U.S. Department of the Interior and Bureau of Land Management should survey the boundaries of private and federal property.

TO ESTABLISH ADJOINING BOUNDARIES

All owners of private property must have access to their property. State law should prevail as individuals must allow other individuals access to their property, no fee should be charged. Property boundaries must be surveyed by the US Department of the Interior and BLM to establish all corners joining private and federal property; this is a continuing problem in our area. (Individual, Mount Ida, AR - #A13372.40000)

1634. Public Concern: The Forest Service should ensure access to private property.

THROUGH THE FOREST PLANNING PROCESS

The best way to ensure that States, tribes, and private citizens have reasonable access to property they own in roadless areas is through the forest planning process. Those routes of concern should be identified and protected through forest-wide goals, objectives and standards. The lands to be protected, and the access to them, should be clearly identified on the preferred alternative map. Those roads then become part of the road management system for the Forest. (Elected Official, Fremont County, ID - #A4942.40100)

THROUGH SPECIAL USE PERMITS

Why shouldn't we the people be able to use the forest areas? Forest planning may have failed to provide adequate protection of roadless areas in the past that proves we need improvement and a way to regulate such areas. The best way to implement the laws that ensures States, tribes, organizations, and private citizens have reasonable access to property they own is to design a use permit and use that money to cover the cost of policing the area. (Individual, No Address - #A4764.40000)

Establishment documents for Roadless Areas should contain identification of access routes and specifications for their development and use. If access will not be permitted then the holdings should be acquired by the government through negotiation or in the extreme, condemnation. The inholder should be compensated. The existing Special Use Permit system of the Forest Service should be adequate for these access situations. (Individual, Olympia, WA - #A278.40500)

ON A CASE-BY-CASE BASIS

You must provide reasonable access to private and other lands adjacent to or within the inventoried roadless areas. If you can't do this and maintain a unit's roadless character, it should not be managed as roadless. What constitutes reasonable access must be negotiated with each landowner. The issue of access to other properties must be addressed on a case-by-case basis in forest plans. (Individual, Lewiston, ID - #A2872.40000)

1635. Public Concern: The Forest Service should avoid additional delays regarding decisions on access to private property.

Because of delays associated with Forest Service roadless policies, it has taken over two years for the Forest Service to issue a Road Use Permit to allow the use of three miles of existing Forest Service road

on the Medicine Bow NF to access a timber sale in a State of Wyoming section inside an inventoried roadless area. This is inexcusable. Any revision of the regulation should not result in any additional potential delays for decisions on rights-of-way or access to private property. (Association, Augusta, ME - #A13312.40000)

1636. Public Concern: The Forest Service should notify private property owners when considering changes that could affect access to their property.

TO ALLOW PROPERTY OWNERS TO ASCERTAIN THE IMPACTS OF ROAD POLICIES

Owners of private inholdings must be specifically notified in writing, including maps with adequate detail, whenever the Forest Service considers changes which could affect access to or the values of their private properties. General notification procedures and practices are not adequate. They do not relate to specific situations and the Forest Service personnel who make these presentations, field comments, and attempt to answer questions have little knowledge of policies and procedures as they would apply to and affect specific inholdings. This has resulted in the inability for the owners of inholdings, like us, to accurately ascertain potential impacts of any road policies, procedures or proposals. Additionally, actual and existing road status information needs to be maintained and made available to interested and affected parties. Our experience is that this is not currently the case. (Individual, Lancaster, CA - #A18019.40000)

1637. Public Concern: The Forest Service should spell out conditions of ingress and egress in forest plans.

Access to private property should be subject to the same ridiculous, discriminatory laws that apply to wilderness areas. Reasonableness and common sense in determining the least impact on federal lands is the least cost to the land owner. The forest plan should spell out conditions of ingress and egress. (Business, Eureka, MT - #A17220.20400)

1638. Public Concern: Local governments should ensure that properties for sale are guaranteed access.

It is the responsibility of local governments to conduct land use planning that ensures properties for sale are guaranteed access. (Individual, No Address - #A27789.40100)

1639. Public Concern: The Forest Service should address access to parcels not presently accessible by road.

ON A CASE-BY-CASE BASIS

As I have reviewed the government maps of the federal lands around us here in Gunnison, I notice many parcels that are not accessed by roads, these parcels seem to have been purchased for mineral rights, grazing, spring access, etc. Access to these lands will need to be provided on a parcel-by-parcel basis. These decisions can be made by the local boards in connection with the owner, and all interested parties. Special education on the problems presented by access plans and requests should be given by the USDA foresters working in the area. (Individual, Gunnison, UT - #A25755.40000)

1640. Public Concern: The Forest Service should oversee local residential access decisions.

TO ENSURE COMPLIANCE WITH STATUTORY FEDERAL RESIDENTIAL REQUIREMENTS, PROTECTIONS, AND PLANNING PROCESSES

In the final proposed rule I hope you include extremely limited, or no, unguided local control for FS residential access decisions. Local control has meant no viable appeal to local FS actions. The local FS has minimal consultation with affected populations. The local FS is severely out of sync with other statutory federal residential requirements, protections and planning processes. Residential use is not the

FS's forte, yet it is important to residents that lawful and reasonable review of decision making prevail, even in the forest. (Individual, Prescott, AZ - #A28094.13120)

1641. Public Concern: The Forest Service should require private property owners to prevent interloping along routes of ingress and egress to their property.

Political and private interests who own land within inventoried roadless areas should have access but should bare the entire burden of ensuring that public lands are protected from interlopers along routes of ingress and egress to their properties. (Individual, Olympia, WA - #A10330.40000)

1642. Public Concern: The Forest Service should ensure that private property owners do not conduct activities that harm adjacent ownerships.

Property ownership does not bestow owners a right to conduct activities on their lands in conflict with, or to the detriment of, adjacent ownerships (i.e. hazardous waste management facilities erected adjacent to residential areas or access roads constructed across the public's roadless areas). (Individual, Kennewick, WA - #A23359.40100)

1643. Public Concern: The Forest Service should allow the advocates of non-wilderness use to compete for access to privately held lands.

The competition is over, and the advocates of non-wilderness uses of our National Forests have already mostly won. Preserve the remaining roadless areas as wilderness and allow the advocates of non-wilderness uses to compete for access to the majority of Forest Service land which remains unprotected. Calling these resources "limited" is misleading in this context. There are very few limits placed on the motorized recreation and resource extraction contingents in this competition. The majority of Forest Service land is open to these uses. Tracts of public land dwarfing the Forest Service holdings were granted to private interests in the last century—very little of which remains roadless. Allow the advocates of non-wilderness uses to compete on the free and open market for access to this privately held land rather than asking all Americans to, yet again, pick up the tab. (Individual, Seattle, WA - #A21681.15160)

Roadless Area Management

1644. Public Concern: The Forest Service should address, on a forest-by-forest basis, the potential impacts of roadless area management on access.

TO OTHER PUBLIC AND PRIVATE LANDS

The potential impacts of known forest health problems, fuel load problems, and fire suppression needs on adjacent landowners must be considered in the development of roadless area management decisions. The Forest Service must also address, on a forest by forest basis, the potential impacts of roadless area management on access to other public and private lands as well as to water supplies for operations, maintenance and public safety concerns. Similarly, diminished water yields and potential water quality problems associated with catastrophic wildfires must also be rectified. (State Agency, Denver, CO - #A2332.30200)

The Forest Service must address, on a forest-by-forest basis, the potential impacts of roadless area management on access to other public and private lands. Although it might seem an obvious consideration to account for, the original scoping roadless policy document lacked strong assurances and safeguards for in-holding access. The final policy adopted a more positive approach, but still left much to be desired in terms of process. (Professional Society, No Address - #A29920.40100)

1645. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule has no impact on access to state and private inholdings.

The Roadless Area Conservation Rule has no effect on access to state and private land inholdings. Roadless areas are no different from any other national forest lands regarding inholding access. The Bush administration should not be perpetuating the myth that the Rule denies access to property inholdings. (Individual, Denver, CO - #A4524.40000)

The Roadless Area Conservation Rule won't affect access to inholdings owned by states, tribes, organizations, and private citizens. Inholding access is the same on roadless areas as it is on other national forest lands. Despite the Bush Administration's claims, it's a myth that the Roadless Rule denies access to property inholdings. (Individual, Hewlett, NY - #A4748.40100)

BECAUSE ACCESS IS ALREADY PROTECTED BY EXISTING LAW

One of the points being raised by the current Administration is the issue of access to private and state lands through national forest lands. This issue is a false issue. Access is protected by current laws, already on the books, and has no bearing on the current roadless area designations. (Individual, Jackson, WY - #A1719.40100)

1646. Public Concern: The Forest Service should retain the provision in the Roadless Area Conservation Rule which provides exceptions to the prohibitions on road construction when necessary to maintain access to inholdings.

The Roadless Area Conservation Rule currently has a provision that provides exceptions to the prohibitions on road construction to assure access to state, tribal, and private lands across inventoried roadless areas. It states that road construction is allowed when a road is needed pursuant to reserved or outstanding rights, or as provided for by statute or treaty. We support retention of this provision of the Roadless Area Conservation Rule. This provision may be clarified with language that specifically includes access to state, tribal, and private lands across roadless areas. (Individual, Asheville, NC - #A22623.40000)

1647. Public Concern: The Forest Service should revise the Roadless Area Conservation Rule.

TO ENSURE THAT REASONABLE ACCESS ROUTES TO PRIVATE PROPERTY ARE MAINTAINED

The state understands that the Roadless Rule is written as a blanket prohibition, with some exceptions allowed. However, the exceptions do not cover future activities, only existing rights. Second, and more importantly, the state does not believe that the exceptions, as written, will have the desired effect. For example, law and equity require access to inholdings within the forest. If the owner of an inholding desires access to the land, the Forest Service is obligated to allow the most reasonable route, considering environmental and economic factors. Unfortunately, rather than do this, which may require consideration of a new or reconstructed road, the tendency will be, borne out by years of experience, to strongly suggest that, because this is a "roadless" area, the ownership of the inholding be transferred to the Forest Service in some manner. Second, even if this is not the case, the most reasonable access may not be the most direct, and may have to be routed in order to avoid topographic features, such as cliffs. The Rule does not indicate any such criteria, or allow for such processes of review. (State Agency, Salt Lake City, UT - #A20742.40000)

1648. Public Concern: The Forest Service should identify roadless areas in private property deeds.

Roadless areas must be designated in the deed to the land so that all know what they are involved with. (Individual, Birmingham, AL - #A1111.40000)

1649. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule has adverse impacts on private property access.

The existing rule inadequately assures that the valid existing rights individual landowners, states or tribes have to access their lands will be honored. (Individual, Juneau, AK - #A22284.40300)

1650. Public Concern: The Forest Service should prohibit home building in roadless areas.

Home-building should be prohibited not only in the roadless areas, but on the perimeter of the roadless areas as well. (Individual, Bozeman, MT - #A285.90110)

Access to National Forest System Lands Through Private Property

Summary

Several respondents discuss the need to maintain access through private property to public lands. They assert that public lands are sometimes landlocked by private property and that the public is then denied legitimate access. "Sometimes the area of private property to cross to get to the National Forest would only be 50 yards or so," states one individual. "But no access is allowed. Many public roads go up to locked gates." To address this problem, some urge the Forest Service to maintain public rights-of-way through private property when public land is bordered on all sides by private land. Likewise, one individual asks the Forest Service to prevent private property owners from blocking access to other private inholdings; and another asks the Agency to allow public access through private or tribal grazing allotments.

1651. Public Concern: The Forest Service should prevent public lands from being landlocked by private lands.

Many roads are shut down due to private property limiting the access. I say no more roads or improvements but also stop shutting down the access to the existing roads. Many lands are becoming landlocked by private land. (Individual, No Address - #A417.90110)

IN THE LOS PADRES NATIONAL FOREST

I used to live near the Los Padres National Forest. The vast majority of the forest in San Luis Obispo County is landlocked by private property. It is a lot of public land with no access unless you own the property next to it. It amounts to a strictly private use of a public resource. Sometimes the area of private property to cross to get to the National Forest would only be 50 yards or so. But no access is allowed. Many public roads go up to locked gates. In theory the reason we maintain the road is for fire suppression. What it amounts to is the government maintaining a private road. (Individual, Eagle River, AK - #A19687.91110)

1652. Public Concern: The Forest Service should maintain public rights-of-way through private property.

WHEN PUBLIC LAND IS BORDERED ON ALL SIDES BY PRIVATE LAND

I think that if public land is bordered on all sides by private land and the only access is through these private lands, the USFS should fairly and reasonably make access available for the general public. (Individual, Sidney, NE - #A4207.91110)

Our major problems were wealthy people, dude ranchers, and commercial outfitters buying or leasing private lands contiguous to public lands. Then they would attempt to block or gate historical roads/trails through prescriptive country, we often had to go to state or Federal courts to protect public access rights.

The problem has not gone away, and Public Land Access Association is active in several Western states. The administration should encourage the BLM and Forest Service to actively seek reasonable access to roadless public lands and enclosed private and state lands including condemnation procedures where necessary. (Individual, Bozeman, MT - #A13871.40300)

Also BLM land that is closed to public by being land locked by private land should have a right-of-way to it for public access. This is our land too! (Individual, Mill Hall, PA - #A7522.91110)

1653. Public Concern: The Forest Service should prevent private property owners from blocking access to other private inholdings.

One property owner was under the impression my southern neighbor was not allowed up the road (Trail 67). He placed a locked gate on the other road to my property thereby locking me out. When I cut the locks to gain access to my property, a criminal charge was filed against me for cutting the locks. From the sheriff's report, ". . . stated that the only reason he locked the gate was to keep the guy who lives in Walker . . . from driving up through his property which [this person] has been told by authorities that he is not allowed to do." The only authorities around are the Forest Service. The person in question does have a right to use that road. (Individual, Phoenix, AZ - #A29149.40000)

1654. Public Concern: The Forest Service should allow public access through private or tribal grazing allotments.

Private or tribal users of federal grazing cannot deny public access to public land. (Individual, Mesa, AZ - #A99.40000)

Maintenance of Routes through National Forest System Lands to Private Property

Summary

General Comments – A number of respondents write that the Forest Service should provide access routes across National Forest System lands to private inholdings. Suggestions for ensuring access include maintaining existing roads and historically accessible routes; establishing the shortest route; defining levels of vehicular access; patterning access routes after the National Park Service; allowing foot and horseback trails, or *only* foot and horseback trails; complying with Revised Statute 2477; training personnel regarding laws governing private property access; allocating more funds to preserve access; and refraining from creating small areas of protected roadless regions, particularly in areas adjacent to private property. People also suggest ensuring access through geodetic grid lines; through established access points; through non-motorized easements; and through airstrips and helispots. Some suggest that the Forest Service address this issue through the forest planning process; through meetings with individual stakeholders; through collaboration with county sheriffs; or by conducting a case-by-case access alternatives analysis for each inholding.

One association recommends that property owners be allowed seasonally unrestricted ground-based access within environmentally reasonable constraints. Some suggest that the Forest Service should grant access to property owners previously denied; should not require private property owners to comply with wilderness standards with regard to access; and should not require fees for access to private property. Finally, some suggest that the Forest Service should manage access routes in a way that contributes to a feeling of inaccessibility, and should block access to groups which damage the environment.

Road Construction/Maintenance – One individual suggests that the Forest Service should permit road construction to land “if the entity possessing the land owned the land prior to the government’s ownership of surrounding properties.” Several other respondents state that the Forest Service should not construct roads for the sole purpose of providing access to private inholdings. One individual asserts, “Private ownership doesn’t mean the right to usurp the public’s right to protected forests. If a stream is on my property, I shouldn’t have the right to pollute it while it flows through my yard to the detriment of my neighbor. Likewise if a group owns land within a forested area, building a road to accommodate them at the expense of those who seek protection for the forest is wrong.”

Road Construction/Maintenance – Funding – Several individuals state that private property owners should bear the cost of constructing or maintaining access roads. According to one person, “It is not the job of the federal government (taxpayers) to provide access to private property. The cost should be borne by those who benefit individually.”

1655. Public Concern: The Forest Service should provide access routes to private property.

The Forest Service should work with private inholders of land to allow them access to their property and give them easements to their property.

No exceptions, the federal government should not devalue property by blocking access. The inholder should have the legal right of condemnation of the necessary easement for his usage, just as the government does when they want to widen the freeway or a county road. (Individual, Bozeman, MT - #A59.40000)

Those that reside in areas adjacent to roadless areas should/must not be denied access to their property. No one should ever intend for public policy that protects wilderness to keep a person from his private property. While it is reasonable that no new roads be built in a roadless area, it is not inconsistent to have a pre-existing route in the wilderness and the desire to protect that wilderness. (Individual, Murrieta, CA - #A367.40000)

On the question regarding public/private property rights . . . by all means those organizations/people/governments should have complete unrestricted access to their land at any time without any intervention from big government. (Individual, Ogden, UT - #A590.40000)

BY MAINTAINING EXISTING ROADS

Roads allowing for inholding access should be maintained, but no new roads built. (Individual, Fayetteville, AR - #A1015.40000)

The Forest Service should not close existing roads that would deny access. If a private landowner closes part of a Forest Service road that crosses their property, the Forest Service should determine the importance of the road and build an alternative route if necessary to protect public access. (Individual, Tucson, AZ - #A4938.40400)

BY ALLOWING PRIVATE PROPERTY OWNERS TO BUILD ROADS

The best way to assure access to private property located within “roadless” areas is to permit property owners to build roads to access their properties. This does not mean the government should build the roads, but the Forest Service must not stand in the way with red tape. (Individual, Salt Lake City, UT - #A806.40000)

BY CONSTRUCTING LOW-IMPACT ROADS

Protecting access to property. This is a difficult question. Where such inholdings may be exchanged or purchased by the Forest Service, a less damaging solution is possible than the requirement to provide new access roads through roadless areas. Where this cannot occur, low impact roads may be necessary or permitted, if they can be built to a standard that protects watershed resources. (Individual, Grangeville, ID - #A728.40000)

“Build roads that are ‘environmentally safe’ (this can be done) to allow access. I suppose you could provide free helicopter service, or have a Sierra Club member volunteer to carry people like a large back pack to and from their property, but I think building a road that is not environmentally damaging makes more sense, and will be less costly (halting people from accessing their own property is a travesty).” (Individual, No Address - #A834.40000)

BY MAINTAINING HISTORICALLY ACCESSIBLE ROUTES

That property that has been historically accessible should usually remain so, or compensation should be provided. Property that has historically depended on the good graces of the Forest Service road program should be understood to have no inherent right to access in cases where those roads were built to be temporary. (Individual, New Haven, CT - #A616.40000)

BY ESTABLISHING THE SHORTEST ROUTE

People should have the closest, shortest route reasonable to their property not hundreds of miles around about to their property. (Individual, Turtle Lake, WI - #A6075.40400)

This area is steep mountain grades and there is a road used to provide a means for me to visit my neighbor. It used to take less than 5 minutes. Now, because of the Forest Service I must drive in a round-about way that is close to a 50-mile trip that takes 2-3 hours. (Individual, Phoenix, AZ - #A29149.40000)

BY DEFINING LEVELS OF VEHICULAR ACCESS

There is access and there is access. The policy question hinges on the right of access. If a person can only walk to their land—is that access? It is clear that law can limit people from using their land to the highest and best use, in that person’s opinion. The same must have implications for the access issue. Should a court find that access by foot, is not adequate access for the enjoyment of the land, then the next step would be to define levels of vehicular access. There are undoubtedly such classifications. (Individual, No Address - #A781.40000)

BY PATTERNING ACCESS ROUTES AFTER THE NATIONAL PARK SERVICE

The “best” ways to implement the laws that guarantee states, tribes, organizations and private landowners access to property they own within roadless areas is to perhaps pattern after the National Park Service and the manner in which they work with those who have land within park boundaries. We have land within Glacier National Park and the partnership we have with them is very satisfactory. It is extremely important that management of private lands and access to them are consistent with the roadless objectives. (Individual, Coram, MT - #A539.40000)

BY CONSTRUCTING MINIMUM SIZED TRAILS

Reasonable access to property doesn’t mean punching in a 40 ft. graded road through a previously roadless tract of land to appease some inholder. “Reasonable access” is a very ambiguous term and I believe the Forest Service should always in these instances defer to the “minimum tool” rule. An 18-inch trail to me can be justified as providing “reasonable access”. (Individual, Challis, ID - #A16973.40400)

BY ALLOWING FOOT AND HORSEBACK TRAILS

Properties currently accessed by foot/horseback trails should also be allowed continued access, although trail maintenance through public land would become the (private property) owner’s responsibility. (Individual, Vista, CA - #A4838.40100)

The best way to ensure legal access to private, tribal, or state land inside roadless areas is to allow foot and/or horse traffic anywhere within the areas. (Individual, Bozeman, MT - #A285.40400)

If the area is designated as roadless, inholders should walk or ride horses into their holdings. Much precedent for this has long been in effect in national parks. (Individual, Ennis, MT - #A102.40000)

BY ALLOWING ONLY FOOT AND HORSEBACK TRAILS

Legal access to private, tribal or state land within roadless areas should be available by foot or by horseback only. (Individual, Bozeman, MT - #A282.40400)

BY ENFORCING REGULATIONS

Access to private inholdings should be allowed on a minimum impact level. Regulations on violation should be heightened to prevent abuse by land speculators, as has occurred with wilderness inholdings near Vail, Colorado. (Individual, Spokane, WA - #A20648.40400)

BY COMPLYING WITH REVISED STATUTE 2477

If USFS personnel respect RS-2477 rights (including the Section 108 prohibition on changing the definition of an RS-2477), access to essentially all such property will be protected. (Organization, Tonopah, NV - #A20337.40100)

If extant RS-2477 rights-of-way and roads are respected, essential motorized access will remain available to essentially all private property and to nearly all of the forest around most communities. If the Forest Service refuses to recognize the RS-2477 status of double track dirt roads or interferes with their maintenance and repair by counties and individuals (which USFS is currently doing at a 130 year old Jarbidge Nevada road, thereby putting the Jarbidge residents at great risk of wildfires), much property will be destroyed, and many people will die in wildfires and you will be responsible. (Organization, Tonopah, NV - #A20337.35000)

BY TRAINING PERSONNEL REGARDING LAWS GOVERNING PRIVATE PROPERTY ACCESS

If forest staff members are unfamiliar with laws regarding access to private lands, training should be conducted to familiarize the staff with these laws. (Individual, Asheville, NC - #A22623.40100)

BY ALLOCATING MORE FUNDS TO PRESERVE ACCESS

We urge the Forest Service to spend more funds working with local governments to enact similar ordinances so that public access is protected. (Elected Official, Hailey, ID - #A4888.12313)

BY REFRAINING FROM CREATING SMALL AREAS OF PROTECTED ROADLESS REGIONS

Finally, the agency should refrain in the forest planning process from creating smaller pockets of protected roadless areas that cause access problems. (Permit Holder, No Address - #A5285.40000)

BY NOT DESIGNATING AREAS ADJACENT TO PRIVATE PROPERTY AS ROADLESS

Protecting access to private property can be done by not allowing an area adjacent to these private properties to be classified as roadless. (County Fire Department, Uintah County, WY - #A15287.40000)

ONLY IF PUBLIC ACCESS TO PUBLIC LAND IS PRESERVED

If the public is refused access to public forest property, then the property owners should also be refused access. The idea of private access or privileges in public or leased land is very unsettling to me! I can fish the river until I reach private property and then the water, streambed, and all that flows over it is no longer public until I reach another property line? Protect access to property unilaterally! (Individual, No Address - #A26741.40000)

ONLY IF PUBLIC ACCESS TO NATIONAL FOREST SYSTEM LANDS IN GENERAL IS PRESERVED

If the public is refused access to public forest property, then the property owners should also be refused access. Essentially, what is happening here, is that you are "condemning" property that the public owns and locking out the public landowners. (Individual, Annabella, UT - #A30323.40000)

WITHIN TEN DAYS OF A PROPERTY OWNER'S REQUEST

Local forests do not need any further laws to limit or hamper access to public lands for any user, organization, tribe, or private citizens. If access is needed to get to property then they should be granted access within 10 days of their request. All they need to do is follow local building codes and use standard road designs. Requiring private property owners to endure months or years of endless studies and appeals is not legal or moral. (Individual, Alturas, CA - #A28581.40000)

THROUGH GEODETIC GRID LINES

Provide reasonable forced access through the defined geodetic grid lines. (Individual, Sitka, AK - #A23579.40000)

THROUGH ESTABLISHED ACCESS POINTS

Access should be assured to the protected areas in the same fashion that we protect access to our California coastline. There must be designated entry points that allow for reasonable access, and all development must allow for these access points. These access points may involve roads leading up to, but not into the protected areas. Eminent domain may be employed to effect this access. (Individual, Santa Barbara, CA - #A504.40000)

THROUGH NON-MOTORIZED EASEMENTS

The best way to ensure legal access to private, tribal or state lands that are completely within roadless areas is to grant the concerned parties non-motorized access easements. The Forest Service should be responsible for designating, designing, building and maintaining access trails where necessary. (Individual, Bozeman, MT - #A3673.40000)

THROUGH AIRSTRIPS AND HELISPOTS

Any private property presently serviced by airstrips or helispots should be allowed to continue with that. Future proposals for airstrips should be granted within FAA guidelines, since backcountry airfields are generally small, have dirt, gravel, or grass surfaces, are useable only in daylight hours of summer and fall, and do not impact surrounding roadless areas to any substantial degree. (Individual, Vista, CA - #A4838.40100)

The best way to implement the laws that ensure States, tribes, organizations, and private citizens have reasonable access to property they own within inventoried roadless areas is, again, by using helicopters. (Individual, No Address - #A536.40400)

THROUGH AN EXCEPTION TO THE ROADLESS AREA CONSERVATION RULE

What is the best way to implement the laws that ensure States, tribes, organizations, and private citizens have reasonable access to property they own within inventoried roadless areas? Exception to the roadless ban should be made so these entities can access their lands. (Individual, No Address - #A850.40000)

To protect the reasonable access to property why not simply add a trailer on to the rule, and/or make an amendment to the rule that provides for the protection of the States, tribes, organizations, and/or individuals that need that protection. The determination and consideration of that protection could be initiated by the local districts, with regional approvals (but with a minimum of "red tape" attached). (Individual, Maricopa, CA - #A3732.40000)

THROUGH THE FOREST PLANNING PROCESS

There are more than 421,000 acres of private lands and 43,000 acres of state lands within inventoried roadless areas. The only reasonable place to resolve access issues is at the local planning level where state, county, and private owners can be notified and invited to provide input, and reasonable solutions can be developed based on their needs and rights to access. (Association, Colville, WA - #A3091.40000)

The current proposed plan also does not provide for access consideration to private and state lands within the inventoried roadless areas. This again should be resolved on a local forest level with all parties' rights to access recognized. (Individual, Pawleys Island, SC - #A6082.40000)

THROUGH MEETINGS WITH INDIVIDUAL STAKEHOLDERS

Contact stakeholders, on an individual basis if required, and see that their needs are met. (Individual, Tucson, AZ - #A936.40000)

THROUGH COLLABORATION WITH COUNTY SHERIFFS

Work with the County Sheriff, he is the protector of access on private property in the county even if it's on Forest Service land or roadless. (Association, Baker City, OR - #A7990.40000)

THROUGH THE NATIONAL FOREST MANAGEMENT ACT

NFMA is the focal point for protecting these routes to private and state lands. There is sufficient direction and flexibility in the regulation to do that. We only need to follow through and see that it happens. (Organization, Saint Anthony, ID - #A13225.40100)

BY CONDUCTING A CASE-BY-CASE ACCESS ALTERNATIVES ANALYSIS FOR EACH INHOLDING

Access to inholdings is important to the state of Nevada. We recommend a case-by-case access alternatives analysis be conducted for each inholding. These analyses should involve all property owners and other concerned stakeholders. Criteria should be established for finalizing access plans and the criteria should be used to strike a balance between minimizing adverse environmental impacts and minimizing access-related costs for property owners. (State Agency, Carson City, NV - #A17669.40100)

TO RESTORE THE PUBLIC'S FAITH IN GOVERNMENT

If for no other reason, honoring the access to the private properties can help to reverse the negative image that government has earned through decades of not being a good neighbor to the private sector. (Association, San Luis Obispo, CA - #A6984.40000)

WHILE PREVENTING ACCESS BY UNAUTHORIZED PARTIES

Again, the simple solution is to maintain standards, existing access to these tracts surrounded by federal lands. Issue federal easements to these owners and reduce this unnecessary headache that private citizens go through to access the property they duly and legally own. Put up locked gates and only allow those with legal access through the federal easement. It is totally unnecessary to quibble about private property access. Give it to them on a national easement level and be done with it. (Individual, Montrose, CA - #A370.40000)

IN ALASKA

There are limited private and state holdings in Alaska. It is critical that these lands have unrestricted access and unrestricted use. If areas surrounding the limited private and state lands are managed in a way that restricts use, the economy of the area will be adversely affected and citizens will be deprived of their rights to use the land for providing jobs and recreation. (Individual, Sitka, AK - #A12821.40300)

IN NORTH DAKOTA

The issue of access has been a contentious one between North Dakota counties and the Forest Service. If the Forest Service is serious about respecting access to property, it needs to adjust its policies to fit the facts and history underlying the acquisition of the lands now called the National Grasslands. Until the Forest Service does so, it cannot achieve this objective in North Dakota and will find itself at odds with the state and counties, not to mention the public.

Virtually all of the roads that the Forest Service to date claims the right to regulate are roads that provide access to private property. However, unlike land reserved for National Forests, these roads and road rights existed before the United States acquired the land and the orders approving the condemnation prove that the United States' title is subject to these rights. Thus, the Forest Service has no legal basis to regulate these roads. This situation further proves that to date, the roadless and related transportation policies have worked to deny access to private property, and in the case of North Dakota, have done so without sound basis. (Elected Official, McKenzie County, ND - #A27737.40000)

LANDS CONTROLLED BY THE STIMSON TIMBER COMPANY

Your letter dated July 19th: **Protecting access to property** USDA will ensure that states, tribes, and private citizens who own property within roadless areas have access to their property as required by existing law. This statement is false. Access is not available. Existing laws (regulations) are constantly being changed in favor of the government to continue denying access.

Stimson Timber has been trying to get access to their private property. Access was originally requested in 1992 when the land was owned by Plum Creek Timber Company. Stimson Lumber Company purchased the land in 1996 and has continued pursuing access.

As of today, July 29, 2001, Stimson still does not have access. Can you imagine the damage to the property from drought and insects that has happened and continues? The Priest Lake Ranger District advises that the EIS has been submitted for printing in the Federal Register. After it has been printed there will be another 45 days for public comment, and then another 45 days for any appeal.

The tangled red tape and unconscionable delays are unacceptable. The forests in the Western United States are constantly changing while your unreasonable rules and time delays deny property rights to those owning property in these forests.

After almost ten years Stimson still does not have access and the economic benefits that could have been enjoyed by the workers, and county and state taxes have been considerably diminished. (Individual, Boise, ID - #A2541.40100)

1656. Public Concern: The Forest Service should allow property owners seasonally unrestricted ground-based access.

WITHIN ENVIRONMENTALLY REASONABLE CONSTRAINTS

Property owners should have seasonally unrestricted ground-based access within environmentally reasonable constraints. Only property owners should have the legal right to appeal what they consider unreasonable constraints. (Association, Cody, WY - #A41559.40000)

1657. Public Concern: The Forest Service should provide access routes to state-owned lands.

IN MINNESOTA

The State of Minnesota and the MNDNR are keenly interested in issues affecting access to state lands. Maintaining access to non-federal working forests is critical to Minnesota's rural economy. The final RAC rule issued late last year substantially affected access to nearly 11,000 acres of state lands and nearly 15,000 acres of state-owned minerals within inventoried roadless areas. The MNDNR provided comments on the proposed RAC rule and DEIS in July 2000 and Minnesota Governor Jesse Ventura responded for the state to the Final EIS and preferred alternative last December. Copies of both letters are attached as background. (State Agency, Saint Paul, MN - #A28770.40000)

IN MONTANA

The state of Montana has experienced trouble in the past with obtaining access to state lands. For example, in a letter dated February 10, 2000 addressed to Region 1 Forester Dale Bosworth, the Montana Department of Natural Resources and Conservation noted difficulty in obtaining access to forested state trust lands across federal acres. In one of the most troubling projects, the state has been unsuccessful after six years of trying to obtain access for the Phoenix timber sale, which would cross a portion of the Beaverhead/Deerlodge National Forest. (Governor, State of Montana - #A17660.40100)

1658. Public Concern: The Forest Service should grant access to property owners previously denied.

Access to private property must be guaranteed, and access must be restored to property owners previously denied. (Individual, San Antonio, TX - #A6004.40000)

1659. Public Concern: Local authorities should determine permissible access routes to private property.

Free access should be allowed, determined by local authorities and not by the Forest Service. (Individual, Ogden, UT - #A494.40000)

The best way to implement the laws that ensure reasonable access to property within roadless areas would be to use a local council of governmental agencies to oversee the proper implementation and enforcement of access laws. (Individual, Boise, ID - #A674.40000)

Work with the County Sheriff he is the protector of access on private property in the county even if it is on FS land. (Individual, Baker City, OR - #A1038.40000)

1660. Public Concern: The Forest Service should manage access routes in a way that contributes to a feeling of inaccessibility.

Laws that ensure access to private properties landlocked within roadless areas must include parameters that dictate roadways be maintained as unobtrusively as possible. Grandfathered roadways in roadless areas must be managed in a way that contributes to the feeling of inaccessibility. Road building to access inholdings should be denied if possible. (Individual, Fairfield, VA - #A15817.40400)

1661. Public Concern: The Forest Service should not require private property owners to comply with wilderness standards.**WITH REGARD TO ACCESS**

Access to private property should be in compliance with state laws. Private land owners should not be subject to the same ridiculous, discriminatory laws that apply to wilderness areas. Reasonableness and common sense in determining the least impact on federal lands, ensures the least cost to the landowner. The forest plan should spell out conditions of ingress and egress. (Association, Eureka, MT - #A17718.40100)

1662. Public Concern: The Forest Service should not require fees for access to private property.

Leave roads open. Require no fees to access a person's private property. (Individual, Mount Ida, AR - #A8739.40000)

1663. Public Concern: The Forest Service should block access to ecologically damaging groups.

Tribes and citizens with private property must be able to access their land, but only in a responsible manner. Organizations, more than likely, will be attempting to extract resources from their own land, and the Forest Service should not help, in any way, these organizations to further their scheme. While a private group's actions on private property is a whole other issue, the Forest Service should actively work to not provide access to ecologically damaging groups. (Individual, Akron, OH - #A17697.40400)

1664. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule has no impact on access to state and private inholdings.**IN IDAHO**

Nowhere in the information I have seen issued by the State of Idaho, through the Attorney General, the Governor or the Idaho Department of Lands, is there any specific problem presented by the RACR in regards to state access to its lands. The State of Idaho has made this issue of access very prominent but there is no proof there. The RACR maintains the current system of permitting access to state, private and

tribal lands. There is not a problem here that needs to be fixed. If the state, or any other entity, desires access to any of its lands through National Forest land it follows the existing procedures and if it is appropriate a road can be built, regardless if it is in a roadless area or some place else.

The Idaho Conservation League follows the issues related to roadless areas very closely and there is no specific problem in the RACR raised by anyone on access with any factual basis. This is a political whipping boy, without any practical merit that I can fathom. I hope these alleged problems are spelled out in this current ANPR process, otherwise it will be confirmed as nonsensical. (Organization, Boise, ID - #A20363.40100)

Road Construction/Maintenance

1665. Public Concern: The Forest Service should permit road construction to land that was privately owned prior to the government's ownership of surrounding property.

If the entity possessing the land owned the land prior to the government's ownership of surrounding properties, then I might be willing to consider some roads through the government-owned wilderness. (Individual, Columbus, OH - #A659.40300)

1666. Public Concern: The Forest Service should not construct roads for the sole purpose of providing access to private inholdings.

This is a nonsense issue. The only thing you could be referring to here is "private inholdings" in wild areas. I'm happy for people lucky enough to have such lands. But they have no right to expect the government to forfeit a common treasure (roadless wild areas) to subsidize the desires of an individual property-owner. If you're lucky enough to hold a few square miles in the middle of a wilderness area, you can walk to it, take a boat, or ride a horse. Just like the rest of us who travel through these areas. (Individual, No Address - #A49.40000)

Private ownership doesn't mean the right to usurp the public's right to protected forests. If a stream is on my property, I shouldn't have the right to pollute it while it flows through my yard to the detriment of my neighbor. Likewise if a group owns land within a forested area, building a road to accommodate them at the expense of those who seek protection for the forest is wrong. Who says landowners have more rights than citizens who pay the taxes that maintain and preserve federal lands? (Individual, Shawnee Mission, KS - #A96.40000)

As for people who own property in or near roadless areas, one can only assume that they were aware that the area was roadless when they made the purchase. Restricting construction of roads in these areas will maintain the character of the areas they purchased. It is NOT the responsibility or role of the government to change these areas by providing increased access. (Individual, No Address - #A621.40000)

1667. Public Concern: The Forest Service should address its contradictory statements regarding special use permits and public roads.

The Forest Service position that public roads require a special use permit under 36 C.F.R. [section] 251.110, is also without precedent. Special use permits are used for access granted by the Forest Service, not for valid existing rights, which predated land acquisition. The special use rules do not apply to public roads under the Federal Highway Act, 23 U.S.C. [section] 201. The Forest Service has represented to the public that the rules do not affect public roads, while telling county governments that no roadwork could occur without a special use permit. Letter of Lesley Thompson, August 1, 2000. These two positions contradict each other. This attitude and the underlying policy preclude the Forest Service from achieving the objective of protecting access to private property. Indeed, the agency's litigation position on this issue has reflected a concerted effort to deny access to private property. (Organization, Denver, CO - #A21358.40000)

Road Construction/Maintenance – Funding

1668. Public Concern: Private property owners should bear the cost of constructing or maintaining access roads.

It is assumed most of these entities have some sort of access to their properties already. Let them maintain that access at their own expense. (Individual, Anchorage, AK - #A518.40300)

Creation of new access roads should be a very last resort, only done when the letter of the law forces your hand. Property owners should shoulder the full cost if and when that happens, and roads must be as primitive as possible and be closed to public use. (Individual, Flagstaff, AZ - #A5026.40400)

It is not the job of the federal government (taxpayers) to provide access to private property. The cost should be borne by those who benefit individually. (Individual, No Address - #A1097.40600)

Legal Considerations

Summary

A number of respondents advise the Forest Service to ensure access to private property as required by existing law—specifically, the Alaska Native Claims Settlement Act, the Alaska National Interest Lands Conservation Act, and Revised Statute 2477 (see comments on these acts in Chapter 2: Other Legal Concerns: Federal Laws, Acts, and Policies). Some suggest the Forest Service review current laws governing private property access; familiarize personnel with laws regarding access to private lands; and disclose its legal obligation to provide access routes under existing laws since “it is misleading to the public to characterize lands burdened by statutory obligations to provide access to private inholdings, as roadless.”

Several respondents comment specifically on the need to uphold valid existing rights. Some say the Forest Service should implement the Roadless Area Conservation Rule because it would adequately protect valid existing rights; others say the Agency should not implement the Rule because it would not protect valid existing rights.

Others discuss the appeals process as it relates to access. One association asserts that private property owners should have the right to appeal unreasonable constraints on access. Another individual states that the Forest Service should ensure consistent treatment of inholders with respect to the appeals process over the establishment of ownership rights. According to this person, “The proposed rule leaves complicated planning considerations, housing laws and social issues up to regional FS determinations. There are limited and complicated appeal processes unique to property within National Forests. The result is disparate treatment of inholders from a federal perspective.”

1669. Public Concern: The Forest Service should ensure access to private property as required by existing law.

Access should be provided for within the laws the same way it has always been; evaluate the need and allow the type of access appropriate according to the need and the existing laws and guidelines. Do not make this concern any more significant than Congress does when it passes laws designating areas as wilderness. (Individual, No Address - #A1702.40100)

Access to state and private inholdings is already covered by other laws and regulations. No special provisions are needed. (Individual, Baltimore, MD - #A2321.40100)

Protecting Access to Property: I would hope you have no plans to terminate anyone's historic or deeded Right-of-Way to their property, without due compensation and due process of LAW. (Individual, Center Sandwich, NH - #A3669.40100)

It is misleading to the public to characterize lands burdened by statutory obligations to provide access to private inholdings as roadless. Many of the Chugach National Forest lands characterized by the rule as roadless are, in fact, burdened by obligations to allow roads to access private lands as promised by ANCSA, ANILCA, and the 1982 CNI Settlement Agreement. Failure to disclose these obligations to the public is intentionally misleading, creating false expectations to citizens and doing a disservice to private inholders. (Professional Society, Anchorage, AK - #A21707.40000)

BY ABIDING BY THE REQUIREMENTS OF THE ALASKA NATIVE CLAIMS SETTLEMENT ACT

The national forests in Alaska are different than other national forests in the U.S. in a number of ways, including laws unique to Alaska, like the Alaska Native Claims Settlement Act (ANCSA) of 1971. With the passage of ANCSA, 44 million acres of federal lands were made available for selection and conveyance to Alaska Natives in 12 regions of the state. Large tracts within both the Tongass and the CNF were made available to satisfy the ANCSA mandate, causing ANCSA Corporations to be effectively joined at the hip with the Forest Service in these regions. Despite the unique legislation enacted to allow ANCSA Corporations to realize the full economic benefits of their lands, obtaining access to its lands across CNF continues to be one of the most difficult challenges Chugach faces. The roadless rule, while acknowledging the existence of "valid and existing rights", does little to clarify those rights and if implemented, as a practical matter, would make obtaining such access even more difficult. (Tribal Corporation, Anchorage, AK - #A20340.40000)

BY ABIDING BY THE REQUIREMENTS OF REVISED STATUTE 2477

Private landowners within forest boundaries must be allowed ingress and egress (whether in a roadless area or not). This brings up another issue. That is RS 2477. Congress granted the states roads over the public lands. This cannot be taken away by declaring a roadless area policy. Any roads that the state or county maintains must be left open for their (constituents) use. (Individual, Miami, AZ - #A880.40100)

BY ABIDING BY THE REQUIREMENTS OF THE ALASKA NATIONAL INTEREST LANDS CONSERVATION ACT

Access to private property is provided for under provisions in the Alaska National Interest Lands Conservation Act (ANILCA), even in Congressionally-designated Wilderness Areas. There is no need to duplicate these provisions in a roadless rule. (Individual, Tacoma Park, MD - #A16325.40100)

ANILCA applies to all national forests and does not provide exception for specific categories of forestland, such as wilderness or inventoried roadless areas. Therefore, "the best way to implement the laws that ensure States, tribes, organizations, and private citizens have reasonable access to property they own within inventoried roadless areas" is for the Forest Service to comply with ANILCA. (Organization, Denver, CO - #A29624.40100)

BY ISSUING NON-APPEALABLE DECISIONS

If there are existing laws which GUARANTEE states, tribes, organizations and private land owners access to property they own within a roadless area, just allow them the access the law says they have by issuing a non appealable decision. Negotiation could be undertaken to plan location of roads and whether they could or should be closed after harvest. But following the law, there should be no denial by the Forest Service or appeal by disinterested parties. (Individual, Whitefish, MT - #A5102.40100)

1670. Public Concern: The Forest Service should review current laws governing private property access.

TO ENSURE THAT ACCESS IS MAINTAINED

There are currently laws on the books to allow reasonable access to private properties located in roadless areas; however, these laws are sometimes sporadically enforced or at least hindered by managers who don't agree with the right of private access. The current laws need to be evaluated to make sure that

access is guaranteed, in non-ambiguous language, and that anyone found violating or hindering the enforcement of these laws should be held accountable without regard to position, rank or influence. (Individual, No Address - #A28602.40000)

1671. Public Concern: The Forest Service should disclose its legal obligations to provide access routes under existing laws.

TO AVOID MISLEADING THE PUBLIC

It is misleading to the public to characterize lands burdened by statutory obligations to provide access to private inholdings, as roadless. Many of the Chugach National Forest lands characterized by the rule as roadless are, in fact, burdened by obligations to allow roads to access private lands as promised by ANCSA, ANILCA, and the 1982 CNI Settlement Agreement. Failure to disclose these obligations to the public is intentionally misleading, creating false expectations to citizens and doing a disservice to private inholders. (Professional Society, Anchorage, AK - #A21707.40000)

1672. Public Concern: The Forest Service should familiarize personnel with laws regarding access to private lands.

If forest staff members are unfamiliar with laws regarding access to private lands, training should be conducted to familiarize the staff with these laws. (Civic Group, Roanoke, VA - #A1713.40100)

1673. Public Concern: The Forest Service should consider that state statutes already ensure access to private property.

COLORADO STATE STATUTES

Colorado State Statutes already ensures access to property cannot be impaired, impeded or disrupted. Enactment of laws intended to perform a purpose, when existing laws already perform that purpose, only confuses legal matters. (Elected Official, Saguache County, CO - #A28774.40100)

1674. Public Concern: The Forest Service should uphold valid existing rights.

ON THE CHUGACH NATIONAL FOREST

Most of Chugach's economically viable lands are adjacent to or surrounded by national forest lands, providing Chugach with no practical means of access to these inholdings except across federal lands within the 5.5 million acre CNF, which is inventoried 98.9% roadless. When applied to roadless areas within the CNF, the potential for the Forest Service's proposal to facilitate efforts to frustrate or impair Chugach's valid existing statutory and common law rights of access to its land is abundantly clear. For this reason, it is imperative that the proposal recognize and preserve, through the implementation of appropriate procedures, the valid existing rights of access, both express and implied, that Chugach enjoys across national forest lands to its land holdings under the provisions of ANCSA, ANILCA, the 1982 CNI Settlement and the common law. (Tribal Corporation, Anchorage, AK - #A20340.20000)

1675. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule.

BECAUSE IT ADEQUATELY PROTECTS VALID EXISTING RIGHTS

The January 12 rule provides protection for forest health, communities, homes and property and assures that the valid existing rights of individual landowners, states or tribes to access their lands will be honored. (Individual, Williamsville, NY - #A951.10152)

1676. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule.

BECAUSE IT WILL NOT PROTECT VALID EXISTING RIGHTS

The existing rule does not adequately assure that the valid existing rights of individual landowners, states or tribes have to access their lands will be honored. (Individual, San Antonio, TX - #A8983.10130)

1677. Public Concern: Private property owners should have the right to appeal unreasonable constraints on access.

Property owners should have seasonally unrestricted ground-based access within environmentally reasonable constraints. Only property owners should have the legal right to appeal what they consider unreasonable constraints. (Association, Cody, WY - #A26503.40000)

1678. Public Concern: The Forest Service should ensure consistent treatment of inholders with respect to the appeals process.

OVER THE ESTABLISHMENT OF OWNERSHIP RIGHTS

The proposed rule allows these decisions of fundamental rights of access to property to remain with local FS officials. This had led, and will continue to lead, to endless litigation between property owners and the FS just to maintain established ownership rights in the ever-changing FS regulatory environment.

In all cases the fundamental right of reasonable use and enjoyment or residential property should be assured. The proposed rule leaves complicated planning considerations, housing laws and social issues up to regional FS determinations. There are limited and complicated appeal processes unique to property within National Forests. The result is disparate treatment of inholders from a federal perspective. (Individual, Prescott, AZ - #A28094.13200)

Land Exchanges/Purchases

Summary

General Comments – One individual asserts that the Forest Service should cease acquiring more private property within inventoried roadless areas until it has regained control over other resources, such as its roads and maintenance backlog. Another person suggests that the Forest Service condemn private property located in roadless areas in order to obtain inholdings.

Land Exchanges – Several respondents suggest land exchanges of various sorts. Some suggest that the Forest Service exchange other federal land for private inholdings located in roadless areas. One individual recommends such land exchanges in order to prevent private interests from influencing management activities. “The presence of these inholdings,” this person states, “gives private interests a disproportionate influence over the management of these National Forests.” A timber association and state agency both recommend that the Forest Service exchange federal land outside of roadless areas for state lands within roadless areas. One individual suggests the Agency exchange other federal land for private inholdings located in wilderness areas; and another person advises against designating an area roadless unless all private inholders first agree to a land exchange.

Purchases – A number of respondents advise the Forest Service to purchase private inholdings—if the area is to be declared wilderness, or if other areas are to be reopened to multiple uses. According to one individual, “The Forest Service should aggressively buy and trade lands to rid roadless areas of private inholdings, and to build connections between roadless

areas and designated Wilderness areas.” Another person suggests the Forest Service should either buy private property or negotiate an access schedule with property owners if traffic levels escalate the environmental impact of access.

One individual advises the Forest Service to purchase inholdings with land and water conservation funds. Another person advises against using Conservation and Reinvestment Act funding to purchase inholdings. Rather, says this respondent, “[CARA] Funding should be for the construction of new roads and old road maintenance should be sought after.”

Other respondents discuss the purchasing process itself. One individual states that the Forest Service should not force private landowners to sell their property for the reason of obtaining inholdings. At the same time, others assert that the Forest Service should discourage private profiteering over the Agency’s purchase of private property in roadless areas, and should not succumb to blackmail by private property owners who threaten to construct large buildings on inholdings. Finally, one special use permit holder says that the price of private property within roadless areas should reflect the presence or absence of an access route to the property.

Land Exchanges/Purchases General

1679. Public Concern: The Forest Service should cease acquiring more private property within inventoried roadless areas.

UNTIL IT HAS REGAINED CONTROL OVER OTHER RESOURCES, SUCH AS ITS ROADS AND MAINTENANCE BACKLOG

Until the agency has regained control over its resources, including roads and other maintenance backlogs, the Forest Service should avoid acquiring more property such as the private property within inventoried roadless areas. Access route maintenance must be a priority. (Individual, Des Moines, IA - #A12587.40500)

1680. Public Concern: The Forest Service should condemn private property located in roadless areas.

TO OBTAIN INHOLDINGS

Condemn the property and move them out. Or restrict the easement to the minimum to get to their property. Gate the easement, lock it so only the property owner has access (a visit to King Ranch in Texas will show you how to keep people out). (Individual, Tustin, MI - #A5276.40000)

Land Exchanges

1681. Public Concern: The Forest Service should exchange other federal land for private inholdings located in roadless areas.

Protecting Access to Property - I feel this is a “straw man” issue that has been raised by those that don’t support the current rule. If roaded access is so critical why has it not already been developed? Land exchanges have long been successfully used in this area. Let’s do more. (Individual, Peck, ID - #A1109.40000)

Conduct land trades for roaded areas to consolidate roadless areas. (Individual, Ennis, MT - #A438.40500)

Owners of non-federal lands that occur within important roadless lands, such as those in the Cabinet Mountains, near Libby, should be 1) offered a land exchange for the land in more accessible areas

without conflicting values; 2) offer the owners a fair market price for their land, then buy it from them; 3) if they won't sell or trade, allow them to access their lands without the aid of motorized vehicles and/or road building. If they won't abide by these options, condemn the land, pay them for it, then put the land into roadless federal land. (Individual, Libby, MT - #A14047.40100)

EXCHANGE PERIPHERAL FEDERAL LAND

As with existing wilderness areas, it is best if the owners of private inholdings can be offered attractive exchanges for property on the periphery of National Forest lands. In this manner easier motorized access to their property can be offered, if that is what they desire. (Individual, Louisville, CO - #A4486.40000)

If private access is not available to parties who own land within roadless areas either by river/trail aircraft or non road using transportation, then the agency should either purchase or trade for similar land outside the roadless area. (Individual, No Address - #A101.40000)

TO PREVENT PRIVATE INTERESTS FROM INFLUENCING MANAGEMENT ACTIVITIES

This question provides an opportunity, however, for me to express the view that the Forest Service should adopt a policy of eliminating these private inholdings by equitable land swaps or the exercise of eminent domain. The presence of these inholdings give private interests a disproportionate influence over the management of these National Forests. Inevitably, they skew management decision making along the lines revealed in question number four. A forest manager once suggested to me that fires on national forest land had to be suppressed in order to protect the tiny percentage of land on the forest owned by private interests. Otherwise they might sue! Nonsense. Save us all a lot of money and headache and just buy these people out. (Individual, Pendleton, OR - #A30482.40000)

1682. Public Concern: The Forest Service should exchange federal land outside roadless areas for state lands within roadless areas.

If access is limited or if the effects of federal policies preclude owners from effectively managing their lands within inventoried roadless areas, land exchanges may be necessary. This is the view of the state of Minnesota. Jesse Ventura, governor of Minnesota, stated in a December 5, 2000, letter to former Secretary Glickman in response to the state's inholding within roadless areas, "I request that the Forest Service assign a high priority to exchanging equivalent federal lands outside of the IRAs for state lands within these areas." Forest plan revisions present the best opportunity to discuss and resolve access issues. (Association, Duluth, MN - #A22631.40500)

BECAUSE THE CUMULATIVE EFFECT OF NATIONAL MANAGEMENT RULES WOULD PREVENT REASONABLE ACCESS TO INHOLDINGS IN ROADLESS AREAS

There are several interrelated National Forest rules that come into play in defining fair and reasonable access to non-federal lands. These include the Roadless Area Conservation Rule, the National Forest Transportation System Policy and Rules, the rules on Cost Recovery for Processing Special Use Applications, and the National Forest System Land and Resource Management Planning rules. Our conclusion was that the cumulative effect of these rules would preclude us from effectively managing state lands within the IRAs. Our suggested resolution was to pursue a land exchange. Where future management of IRAs as wilderness or unroaded areas precludes reasonable access (e.g., time, cost) to state lands, land exchange for federal lands outside the IRAs should be a high priority. (State Agency, Saint Paul, MN - #A30025.16100)

1683. Public Concern: The Forest Service should exchange other federal land for private inholdings located in wilderness areas.

Private land holdings within wilderness should be traded so that the wilderness is relatively free of such encumbrances. (Individual, Evergreen, CO - #A19178.35300)

1684. Public Concern: The Forest Service should not designate an area roadless unless all private inholders first agree to a land exchange.

If the entity or private property owner does not agree to a land exchange, the area should not be designated roadless. (Individual, Kalispell, MT - #A3380.40000)

Purchases

1685. Public Concern: The Forest Service should purchase private inholdings.

If they have an easement of record there should be no problem. A better way would be to purchase the land and do away with the problem. I can't think of a better use of taxpayers dollars. (Individual, Kalispell, MT - #A97.40000)

Also, outright purchase from willing sellers using the Land and Water Conservation Fund should be aggressively pursued. (Individual, Peck, ID - #A1109.40000)

Private inholdings are a broader issue best dealt with by buyout. (Individual, Granite Bay, CA - #A5166.40100)

I assume this question [5] is addressing the situation of an inholding property. These properties should be acquired by the federal government at any opportunity. The public should not be in the business of building roads so an individual can access property that more properly should be part of the surrounding wilderness. (Individual, Macomb, IL - #A95.40500)

IF THE AREA IS TO BE DECLARED WILDERNESS

Private land owners must be provided reasonable and appropriate access to accommodate the intended use of their land. If the area is to be declared Wilderness, attempts must be made by the government to acquire such private lands. Lands outside of Wilderness must be actively managed to maintain healthy timber stands and keep fuel accumulations within reasonable levels. It follows therefore that reasonable and appropriate private landowner access can be accommodated within these lands. (Individual, Manhattan, MT - #A21848.40000)

ONLY IF OTHER AREAS ARE TO BE REOPENED TO MULTIPLE USES

Private property rights are one of the cornerstones of this nation and their preservation should be a primary concern. The right to access one's private property should not be lost at the expense of maintaining the integrity of a so-called "roadless" areas. To purchase or to attempt to purchase in order to maintain the illusory "roadless" character should only be done if other areas are to be reopened to multiple use and if the owner is truly interested and motivated to sell or exchange the parcel. (Individual, Denver, CO - #A5433.40100)

WITH LAND AND WATER CONSERVATION FUND MONEY

This is really tough—especially where there is a lot of checkerboard land. I recall one private parcel in the Crazy Mountains of Montana, a high elevation section that would have been a nightmare to build a road to. The owner was threatening to put in a subdivision and wanted roaded access, but the real agenda was to instigate a land exchange, whereby the forest would obtain the Goat Rocks section (thus sparing it from damage, to be sure), but in the process would have to give up a section of prime deer winter range on the margin of the mountains. Not a good deal for the public, either way. Probably the best way to handle it is to use Land and Water Conservation funds to purchase these inholdings. (Individual, Jackson, WY - #A10527.35300)

TO BUILD CONNECTIONS BETWEEN ROADLESS AREAS AND DESIGNATED WILDERNESS AREAS

It is very disingenuous to claim this as a serious issue. How many blocks of private land are actually surrounded by inventoried roadless forest? The Forest Service should aggressively buy and trade lands

to rid roadless areas of private inholdings, and to build connections between roadless areas and designated Wilderness areas. (Individual, Bozeman, MT - #A6189.40500)

IN THE TONGASS NATIONAL FOREST

I would like to see a more ambitious effort by TNF to acquire private inholdings in roadless areas, especially, the North Fork American. I like what they have done so far, and want them to do more. (Individual, Dutch Flat, CA - #A22445.35300)

1686. Public Concern: The Forest Service should either buy private property or negotiate an access schedule with property owners.

IF TRAFFIC LEVELS ESCALATE THE ENVIRONMENTAL IMPACT OF ACCESS

If high traffic levels in a particular area escalate the environmental impact of such access, you can review the matter and either buy the property or negotiate an access schedule with the owners. (Individual, Chestertown, MD - #A462.40000)

1687. Public Concern: The Forest Service should not use Conservation and Reinvestment Act funding to purchase privately owned forest lands.

Conservation and Reinvestment Act (CARA) funding should be reduced and restricted from purchasing privately owned forest near or within State or National Forests. Until the present Forest are managed correctly and an estimated \$8.4 billion maintenance and reconstruction backlog as of January 2001 is caught up, in order to maintain the existing 380,000-plus mile road system to environmental and safety standards, there should be no "new" forest acquired by USDA Forest Service. Instead, funding should be for the construction of new roads and old road maintenance should be sought after. (Individual, Jefferson, OR - #A775.40500)

1688. Public Concern: The Forest Service should not force private landowners to sale their property.

FOR THE REASON OF OBTAINING INHOLDINGS

The rights to access private property should not be eliminated that predate all current laws, regulations, and designation of roadless areas. The USFS must abide by all existing applicable law in this manner. If private property within roadless areas is believed to be desirable for acquisition by the Forest Service, reasonable offers should be made to the owners. The sale of any private property within the National Forest should never be mandatory or coerced. (Individual, Edgewood, NM - #A5638.40000)

1689. Public Concern: The Forest Service should discourage private profiteering over the Agency's purchase of private property in roadless areas.

Existing rights to property within roadless areas is a difficult issue. I happen to know that one individual in my state of Colorado . . . makes a business out of profiting from purchases specifically within such areas, expressly for the purpose of forcing this issue. Such greed-motivated activity should be discouraged if not legislated against. (Individual, Denver, CO - #A20707.40000)

1690. Public Concern: The Forest Service should not succumb to blackmail by private property owners.

WHO THREATEN TO CONSTRUCT LARGE BUILDINGS ON INHOLDINGS

Buy them out wherever possible, at fair market rates for the type of property, but do not give in to property owners attempting to blackmail the Forest Service by threatening the construction of large buildings on inholdings. (Individual, Dallas, TX - #A18002.40500)

1691. Public Concern: The price of private property within roadless areas should reflect the presence or absence of an access route to the property.

When property is purchased inside of inventoried roadless areas, the property value should reflect the fact that road access is not an option. Otherwise the roadless designation becomes an economic bonanza to the property owner. Access should be the same kind as that enjoyed by the public. (Permit Holder, Rifle, CO - #A29619.40000)

Appendix A

Content Analysis Process

Public responses on the Advance Notice of Proposed Rulemaking are documented and analyzed using a process called content analysis. This is a systematic process of compiling and categorizing all public viewpoints and concerns submitted on a plan or project. Content analysis is intended to help decision makers clarify or adjust the the next phase of the project. Information from public meetings, letters, emails, faxes, and other sources are all included in this analysis.

In the content analysis process, each response is assigned a unique number. This number allows analysts to link specific comments to original responses. All respondents' names and addresses are entered into a project-specific database program, enabling creation of a complete list of all respondents.

Analysts read and code responses using the coding structure. Each comment is coded by subject and verified by a second analyst for accuracy and consistency. Then all coded comments are entered verbatim into a comment database. Database reports track all input and allow analysts to identify public concerns and to analyze the relationships among them. The final analysis document includes an executive summary, which discusses respondents' main areas of concern, and a formal list of public concern statements. Each public concern statement is accompanied by one or more sample excerpts from original responses.

This process and the resulting document do not replace responses in their original form. Rather, they provide a map to the responses and other input on file at the office of the Content Analysis Team (CAT) in Salt Lake City. Interested parties are encouraged to read public comment firsthand.

It is important to recognize that the consideration of public comment is not a vote-counting process in which the outcome is determined by the majority opinion. Relative depth of feeling and interest among the public can serve to provide a general context for decisionmaking. However, it is the appropriateness, specificity, and factual accuracy of comment content that serves to provide the basis for modifications to planning documents and decisions. Further, because respondents are self-selected, they do not constitute a random or representative public sample. The National Environmental Policy Act (NEPA) encourages all interested parties to submit comment as often as they wish regardless of age, citizenship, or eligibility to vote. Respondents may therefore include businesses, people from other countries, children, and people who submit multiple responses. Therefore, caution should be used when interpreting comparative terms in the summary document. Every substantive comment and suggestion has value, whether expressed by one respondent or many. All input is read and evaluated and the analysis team attempts to capture all relevant public concerns in the analysis process.

Appendix B Coding Structure

Presented below is the list of categories or “codes” used to sort public comment on the Advance Notice of Proposed Rulemaking. A more detailed description of the coding, database construction, and other elements of the methodology used for this analysis can be found in Appendix A: Content Analysis Process.

PLANN 10000 Purpose and Need for Roadless Area Policy

- 10110 Need for a national roadless rule, general
 - 10111 Necessary
 - 10112 Unnecessary
- 10120 Need for revision of the Jan. 2001 Rule
 - 10130 Abandon Rule/develop new Rule (*general reasons why*)
 - 10131 LACK OF RESPONSIVENESS TO LOCAL CONCERNS
 - 10132 ADEQUACY OF PUBLIC INPUT FOR SCOPING/DEIS
 - 10133 Volume of comment/content/participation
 - 10134 Timeframe
 - 10135 ADEQUACY OF MAPPING/OTHER INFORMATION FOR SCOPING/DEIS
 - 10136 RANGE OF ALTERNATIVES, DEIS (*GENERAL REFERENCE TO ADEQUACY OF RANGE OF ALTERNATIVES*)
 - 10137 ADEQUACY OF PRIOR INVENTORIES (*RARE I, RARE II*)
 - 10138 CONCURRENT NATIONAL PROJECTS
 - 10139 LITIGATION, FS/JD DEFENSE OF JAN. 2001 RULE
 - 10140 POLITICAL CONSIDERATIONS
 - 10141 FLAWS IN JAN 2001 RULE, OTHER
 - 10150 Strengthen Rule/do not develop Rule (*general reasons why*)
 - 10151 RESPONSIVENESS TO LOCAL CONCERNS
 - 10152 ADEQUACY OF PUBLIC INPUT FOR SCOPING/DEIS
 - 10153 Volume of comment/content/participation
 - 10154 Timeframe
 - 10155 ADEQUACY OF MAPPING/OTHER INFORMATION FOR SCOPING/DEIS
 - 10156 RANGE OF ALTERNATIVES, DEIS (*GENERAL REFERENCE TO ADEQUACY OF RANGE OF ALTERNATIVES*)
 - 10157 ADEQUACY OF PRIOR INVENTORIES (*RARE I, RARE II*)
 - 10157 CONCURRENT NATIONAL PROJECTS
 - 10159 LITIGATION, FS/JD DEFENSE OF JAN. 2001 RULE
 - 10160 POLITICAL CONSIDERATIONS
 - 10161 FLAWS IN JAN 2001 RULE, OTHER

PLANN 11000 Issue (Q10)

- 11100 ANPR Issue identification (*adequacy, accuracy, clarity of the 10 questions, NOT answers to the questions*)
 - 11110 1. Informed decisionmaking (role of local forest planning)

- 11120 2. Working together to address roadless values
- 11130 3. Protecting forests (from fire and fuels, insects and disease)
- 11140 4. Protecting communities, homes, and property
- 11150 5. Protecting access to property
- 11160 6. Describing values of IRAs
- 11170 7. Describing activities allowed/prohibited
- 11180 8. Designating areas
- 11190 9. Competing values and limited resources (*balancing of*)
- 11200 10. Other concerns

PLANN 12000 Decisionmaking Authority (Q1) (*Who should have authority*)

- 12100 Role/authority
 - 12110 President/exec branch
 - 12111 CURRENT ADMINISTRATION
 - 12112 FORMER ADMINISTRATION
 - 12120 Forest Service
 - 12121 WASHINGTON OFFICE
 - 12122 CHIEF
 - 12123 ID TEAM
 - 12124 CAT
 - 12125 LOCAL FOREST SERVICE PERSONNEL
 - 12130 Legislative branch
 - 12140 Judicial branch
 - 12150 City, state, and county governments
 - 12151 LOCAL, STATE, AND COUNTY AGENCIES OR ELECTED OFFICIALS
 - 12160 Tribal governments
- 12200 Trust and integrity, general
 - 12210 Current Administration
 - 12220 Former Administration
 - 12230 Forest Service
 - 12240 City, state, and county governments or officials
 - 12250 Tribal governments
- 12300 Managing across jurisdictions (*protocol and need for managing across jurisdictions*)
 - 12310 Planning and Implementation (*involving agencies, states and counties in planning*)
 - 12311 MULTI-FOREST/REGIONAL (WITHIN FOREST SERVICE)
 - 12312 OTHER FEDERAL AGENCIES (BLM, PARK SERVICE)
 - 12313 STATE, LOCAL, OTHER AGENCIES
 - 12314 PRIVATE LANDOWNERS
- 12400 Interim direction (during rule revision, prior to forest plan revision, etc.)
 - 12410 Chief maintains authority
 - 12420 Regional foresters delegated authority
 - 12430 Line officers delegated authority (*Forest Sups or Districts*)
 - 12440 Moratorium on entry until rule finalized
 - 12450 Moratorium on entry until forest plans revised
 - 12451 TONGASS
 - 12460 No moratorium/no special considerations for RAs

PLANN 13000 Role of Local Forest Plan Process (NFMA) (Q1) *(How the planning process should work)*

- 13100 Appropriate scale of decisionmaking (local vs. national, who decides)
 - 13110 Forest-level ("local") decision-making
 - 13120 National direction without local planning
 - 13130 Local planning with national direction
- 13200 Role and process of local forest planning (how to)
 - 13210 Implementation of national/WO direction
 - 13211 INCORPORATE NATIONAL RULE DURING NEXT FOREST PLAN REVISION
 - 13212 UPDATE INFORMATION/INVENTORIES
 - 13213 DETERMINE SITE-SPECIFIC AREAS FOR NATIONAL EXEMPTIONS
 - 13214 DETERMINE ADDITIONAL SITE-SPECIFIC RESTRICTIONS/PROHIBITIONS
 - 13220 Evaluation through current forest planning process *(little or no additional national guidance)*
 - 13230 Evaluation project-by-project, forest-level *(little or no national guidance)*

PLANN 14000 Public Involvement, ANPR (Q2)

- 14100 Adequacy/availability of information
 - 14110 Federal Register notice *(Federal Register notice detailed enough or not)*
 - 14120 Outreach/agency communication efforts
 - 14130 Web site
 - 14140 General request for more information
- 14200 Public meetings
- 14300 Adequacy of comment period *(for adequacy of comment period, Jan. 2001 Rule, see Purpose and Need)*
 - 14310 Extension needed
 - 14320 No extension needed
- 14400 Adequacy of timeframe *(for adequacy of timeframe, Jan. 2001 Rule, see Purpose and Need)*
 - 14410 ANPR, PR, and final rule
 - 14420 In conjunction with other national projects
 - 14421 TRANSPORTATION POLICY
 - 14422 PLANNING REGS
 - 14430 In conjunction with forest and regional level projects
- 14500 Use of science/best available information

PLANN 15000 Public Involvement in Decisionmaking, General (Q2, Q9)

- 15100 Managing National Forest System lands
 - 15110 Role of general public *(including public opinion)*
 - 15111 LOCAL CITIZENS/COMMUNITIES
 - 15112 NATION-WIDE CITIZENS/COMMUNITIES
 - 15120 Role of interest groups
 - 15121 ENVIRONMENTAL GROUPS
 - 15122 INDUSTRY/BUSINESS GROUPS

- 15123 MULTIPLE USE/WISE USE, RECREATION, ETC.
- 15130 Role of state and local governments
 - 15131 COOPERATING AGENCY STATUS
- 15140 Role of other federal agencies
 - 15141 COOPERATING AGENCY STATUS
- 15150 Use of public involvement/comment (*adequacy, methodology*)
 - 15151 METHODOLOGY AND TECHNIQUES
 - 15152 SUGGESTIONS
 - 15153 SUBMITTED ON SCOPING/DEIS FOR JAN. 2001 RULE
 - 15154 ANPR
- 15160 Managing competing interests **(Q9)**
 - 15161 EXISTING LEGAL/ADMINISTRATIVE GUIDANCE
 - 15162 ENHANCED COLLABORATIVE EFFORTS
 - 15163 PUBLIC EDUCATION/INFORMATION EFFORTS
 - 15164 FS STAFF TRAINING/EDUCATION
 - 15165 WILL OF PUBLIC
 - 15166 ECONOMIC VALUES (MARKET)
 - 15167 ECOSYSTEM/PRESERVATION VALUES
 - 15168 RELATIVE IMPACTS OF COMPETING USES
 - 15169 SCIENTIFIC CONSENSUS

PLANN 16000 Relationship to Other National Planning Processes, FS (Q10)

- 16100 National and regional
 - 16110 Transportation/roads policy
 - 16120 Planning regulations
 - 16130 Interior Columbia River Basin Ecosystem Management Plan

PLANN 17000 Agency Organization and Funding

- 17100 Funding for Forest Service (*likelihood of future funding; budget allocation; revise funding*)
 - 17110 Tax-based funding
 - 17120 Fee-based funding/fee demo areas (recreation, etc.)
 - 17130 Other sources of revenue
 - 17140 Use of volunteers
- 17200 Funding for Roadless ANPR (*reference to existing and potential funding sources*)
 - 17210 Funding for the proposed rule
 - 17220 Cost of implementation of final rule (*reference to projected or assumed costs of implementation to agency; for impacts to business, etc. see ECONO*)
 - 17230 Monitoring and enforcement (*funding of only*)
 - 17240 Effects on other forest funding priorities
- 17300 Organization structure and staffing

LEGAL 20000 Relationship to Applicable Laws, Regulations and Policies (*for general comments or laundry lists only, specific comments should be coded to the resource*)

- 20100 Constitution
- 20200 Federal laws, acts, and policies

- 20201 NFMA (*National Forest Management Act*)
- 20202 MUSYA (*Multiple Use and Sustained Yield Act*)
- 20203 NEPA (*National Environmental Policy Act*)
- 20204 Organic Act
- 20205 FLPMA (*Federal Land Policy and Management Act*)
- 20206 Wilderness Act (*including state wilderness acts*)
- 20207 ANILCA (*Alaska Native Interest Lands Conservation Act*)
- 20208 RS 2477
- 20209 APA (*Administrative Procedures Act*)
- 20210 ADA (*Americans with Disabilities Act*)
- 20211 FACAA (*Federal Advisory Committee Act*)
- 20212 FOIA (*Freedom of Information Act*)
- 20213 Civil Rights Act
- 20214 National Outdoor Recreation Act
- 20215 Government Performance and Results Act
- 20216 Paperwork Reduction Act
- 20217 RFA (*Regulatory Flexibility Act*)
- 20218 SBREFA (*Small Business Regulatory Enforcement Fairness Act*)
- 20219 Unfunded Mandates Reform Act
- 20220 CAA (*Clean Air Act*)
- 20221 CWA (*Clean Water Act*)
- 20222 ESA (*Endangered Species Act*)
- 20223 Mining laws and regulations
- 20300 Executive orders
- 20400 State and local laws
- 20500 Forest Service manuals, handbooks etc.

DESIG 25000 Designating Management Categories/Allocations (Q8)

- 25100 Current legal and administrative guidance
 - 25110 Sufficient
 - 25120 Insufficient
- 25200 Recommend as wilderness
 - 25210 All RAs
 - 25220 Qualifying RAs
 - 25230 Forest-by-forest determination
 - 25240 No RAs
- 25300 Create specific roadless MA allocation(s) (*Backcountry, Primitive, etc.*)
 - 25310 Forest-by-forest
 - 25320 Do not create special allocations
 - 25330 Use existing forest MA categories
 - 25340 Forest discretion/case-by-case/apply MAs as appropriate
 - 25350 Special interest areas (*Research Natural Areas, Recreational Non-motorized, Wild and Scenic, etc.*) (*less intensive uses*)
 - 25360 Timber production, wildlife habitat, motorized recreation, etc. (*more intensive uses*)

NADIS 30000 Natural Disturbance Processes and Forest Health (Q3)

- 30100 Forest health, general comments
 - 30110 Current conditions/HRV/desired conditions
 - 30120 Differences between ecotypes/cover types
 - 30130 Economic vs. ecological perspectives on forest health
- 30200 Forest management access (*need for access to prevent disturbance*)
- 30300 Role of fire in forested ecosystems
 - 30310 Restoring fire as a natural process
 - 30320 Protection of timber resources from fire
- 30400 Fire management: response policy/decision protocol
 - 30410 Fire management plans (general references, process and integration into forest plans)
 - 30420 Planned ignitions/prescribed fire
 - 30430 Unplanned ignitions (*natural ignitions, wildland fire, etc.*)
- 30500 Mechanical fuel reduction
 - 30510 Fuels reduction, general
 - 30511 EFFICACY OF MECHANICAL TREATMENTS
 - 30512 PRIORITY AREAS
 - 30520 Timber harvest
 - 30530 Thinning
 - 30531 THINNING IN COMBINATION W/PRESCRIBED FIRE
 - 30540 Fire breaks
 - 30550 Slash removal and other harvest prescriptions
 - 30560 Grazing and fine fuel reduction
- 30600 Other risk reduction, FS efforts/responsibility
 - 30610 Prevention and public education
- 30700 Responsibility of private individuals/landowners
- 30800 Risk to FS and natural resource lands from private property
- 30900 Costs of fire management
 - 30910 Suppression efforts
 - 30920 Ecosystem restoration
- 31100 Post-fire treatments
 - 31110 Burned Area Emergency Rehabilitation (BAER) efforts
 - 31120 Salvage logging
- 31200 Insects and disease, general
 - 31210 Role of insects/disease in natural systems
 - 31220 Prevention/treatment/detection
 - 31221 NEED FOR ROADS/ACCESS
 - 31222 HARVEST OF TIMBER RESOURCES TO AVOID LOSS TO INSECTS AND DISEASE
 - 31223 SALVAGE LOGGING (*INSECT OR DISEASE KILLED*)
- 31300 Non-native plants and noxious weeds
 - 31310 Introduction/spread
 - 31311 ROAD/ TRAIL BUILDING
 - 31312 WEED FREE FEED
 - 31313 RECREATION MANAGEMENT

- 31320 Treatment
- 31321 USE OF HERBICIDES

PRIVA 35000 Private Property Protection (Urban Interface and Inholdings) (Q4)

- 35100 Public/firefighter safety (protecting people from fire)
 - 35110 Responsibility of FS
 - 35111 SUPPRESSION
 - 35112 FUELS REDUCTION
 - 35113 PUBLIC EDUCATION
 - 35120 Responsibility of state and local governments
 - 35130 Responsibility of landowners/private citizens
- 35200 Economic loss reduction (*saving homes and private land*)
 - 35210 Responsibility of FS
 - 35220 Responsibility of state and local governments
 - 35230 Responsibility of landowners/private citizens
- 35300 Land exchanges, acquisitions, and conservation easements (*as related to protection*)

ACCES 40000 Private Property Access Across National Forest System Lands (Q5)

- 40100 Existing legal requirements
- 40200 Jan. 2001 Rule exceptions
- 40300 Additional exceptions
- 40400 Minimum means necessary
- 40500 Acquisition of inholdings (*as related to access*)
- 40600 Costs of access roads/mitigation of impacts

EVALU 45000 Characteristics of Roadless Areas (Q6)

- 45100 Roadless area characteristics general
- 45200 General comments about definition of a road
- 45300 General comments about the number of acres
 - 45310 5000 acres
 - 45320 1000 acres
 - 45330 All or any size roadless area
 - 45331 ADJACENT TO WILDERNESS/OTHER PROTECTED AREAS (NATIONAL PARKS, ETC)
 - 45340 Different geographic standards
 - 45341 EAST VS. WEST/100TH MERIDIAN
- 45400 Inventory status
 - 45410 IRA
 - 45420 Uninventoried
 - 45430 Land acquisitions
 - 45440 Most current inventory
- 45500 Prior/currently scheduled management activities
 - 45510 Should disqualify an IRA from rule provisions

- 45511 TIMBER HARVEST/SCHEDULED SALES
- 45512 ROADS
 - 45513 Roaded portions of IRAs
 - 45514 Non-system roads and ways (*how can a roadless area have roads?*)
- 45515 TRAILS
- 45520 Should not disqualify an IRA from rule provisions
 - 45521 TIMBER HARVEST/ SCHEDULED SALES
 - 45522 ROADS
 - 45523 Roaded portions of IRAs
 - 45524 Non-system roads and ways (restore/ignore)
 - 45525 TRAILS
- 45600 Exemptions of specific areas from a national rule
 - 45610 Do exempt from rule (do not include this area)
 - 45611 SPECIFIC REGIONS, GEOGRAPHIC AREAS
 - 45612 SPECIFIC NATIONAL FORESTS
 - 45613 Tongass
 - 45614 SPECIFIC ROADLESS AREAS
 - 45615 NATIONAL FORESTS WITH AN ROD AND APPEALS UNDERWAY OR COMPLETED
 - 45616 CURRENT OR PROPOSED TIMBER SALES (*I.E. ALLOW THEM TO PROCEED*)
 - 45617 SPECIAL USE PERMIT AREAS (*SUCH AS SKI RESORTS*)
 - 45618 LAND EXCHANGES OR OTHER AGREEMENTS (*I.E. ALLOW THEM TO PROCEED*)
 - 45619 SCIENTIFIC/RESEARCH AREAS OR FACILITIES
 - 45620 Do not exempt from rule (include this area)
 - 45621 SPECIFIC REGIONS, GEOGRAPHIC AREAS
 - 45622 SPECIFIC NATIONAL FORESTS
 - 45623 Tongass
 - 45624 SPECIFIC ROADLESS AREAS
 - 45625 NATIONAL FORESTS WITH AN ROD AND APPEALS UNDERWAY OR COMPLETED
 - 45626 CURRENT OR PROPOSED TIMBER SALES (*I.E. DO NOT ALLOW THEM TO PROCEED*)
 - 45627 SPECIAL USE PERMIT AREAS (*SUCH AS SKI RESORTS*)
 - 45628 LAND EXCHANGES OR OTHER AGREEMENTS (*I.E. DO NOT ALLOW THEM TO PROCEED*)
 - 45629 SCIENTIFIC/RESEARCH AREAS OR FACILITIES

ENVIR 50000 Environmental Values, Introduction/General (Q6)

- 50100 Ecosystem management as guiding policy
- 50200 Multiple use management as guiding policy
- 50300 Short-term vs. long-term productivity/risks
- 50400 Effects on other nations/global environment
 - 50410 Global warming/greenhouse effects
 - 50420 Deforestation/desertification (transfer of effects)

- 50500 Biological diversity (*general comments only; specific comments code to resource*)
 - 50510 Ecosystems/ecoregions
 - 50520 Size and configuration (island biogeography, fragmentation, etc.)
- ENVIR 51000 Water and Watersheds**
 - 51100 Groundwater
 - 51200 Water yield and streamflow
 - 51210 Water rights and diversions (on and off forest)
 - 51300 Watersheds
 - 51310 Health, general comments
 - 51320 Water quantity and timing
 - 51330 Flooding
 - 51340 Water quality
 - 51341 MASS WASTING AND SEDIMENTATION
 - 51342 DRINKING WATER SOURCES
- ENVIR 52000 Air Quality, Soils, and Cave Resources**
 - 52100 Air quality
 - 52110 Fire, smoke effects on air quality
 - 52120 Dust and particulates
 - 52130 Contribution of forest stands to air quality
 - 52200 Soils
 - 52210 Soil erosion, general (not specific to water quality)
 - 52220 Soil productivity
 - 52300 Cave Resources (*Karst formations, limestone*)
- ENVIR 53000 Terrestrial Wildlife**
 - 53100 Wildlife habitat (*quality, quantity, season, including snags & down logs*)
 - 53110 Connectivity/fragmentation
 - 53200 Threatened, endangered, proposed and sensitive species
 - 53300 Game species (*desired non-native species, harvested species*)
- ENVIR 54000 Aquatic Wildlife**
 - 54100 Wildlife habitat (*quality, quantity, season*)
 - 54110 Connectivity/fragmentation
 - 54200 Threatened, endangered, proposed and sensitive species
 - 54300 Game species (*desired non-native species, harvested species*)
- VEGET 60000 Vegetation and Botanical Resources (Q6)**
 - 60100 Structural composition, forest canopy species/trees
 - 60110 Early successional
 - 60120 Late successional/old growth
 - 60130 Mid-elevation ecosystems
 - 60200 Snags and coarse woody debris (*amount, size, location, etc.*)
 - 60300 Botanical resources (non-forest canopy plants and fungi)
 - 60310 Threatened, endangered, proposed and sensitive plants (*TEPS*)
 - 60400 Rare and unique communities (*Botanical Special Interest Areas*)
 - 60500 Alpine communities
 - 60600 Non-forested vegetation

NRCOM 65000 Natural Resource Commodities

- 65100 Rangeland resources
 - 65110 Vegetation (*incl. response to grazing*)
 - 65120 Capability, suitability, forage
 - 65130 Restoration
 - 65140 Allotment management
- 65200 Timberland resources, general
 - 65210 Current timber conditions
 - 65220 Timber harvest method
 - 65230 Future of logging
 - 65240 Importance of timber resources in IRAs (*see **ECONO** for economic values*)
 - 65241 ACREAGE AFFECTED/RELATIVE PORTION OF TIMBER FROM RAS
 - 65250 Forest Service expenditures on timber management (*timber revenue/timber subsidy*)
 - 65260 Timberland suitability
 - 65261 LANDS SUITED/TENTATIVELY SUITED
 - 65262 TIMBERLANDS NOT SUITABLE
 - 65263 SALE QUANTITIES (*ALLOWABLE, PROBABLE, TOTAL SALE PROGRAM*)
 - 65270 Long-term sustained yield capacity (LTSYC)
 - 65280 Best management practices
 - 65290 Importance of other forest products (fuelwood, Christmas trees, etc.)
- 65300 Mining
 - 65310 Legal and administrative framework
 - 65320 Mining access/need for roads
 - 65330 Relative importance of public lands mineral deposits
 - 65331 EXTENT OF DEPOSITS/ESTIMATES
 - 65340 Importance of mining (*see **ECONO** for economic values*)
 - 65350 Recreational importance of mining (including rock and fossil collecting)
 - 65360 Hazardous materials
 - 65370 Mitigation and reclamation measures/costs

SOCIO 70000 Social Environment and Values (Q6)

- 70100 Population and demographics/community types
 - 70110 Urban
 - 70120 Urban interface
 - 70130 Rural
- 70200 Cultural integrity (*community structure and stability*)
- 70300 Maintaining quality of life (*general references*)
 - 70310 Scenic quality
 - 70320 Escape from urban environment
 - 70330 Spiritual/religious values
 - 70340 Family stability/togetherness

- 70400 Future generations (bequest values)
- 70500 Intrinsic value of non-commodity resources (*ecosystems, wildlife, etc. have/don't have inherent right to exist separate from utility or value to humans*)
- 70600 Environmental Justice Executive Order compliance (*management compliance, also general social justice and equal opportunity*)
- 70700 Accessibility/opportunity for elderly/disabled

ECONO 75000 Economic Environment and Values (Q6)

- 75100 Economic diversity/resiliency
- 75200 Economic vulnerability (*assessment and mitigation*)
- 75300 Maintaining community stability (*general references*)
 - 75310 Employment (*job and income changes to communities*)
 - 75320 Business viability
- 75400 Sustaining levels of forest products and services (*need and appropriate levels*)
- 75500 Contribution of/importance to economies/businesses
 - 75510 Timber resources
 - 75520 Grazing/livestock
 - 75530 Mineral resources
 - 75540 Recreation/tourism
- 75600 Subsidies/costs of management to agency or taxpayers
 - 75610 Timber sales (*below cost*)
 - 75620 Grazing/range
 - 75630 Recreation
- 75700 State, county, and local government revenues/costs (*effects on counties/communities*)
 - 75710 Infrastructure costs associated with population growth (*effects on counties/communities*)
 - 75720 Changes in PILT revenue (*effects on counties/communities*)
 - 75730 Changes in 25% fund (*effects on counties/communities*)
- 75800 Non-Market economic values/ecosystem services
- 75900 Cost benefit analysis (*analysis of comparison of cost of Roadless revision and projected benefits*)
- 75950 Effects on other nations/global economy

CULTR 80000 Heritage Resources (Q6)

- 80100 Cultural resources
 - 80110 Potential undiscovered sites
 - 80120 Protection of American Indian heritage sites
 - 80130 Historic trails
 - 80140 Historic structures

TRIBL 85000 American Indian Rights and Interests (Q6)

- 85100 Federal trust responsibilities
 - 85110 Treaty rights
- 85200 Management of special forest products of interest (including protection of culturally important species)

- 85210 Hunting, fishing, grazing, gathering rights and interests (*medicinal plants*)
- 85220 Role of fire
- 85230 Endangered Species Act conservation measures (*protection of treaty guarantees*)
- 85240 Traditional and cultural species of interest to American Indians
- 85300 Native American use of public lands
 - 85310 Cultural interests
 - 85311 PROTECTION OF TRADITIONAL CULTURAL RESOURCES/HISTORIC USE AREAS
 - 85312 ACCESS TO TRADITIONAL CULTURAL RESOURCES/HISTORIC USE AREAS
 - 85320 Economic interests
 - 85330 Traditional interests
 - 85340 Spiritual interests
 - 85350 Government interests

ACTIV 90000 Human Uses and Management Activities (Q7)

- 90100 Allow activities general or multiple
- 90110 Prohibit/restrict activities general or multiple
- 90120 Allow road construction general
 - 90121 Temporary roads
- 90130 Prohibit/restrict road construction
 - 90131 Temporary roads
- 90210 Allow road reconstruction
- 90220 Prohibit/restrict road reconstruction
- 90310 Allow road closure/removal/decommissioning
- 90320 Prohibit/restrict road closure/removal/decommissioning
- 90410 Allow trail construction general
 - 90411 Motorized
 - 90412 Mechanized
 - 90413 Non-motorized
- 90420 Prohibit/restrict trail construction general
 - 90421 Motorized
 - 90422 Mechanized
 - 90423 Non-motorized
- 90510 Allow timber harvest, general
 - 90511 Current timber sales
 - 90512 Proposed timber sales
 - 90513 Even-aged management (clearcuts)
 - 90514 Uneven-aged management
 - 90515 Stewardship
 - 90516 Helicopter
- 90520 Prohibit/restrict timber harvest, general
 - 90521 Current timber sales
 - 90522 Proposed timber sales
 - 90523 Even-aged management (clearcuts)

- 90524 Uneven-aged management
- 90525 Stewardship
- 90526 Helicopter
- 90610 Allow livestock grazing
- 90620 Prohibit/restrict livestock grazing
- 90710 Allow exploration/development for minerals/oil and gas
 - 90711 Open withdrawn areas
- 90720 Prohibit/restrict exploration for minerals
 - 90721 Withdraw RAs
- 90810 Allow ski area permits/expansion
- 90820 Prohibit/restrict ski area permits/expansion
- 90910 Allow recreational facilities development (campgrounds, etc.)
- 90920 Prohibit recreational facilities development (campgrounds, etc.)
- 91110 Allow recreational activities, general or multiple
- 91120 Prohibit recreational activities, general or multiple
- 91210 Allow recreation activities, specific
 - 91211 Motorized activities
 - 91212 SUMMER
 - 91213 WINTER
 - 91214 Mechanized activities
 - 91215 Equestrian activities
 - 91216 Outfitter/guide permits
 - 91217 Competitive or group events
- 91220 Prohibit/restrict recreation activities, specific
 - 91221 Motorized activities
 - 91222 SUMMER
 - 91223 WINTER
 - 91224 Mechanized activities
 - 91225 Equestrian activities
 - 91226 Outfitter/guide permits
 - 91227 Competitive or group events
- 91310 Allow hunting/fishing
- 91320 Prohibit/restrict hunting/fishing
- 91410 Allow animal damage control
- 91420 Prohibit/restrict animal damage control
- 91510 Allow communication site designations and developments
- 91520 Prohibit/restrict communication site designations and developments
- 91610 Allow hydroelectric development
- 91620 Prohibit/restrict hydroelectric development
- 91710 Allow utility facilities/corridors
- 91720 Prohibit/restrict utility facilities/corridors

Alternative Field

This code is used to identify comments specific to the ten questions identified in the Federal Register.

XX – Multiple questions or no specific questions mentioned

01 – Question 1

02 – Question 2

03 – Question 3

04 – Question 4

05 – Question 5

06 – Question 6

07 – Question 7

08 – Question 8

09 – Question 9

10 – Question 10

Appendix C Public Concern List

Introduction

Public Concerns are derived directly from public comment. Each represents the gist of a statement of concern made by the public. Concerns may be derived from one person’s input, but often represent the view of many respondents. They are intended to aid decision makers in characterizing the issues to be analyzed. They may also provide a framework for preparing responses to public comment. Primarily, public concerns serve to guide readers to public comment on specific topics. As such, this index is intended to be used as a cross reference to public concerns listed in Chapters 1-6 of the Summary of Public Comment. Readers may identify their areas of concern within the list provided in this index and then reference the relevant portion of the summary document. There they will find sample quotes in support of the concern statement. Each sample quote includes a letter number reference should users wish to look at the original letter on file at the office of the Content Analysis Team (CAT) in Salt Lake City.

CHAPTER 1 INTRODUCTION TO NATIONAL ROADLESS PROTECTION RULEMAKING	1-1
NATIONAL ROADLESS PROTECTION – GENERAL REMARKS.....	1-1
Need for a National Roadless Rule General	1-1
1. Public Concern: The Forest Service should clarify the need for a national roadless rule.....	1-1
Because existing law already mandates environmental protection	1-2
Because existing law already provides for adequate public involvement in forest management decisions.....	1-2
Develop a National Roadless Rule	1-2
2. Public Concern: The Forest Service should develop a national roadless rule.	1-2
Because once these areas are gone they’re gone forever	1-2
Because individual states are unable to adequately protect roadless areas	1-3
Because most National Forest System lands are already managed for multiple uses	1-3
Because roadless areas are needed to preserve environmental and human values	1-3
Because the majority of citizens enjoy using roadless areas.....	1-3
To settle controversies regarding roadless areas.....	1-4
Do Not Develop a National Roadless Rule	1-4
3. Public Concern: The Forest Service should not develop a national roadless rule.	1-4
Because current law adequately protects the environment	1-4

Because the National Forest Management Act already adequately provides for public input 1-4

Because the courts have established that national forests are not wholly dedicated to recreational and environmental values 1-4

Because forests are in better shape now than at any other time in recent history..... 1-5

Because the Agency already has enough regulatory control and management authority to protect these areas 1-5

4. Public Concern: The Forest Service should delay development of another national roadless rule 1-5

 Until judicial resolution of the Roadless Area Conservation Rule 1-5

 Until forest plan revision processes take place 1-5

Need for the Roadless Area Conservation Rule 1-5

Need for the Roadless Area Conservation Rule General 1-7

5. Public Concern: The Forest Service should clarify the need for the Roadless Area Conservation Rule. 1-7

 Because the rule does not address the stated purpose and need 1-7

 Because only a small percentage of roadless areas is projected to be developed between 2000 and 2004 1-7

6. Public Concern: The Forest Service should explain how current management does not provide the protection which it is the purpose and need of the Roadless Area Conservation Rule to provide..... 1-8

Implement the Roadless Area Conservation Rule 1-8

7. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule as it now stands. 1-8

 Because only a national rule can guarantee protection of national forests through changing politics and personnel 1-9

 Because it provides consistent standards 1-9

 Because the five principles of roadless conservation have already been followed..... 1-10

 Because it is based on the best available science 1-10

 Because once these places are gone they're gone forever 1-10

 Because it is long overdue 1-10

 To avoid repeating mistakes of the past..... 1-11

 Because it represents a balanced approach to forest conservation 1-11

 Because it still leaves ample area for other uses 1-12

 Because it adequately protects other interests..... 1-12

 Because so much forest land has already been Actively managed 1-13

 Because wilderness areas are too high in elevation and too far separated from each other to adequately preserve biodiversity and wilderness recreation 1-13

 Because Roadless areas serve a different purpose than wilderness areas 1-13

 Because the original process was sufficiently local..... 1-13

 Because it represents the will of the people 1-14

Because roadless areas in eastern forests are so scarce 1-15

Because it preserves the status quo..... 1-15

8. Public Concern: The Forest Service should recognize that the Court’s concerns do not justify a departure from the Roadless Area Conservation Rule..... 1-15

9. Public Concern: The Forest Service should consider that revisiting the Roadless Area Conservation Rule will have negative effects. 1-16

It is a waste of taxpayer money 1-16

It will weaken public trust in the federal government 1-16

It will weaken public trust in the Forest Service planning process 1-16

It will polarize the political climate and incite people to radical actions 1-16

10. Public Concern: The Forest Service should recognize that many groups support the Roadless Area Conservation Rule. 1-17

Some western governors..... 1-17

Local residents 1-17

Average citizens 1-18

Tribes 1-18

Do Not Implement the Roadless Area Conservation Rule 1-18

11. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule..... 1-18

Because it is the product of a biased process 1-18

Because it is based on emotion, not logic 1-19

Because benefits of the Rule are inflated based on subjective reasoning..... 1-19

Because it was developed without local input and due process 1-19

Because it ignores progress made at the local level 1-20

Because roadless issues were adequately dealt with in Rare I and Rare II..... 1-20

Because roadless areas are already adequately protected..... 1-20

Because there should be no roadless areas 1-21

Because it does not represent a balanced approach to forest conservation 1-21

Because it does not address the different needs of eastern and western forests 1-22

Because it disproportionately affects western states 1-22

Because it will make the job of managing forests more difficult..... 1-22

Because it is based on inadequate information 1-22

Because its support has not been adequately demonstrated 1-23

Because there is opposition to it..... 1-23

Because it will prompt civil disobedience protests 1-23

Because it will increase safety hazards 1-23

12. Public Concern: The Forest Service should not use inadequate road maintenance funding as a reason for developing the Roadless Area Conservation Rule..... 1-24

13. Public Concern: The Forest Service should recognize that support for the Roadless Area Conservation Rule is the result of misrepresentation of current forest management practices..... 1-24
Revision of the Roadless Area Conservation Rule 1-24

14. Public Concern: The Forest Service should revise the Roadless Area Conservation Rule. 1-24
 To adequately address forest health, access, and local input 1-24
 To address access for recreation and resource USE 1-25
 To omit from consideration lands suitable for timber REMOVAL 1-25
 To provide for reasonable management 1-25
 Because it was the product of an inadequate process 1-25

15. Public Concern: The Forest Service should recognize that the Advance Notice of Proposed Rulemaking does not substantiate the need to revise the Roadless Area Conservation Rule. 1-26
Strengthen the Roadless Area Conservation Rule 1-26

16. Public Concern: The Forest Service should strengthen the Roadless Area Conservation Rule. 1-26
 By eliminating Exceptions 1-26
 By identifying areas which should not be exempted from the Rule 1-26
Defense of the Roadless Area Conservation Rule..... 1-27

17. Public Concern: The Administration should defend the Roadless Area Conservation Rule against lawsuits. 1-27

18. Public Concern: The Administration should not defend the Roadless Area Conservation Rule against lawsuits. 1-28

Other..... 1-28

19. Public Concern: The Forest Service should clarify the Roadless Area Conservation Rule. 1-28

20. Public Concern: The Forest Service should consider that it has already issued a decision on the Roadless Area Conservation Rule and should now emphasize work on more pressing issues 1-28

21. Public Concern: The Forest Service should separate the Roadless Area Conservation Rule into two policies to administer lands in the eastern and western United States..... 1-29

22. Public Concern: The Forest Service should ensure that one state does not shoulder disproportionate effects of a national roadless rule. 1-29

ISSUE IDENTIFICATION..... 1-30
 Adequacy of Questions in the Advance Notice of Proposed Rulemaking 1-30
Adequacy of Questions; General..... 1-30

23. Public Concern: The Forest Service should recognize various problems with the 10 questions asked in the Advance Notice of Proposed Rulemaking. 1-30
 They are unclear 1-30
 They are biased 1-31
 They have built-in assumptions 1-32
 They lead to certain responses 1-32

They are too open to interpretation 1-33

They are not relevant..... 1-33

They distract people from the main issues 1-33

They discourage public involvement..... 1-33

They only reflect the views of the small minority who oppose
roadless area protection 1-33

They attempt to justify the reversal of the Roadless Area
Conservation Rule 1-33

Their intent is to divert attention from the Administration’s attempt to
disqualify the Rule 1-34

They are an attempt to give greater weight to local citizens’
comments 1-34

They focus exclusively on the role of local forest planning and fail to
mention the Roadless Area Conservation Rule 1-34

They encourage conflict between DIVERSE GROUPS..... 1-34

They are framed to favor RESOURCE USERS..... 1-34

They let RESOURCE USERS define the terms of the debate..... 1-34

They do not contribute to a healthy and reasonable debate about
the value of roadless areas 1-35

24. Public Concern: The Forest Service should explain why none of
the 10 questions in the Advance Notice of Proposed Rulemaking
address inventoried roadless areas as fully functioning
ecosystems..... 1-35

25. Public Concern: The Forest Service should clarify whether the 10
questions in the Advance Notice of Proposed Rulemaking are an
attempt to conduct scoping for a new or supplemental EIS..... 1-35

And whether previous public comments will be considered..... 1-35

26. The Forest Service should recognize that all of the issues
addressed in the 10 questions in the Advance Notice of Proposed
Rulemaking were already addressed..... 1-35

27. Public Concern: The Forest Service should consider that the 10
questions in the Advance Notice of Proposed Rulemaking are no
substitute for the public involvement process. 1-35

28. Public Concern: The Forest Service should eliminate the use of
questions to solicit public comment. 1-36

29. Public Concern: The Forest Service should recognize that the 10
questions in the Advance Notice of Proposed Rulemaking are a
positive step toward adequate public involvement..... 1-36

Adequacy of Specific Questions 1-36

30. Public Concern: The Forest Service should recognize that
Question 3 in the Advance Notice of Proposed Rulemaking is
biased. 1-36

Because it implies that thinning and road construction are essential
to forest health..... 1-36

Because it reflects a lack of knowledge of forest ecology..... 1-36

- 31. Public Concern: The Forest Service should define “near” as used in Question 4 in the Advance Notice of Proposed Rulemaking. 1-36
- 32. Public Concern: The Forest Service should recognize that Question 4 in the Advance Notice of Proposed Rulemaking is misleading. 1-36
 - Because it implies that roadless areas pose a fire threat to homes and communities 1-36
- 33. Public Concern: The Forest Service should address various problems with Question 5 in the Advance Notice of Proposed Rulemaking. 1-37
 - It is out of scope for this analysis 1-37
 - It reflects an inadequate review of the Roadless Area Conservation Rule..... 1-37
 - It raises suspicions that more is being addressed than reasonable access 1-37
 - Define “reasonable access” 1-37
- 34. Public Concern: The Forest Service should recognize that Question 6 in the Advance Notice of Proposed Rulemaking should be asked during the National Environmental Policy Act process. 1-37
- 35. Public Concern: The Forest Service should clarify whether Question 8 in the Advance Notice of Proposed Rulemaking refers to the designation of additional roadless areas. 1-38
 - Beyond those already identified in the Roadless Area Conservation Rule..... 1-38
- 36. Public Concern: The Forest Service should recognize that Question 8 in the Advance Notice of Proposed Rulemaking is inappropriate for addressing roadless area protection..... 1-38
 - Because wilderness designation is outside THE scope 1-38
 - Because the Forest Service is already required to inventory for wilderness area candidates during the forest planning process 1-38
- 37. Public Concern: The Forest Service should recognize that Question 9 in the Advance Notice of Proposed Rulemaking goes beyond the issue of management of inventoried roadless areas..... 1-38

CHAPTER 2 PROCESS, PLANNING, POLICIES, AND LAWS 2-1

- NATIONAL FOREST MANAGEMENT ACT 2-1
 - National Rulemaking General 2-1
 - 38. Public Concern: The Forest Service should clarify its legal authority to issue national regulations. 2-1
 - Which change land allocations in any national forest..... 2-1
 - 39. Public Concern: The Forest Service should recognize that the Secretary of Agriculture *does* have the legal authority to issue a national roadless rule. 2-2
 - Compliance with the National Forest Management Act..... 2-2
 - 40. Public Concern: The Forest Service should comply with the National Forest Management Act. 2-3

To ensure a fair and open public involvement process..... 2-3

By ensuring that forest plans are in compliance 2-3

By addressing specific environmental protections mandated by the Act 2-4

By providing enough staff and resources in the field to implement forest plans and achieve objectives..... 2-4

By withdrawing the Roadless Area Conservation Rule..... 2-4

Until the statutory system is modified 2-4

41. Public Concern: The Forest Service should consider the Senate’s report on the National Forest Management Act. 2-4

Which stipulated that there should be no national land management prescriptions 2-4

42. Public Concern: The Forest Service should consider that the National Forest Management Act has not prevented development of roadless areas. 2-5

43. Public Concern: The Forest Service should apply the National Forest Management Act to national-level decisionmaking..... 2-5

To address the desires of all Americans..... 2-5

Planning Regulations 2-5

44. Public Concern: The Forest Service should coordinate the roadless area regulations with the Planning Regulations. 2-6

By evaluating the social and economic impacts of each alternative 2-6

The Secretary of Agriculture should eliminate the national application of the current rule and establish national standards to guide the forest planning process..... 2-6

45. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule under the former Planning Regulations..... 2-6

46. Public Concern: The Forest Service should postpone decisions regarding roadless area management until completing the revision of the Planning Regulations. 2-7

Particularly the 36 Code of Federal Regulations 219 Rule 2-7

47. Public Concern: The Forest Service should review and amend the Planning Regulations. 2-7

To address the appropriate management direction for unroaded areas 2-7

With respect to emphasis given to ecological sustainability and to treatment of unroaded areas 2-8

Without weakening existing environmental safeguards 2-8

By removing the phrase “at the discretion of the decision officer” 2-8

By including oil and gas leasing decisions and procedures..... 2-8

By REMOVING the objection procedures and retaining existing appeal regulations 2-9

48. Public Concern: The Forest Service should prioritize completion of forest plan revisions once the new Planning Regulations are finalized. 2-9

- 49. Public Concern: The Forest Service should comply with the 2000 Planning Regulations.....2-9
- 50. Public Concern: The Forest Service should seek further public input before taking further actions regarding the Planning Regulations and Roads Policy.....2-9
- 51. Public Concern: The Forest Service should explain why the word “access” was removed from the Code of Federal Regulations (CFR) 212 rule without notifying the public in federal register notices, and should open the CFR 219 rule for full public discourse.2-9
- Relationship to Other Plans/Policies2-10
 - 52. Public Concern: The Forest Service should coordinate roadless area management with local forest plans.2-10
 - 53. Public Concern: The Forest Service should coordinate land use management with the planning and land use policies of local governments.....2-10
 - 54. Public Concern: The Forest Service should support the Giant Sequoia National Monument Management Plan.2-11
 - 55. Public Concern: The Forest Service should coordinate roadless area regulations with the Interior Columbia Basin Ecosystem Management Project planning process.2-11
- NATIONAL ENVIRONMENTAL POLICY ACT2-12
 - Compliance with the National Environmental Policy Act2-12
 - 56. Public Concern: The Forest Service should comply with the National Environmental Policy Act.....2-12
 - By holding fair and open public meetings and considering substantive written comments2-12
 - By including input from local, state, and federal elected officials.....2-13
 - By incorporating accurate information about roadless areas.....2-13
 - By adequately analyzing all issues and concerns in the Roadless Area Conservation Rule Final EIS.....2-13
 - By providing site-specific information2-13
 - By providing the public with adequate information to allow informed comment2-14
 - By adequately studying the issues before initiating policies2-14
 - By ensuring that the outcome is not predetermined2-14
 - By not committing resources such as to prejudice selection of an alternative.....2-14
 - By withdrawing the Roadless Area Conservation Rule2-15
 - 57. Public Concern: The Forest Service should recognize that it is circumventing the National Environmental Policy Act by requiring additional comments after the record of decision was issued for the Roadless Area Conservation Rule.....2-15
 - 58. Public Concern: The National Environmental Policy Act should be revised.....2-15
 - Environmental Analysis Documents.....2-15

Environmental Analysis Documents General..... 2-16

59. Public Concern: The Forest Service should require an environmental assessment or EIS before undertaking any significant action. 2-16

Rather than arbitrarily prohibiting road construction 2-16

60. Public Concern: The Forest Service should require environmental assessments for roadless areas rather than EISs. 2-16

Because many of the areas are already roaded 2-16

61. Public Concern: The Forest Service should conduct an additional environmental review under the National Environmental Policy Act. .. 2-16

If the previous review was inadequate as to require additional action..... 2-16

62. Public Concern: The Forest Service should prepare another EIS for a revised Roadless Rule..... 2-17

Prior to releasing lands for other management purposes, as required by California v. Block..... 2-17

To facilitate working together with all interested parties 2-17

That meets page limitations..... 2-17

63. Public Concern: The Forest Service should employ the programmatic approach to EISs consistently..... 2-17

64. Public Concern: The Forest Service should consider that the Finding of No Significant Impact document, which allowed the roadless initiative to proceed, violated legal requirements for land withdrawals over 5,000 acres. 2-18

National Environmental Policy Act and Federal Land Policy and Management Act requirements 2-18

Roadless Area Conservation Rule EIS 2-18

65. Public Concern: The Forest Service should address inadequacies in the Roadless Area Conservation Rule Draft EIS..... 2-18

It failed to substantiate statements 2-18

It was not sufficiently site-specific and did not consider a sufficient range of alternatives 2-18

It failed to adequately discuss environmental and economic impacts .. 2-19

It failed to address meaningful input by affected citizens and parties... 2-19

Its underlying analysis was insufficient..... 2-19

66. Public Concern: The Forest Service should consider that the final Roadless Area Conservation Rule includes restrictions on lands outside of unroaded portions of inventoried roadless areas. 2-19

Restrictions were not included in the alternatives..... 2-19

67. Public Concern: The Forest Service should consider that the public was not given the opportunity to comment on vital aspects of the Roadless Area Conservation Rule which were added to the Final EIS, but which were not part of the Draft EIS..... 2-20

68. Public Concern: The Forest Service should prepare a supplemental Draft EIS..... 2-20

That quantifies miles of existing roads in inventoried roadless areas ... 2-20

That provides maps of roadless areas2-20

69. Public Concern: The Forest Service should consider that data from the past 30 years of Environmental impact statements is sufficient to analyze the effects of the Roadless Area Conservation Rule.....2-20

70. Public Concern: The Forest Service should adopt Alternative 3D.2-20
Because it represents the best characterization of roadless area values and management planning2-20

71. Public Concern: The Forest Service should adopt Alternative 4D.2-21

72. Public Concern: The Forest Service should adopt Alternative T4.2-21
Which emphasizes fragile ecosystem protection over locally controlled development2-21

INTERIM DIRECTION2-22

Interim Direction General2-22

73. Public Concern: The Forest Service should establish interim direction for roadless area management.2-22
To address roadless area management for national forests which are revising or have recently revised their forest plans under the 1982 Planning Regulations2-23
To protect areas that cannot be actively managed during the current planning cycle2-23
For smaller areas in forests through project-by-project analysis2-23
In collaboration with other agencies and affected users.....2-23

74. Public Concern: The Forest Service should establish interim direction for mining.2-23
In Gunnison County2-23

75. Public Concern: The Forest Service should establish a temporary moratorium on activities in roadless areas.2-23
For at least 50 years2-24
For development projects that are inconsistent with the Roadless Area Conservation Rule2-24
While the matter is being litigated2-24
Until the entire maintenance and reconstruction backlog is eliminated.....2-24
Until a new management policy is developed2-24
Until the Agency determines what type of forestry should be practiced.....2-24

76. Public Concern: The Forest Service should clarify that the Roadless Area Conservation Rule is not in effect and that the lands will be managed according to already existing procedures and classifications.2-25

The Interim Directive2-25

77. Public Concern: The Forest Service should make the Interim Directive permanent.2-25
Until forest plans are revised.....2-25

78. Public Concern: The Forest Service should strengthen existing interim protection of roadless areas.....2-25

To prevent any further loss of the roadless area base..... 2-25

By adopting the Roadless Area Conservation Rule until federal officers are convinced of its need 2-25

79. Public Concern: The Forest Service should consider that the Interim Directive would return land management to its prior state. 2-26

By leaving the fate of roadless areas to the forest planning process.... 2-26

80. Public Concern: The Forest Service should recognize that the interim direction outlined in the June 7, 2001, memo to staff is an implementation of the Roadless Area Conservation Rule..... 2-26

Which is a violation of the District Court ruling 2-26

OTHER POLICY CONCERNS 2-27

Other Policy Concerns General..... 2-27

81. Public Concern: The Forest Service should evaluate the cumulative effects of multiple management proposals. 2-27

The Roadless Area Conservation Rule, the Planning Regulations, and the Roads Policy..... 2-27

The Roadless Area Conservation Rule and other withdrawals of National Forest System lands..... 2-27

The Roadless Area Conservation Rule, multiple use mandates, and the fire plan, etc..... 2-27

82. Public Concern: The Forest Service should concurrently address related policies and regulations. 2-28

The Roadless Area Conservation Rule, Planning Regulations, and road management policies 2-28

83. Public Concern: The Forest Service should withdraw the Roadless Area Conservation Rule, the revised Roads Policy, and the revised Planning Regulations. 2-28

84. Public Concern: The Forest Service should clarify how the topic of unroaded areas will be integrated into the Planning Regulations and the Forest Service Manual and Handbook..... 2-28

Other Policy and Project Concerns – Specific Policies..... 2-28

Forest Service Manual 2-29

85. Public Concern: The Forest Service should consult the 7703.1 Forest Service Manual for roadless area management direction..... 2-29

86. Public Concern: The Forest Service should coordinate review of the Roadless Area Conservation Rule with review of the Forest Service Manual 7710 revision..... 2-29

Because they have complementary direction 2-29

Quincy Library Group 2-29

87. Public Concern: The Forest Service should support the Quincy Library Group legislation..... 2-29

Recreation Agenda 2-30

88. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule conforms to the Recreation Agenda. 2-30

Roads Policy 2-30

89. Public Concern: The Forest Service should support the Roads Policy.....2-30

90. Public Concern: The Forest Service should consider the cumulative effects of the Roads Policy in combination with the Roadless Area Conservation Rule.2-30

91. Public Concern: The Forest Service should inform the public regarding the impact of the Roads Policy on management of inventoried roadless areas.2-30

92. Public Concern: The Forest Service should coordinate the Roads Policy with the Roadless Area Conservation Rule.....2-30

93. Public Concern: The Forest Service should decide roadless area management only after completion of the Roads Policy.....2-31

Sierra Nevada Framework.....2-31

94. Public Concern: The Forest Service should support the Sierra Nevada Framework decision.2-31

Other.....2-32

95. Public Concern: The Forest Service should incorporate rulemaking 65 FR 11680m 11682 into future planning efforts.2-32

 With respect to the requirement to consult with affected state, tribal, and local governments in identifying transportation needs.....2-32

96. Public Concern: The Forest Service should manage the forests with the pre-1994 direction.2-32

APPEALS AND LITIGATION.....2-33

 Appeals and Litigation General2-33

 97. Public Concern: The appeals process should be limited.2-33

 Regarding implementation of new policies at the local level2-33

 Require litigants to submit to arbitration before their cases can proceed to court2-33

 Restrict litigation to entire management plans, not individual sales or aspects thereof2-33

 98. Public Concern: Time limitations should be imposed on litigation.2-34

 99. Public Concern: The Forest Service should not allow litigation to sidetrack the legitimate forest planning process as defined by the National Forest Management Act.2-34

 100. Public Concern: The Forest Service should not make settlement agreements with groups who bring ‘citizen lawsuits’ to curtail activities.....2-34

 101. Public Concern: The Forest Service should develop a land-use clearinghouse to sort out issues before litigation.....2-34

 102. Public Concern: The Forest Service should not allow Environmental Protection Agency data in court.2-34

 As it points to a lack of due process.....2-34

 Appeals and Litigation – Specific Cases2-35

Roadless Area Conservation Rule.....2-35

 103. Public Concern: The Forest Service should implement the existing Roadless Area Conservation Rule.2-35

To eliminate prolonged and costly legal battles..... 2-35

104.Public Concern: The Forest Service should recognize that any attempt to modify the Roadless Area Conservation Rule through settlement of litigation would be illegal..... 2-35

105.Public Concern: The Forest Service should pay greater heed to public comment..... 2-36

To avoid litigation..... 2-36

106.Public Concern: The Forest Service should delay any decision on the Roadless Area Conservation Rule until judicial review. 2-36

So that the impacts of proposed management can be analyzed against the appropriate baseline 2-36

107.Public Concern: The Forest Service should meet stated objectives presented in its review of the Roadless Area Conservation Rule to the U.S. District Court. 2-37

108.Public Concern: The Forest Service should address issues related to the legal challenge brought by North Dakota interests. 2-37

State-granted public rights-of-way along section lines..... 2-37

Description of the roadless issue as it applies to the North Dakota litigation is inaccurate 2-38

Roadless areas recommended as wilderness in the North Dakota draft plan revision were also recommended as roadless areas in the Roadless Area Conservation Rule..... 2-38

The Roadless Area Conservation Rule failed to recognize the extensive road system in areas in North Dakota identified as roadless..... 2-38

Other Cases..... 2-38

109.Public Concern: The Forest Service should disclose its role in the Luppi case. 2-38

OTHER LEGAL CONCERNS..... 2-39

Other Legal Concerns General..... 2-39

110.Public Concern: The Forest Service should recognize that it has only as much authority to make law as may be delegated to it by Congress. 2-39

To maintain its legitimacy with the public..... 2-39

111.Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule..... 2-40

Because it fails to adhere to existing laws, regulations, and policies.... 2-40

112.Public Concern: The Forest Service should develop a new national roadless rule that is fully compliant with the law. 2-40

113.Public Concern: The Forest Service should comply with existing federal laws, acts, and regulations..... 2-41

So states, communities, organizations, and individuals may benefit from the entire range of uses..... 2-41

114.Public Concern: Legal criteria must be developed which strictly defines what government agencies and private corporations can and cannot do on public land. 2-41

Because both the Forest Service and the Bureau of Land Management have shown themselves incapable of protecting the environment2-41

115.Public Concern: The Forest Service should support the consolidation of existing federal legislation and rules.....2-41

116.Public Concern: The Forest Service should stop trying to enact legislation through changing rules and regulations in the Federal Register.....2-41

117.Public Concern: The Forest Service should require foresters to review their assigned territory annually and make management recommendations to their supervisors.....2-42

For the purpose of reviewing and updating relevant laws, regulations, and policies.....2-42

118.Public Concern: The Forest Service should avoid extreme interpretations of environmental laws.2-42

The U.S. Constitution2-42

119.Public Concern: The Forest Service should ensure that the Roadless Area Conservation Rule is in line with the U.S. Constitution.2-42

120.Public Concern: The Forest Service should recognize the U.S. Constitution’s doctrine of states’ sovereignty.....2-43

121.Public Concern: The Forest Service should review the U.S. Constitution’s doctrine of states’ rights before considering any actions affecting Revised Statute 2477 roads.2-43

122.Public Concern: The Forest Service should recognize that, under the U.S. Constitution, the government may only own land for forts, post offices, and other legitimate needs.2-43

123.Public Concern: The Forest Service should acknowledge that federal ownership of land is not a violation of the U.S. Constitution’s doctrine of states’ sovereignty.....2-43

124.Public Concern: The Forest Service should comply with the establishment clause of the First Amendment.....2-44

By avoiding management based on religious values2-44

125.Public Concern: The Forest Service should comply with the commerce clause in the U.S. Constitution.....2-44

By avoiding any policy that would make it easier to harvest timber in one state than in another.....2-44

126.Public Concern: The Forest Service should honor the Second Amendment.....2-44

127.Public Concern: The Forest Service should abide by the Tenth Amendment.....2-44

128.Public Concern: The Forest Service should consider the constitutional impacts of one administration summarily dismissing the previous administration’s rulings.....2-45

Federal Laws, Acts, and Policies2-45

Administrative Procedures Act.....2-47

129. Public Concern: The Administration should comply with the Administrative Procedures Act..... 2-47

 By providing adequate information and time to comment..... 2-47

 By providing effective public process in promulgating rules 2-47

Alaska National Interest Land Conservation Act..... 2-47

130. Public Concern: The Forest Service should comply with the Alaska National Interest Lands Conservation Act..... 2-47

 By adequately analyzing impacts of a national roadless rule on Alaska’s national forests..... 2-47

 By excluding the Tongass National Forest from the final rule..... 2-48

 By foregoing sweeping national level withdrawals such as the Roadless Area Conservation Rule 2-48

 By foregoing any attempt to set aside lands in Alaska outside the National Forest Management Act planning regulations 2-48

 By not recommending anymore areas for wilderness designation in Alaska..... 2-49

 By foregoing any further roadless area review and evaluation in Alaska..... 2-49

 By foregoing any further roadless reviews on the Tongass National Forest 2-49

 By not closing areas of more than 5,000 acres without congressional approval..... 2-49

 By providing reasonable and timely access to inholdings..... 2-50

131. Public Concern: The Alaska National Interest Land Conservation Act should be amended. 2-50

 To allow ownership in inventoried roadless areas without roaded access 2-50

132. Public Concern: The Forest Service should not use the Alaska National Interest Land Conservation Act as an excuse to grant access. 2-50

Alaska Native Claims Settlement Act..... 2-50

133. Public Concern: The Forest Service should comply with the Alaska Native Claims Settlement Act. 2-50

 By allowing access to American Indian land inholdings..... 2-50

134. Public Concern: The Forest Service should clarify the rights specified to Alaska Native Claims Settlement Act corporations. 2-50

Americans with Disabilities Act 2-51

135. Public Concern: The Forest Service should comply with the Americans with Disabilities Act. 2-51

 By providing adequate access..... 2-51

 To avoid the threat of litigation 2-52

Clean Air Act..... 2-52

136. Public Concern: The Forest Service should comply with the Clean Air Act. 2-52

Clean Water Act..... 2-52

137. Public Concern: The Forest Service should comply with the Clean Water Act.....2-52
 By including in management plans roads that cross streams or wetlands2-52
 By obtaining the necessary permits and exemptions for closing forest system roads.....2-52

138. Public Concern: The Forest Service should comply with the Clean Water Act and the Endangered Species Act.2-53
 By not Removing timber or building roads2-53

139. Public Concern: The Forest Service should integrate the Clean Water Act and the Endangered Species Act early in the forest planning process.2-53

140. Public Concern: The Forest Service should not use the Clean Water Action Plan as a guideline for roadless area management.2-53
 Until current litigation over its implementation has been settled and its impacts have been analyzed under the National Environmental Policy Act2-53

Conservation and Reinvestment Act.....2-53

141. Public Concern: The Forest Service should encourage the Senate to pass the Conservation and Reinvestment Act.2-53
 If stakeholders are not allowed to remove timber2-53

142. Public Concern: The Forest Service should delay any decisions regarding the Roadless Area Conservation Rule until the Senate votes on its version of the Conservation and Reinvestment Act.2-54

Enabling Act.....2-54

143. Public Concern: The Forest Service should comply with the Enabling Act.2-54
 By providing a continuous supply of timber and preserving the watershed.....2-54

Endangered Species Act2-54

144. Public Concern: The Forest Service should comply with the Endangered Species Act.2-54

145. Public Concern: The Forest Service should consider that the Roadless Area Conservation Rule will jeopardize compliance with the Endangered Species Act.2-54
 Because it will reduce access for regular inspection for diseases and pests.....2-54

146. Public Concern: The Forest Service should clarify the relationship of the Endangered Species Act to international environmental legislation.2-54

147. Public Concern: The Endangered Species Act should be revised.....2-55
 Because it does not stop evolution.....2-55
 Because it harms resource industries, recreation, and agriculture2-55
 Because it is being used by groups as a tool against traditional uses of forest lands2-56

Because it has not been established long enough to obtain the necessary data to declare some species endangered..... 2-56

To eliminate the principle that habitat is more important than use..... 2-56

To allow an automatic exemption to protect life and property..... 2-56

148.Public Concern: The Endangered Species Act should be eliminated in its current form..... 2-57

Because of its impact on private property rights 2-57

Because of its role in closing roads 2-57

Because the science is flawed 2-57

149.Public Concern: The Forest Service should support legislation that prevents litigation over the Endangered Species Act and reimbursement of legal fees..... 2-57

Encourage the repeal of the citizen suit provision of the Endangered Species Act..... 2-58

150.Public Concern: The Forest Service should consider that protection of unroaded areas on federal lands has provided state and private lands more latitude for management under the Endangered Species Act. 2-58

Federal Advisory Committee Act..... 2-58

151.Public Concern: The Forest Service should comply with the Federal Advisory Committee Act. 2-58

By avoiding closed-door sessions with targeted groups..... 2-58

152.Public Concern: The Forest Service should seek removal of the bureaucratic requirements of the Federal Advisory Committee Act. ... 2-58

To facilitate formation of forest-level advisory committees 2-58

Forest and Rangeland Renewable Resource Planning Act 2-59

153.Public Concern: The Forest Service should comply with the Forest and Rangeland Renewable Resource Planning Act. 2-59

By addressing roadless area management in the forest planning process..... 2-59

By not managing roadless areas as de facto wilderness..... 2-59

Knutson-Vandenberg Act..... 2-59

154.Public Concern: The Knutson-Vandenberg Act should be repealed..... 2-59

Because it aggravates conflicting interests..... 2-59

Mining Laws General 2-60

155.Public Concern: The Forest Service should recognize its legal obligation to maintain roaded access for mineral exploration and development. 2-60

As required by multiple laws and regulatory acts 2-60

Mining Law of 1872 2-65

156.Public Concern: The Forest Service should comply with the Mining Law of 1872. 2-65

To remain free of foreign dependence on raw materials 2-65

By maintaining access for mineral exploration and development 2-65

By allowing unrestricted modes of transportation 2-66

By not materially interfering with prospecting, mining, or mineral processing.....2-66

157.Public Concern: The Mining Act of 1872 should be revised.2-66

 To grant royalties and leasing fees to government managers commensurate with those received from privately owned land2-66

158.Public Concern: The Mining Act of 1872 should be repealed.2-66

Mining and Mineral Policy Act.....2-66

159.Public Concern: The Forest Service should comply with the Mining and Mineral Policy Act.2-66

 By maintaining access to mineral deposits in National Forest System lands.....2-66

Multiple Use and Sustained Yield Act.....2-67

160.Public Concern: The Forest Service should comply with the Multiple Use and Sustained Yield Act.....2-67

 By ensuring that forest plans are in compliance.....2-67

 By maintaining access2-67

 By providing for a combination of uses in whatever matrix will best meet the needs of the American people.....2-67

 By using multiple-use sustainability as the standard rather than ecosystem sustainability.....2-67

 By giving equal consideration to all resources2-68

161.Public Concern: The Forest Service should clarify how the Roadless Area Conservation Rule complies with the Multiple Use and Sustained Yield Act.2-68

162.Public Concern: The Forest Service should analyze how many wild fires in 2000 occurred in study areas and whether the Multiple Use and Sustained Yield Act has been suspended.2-68

163.Public Concern: The Forest Service should reevaluate the legal mandate to provide sustained yield of renewable resources.2-68

National Forest Protection and Restoration Act.....2-68

164.Public Concern: The Forest Service should comply with the proposed National Forest Protection and Restoration Act.....2-68

 By eliminating commercial logging and diverting subsidies to true restoration2-68

 To eliminate future management errors2-69

Northern Rockies Ecosystem Protection Act2-69

165.Public Concern: The Forest Service should support the Northern Rockies Ecosystem Protection Act, HR 488.....2-69

 To protect remaining pristine lands2-69

Organic Act.....2-69

166.Public Concern: The Forest Service should comply with the Organic Act.....2-69

 By managing for multiple uses2-69

Regulatory Flexibility Act2-70

167.Public Concern: The Forest Service should comply with the Regulatory Flexibility Act.2-70

By providing a regulatory flexibility analysis 2-70

By stating the legal basis for the proposed action and describing
alternatives which minimize the economic impact on small
businesses 2-71

Revised Statute 2477..... 2-72

168.Public Concern: The Forest Service should comply with Revised
Statute 2477. 2-72

With respect to road closures 2-72

By acknowledging all identified Revised Statute 2477 rights-of way
as roads..... 2-72

169.Public Concern: The federal government should issue easement
deeds that title insurance companies will insure. 2-73

Including Revised Statute 2477 routes 2-73

170.Public Concern: The Forest Service should defer action on
roadless area management until local communities complete
studies of Revised Statute 2477 claims. 2-73

171.Public Concern: The Forest Service should clarify its position on
Revised Statute 2477 roads..... 2-73

With respect to roadless areas 2-73

172.Public Concern: The Forest Service should consult with counties
regarding Revised Statute 2477 roads. 2-73

Sierra County 2-73

173.Public Concern: The Forest Service should comply with the
Revised Statute 2477 (RS 2477) savings provisions and the
Section 108 prohibition against redefining what an RS 2477 road
is.2-74

By respecting all valid existing rights 2-74

Tongass Timber Reform Act 2-74

174.Public Concern: The Forest Service should comply with the
Tongass Timber Reform Act. 2-74

By excluding the Tongass National Forest from the final rule..... 2-74

By providing an adequate volume of timber 2-75

175.Public Concern: The Forest Service should acknowledge legal
rulings that the Tongass Timber Reform Act does not require
unconditional timber sale offerings. 2-75

By including the Tongass National Forest from a national rule..... 2-75

Weeks Act..... 2-76

176.Public Concern: The Forest Service should comply with the Weeks
Act. 2-76

By managing for multiple uses 2-76

Wild Horse Act 2-76

177.Public Concern: The Wild Horse Act should be revised..... 2-76

Due to its role in increasing the horse population 2-76

Wilderness Acts 2-76

178.Public Concern: The Forest Service should comply with the
Wilderness Act..... 2-76

Regarding land inventory and wilderness recommendations2-76
 By not creating de facto wilderness areas.....2-76
 179.Public Concern: The Forest Service should comply with the
 Wyoming Wilderness Act.....2-77
 By not creating de facto wilderness areas.....2-77
 By not establishing buffer zones2-77
 By not conducting any further roadless area review and evaluation2-77
 180.Public Concern: The Forest Service should comply with the
 Oregon-Washington Wilderness Act.....2-78
 By honoring its promised exchange of 86,000 acres of timber
 ground for designated wilderness area2-78
Executive Orders2-78
 181.Public Concern: The Forest Service should comply with Executive
 Order 12866.2-78
 By identifying a need for a new regulation2-78
 182.Public Concern: The Forest Service should comply with Executive
 Order 13211.2-79
 By preparing a Statement of Energy Effects2-79
 By ensuring an adequate land base is available for leasing with
 reasonable stipulations2-80
 183.Public Concern: The Forest Service should reevaluate its
 application of Executive Orders 11644 and 11989.2-80
 With respect to resolution of conflicts between users.....2-80
 184.Public Concern: The Forest Service should comply with executive
 orders directing federal agencies to expedite permitting and to
 reduce impediments to energy development.....2-80
Other.....2-80
 185.Public Concern: The Forest Service should comply with Public
 Law 96-550.....2-80
 By rescinding the Roadless Area Conservation Rule.....2-80
 186.Public Concern: The Forest Service should comply with Public
 Law 105-359.....2-81
 By providing recreation and outdoor opportunities for the
 handicapped, elderly, and physically impaired.....2-81
 187.Public Concern: The Forest Service should comply with the 1997
 guidance document by the Council on Environmental Quality
 regarding environmental justice.....2-81
 As it relates to equal treatment and access to public lands.....2-81

CHAPTER 3 PUBLIC INVOLVEMENT 3-1

INFORMED DECISIONMAKING (*QUESTION 1*)3-1
 Informed Decisionmaking General3-1
 188.Public Concern: The Forest Service should recognize that the
 Roadless Area Conservation Rule is a good example of informed
 decisionmaking.....3-1

189.Public Concern: The Forest Service should recognize that informed decisionmaking processes have occurred under the National Forest Management Act and state wilderness bill processes. 3-2

190.Public Concern: The Forest Service should use the best available means within existing constraints in decisionmaking. 3-2

191.Public Concern: The Forest Service should streamline the decisionmaking process. 3-3
 To eliminate long delays..... 3-3

192.Public Concern: The Forest Service should not make decisions merely to avoid litigation. 3-3

193.Public Concern: The Forest Service should make roadless area decisions through an allocation decision process. 3-3

194.Public Concern: The Forest Service should issue a preliminary document for public review. 3-3

Decisionmaking Authority 3-4

The Forest Service..... 3-5

195.Public Concern: The Forest Service Chief should retain decisionmaking authority. 3-5
 Over road construction in roadless areas 3-5

196.Public Concern: The Forest Service should decide the management direction for roadless areas..... 3-6
 Rather than Congress 3-6
 Rather than politicians 3-6
 Rather than the public 3-6
 Because it has a duty to apply its expertise..... 3-7
 As professionals, rather than referees between competing interests 3-7
 By developing uniform direction for the procedures to be used in roadless area management decisionmaking 3-7
 By conducting large regional meetings of forest officials to decide the use of roadless areas 3-7
 By allowing each national forest to assume the lead responsibility for developing management proposals..... 3-7
 By giving the district ranger greater decisionmaking authority..... 3-7
 By allowing local forest managers to have complete decisionmaking authority..... 3-8

197.Public Concern: The Forest Service should not give local forest managers greater latitude in management decisions. 3-8

198.Public Concern: The Forest Service should insulate local officials from negative repercussions of decisions. 3-8

199.Public Concern: The Forest Service should clarify its authority and relationship with Congress..... 3-9

200.Public Concern: The Forest Service should clarify the discretionary authority of the responsible official..... 3-9
 And cease delegating authority to the responsible official without regulations requiring an EIS and public comment 3-9

201. Public Concern: The Forest Service should adhere to its agency mandate. 3-9

The Legislative Branch 3-9

202. Public Concern: Congress should manage federal lands. 3-9

 To allow input from constituents 3-10

 To address local conditions 3-10

 To allow a change in management direction with each election, and to end the present stalemate over roadless area management 3-10

 To maintain consistency in forest plans 3-10

 Due to the polarization of the issues 3-10

203. Public Concern: The Forest Service should recognize Congress’s authority to create, modify, or terminate withdrawals of public lands. 3-10

 To ensure the continued integrity of national resource management systems 3-10

204. Public Concern: Congress should review all land use policies adopted by the Forest Service. 3-11

 So that the public can hear the debates 3-11

205. Public Concern: The Forest Service should make recommendations regarding forest management to elected representatives for their approval. 3-11

206. Public Concern: The Forest Service should submit forest plans to a local vote, then submit voter-approved plans to Congress for approval. 3-11

State, County, and City Governments 3-11

207. Public Concern: States should manage federal lands. 3-11

208. Public Concern: The Forest Service should not allow local government entities to have a role in decisionmaking. 3-12

 Because excessive local control leads to exploitation-driven political pressure 3-12

Other 3-12

209. Public Concern: The Forest Service should allow various groups to be decision makers. 3-12

 Disinterested, unaffiliated individuals 3-12

 A committee of experts 3-12

 Scientists and other Forest Service specialists who work with the land 3-12

 A panel of appointed people representing different interests 3-12

 A committee appointed by county commissions. 3-12

Trust and Integrity 3-13

210. Public Concern: The Forest Service should maintain high ethical standards. 3-13

211. Public Concern: The Forest Service should avoid making decisions in secrecy. 3-13

 Regarding management of roadless areas 3-13

212.Public Concern: The Forest Service should avoid making decisions based on preconceived outcomes. 3-13

213.Public Concern: The Forest Service should keep politics out of the decisionmaking process. 3-13

214.Public Concern: The Forest Service should consider that the way it handled the Roadless Area Conservation Rule has severely damaged its public relations and community support. 3-14

215.Public Concern: The Forest Service should consider that local managers felt constrained to identify roadless areas during development of the Roadless Area Conservation Rule. 3-15

216.Public Concern: The Forest Service should address the public’s suspicions regarding the *real* motivation behind this round of comment. 3-15

217.Public Concern: The Forest Service should acknowledge its bias toward commercial interests. 3-16

218.Public Concern: The Forest Service should avoid asking the same questions until it gets the desired answer. 3-17

219.Public Concern: The Forest Service should work to regain the public’s confidence. 3-17

The Forest Service Chief..... 3-17

By maintaining its objectivity..... 3-18

By being honest about the roaded/unroaded status of areas 3-18

By considering public concerns and managing users and resources fairly 3-19

220.Public Concern: The Forest Service should honor existing agreements between citizens and the government..... 3-19

221.Public Concern: The Forest Service should be abolished or replaced..... 3-19

Local vs. National Decisionmaking..... 3-20

Local vs. National Decisionmaking General..... 3-21

222.Public Concern: The Forest Service should review the Western Governors Association 1999 Policy Resolution, *Principles for Environmental Management in the West*. 3-21

For guidance in resolving the tension between national and local forest planning 3-21

223.Public Concern: The Forest Service should tailor the level of decisionmaking to the scope of the issues. 3-21

National level decisionmaking for issues of national importance, forest level decisionmaking for issues specific to the forest, and site-specific decisionmaking for projects within the forest 3-21

Local (Forest Level) Decisionmaking 3-21

224.Public Concern: The Forest Service should define what and who comprises “local forest planning.” 3-21

Because virtually all national forests span numerous counties, local jurisdictions, and in many cases, state boundaries 3-21

225. Public Concern: The Forest Service should make management decisions at the local level. 3-22

 Because it is not the role of the Washington Office to micromanage resources 3-22

 Because national management will not result in protection of the values people really care about..... 3-23

 To ensure that government actions do not interfere with the objectives of local planning efforts 3-23

 Because it is required by the National Forest Management Act..... 3-23

 Because different areas have different conditions and needs 3-24

 Because local planners have a better understanding of local needs and concerns regarding land management 3-25

 Because different areas have different use demands 3-26

 Because a management change in roadless areas may adversely affect the remaining areas of the forest..... 3-26

 Because professional forest managers are trained for many years 3-26

 Because greater weight should be placed on the greater forest experience..... 3-27

 Because local residents have the most knowledge about the resources and the most to lose if a bad decision is made 3-27

 Because local residents know how their forests have been used through time 3-27

 Because roadless areas are vital to adjacent communities..... 3-27

 Because national planning does not allow an adequate timeframe to consider impacts on individual roadless areas 3-28

 Because local planners are best able to deal with problems in a timely manner..... 3-28

 In spite of the threat of litigation from Wilderness Advocacy Groups 3-28

226. Public Concern: The Forest Service should consider that localizing decisionmaking requires that current law be revised. 3-28

227. Public Concern: The Forest Service should allow local decisionmaking only if an easily accessible appeals process is in place..... 3-28

228. Public Concern: The Forest Service should develop regional guidance for implementing the Roadless Area Conservation Rule..... 3-28

 Which recognizes the different conditions and management needs of forests in different areas of the country 3-29

229. Public Concern: The Forest Service should allow local districts to manage forests under a sustainable yield harvest plan..... 3-29

 To enable districts to be economically self-sufficient..... 3-29

230. Public Concern: The Forest Service should allow individual national forests to opt out of the Roadless Area Conservation Rule. 3-29

 Or to make local exceptions to the Rule’s prohibitions 3-29

231. Public Concern: The Forest Service should not allow individual forests to opt out of the Roadless Area Conservation Rule. 3-30

232. Public Concern: The Forest Service should recognize that “local expertise” may or may not be superior to professional Forest Service expertise. 3-30
 Depending on the motivation..... 3-30

233. Public Concern: The Forest Service should clarify how local expertise will provide more reliable information than was gathered for the Roadless Area Conservation Rule..... 3-30
Local (Forest Level) Decisionmaking with National Guidance 3-30

234. Public Concern: The Forest Service should ensure that local forest planning adheres to the Roadless Area Conservation Rule. 3-30
 By not allowing local forest planning to make exceptions to the Roadless Area Conservation Rule 3-31
 By maintaining a high threshold for granting exceptions 3-31

235. Public Concern: The Forest Service should evaluate local decisions regarding inventoried roadless areas within the context of the Roadless Area Conservation Rule..... 3-32
 With regular and on-going natural resource inventories and assessments 3-32

236. Public Concern: The Forest Service should establish general guidelines for the consideration of roadless areas..... 3-32
 While allowing exceptions as approved by the Secretary of Agriculture 3-32
 While allowing forest supervisors to nominate areas suitable for designation 3-32
 While allowing forest plans to allocate lands 3-33
 While allowing forest plans to address specific forest activities that are both feasible and sustainable 3-33
 While allowing forest plans to determine the relative merits of their roadless areas and need for roads 3-33

237. Public Concern: The Forest Service should use local knowledge to enhance national planning..... 3-33
National Decisionmaking..... 3-33

238. Public Concern: The Forest Service should make management decisions at the national level. 3-33
 Because national forests are national resources 3-33
 Because decisions must be in the best interest of the whole country... 3-34
 Because a uniform policy is needed 3-35
 Because the fragmentation created by roads transcends local and regional management..... 3-36
 Because federal dollars support the Forest Service and the lands it administers 3-36
 Because local interests may be tied to the profit motive of local interests and not represent the collective will of the state or the nation..... 3-36
 Because the forest planning process has failed to adequately protect roadless areas 3-36

Because local planning has resulted in an \$8.5 billion road maintenance backlog 3-38

Because regional or national personnel have better access to qualified scientific opinion 3-38

Because local planners are often incompetent..... 3-38

Because the political will to protect roadless areas can not be found at the local level 3-38

Because allowing local decisionmaking would weaken the Roadless Area Conservation Rule 3-38

With local forest planning serving in an advisory and technical assistance capacity 3-39

239.Public Concern: The Forest Service should make management decisions *only* at the national level. 3-39

With no room for local interpretation 3-39

240.Public Concern: The Forest Service should not change the management guidelines of the Roadless Area Conservation Rule to conform to local government plans..... 3-39

The Forest Planning Process..... 3-39

The Forest Planning Process General..... 3-40

241.Public Concern: The Forest Service should consider that the Secretary of Agriculture’s five principles imply that only the forest planning process must be used for managing Roadless Areas. 3-40

242.Public Concern: The Forest Service should consider that roadless issues have been addressed in the forest planning process. 3-41

243.Public Concern: The Forest Service should recognize that implementation of one of the Roadless Area Conservation Rule action alternatives amounts to an amendment to or modification of forest plans..... 3-41

The Inyo Forest Plan 3-41

244.Public Concern: The Forest Service should ensure that the forest planning process is interdisciplinary and based on site-specific ecosystem considerations. 3-41

245.Public Concern: The Forest Service should clarify that, with the Roadless Area Conservation Rule, many management decisions would continue to be made through the forest planning process..... 3-41

246.Public Concern: The Forest Service should ensure that decisions reached through the local planning process cannot easily be changed by Congress..... 3-42

247.Public Concern: The Forest Service should recognize that the local forest planning process is complementary and consistent with the Roadless Area Conservation Rule. 3-42

And can proceed in tandem with the full implementation of the Rule 3-42

248.Public Concern: The Forest Service should recognize that the National Forest Management Act does not mandate local forest planning..... 3-42

249. Public Concern: The Forest Service should consider that, by its own actions, it has disabled itself from managing roadless areas through the normal planning process..... 3-43

The Forest Planning Process – Development/Implementation of Forest Plans..... 3-43

250. Public Concern: The Forest Service should ensure that any national forest without a forest plan in place immediately begin the public process of creating one. 3-43

Because forests with plans in place do not need additional roadless area protection 3-43

251. Public Concern: The Forest Service should ensure that forest plans are amended and/or revised in a timely manner. 3-43

252. Public Concern: The Forest Service should consider the time and money that has already been invested in forest plan development. ... 3-44

253. Public Concern: The Forest Service should make efforts to remove institutional impediments to implementing existing forest plans..... 3-44

254. Public Concern: The Forest Service should use the National Forest Management Act processes in developing forest plans rather than the Forest Service Manual 7710 road management policy. 3-44

The Forest Planning Process – Public Participation 3-44

255. Public Concern: The Forest Service should ensure all stakeholders equal access to the forest planning process..... 3-44

By proactively seeking out stakeholders and inviting their participation 3-44

256. Public Concern: The Forest Service should encourage timely participation in the forest planning process..... 3-44

257. Public Concern: The Forest Service should ensure that forest plans reflect public concerns..... 3-45

258. Public Concern: The Forest Service should recognize local contributions to forest plans. 3-45

259. Public Concern: The Forest Service should open all local forest planning processes to the American public at large..... 3-45

By posting local decisions on the Internet for all to review and comment on..... 3-45

The Forest Planning Process – Its Appropriate Role 3-46

260. Public Concern: The Forest Service should consider the appropriate role of the forest planning process..... 3-46

To identify local concerns, attitudes, issues, and problems that might otherwise remain unknown at the national level 3-46

To assess the impacts of a proposed action 3-46

To resolve roadless issues 3-46

To maintain maximum amounts of remaining roadless areas 3-46

To protect roadless areas..... 3-46

To restore natural processes to roadless areas 3-47

To protect public lands from undue use..... 3-47

To implement sustainable forest management practices 3-47

To determine allowable activities in roadless areas 3-47

To address activities not regulated by the Roadless Area Conservation Rule..... 3-48

To determine roadless suitability, recreation opportunity, and desired future conditions 3-48

To collect data and enforce federal regulations..... 3-48

To implement national directives 3-48

To implement and enforce existing laws, rules, and regulations 3-49

To carry out approved plans..... 3-49

To serve as the mediator between individuals and the Forest Service in implementing the Roadless Area Conservation Rule 3-49

To identify situations that meet the exceptions allowed in the Roadless Area Conservation Rule 3-50

To identify roadless areas that are not in the current inventory and roadless areas that need to be restored..... 3-50

To address management of uninventoried and unroaded areas 3-50

To determine roadless area boundaries and develop site-specific resource prescriptions compliant with the Roadless Area Conservation Rule..... 3-50

To consider each roadless area and how it is intertwined with surrounding lands..... 3-51

To identify local resources that may merit additional protection 3-51

To address management of national grasslands..... 3-51

To focus on education and research 3-51

To educate communities on the ecological importance of roadless areas 3-51

261. Public Concern: The Forest Service should recognize that the appropriate role of the forest planning process cannot be determined until changes to the Planning Regulations are finalized. 3-52

WORKING TOGETHER (QUESTION 2) 3-53

Adequacy of Public Involvement Processes/Methods..... 3-53

Adequacy of Public Involvement Processes/Methods General..... 3-55

262. Public Concern: The Forest Service should reevaluate public participation processes..... 3-55

To ensure fairness 3-55

To ensure honesty 3-55

263. Public Concern: The Forest Service should enhance the public participation process..... 3-55

By ensuring that it is open and comprehensive..... 3-55

By adequately publicizing proposed actions and opportunities to comment 3-56

By utilizing mass media..... 3-56

By accepting input through all mediums of communication..... 3-57

By using an informal method of communication..... 3-57

By adequately soliciting public involvement..... 3-57

By using surveys to solicit public comment 3-57

By conducting nationwide polling 3-57

By using simple English rather than agency jargon 3-58

By giving due consideration to all relevant information and perspectives 3-58

By emulating the Bureau of Land Management 3-58

By emulating the White Mountain National Forest..... 3-58

By requiring participants to interact 3-58

264. Public Concern: The Forest Service should not confuse the large number of public meetings held and letters received for the Roadless Area Conservation Rule as quality public involvement. 3-58

As mandated by the National Environmental Policy Act 3-58

265. Public Concern: The Forest Service should recognize that public involvement efforts for the Roadless Area Conservation Rule were more than adequate..... 3-59

266. Public Concern: The Forest Service should recognize that the public involvement process under the National Environmental Policy Act is biased in favor of local interests. 3-60

Adequacy/Availability of Information 3-60

267. Public Concern: The Forest Service should adequately notify the public of pending management proposals. 3-60

Notify people on its mailing list of pending management proposals 3-60

Maintain a current mailing list 3-60

Notify students through university contacts or rangers 3-60

Post all information on local and national web sites, including opportunities to respond 3-60

Ensure that the responding email address works 3-61

268. Public Concern: The Forest Service should address the biased and inadequate information on the roadless area homepage. 3-61

269. Public Concern: The Forest Service should establish consistent terminology and reporting procedures for advance notices. 3-62

270. Public Concern: The Forest Service should provide site-specific information. 3-62

To allow informed comment 3-62

Showing the relative importance of specific roadless areas 3-62

271. Public Concern: The Forest Service should not use the Federal Register to announce comment periods. 3-62

Adequacy of Public Meetings 3-63

272. Public Concern: The Forest Service should conduct public meetings. 3-63

That are legitimate 3-63

That comply with federal rules 3-63

In a fair and impartial manner 3-63

At convenient times and places 3-63

With adequate notice 3-64

That discuss local areas of concern 3-64

That discuss possible modifications to the Roadless Area
Conservation Rule..... 3-64

Instead of soliciting only written comments 3-64

273.Public Concern: The Forest Service should conduct as many
public meetings for the Advance Notice of Proposed Rulemaking
as were conducted for the Roadless Area Conservation Rule. 3-64

274.Public Concern: The Forest Service should conduct fewer, more
productive public meetings. 3-64

275.Public Concern: The Forest Service should improve the way forest
personnel conduct public meetings. 3-65

Ensure that personnel are well informed regarding proposed
actions..... 3-65

Ensure that personnel use unbiased language 3-65

276.Public Concern: The Forest Service should improve citizen
participation in public meetings. 3-65

Ensure that local citizens are adequately represented at meetings 3-65

Eliminate bribed attendance at meetings 3-65

Allow adequate speaking time at meetings 3-65

277.Public Concern: The Forest Service should conduct meetings on
the model of those held by the Sequoia and Kings Canyon
National Parks 3-65

278.Public Concern: The Forest Service should televise public
meetings..... 3-66

279.Public Concern: The Forest Service should conduct day-long
workshops. 3-66

280.Public Concern: The Forest Service should hold a national public
convention. 3-66

Adequacy of Comment Period 3-66

281.Public Concern: The Forest Service should allow an adequate
comment period..... 3-66

To ensure a fair and open process..... 3-66

282.Public Concern: The Forest Service should extend the comment
period. 3-66

To 90 days 3-66

To 120 days 3-67

To 180 days 3-67

To 240 days 3-67

283.Public Concern: The Forest Service should recognize that
extending the comment period would work against the Roadless
Area Conservation Rule. 3-67

284.Public Concern: The Forest Service should recognize that the
comment period for the Roadless Area Conservation Rule was too
short. 3-67

285.Public Concern: The Forest Service should recognize that an additional comment period would be insufficient to address the deficiencies in the Roadless Area Conservation Rule Final EIS. 3-68

286.Public Concern: The Forest Service should notify previous respondents to the Roadless Area Conservation Rule of the comment period for the Advance Notice of Proposed Rulemaking. 3-68

Adequacy of Timeframe 3-68

287.Public Concern: The Forest Service should recognize that the time frame for comment on the Roadless Area Conservation Rule was adequate. 3-68

288.Public Concern: The Forest Service should recognize that the time frame for developing the Roadless Area Conservation Rule was not adequate. 3-69

As evidenced by poor data and numerous mistakes 3-69

Use of Science/Best Information Available 3-69

289.Public Concern: The Forest Service should make decisions based on science. 3-69

Rather than politics. 3-70

Rather than a vote 3-70

By considering the benefits and costs of each action 3-70

By making better use of existing information 3-70

By acquiring sufficient data to understand the issues. 3-70

By verifying the content and validity of data 3-70

To avoid a one-size-fits-all conclusion. 3-70

To avoid bias in decisionmaking. 3-70

To balance ecosystem stability and economic activity. 3-71

290.Public Concern: The Forest Service should avoid relying on weak scientific analysis. 3-71

291.Public Concern: The Forest Service should recognize that the best available science regarding individual areas is maintained at the local level. 3-71

292.Public Concern: The Forest Service should recognize that science does not change with geographic location or political affiliation. 3-72

293.Public Concern: The Forest Service should avoid multiple studies on the same research topic or proposed management action. 3-72

To eliminate long delays. 3-72

294.Public Concern: The Forest Service should heed the counsel of scientific committees. 3-72

Review information from the Union of Scientists 3-72

Follow the recommendations of the Committee of Scientists regarding the planning process 3-73

Consult with the Union of Concerned Scientists regarding the need to preserve biodiversity. 3-73

295.Public Concern: The Forest Service should provide access to science and research regarding roadless areas. 3-73

296.Public Concern: The Forest Service should not accept as scientific facts the anecdotes or opinions submitted by the public.3-73

297.Public Concern: The Forest Service should consider “The Roadless Area Initiative: Politics Makes Poor Policy.”3-73
 Because it is well grounded in facts, science, and breadth3-73

298.Public Concern: The Forest Service should scrutinize scientific studies submitted by representatives.3-74
 To validate the information3-74

299.Public Concern: The Forest Service should develop a sense of perspective when evaluating environmental impacts.....3-74
 To avoid arbitrary and capricious reasoning based on biased science3-74

Adequacy of Public Comment.....3-74

300.Public Concern: The Forest Service should recognize that there was adequate opportunity for public comment on the Roadless Area Conservation Rule.3-74

301.Public Concern: The Forest Service should recognize that the volume of comment received on the Roadless Area Conservation Rule was more than adequate.....3-75

302.Public Concern: The Forest Service should recognize that there has been sufficient local input.3-75

303.Public Concern: The Forest Service should explain its assertion that there was inadequate local input on the Roadless Area Conservation Rule.3-76

304.Public Concern: The Forest Service should consider that the only groups objecting to the adequacy of the public comment process for the Roadless Area Conservation Rule are those that don’t want it. 3-76

305.Public Concern: The Forest Service should recognize that there is inadequate opportunity to comment on the Advance Notice of Proposed Rulemaking.3-77

Analysis of Public Comment.....3-77

306.Public Concern: The Content Analysis Team should adequately analyze and report public comments.3-77
 So that the actual desires of respondents can be determined.....3-77

307.Public Concern: The Forest Service should quantitatively analyze public comment.3-77
 Accurately tabulate comments3-77
 Quantify how public opinion has changed since earlier planning processes in which roadless areas were addressed3-77

308.Public Concern: The Forest Service should create transcripts of public meetings.3-78

309.Public Concern: The Forest Service should verify the validity of organized response letters.3-78

310.Public Concern: The Forest Service should disclose the details of late submissions.3-78

Scope of Public Comment to be Considered 3-79

311.Public Concern: The Forest Service should respect the comments already received for the Roadless Area Conservation Rule. 3-79

By considering comments submitted for the Roadless Area Conservation Rule along with those submitted for the Advance Notice of Proposed Rulemaking 3-80

312.Public Concern: The Forest Service should include all previous comments regarding roadless area management in the record for the Advance Notice of Proposed Rulemaking. 3-80

Including the comments submitted by the Environmental Protection Agency on May 21, 1973..... 3-80

313.Public Concern: The Forest Service should not accept mail-in public comments..... 3-80

Because that enables groups to have undue influence 3-80

314.Public Concern: The Forest Service should disregard organized response letters. 3-81

Consideration of Public Comment..... 3-81

315.Public Concern: The Forest Service should consider all comments. .. 3-81

By giving equal consideration to every viewpoint 3-81

To ensure a fair and open process..... 3-81

Within the context of maintaining forest health 3-82

316.Public Concern: The Forest Service should not reject consideration of issues just because they were already addressed in the Roadless Area Conservation Rule Final EIS..... 3-82

317.Public Concern: The Forest Service should give all parties' comments equal weight. 3-82

Both local and national comments..... 3-82

Comments from all interest groups..... 3-82

Comments from organized response letters..... 3-83

318.Public Concern: The Forest Service should differentially weigh public comments..... 3-83

By giving greater weight to local and resource-dependent interests 3-83

By giving greater weight to professional foresters, wildlife biologists, and fire managers..... 3-83

By giving greater weight to individuals than to businesses..... 3-83

By giving less weight to organized response letters 3-84

By giving less weight to unfounded and bizarre viewpoints..... 3-84

By giving less weight to “non-participants” 3-84

By considering respondents' qualifications and implications of suggested courses of action..... 3-84

At public meetings 3-85

319.Public Concern: The Forest Service should consider special interest groups' comments with caution..... 3-85

Special interest group leaders do not necessarily reflect members' opinions 3-85

Special interest groups do not necessarily represent the views of the local community or of the public at large 3-85

320.Public Concern: The Forest Service should identify input from those with a monetary stake in the outcome. 3-85

321.Public Concern: The Forest Service should recognize that those with financial interests in forest resources have an incentive to submit detailed and aggressive responses..... 3-86

322.Public Concern: The Forest Service should evaluate the consideration it ought to give to the majority opinion. 3-86

Give serious consideration to the majority opinion 3-86

Decide the management of roadless areas through a public vote..... 3-86

Do not allow the public comment process to turn into a vote 3-86

Recognize that making decisions based on majority preference is a violation of the Agency’s congressionally mandated duty 3-87

323.Public Concern: The Forest Service should avoid relying on public opinion surveys. 3-87

Because they are error prone and unreliable 3-87

324.Public Concern: The Forest Service should consider material comments..... 3-87

As required by the National Environmental Policy Act 3-87

Response to Public Comment 3-88

325.Public Concern: The Forest Service should adequately respond to public comment. 3-88

Regarding specific roadless areas 3-88

To comply with the Council on Environmental Quality regulations 3-88

Other..... 3-89

326.Public Concern: Organizations which solicit comment for federal land policies should assure the public that all comments will be submitted to the appropriate agency. 3-89

Regardless of the position taken by the respondent 3-89

Public Involvement in Decisionmaking 3-89

Public Involvement in Decisionmaking General..... 3-91

327.Public Concern: The Forest Service should protect the right to public participation in forest planning..... 3-91

328.Public Concern: The Forest Service should establish strong lines of communication with the public..... 3-91

To understand how management affects communities 3-91

Because many people do not understand how decisions and lifestyle choices are related to land management 3-91

329.Public Concern: The Forest Service should be responsive to the public. 3-92

By addressing concerns from all sectors of society..... 3-92

330.Public Concern: The Forest Service should recognize that public involvement during development of the Roadless Area Conservation Rule was sufficient. 3-92

331. Public Concern: The Forest Service should consider that issues being raised now should have been raised during the public comment period for the Roadless Area Conservation Rule. 3-93
 To raise them afterward and then cry foul is contrary to the intent of the National Environmental Policy Act..... 3-93

332. Public Concern: The Forest Service should consider that those who are satisfied with the status quo might not participate. 3-93

333. Public Concern: The Forest Service should consider that the Roadless Area Conservation Rule expressly includes the requirement that input be sought from state and local officials, tribes, and any other interested parties..... 3-93

334. Public Concern: The Forest Service should list the tribes and communities that did not provide input on the Roadless Area Conservation Rule. 3-93

335. Public Concern: The Forest Service should require those who want to participate in forest management decisions to contribute to forest stewardship activities. 3-94

The Role of the General Public 3-94

336. Public Concern: The Forest Service should allow all citizens full access to the decisionmaking process. 3-94

337. Public Concern: The Forest Service should ensure that all interested parties have the opportunity to provide site-specific input regarding individual roadless areas. 3-94
 So that, given a recognizable local need in a specific area, an exception to the Roadless Area Conservation Rule may be provided..... 3-94

The Role of Local/Rural Residents 3-94

338. Public Concern: The Forest Service should solicit and consider local input..... 3-94

339. Public Concern: The Forest Service should allow adequate local input into scoping and planning. 3-95

340. Public Concern: The Forest Service should acknowledge that local concerns have been fully and adequately considered. 3-95

The Role of Special Interest Groups 3-95

341. Public Concern: The Forest Service should include environmental interest groups in the decisionmaking process. 3-95
 The Theodore Roosevelt Conservation Alliance 3-96

342. Public Concern: The Forest Service should recognize that conservation organizations have the same interests as all citizens. ... 3-96
 That is, to ensure good public policy and protection of finite resources..... 3-96

343. Public Concern: The Forest Service should consider putting environmental groups in charge of public involvement. 3-96
 Because they have a record of doing so successfully 3-96

344. Public Concern: The Forest Service should exclude environmental interest groups from the decisionmaking process..... 3-96

Environmental stakeholder councils.....3-96

345.Public Concern: The Forest Service should not pander to environmental interest groups.3-96

 Because they want to lock out the majority from public lands3-97

346.Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule was orchestrated by environmental groups.3-97

347.Public Concern: The Forest Service should not use environmental groups as moderators in the public involvement process.3-99

348.Public Concern: The Forest Service should recognize that conservation groups falsely appear to outnumber those favoring responsible land access.3-99

349.Public Concern: The Forest Service should exclude industrial interest groups from the decisionmaking process.3-99

350.Public Concern: The Forest Service should not pander to industrial interest groups.....3-99

351.Public Concern: The Forest Service should include special interest groups in the decisionmaking process.....3-100

 Local and national organizations3-100

 Outfitters and backcountry guides3-100

 Off-road vehicle users3-100

352.Public Concern: The Forest Service should exclude special interest groups from the decisionmaking process.3-100

 Stakeholder councils3-100

Collaboration Processes.....3-100

353.Public Concern: The Forest Service should adequately incorporate collaboration in the decisionmaking process.3-100

354.Public Concern: The Forest Service should allow flexibility in collaboration processes.....3-101

355.Public Concern: The Forest Service should place limits on the number of active collaborative groups that operate regionally, on a concurrent basis.3-101

356.Public Concern: The Forest Service should follow the model of collaboration used in other planning processes.....3-101

 The collaborative stewardship process used by the Chugach National Forest.....3-101

 The Winiger Ridge Ecosystem Management Pilot Project3-101

 The Enlibra process for taking actions in the West3-101

357.Public Concern: The Forest Service should recognize that groups unwilling to collaborate have no legal standing.3-102

358.Public Concern: The Forest Service should avoid over-reliance on collaboration.3-102

 To avoid displacing traditional sources of legitimacy, such as the electoral process of representative democracy3-102

 To avoid creating policies that are merely agreeable rather than high quality3-102

Because it is limited to solving easy problems 3-102

Because agreement between parties may not be possible 3-102

Because it gives resource user interests unfair influence in
decisionmaking..... 3-103

Because the time commitment it imposes makes it an unrealistic
solution 3-103

359.Public Concern: The Forest Service should consider that
collaboration cannot occur until those who are party to litigation
over the Roadless Area Conservation Rule recognize the authority
of federal acts. 3-103

360.Public Concern: The Forest Service should recognize that the term
“collaboration” carries the connotation of bias in decisionmaking. 3-103

Collaboration with State and Local Governments 3-104

361.Public Concern: The Forest Service should collaborate with state
and local governments in managing roadless areas..... 3-104

By respecting state regulatory authority 3-104

By creating a staff position for a state liaison 3-104

By establishing a state oversight team 3-104

362.Public Concern: The Forest Service should designate specific
entities as cooperating agencies..... 3-105

State of Montana 3-105

State of Wyoming, County Commissioners, and Conservation
Districts..... 3-105

Western states 3-105

363.Public Concern: The Forest Service should establish a consistent
system for extending cooperating agency status to local entities. 3-105

364.Public Concern: The Forest Service should include western
governors in the development of roadless area guidelines. 3-105

365.Public Concern: The Forest Service should revise federal
regulations. 3-105

To better solicit input and cooperation from state and local
governments..... 3-105

366.Public Concern: The Forest Service should collaborate with
counties in managing roadless areas. 3-106

367.Public Concern: The Forest Service should consider that
consultation with other agencies, states, and American Indian
tribes was not complete prior to issuance of the Roadless Area
Conservation Rule Final EIS..... 3-106

368.Public Concern: The Forest Service should *only* notify states and
American Indian tribes of pending federal actions. 3-106

369.Public Concern: The Forest Service should make collaboration a
goal of the public involvement process at the local level. 3-106

Rather than at the national level 3-106

By encouraging local governments to help identify impacts on rural
communities and other landowners 3-107

By asking local governments to provide their preferred management prescriptions for National Forest System lands within their borders3-107

By fostering adequate dialog between Forest Service managers and local government officials3-107

370.Public Concern: The Forest Service should recognize that revisiting the Roadless Area Conservation Rule ignores collaboration that has already occurred at the local level.3-107

371.Public Concern: The Forest Service should create policies and teams to work with state and local authorities in putting into place “right to manage” laws.3-107

To protect the Forest Service from litigation.....3-107

372.Public Concern: The Forest Service should have an agency representative attend community meetings.3-108

Collaboration with Agencies..... 3-108

373.Public Concern: The Forest Service should collaborate with the U.S. Fish and Wildlife Department.....3-108

In forest planning.....3-108

In managing roadless areas3-108

374.Public Concern: The Forest Service should explain its relationship with the U.S. Fish and Wildlife Department.3-108

375.Public Concern: The Forest Service should collaborate with other agencies in managing roadless areas.3-108

Collaboration with Other Groups..... 3-109

376.Public Concern: The Forest Service should ensure adequate collaboration with diverse groups.3-109

By explaining laws and how they apply to decisionmaking3-109

By arranging face-to-face working groups of all interests.....3-109

By bringing together a core group from various interest groups to draft solutions.....3-109

377.Public Concern: The Forest Service should create a Board of Trustees.3-109

To oversee management decisions, monitor enforcement, and ensure adherence to well balanced principles.....3-109

378.Public Concern: The Forest Service should create partnerships that are inclusive of all economic levels.....3-109

379.Public Concern: The Forest Service should respect the role of the Continental Divide Trail Alliance.....3-109

380.Public Concern: The Forest Service should employ advisory committees.3-110

Resource advisory committees3-110

381.Public Concern: The Forest Service should accept the cooperative behavior between special interest groups as evidence of collaboration.3-110

382.Public Concern: The Forest Service should collaborate with the Mono Collaborative Planning Team.....3-110

Education 3-110

383.Public Concern: The Forest Service should educate the public about specific topics. 3-110

 About the importance of managing public lands for the greatest good for the greatest number over the long term 3-110

 About the facts and benefits of the Roadless Area Conservation Rule 3-110

 About resource management needs..... 3-111

384.Public Concern: The Forest Service should consider adopting the “Wood is Good” campaign. 3-111

 To change the way people view wood-based products 3-111

385.Public Concern: The Forest Service should educate the public with new materials..... 3-111

 By publishing informative articles 3-111

 By producing a television program regarding roadless areas..... 3-111

 By developing a seminar for new users and monitoring all users..... 3-112

386.Public Concern: The Forest Service should educate the public..... 3-112

 Rather than closing more land..... 3-112

Volunteerism 3-112

387.Public Concern: The Forest Service should encourage volunteerism. 3-112

 To cut maintenance costs..... 3-113

 From user groups 3-113

 From troubled youth, hunters, and anglers..... 3-113

 From retirees 3-113

American Indian Rights and Interests..... 3-113

388.Public Concern: The Forest Service should conduct meaningful consultation with American Indians regarding roadless area management..... 3-115

389.Public Concern: The Forest Service should reevaluate its relationship with tribal corporations..... 3-115

390.Public Concern: The Forest Service should manage public lands for traditional tribal uses in accordance with treaties. 3-115

 By considering treaty rights during roadless area evaluations..... 3-115

 By implementing the Roadless Area Conservation Rule 3-115

391.Public Concern: The Forest Service should not abdicate tribal treaty rights in order to foster harmony between competing interests. 3-116

392.Public Concern: The Forest Service should implement the Roadless Area Conservation Rule..... 3-116

 To foster treaty resource protection..... 3-116

 To promote tribal salmon recovery efforts 3-116

 To protect American Indian cultural practices..... 3-117

 To protect American Indian sacred sites 3-117

393.Public Concern: The Forest Service should exclude the Tongass National Forest from a national roadless rule. 3-117

To fulfill obligations of the United States’ trust relationship with American Indians3-117

Comments from Other Respondents Regarding American Indian Tribal Interests.....3-117

394.Public Concern: The Forest Service should give high priority to American Indian concerns when formulating a national roadless rule.3-117

395.Public Concern: The Forest Service should conduct meaningful consultation with American Indians regarding roadless area management.3-118

396.Public Concern: The Forest Service should clearly distinguish between tribal rights and other special interests.....3-118

397.Public Concern: The Forest Service should protect American Indian lands from commercial exploitation.....3-118

398.Public Concern: The Forest Service should acknowledge the environmental consequences of the tribal corporation land grant selection process.....3-118

399.Public Concern: The Forest Service should review native corporation and institutional logging contracts in southeast Alaska...3-118

400.Public Concern: American Indians should be allowed to manage public lands.3-118

Because of their proven record of caring wisely for the land.....3-118

401.Public Concern: The Forest Service should allow American Indians to practice traditional religious and cultural activities in roadless areas.3-119

402.Public Concern: The Forest Service should implement a national roadless rule.....3-119

To protect American Indian cultural practices3-119

To help protect American Indian sacred sites3-120

403.Public Concern: The Forest Service should ensure subsistence needs are met for southeast Alaska rural communities.3-120

By maintaining wildlife and fish populations3-120

By allowing American Indian tribes to hunt in national forests.....3-120

404.Public Concern: Tribal governments should not adopt a similar roadless policy for reservation forests.3-120

Because it will have a negative economic impact on American Indians3-120

405.Public Concern: The Forest Service should support a more sustainable timber industry.....3-120

To preserve traditional northwest weaving3-120

COMPETING VALUES/LIMITED RESOURCES (QUESTION 9).....3-122

Managing Competing Interests3-122

Managing Competing Interests General3-123

406.Public Concern: The Forest Service should clarify its purpose and mission in order to manage competing interests.3-123

By appointing a commission to address the issue.....3-123

By developing a mission statement 3-124

407.Public Concern: The Forest Service should restore the trust of the public before attempting to manage competing interests..... 3-124

408.Public Concern: The Forest Service should manage competing interests. 3-124

By implementing the Roadless Area Conservation Rule 3-124

By complying with current legislation, using the best available information, encouraging local input, and providing sufficient staff..... 3-124

By complying with all applicable laws 3-125

By identifying what is required by law and what is discretionary 3-125

By complying with the National Forest Management Act..... 3-125

By complying with the National Environmental Policy Act 3-125

By preparing environmental analyses in conformance with the National Environmental Policy Act..... 3-125

By considering the results of the United States Institute for Environmental Conflict Resolution..... 3-125

By consulting the volumes of literature it has published in response to public concerns..... 3-126

By adequately understanding political, management, and leadership issues and putting aside its own self-interests 3-126

By recognizing its own vested interests..... 3-126

By using scientific studies..... 3-126

By following the example of the Quincy Library Group 3-126

By using the Adaptive Environmental Management process..... 3-126

By using an Earth Governing Social System 3-127

By ensuring a fair and open process 3-127

By presenting both sides of the issue in a balanced, honest, and fair manner 3-127

By applying its policies to all interests consistently..... 3-127

By balancing competing values 3-127

By cultivating relationships with all different interest groups..... 3-128

By considering who is most affected by the decision..... 3-128

By making land use decisions based on the relative value of different uses to society..... 3-128

By evaluating the relative impacts of competing uses 3-128

By taking a long term view..... 3-128

By considering each roadless area for its contribution to a larger cause..... 3-129

By making a distinction between roaded and roadless area values. ... 3-129

By discounting the comments of exclusionary groups 3-129

By ignoring extreme viewpoints 3-129

By increasing direct contact between regions and the Washington Office 3-130

Before engaging the public..... 3-130

409.Public Concern: The Forest Service should not attempt to change the beliefs of citizens. 3-130

410. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule has magnified conflict between groups.3-130

411. Public Concern: The Forest Service should recognize that consensus is an unrealistic goal.3-130

412. Public Concern: The Forest Service should recognize that not all parties will be satisfied with management decisions.3-130

413. Public Concern: The Forest Service should recognize that most competing values arise from radical groups.3-131

Administrative/Agency Guidance 3-131

414. Public Concern: The Forest Service should implement the desires of the current President.3-131

415. Public Concern: The Forest Service should take a leadership role and finalize its decision.3-131

416. Public Concern: The Forest Service should allow trained foresters to make decisions.3-132

 Rather than relying on public comment.3-132

417. Public Concern: The Forest Service should comply with the law and use professional judgment.3-132

Local Forest Planning Process 3-132

418. Public Concern: The Forest Service should recognize that the local forest planning process provides the best way to work with different groups.3-132

 By allowing competing values to be identified locally on each forest ..3-133

 By establishing local boards to make decisions3-133

 Because issues relating to specific areas can be discussed3-133

Enhanced Collaborative Efforts 3-133

419. Public Concern: The Forest Service should manage conflicting interests.3-133

 By emphasizing collaboration.3-133

 By making every effort to meet everyone's needs.3-133

 By using conflict resolution strategies3-134

 By establishing local monitoring teams composed of diverse stakeholders dedicated to sustaining roadless ecosystems3-134

 By using professional negotiators, public relations consultants, and conflict resolution specialists3-134

 By forming advisory planning groups3-134

420. Public Concern: The Forest Service should collaborate with special interest groups.3-135

 By meeting with them individually and collectively and developing agenda items equally important to both3-135

 By dealing with one representative from each interest group.3-135

421. Public Concern: The Forest Service should advise groups that the fairest way of resolving differences is through compromise.3-135

422. Public Concern: The Forest Service should recognize that interest groups must have an incentive to compromise.3-135

Public Education/Information Efforts 3-136

423.Public Concern: The Forest Service should use public education to
 resolve conflicts. 3-136

 Through forest rangers 3-136

 Through classrooms and service groups 3-136

 Through seminar programs 3-136

 By establishing a department of information..... 3-136

 Rather than closing access to forest lands 3-136

424.Public Concern: The Forest Service should inform the public that
 national forests are not national parks. 3-137

Forest Service Staff Training/Education..... 3-137

425.Public Concern: The Forest Service should manage competing
 interests. 3-137

 Through the use of science and unbiased employees..... 3-137

 By consulting with personnel who have worked under the
 Northwest Forest Plan 3-137

 By having all Forest Service employees read “A Conspiracy of
 Optimism” 3-137

426.Public Concern: The Forest Service should employ a diverse staff. 3-137

 By having as many conservation biologists and
 educators/naturalists as foresters on its staff 3-137

427.Public Concern: The Forest Service should educate personnel. 3-138

 To understand that competing interests are nothing new 3-138

 To adequately understand political, management, and leadership
 issues 3-138

 To work with a diverse constituency 3-138

 To facilitate cooperative meetings 3-138

Will of the Public/Elected Representatives..... 3-138

428.Public Concern: The Forest Service should abide by the wishes of
 the majority. 3-138

 By preserving roadless areas 3-139

 Because National Forest System lands are owned by the majority.... 3-139

 Rather than the presidential administration 3-139

 Rather than private interests 3-139

 Rather than special interest groups 3-139

 Rather than merely avoiding litigation..... 3-140

 While protecting minority rights 3-140

429.Public Concern: The Forest Service should allow elected officials
 to make decisions. 3-140

Ecosystem/Preservation Values 3-141

430.Public Concern: The Forest Service should place the highest value
 on ecosystem preservation when managing conflict..... 3-141

 By being a steward of the forests and an advocate for wildlands 3-141

CHAPTER 4 ROADLESS AREA VALUES (QUESTION 6) 4-1

CHARACTERISTICS OF ROADLESS AREAS..... 4-1

Characteristics of Roadless Areas General4-1

Evaluation of Roadless Areas.....4-2

431.Public Concern: The Forest Service should clearly state the benefits of having roadless areas.....4-2

432.Public Concern: The Forest Service should undertake a comprehensive evaluation of roadless areas.4-2

 To determine their characteristics, resource values, and effects of various activities.....4-2

 To consider similar characteristics4-2

433.Public Concern: The Forest Service should consider how roadless areas are characterized in evaluating roadless areas.4-3

 By a wide range of features and attributes4-3

 By their inaccessibility4-4

 By barren landscape, scrub-brush, rock, and ice4-4

434.Public Concern: The Forest Service should consider various values when evaluating roadless areas.....4-4

 The value of roadlessness4-4

 The value of rareness4-4

 The value of remoteness.....4-4

 The value of proximity to communities4-4

 The value of the overall landscape.....4-5

 The values associated with wilderness areas4-5

 The values associated with roadless areas contiguous to areas with special congressional designations.....4-5

 Intangible and tangible values.....4-5

 In conjunction with consideration of a full range of uses4-5

435.Public Concern: The Forest Service should document the other major values and opportunities provided by roadless areas.....4-6

436.Public Concern: The Forest Service should not allow the presence or absence of roads in an area to overshadow the appropriate consideration of other values.....4-6

 Such as healthy forests and wildlife habitat.....4-6

437.Public Concern: The Forest Service should publish a compendium of submitted roadless values.4-6

 Without compiling any scorekeeping statistics4-6

438.Public Concern: The Forest Service should periodically reevaluate roadless areas.....4-7

 To assess change and potential impacts to adjacent nonfederal lands4-7

439.Public Concern: The Forest Service should consider that roadless area values were already identified.4-7

 During the RARE process4-7

 In previous public comment periods for the Roadless Area Conservation Rule.....4-7

 And it is a waste of taxpayer money to undergo another process to consider exactly the same values4-8

Roadless area evaluation in Wyoming was concluded with the passage of the Wyoming Wilderness Act 4-9

440.Public Concern: The Forest Service should not consider environmental, social, and economic values when evaluating roadless areas. 4-9

441.Public Concern: The Forest Service should not evaluate roadless areas separate from its regular, on-going natural resource inventories and assessments..... 4-9

Until the Forest Service proposes an action that may affect roadless areas 4-9

Adequacy of Analysis..... 4-9

442.Public Concern: The Forest Service should define roadless values in a context consistent with other aspects of land and resource management plans. 4-9

443.Public Concern: The Forest Service should recognize that the Advance Notice of Proposed Rulemaking misrepresents the value of roadless areas. 4-9

444.Public Concern: The Forest Service should assign value to actual scientific measured valuation, not “perceived” value. 4-10

Because you can’t place a monetary value on ethereal items..... 4-10

445.Public Concern: The Forest Service should define social value and ecological value. 4-10

Adequacy of Maps and Inventories 4-10

Maps General 4-11

446.Public Concern: The Forest Service should provide adequate maps..... 4-11

To foster informed decisionmaking..... 4-11

447.Public Concern: The Forest Service should distribute copies of the detailed maps of inventoried roadless areas that are currently on file in the Washington Office. 4-11

Send maps to regional offices and each national forest for citizen review and boundary adjustments..... 4-11

448.Public Concern: The Forest Service should acknowledge that adequate maps were made available to the public. 4-11

449.Public Concern: The Forest Service should recognize the inadequacy of maps in the Roadless Area Conservation Rule Final EIS..... 4-12

450.Public Concern: The Forest Service should adjust roadless area boundary lines where needed..... 4-12

To facilitate the economical management of roadless areas and adjacent lands 4-13

To manage areas that may have been roaded after RARE II..... 4-13

To serve all needs 4-13

By using relevant and credible information..... 4-13

Based on historic factors including operating practices and land management 4-13

451.Public Concern: The Forest Service should not arbitrarily adjust roadless area boundaries to accommodate current or future uses..... 4-13
 In the inventorying process 4-13

452.Public Concern: The Forest Service should make roadless area boundaries obvious. 4-14
 To prevent litigation and disputes over differing interpretations 4-14

453.Public Concern: The Forest Service should follow the guidelines required by 40 Code of Federal Regulations 1502.8 for document mapping..... 4-14
 In the use of plain language and appropriate graphics..... 4-14

454.Public Concern: The Forest Service should not delineate roadless areas on a map. 4-15
 Because once these lands are designated, it will be difficult to use resources that may be needed in the future 4-15

455.Public Concern: The Forest Service should adequately mark roads on maps and on the ground..... 4-15

Accuracy of Maps 4-15

456.Public Concern: The Forest Service should accurately map roadless areas. 4-15
 To accurately identify roadless areas 4-15
 To ensure that elimination of future roads does not put federal and private timber resources at risk 4-15
 To ensure adequate assessment of the present and future impacts of roadless areas..... 4-15
 To ensure that management options can be accurately assessed..... 4-16
 As part of the public involvement program for forest planning..... 4-16
 By ground validation..... 4-16
 Inventory and map the geographic location of roadless areas in relation to the other similar and dissimilar areas and any cultural development..... 4-16
 Map classified, unclassified, and obliterated roads in areas that qualify as roadless 4-16
 Inventory and map classified roads for the Colville, Okanogan, and Idaho Panhandle National Forests 4-16

457.Public Concern: The Forest Service should use updated maps. 4-17
 To give the proposal credibility and to allow the public to make specific comments..... 4-17

458.Public Concern: The Forest Service should correct mapping errors. 4-17
 To include eligible roadless areas 4-17
 To correct areas on the Tongass National Forest shown as “approved for development” 4-18
 To include additional territory the inventories excluded 4-18
 Correct the map of the Santa Rosa Ranger District that shows the district as roadless 4-18

Identify the trail in the Three Prong area that enters the Meadow Creek roadless area on the Nez Perce National Forest as a trail rather than a road..... 4-18

459.Public Concern: The Forest Service should consider that past inaccuracies in determining roadless area boundaries may cause problems in the future. 4-18
 Because mapping errors may prohibit improvements to areas that should not have been included in a roadless designation in the first place..... 4-18

460.Public Concern: The Forest Service should coordinate with adjoining Bureau of Land Management lands when making maps..... 4-18

461.Public Concern: The Forest Service should ensure that Forest Visitors Maps are consistent with the Forest Travel Plan. 4-19
 To decrease visitor confusion..... 4-19

462.Public Concern: The Forest Service should use Geographic Information System technology to document and map the location of uninventoried roadless areas larger than 1,000 acres. 4-19

463.Public Concern: The Forest Service should consider that forests have not been accurately described or represented to the public..... 4-19
 Old growth and second growth have not been accurately described ... 4-19
 Travelways have not been accurately described..... 4-20

Inventories General..... 4-20

464.Public Concern: The Forest Service should inventory certain features in roadless areas..... 4-20
 Inventory and evaluate all natural resources and their potential value, including extractive minerals..... 4-20
 Inventory all infrastructure and developments 4-20
 Inventory and ground validate each road and trail to determine its recreational value and any problems requiring mitigation..... 4-20
 Inventory topographic and physical characteristics 4-20
 Inventory forest health conditions..... 4-21
 Inventory values, social and economic impacts, and long-term uses ... 4-21
 Inventory roadless areas, roaded areas, classifications of roads, and private access roads..... 4-21

465.Public Concern: The Forest Service should specify when the uninventoried roadless areas are to be inventoried and clarify that existing management will not change prior to completion of the inventory. 4-21

466.Public Concern: The Forest Service should delete roaded portions of inventoried roadless areas from the inventory. 4-21

467.Public Concern: The Forest Service should include previously inventoried trails in the present inventory. 4-22

468.Public Concern: The Forest Service should clarify that the existence of user-created routes is not an appropriate reason for removing a roadless area from the inventory..... 4-22

469.Public Concern: The Forest Service should consider a road that has appeared on a forest map for more than ten years to be a road.4-22
 For the purposes of defining roadless areas4-22

470.Public Concern: The Forest Service should clarify the present status of lands classified as inventoried roadless areas—roaded or unroaded—since RARE II.4-22

471.Public Concern: The Forest Service should not change current inventory information.4-23
 Because it would be a violation of the National Environmental Policy Act4-23

472.Public Concern: The Forest Service should require forests to survey areas not included in the Roadless Area Conservation Rule.4-23
 Through the National Forest Management Act process4-23

473.Public Concern: The Forest Service should identify all roadless areas created or enlarged by road closures.4-23

474.Public Concern: The Forest Service should state who did the roadless inventory, and explain the methodology and criteria used to determine whether an area is roadless.....4-23

Accuracy of Inventories4-23

475.Public Concern: The Forest Service should update the roadless area inventory.....4-23
 By using current information.....4-23
 By allocating money to identify roadless areas not currently in the inventory.....4-24
 By inventorying all resources4-24
 By inventorying roadless acreage4-25
 By inventorying previously unidentified roadless areas4-25
 By inventorying and mapping roads4-25
 By inventorying classified and unclassified roads4-26
 By completing a comprehensive biological inventory4-26
 By using uniform criteria.....4-26
 By using a scale appropriate for planning4-27
 By having an independent third party complete a science based inventory of roadless areas and features4-27
 By including local, state, and federally elected officials in the process.....4-28
 By using the criteria listed in the Forest Service Planning Handbook ...4-28
 Through stand examinations4-28
 With citizen inventories4-28

476.Public Concern: The Forest Service should integrate the best available information from its own road inventories.....4-29
 By using current Geographic Information System data4-29

477.Public Concern: The Forest Service should consider that there was an inconsistent application of data entry standards when roadless areas were inventoried. 4-30

478.Public Concern: The Forest Service should provide a physical description of the areas proposed for roadless designation..... 4-30

Definitions 4-30

479.Public Concern: The Forest Service should define certain terms. 4-30

Road..... 4-30

Road building 4-32

Unroaded..... 4-32

Roadless area 4-32

480.Public Concern: The Forest Service should clarify the relationship between inventoried roadless areas, unroaded areas, and classified roads. 4-33

481.Public Concern: The Forest Service should accurately label unroaded and roadless areas. 4-34

So that opposing interests can understand the actual situation on the ground 4-34

482.Public Concern: The Forest Service should not define areas covered by special use permits or mineral leases as roadless or unroaded lands. 4-34

483.Public Concern: The Forest Service should refer to areas with roads or motorized trails as unroaded, not roadless. 4-34

484.Public Concern: The Forest Service should not use the term roadless to describe areas containing forest products necessary for the future operation of the timber industry and community recreational roads and trails 4-35

485.Public Concern: The Forest Service should not use the term non-road. 4-35

486.Public Concern: The Forest Service should clearly differentiate between a road and a trail. 4-35

ENVIRONMENTAL VALUES..... 4-36

Environmental Values General..... 4-36

487.Public Concern: The Forest Service should hold the Administration accountable for maintaining environmental safeguards. 4-37

By demanding an explanation of how it intends to further protect natural resources..... 4-37

488.Public Concern: The Forest Service should adequately identify forest environmental values. 4-37

489.Public Concern: The Forest Service should recognize that preservation values have already been adequately addressed. 4-37

490.Public Concern: The Forest Service should preserve the environment. 4-38

To protect global ecosystems..... 4-38

To help stop deforestation 4-38

To protect ecological SYSTEMS 4-38

To preserve unique climates/ecosystems4-38

By taking a long-term view4-38

By protecting low-elevation ecosystems4-39

By monitoring traffic4-39

By rewarding Forest Service personnel for maintaining and
improving healthy ecosystems4-39

By encouraging the establishment of conservation associations to
help protect ecological forest values4-39

By encouraging the signing of the Kyoto Treaty.....4-39

491.Public Concern: The Forest Service should revise forest plans to
address environmental concerns.....4-39

The Northwest Forest Plan.....4-39

492.Public Concern: The Forest Service should avoid relying on
planned mitigation to offset environmental effects.....4-40

493.Public Concern: The Forest Service should consider that the
Roadless Area Conservation Rule will promote the use of less
environmentally friendly products.4-40

494.Public Concern: The Forest Service should recognize that pre-
settlement conditions are not attainable.4-40

495.Public Concern: The Forest Service should recognize that the
Wyoming Wilderness Act does not adequately protect the
environment and wildlife habitat.4-40

Environmental Values General – Roadless Areas4-40

496.Public Concern: The Forest Service should protect roadless areas. ...4-40

To preserve their ecological values.....4-40

To increase representative ecosystem types4-41

To preserve biodiversity4-42

To preserve the food chain.....4-43

To use as models of ecosystem management.....4-43

To restore surrounding areas.....4-43

To set an example for other countries.....4-43

497.Public Concern: The Forest Service should ensure that protection
of roadless areas does not result in increased damage to roaded
areas.4-43

Protect roaded areas Through the National Forest Management Act ...4-43

498.Public Concern: The Forest Service should implement the
Roadless Area Conservation Rule.4-43

Because watersheds and wild habitat extend beyond local
administrative boundaries4-44

Adequacy of Analysis4-44

499.Public Concern: The Forest Service should make decisions based
on science.4-44

In order to allow ecosystem management to be the prime objective....4-44

To ensure sustainability4-44

500.Public Concern: The Forest Service should adequately evaluate
environmental impacts.....4-44

To avoid arbitrary and capricious decisionmaking..... 4-44

501.Public Concern: The Forest Service should address the environmental impacts of modern problems on forests. 4-45

Acid rain and global warming 4-45

502.Public Concern: The Forest Service should recognize the global ramifications of environmental destruction..... 4-45

503.Public Concern: The Forest Service should protect roadless areas. .. 4-45

To enable the study of the long-term effects of timber removal..... 4-45

504.Public Concern: The Forest Service should compare the negative impacts of decreased access against the environmental benefits. 4-46

505.Public Concern: The Forest Service should identify underrepresented biological communities. 4-46

506.Public Concern: The Forest Service should evaluate the status of non-National Forest System lands in the coastal rainforests of southeast Alaska and British Columbia. 4-46

To determine whether additional conservation efforts on the Tongass are needed to provide a buffer for region-wide cumulative effects..... 4-46

507.Public Concern: The Forest Service should provide an analysis of geologic hazard mitigation opportunities that will be lost as a result of roadless area designations. 4-46

In Wyoming 4-46

508.Public Concern: The Forest Service should recognize that the concept of biodiversity is a fraud..... 4-46

Funding..... 4-47

509.Public Concern: The Forest Service should use money allocated for roads to fund ecosystem management and protection of wildlife .. 4-47

510.Public Concern: The Forest Service should fund the study of landscape ecology, conservation biology, and fire ecology. 4-47

In and next to roadless areas 4-47

511.Public Concern: The Forest Service should identify the funding required to comply with environmental requirements..... 4-47

512.Public Concern: The Forest Service should require that proponents of road construction bear the costs of damage to affected ecosystems..... 4-47

513.Public Concern: The Forest Service should allow expansion of current access only if a bond is posted sufficient to repair any accompanying damage..... 4-47

514.Public Concern: The Forest Service should provide funding to research the effects of habitat degradation..... 4-48

515.Public Concern: The Forest Service should provide funding for reclamation projects..... 4-48

516.Public Concern: The Forest Service should provide more environmental research funding..... 4-48

As long as the research is linked to authority to approve timber harvest and road construction in roadless areas. 4-48

Education..... 4-48

517.Public Concern: The Forest Service should educate the public. 4-48

 About the environment and ecology..... 4-48

 About the costs of environmental degradation 4-48

 About conservation goals..... 4-49

 About the need to make productive use of forests 4-49

Evaluation of Roadless Areas 4-50

518.Public Concern: The Forest Service should only consider environmental factors when making decisions. 4-50

 Because National Forests cannot accommodate every use..... 4-50

 Because claims that these areas need to be opened for economic reasons are false..... 4-50

519.Public Concern: The Forest Service should evaluate roadless areas with respect to general environmental considerations. 4-50

 Evaluate ecosystems 4-50

 Evaluate watersheds 4-51

 Evaluate native biodiversity..... 4-51

 Evaluate sustainability..... 4-51

 Evaluate habitat requirements..... 4-51

 Evaluate roadless areas under the current climatic period and range of variability 4-51

520.Public Concern: The Forest Service should determine how much land is needed for ecosystem integrity. 4-52

521.Public Concern: The Forest Service should conduct an inventory of soil, water, and geologic resources. 4-52

Management 4-52

Management General..... 4-53

522.Public Concern: The Forest Service should protect roadless areas. ... 4-53

 To encourage energy conservation..... 4-53

523.Public Concern: The Forest Service should concentrate protection efforts on the most ecologically important roadless areas. 4-54

524.Public Concern: The Forest Service should protect areas not designated as roadless..... 4-54

525.Public Concern: The Forest Service should protect areas adjacent to roadless areas..... 4-54

 To preserve the ecological value of the area..... 4-54

526.Public Concern: The Forest Service should combine the technical advances and experience of forest managers with the best available science to determine appropriate management. 4-54

 To maintain a healthy ecology in roadless areas 4-54

527.Public Concern: The Forest Service should manage forests primarily for natural habitats. 4-54

528.Public Concern: The Forest Service should connect protected areas. 4-55

529.Public Concern: The Forest Service should manage forests through their entire life cycle..... 4-55

530.Public Concern: The Forest Service should document the risks and impacts of management and non-management..... 4-55

531.Public Concern: The Forest Service should return environmental policies to their status before the Clinton Administration. 4-55

Ecosystem/Restoration Management 4-55

532.Public Concern: The Forest Service should emphasize long-term protection over short-term profits. 4-55

533.Public Concern: The Forest Service should recognize that short-term solutions will not fix long-term problems. 4-56

534.Public Concern: The Forest Service should manage roadless areas in an ecosystem based framework. 4-56

By managing within historic ranges of ecological variability 4-56

535.Public Concern: The Forest Service should manage roadless areas using the principles of conservation biology..... 4-56

536.Public Concern: The Forest Service should allow natural processes to manage fish and wildlife species. 4-57

537.Public Concern: The Forest Service should restore natural disturbance regimes. 4-57

To allow the buildup of coarse woody debris and large woody debris..... 4-57

To allow regeneration of the forest floor 4-57

538.Public Concern: The Forest Service should focus on restoring degraded areas..... 4-57

539.Public Concern: The Forest Service should ensure the reclamation of developed lands..... 4-57

Through technology 4-57

540.Public Concern: The Forest Service should engage the public in protecting the environment. 4-57

Encourage non-profit organizations to support the preservation of pristine areas 4-57

Allow the public to sponsor/adopt an area of the forest..... 4-58

541.Public Concern: The Forest Service should organize public/private partnerships to maintain and protect areas most in need of repair. 4-58

542.Public Concern: The Forest Service should retain roadless areas as scientific control areas. 4-58

Gravina, southeast Alaska..... 4-58

543.Public Concern: The Forest Service should recognize that timber interests have marginalized ecological forestry. 4-58

Multiple Use Management 4-59

544.Public Concern: The Forest Service should clarify the meaning of multiple use..... 4-59

545.Public Concern: The Forest Service should base multiple use management on local citizen needs..... 4-59

546.Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule does not threaten the tradition of multiple use..... 4-59

547.Public Concern: The Forest Service should recognize that maintaining forested areas without roads is an appropriate measure in the context of multiple use management.4-59

548.Public Concern: The Forest Service should recognize that preservation is in opposition to multiple use.4-60

549.Public Concern: The Forest Service should recognize that roadless area values are attainable through multiple use management of roaded areas.4-60

Allow Multiple Use Management.....4-60

550.Public Concern: The Forest Service should allow multiple use and sustained yield management.....4-60

 By allowing the exercise of existing rights4-60

 By including recreational and economic uses4-60

 By rotating roadless area inventories4-60

 Because it best meets the needs of the people.....4-61

 Because there are already enough protected areas4-61

 Because allowing any single use to dominate the public landscape would be unfair.....4-61

 As required by law.....4-61

551.Public Concern: The Forest Service should reexamine forest plans to ensure that multiple use requirements are being met.....4-62

552.Public Concern: The Forest Service should manage national forests for sustainable use.....4-62

 By implementing restrictions on timber REMOVAL methods and practices.....4-62

Do Not Allow/Reconsider Multiple Use Management4-62

553.Public Concern: The Forest Service should not manage National Forest System lands under the multiple use philosophy.....4-62

 Because some uses should be strictly limited4-62

 Because it is not realistic.....4-63

 Because there are too few forests left to jeopardize them any further.....4-63

Other Management Philosophies.....4-63

554.Public Concern: The Forest Service should manage roadless areas according to the philosophy of Theodore Roosevelt.....4-63

555.Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule opposes the Roosevelt philosophy of conservation.4-63

556.Public Concern: The Forest Service should develop policies for protecting and using forest lands without excluding people.....4-64

557.Public Concern: The Forest Service should eliminate biodiversity and ecosystem management as management principles.....4-64

Effects of Activities/Disturbance on the Environment.....4-64

558.Public Concern: The Forest Service should consider forms of large-scale damage to forests other than that of fire.4-64

 Including human caused damage4-64

559.Public Concern: The Forest Service should recognize that fire results in greater environmental impact than other uses. 4-64
 Timber REMOVAL..... 4-64
 Road and fire line construction 4-64
 560.Public Concern: The Forest Service should recognize that some activities do not endanger the environment. 4-65
 Road construction..... 4-65
 Off-road vehicles 4-65
 561.Public Concern: The Forest Service should use all-terrain vehicles for managing the habitat of all the forests and grasslands in the United States. 4-65
 562.Public Concern: The Forest Service should permit environmental clean-up activities. 4-65
 563.Public Concern: The Forest Service should prohibit the collection of animal and plant specimens. 4-65
 564.Public Concern: The Forest Service should require a permit for destructive sampling of the forest biosystem. 4-65
 565.Public Concern: The Forest Service should allow the commercial use of surplus plant and animal species. 4-66
 As determined by monitoring teams 4-66
Positive Effects 4-66
 566.Public Concern: The Forest Service should consider the positive environmental effects of activities/disturbance..... 4-66
 Roads 4-66
 Fire 4-66
 Insects and disease..... 4-67
 Downed timber 4-67
 567.Public Concern: The Forest Service should assess the volume of additional stream sedimentation that will occur because of the absence of timber management and fire control..... 4-68
 Assess the damage this will cause to threatened and endangered species 4-68
 568.Public Concern: The Forest Service should allow stewardship timber removal. 4-68
 To increase the abundance of dead wood on forest floors..... 4-68
 569.Public Concern: The Forest Service should consider that some ecosystems and threatened species need disturbance and roadways to exist..... 4-68
Negative Effects..... 4-69
 570.Public Concern: The Forest Service should address the negative environmental impacts of activities/disturbance..... 4-69
 Resource Use..... 4-69
 Mechanical forest health treatments..... 4-69
 Off-road vehicles and LOGGING equipment 4-69
 Roads and mines..... 4-69
 Drilling 4-70

Effects of road building on areas adjacent to roadless areas4-70

Fire4-70

Prescribed fire4-71

Water Quality4-71

Water Quality General4-72

571.Public Concern: The Forest Service should protect roadless areas. ...4-72

 To protect water quality4-72

 To protect against flooding and landslides4-72

 To provide baseline aquatic data4-72

 To act as biological defenses against pollution4-72

572.Public Concern: The Forest Service should adequately assess the true value of water on National Forest System lands.4-73

573.Public Concern: The Forest Service should recognize that water is necessary for food resources.4-73

574.Public Concern: The Forest Service should address the effects of wilderness designation on water quality.4-73

575.Public Concern: The Forest Service should allow roaded access to water resources.....4-73

 To protect water resources from naturally occurring sedimentation4-73

576.Public Concern: The Forest Service should not use the risk of sedimentation as justification for motorized recreation and access closures.4-74

 Because roads and trails can easily be hydrologically disconnected from streams4-74

577.Public Concern: The Forest Service should recognize that good timber removal practices can ensure good water quality.....4-74

578.Public Concern: The Forest Service should use buffer zones to protect water quality.4-74

579.Public Concern: The Forest Service should explain the reason grazing and timber removal are believed to pollute water more than wild fire.4-74

Watershed Health4-74

580.Public Concern: The Forest Service should adequately address watershed protection.4-74

 As mandated by the Organic Act.....4-74

581.Public Concern: The Forest Service should assess watershed health from a ridgetop-to-ridgetop perspective.4-74

582.Public Concern: The Forest Service should address the effects of certain activities on watersheds.....4-75

 Roads.....4-75

 Selective timber removal4-75

583.Public Concern: The Forest Service should manage vegetation for watershed health.4-75

584.Public Concern: The Forest Service should protect roadless areas. ...4-76

 To preserve watershed health.....4-76

 To protect watersheds in California.....4-76

To provide for irrigation..... 4-76

To protect community water sources..... 4-76

585.Public Concern: The Wilderness Act should be revised to protect drinking water. 4-77

586.Public Concern: The Forest Service should ensure that land designations do not interfere with management access to watersheds. 4-77

587.Public Concern: The Forest Service should recognize that there is no inherent watershed benefit associated with roadless area conservation. 4-77

588.Public Concern: The Forest Service should identify critical areas of key watersheds..... 4-77

Water Quantity..... 4-77

589.Public Concern: The Forest Service should increase logging to increase water quantity. 4-77

590.Public Concern: The Forest Service should recognize that increasing logging will not increase water quantity. 4-78

Air Quality..... 4-78

Air Quality General..... 4-79

591.Public Concern: The Forest Service should define air quality as a key objective..... 4-79

592.Public Concern: The Forest Service should protect air quality..... 4-79

 By strengthening the Clean Air Act..... 4-79

 By prohibiting road construction 4-79

593.Public Concern: The Forest Service should protect roadless areas. .. 4-79

 To preserve air quality 4-79

 To create sinks for the absorption of greenhouse gas emissions 4-79

 To counteract global warming 4-79

 To reduce the threat of asthma 4-80

594.Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule will not increase carbon sequestration. 4-80

595.Public Concern: The Forest Service should protect forests to maintain the current radiation. 4-80

Adequacy of Analysis..... 4-80

596.Public Concern: The Forest Service should provide data regarding airborne contaminants from wildfire. 4-80

Effects of Activities/Disturbance on Air Quality 4-81

597.Public Concern: The Forest Service should plant trees..... 4-81

 To counter the effects of greenhouse gases 4-81

 To absorb industrial air pollution..... 4-81

598.Public Concern: The Forest Service should consider the contribution of old, rotten trees to greenhouse gases..... 4-81

599.Public Concern: The Forest Service should remove mature trees and trees at risk of falling..... 4-81

 To improve air quality 4-81

600.Public Concern: The Forest Service should address impacts of
 motorized activity on air quality. 4-82
 Vehicle emissions 4-82
 Construction equipment 4-82
 601.Public Concern: The Forest Service should carry out controlled
 burns. 4-82
 To reduce air pollution..... 4-82
 Soils 4-82
Soils General 4-83
 602.Public Concern: The Forest Service should recognize the
 environmental importance of soil. 4-83
Adequacy of Analysis 4-83
 603.Public Concern: The Forest Service should develop a national
 interagency soil survey and inventory program with standardized
 monitoring methods. 4-83
 To better assess the current and future health of these lands, as
 well as impacts from various uses..... 4-83
 604.Public Concern: The Forest Service should address soil
 composition in individual forests. 4-83
Effects of Activities/Disturbance on Soils..... 4-83
 605.Public Concern: The Forest Service should address the effects of
 activities on soil. 4-83
 Effects of timber REMOVAL on surface soils 4-83
 Effects of timber LOGGING and road building on erosion and
 landslides 4-83
 Effects of soil compaction..... 4-84
 606.Public Concern: The Forest Service should retain biomass from
 habitat restoration..... 4-84
 Scenery 4-84
 607.Public Concern: The Forest Service should place greater value on
 scenic resources..... 4-84
 By completing visual assessments of all roadless areas..... 4-84
 608.Public Concern: The Forest Service should implement a national
 roadless rule. 4-84
 To provide relief from unsightly clear cuts 4-84
 Wildlife 4-84
Wildlife General 4-86
 609.Public Concern: The Forest Service should protect roadless areas. ... 4-86
 For wildlife 4-86
 For amphibians 4-86
 To maintain healthy fisheries..... 4-86
 To ensure reproductive capability 4-87
 For subsistence species..... 4-87
 To provide wildlife corridors..... 4-87
 610.Public Concern: The Forest Service should protect wildlife..... 4-87
 By actively managing roadless areas 4-87

By returning to its original role of protecting the land and its wildlife, as in the days of Gifford Pinchot..... 4-88

By managing wildlife and wildlife habitat in cooperation with state departments of natural resources 4-88

By allowing state fish and wildlife agencies to manage populations 4-88

By allowing field research in roadless areas..... 4-88

By allowing wildlife research, trout stocking, and wildlife law enforcement activities in areas where existing roads already allow motorized access..... 4-88

By supporting legislation to preclude, prevent, or overrule lawsuits designed to mitigate the scientific management of wildlife 4-88

By implementing the Theodore Roosevelt Conservation Alliance Square Deal Initiatives..... 4-88

By protecting southern Appalachian roadless areas 4-89

611.Public Concern: The Forest Service should avoid making land designations that restrict wildlife management. 4-89

612.Public Concern: The Forest Service should recognize the long-term negative impacts of managing for individual members of species. 4-89

613.Public Concern: The Forest Service should protect grassland species. 4-89

614.Public Concern: The Forest Service should treat wildlife and domestic livestock equally. 4-90

615.Public Concern: The Forest Service should value human life over wildlife and plantlife..... 4-90

616.Public Concern: The Forest Service should manage wildlife under recommendations of local fish and game agencies. 4-90

Wildlife General – Species-Specific Considerations 4-91

617.Public Concern: The Forest Service should protect roadless areas. .. 4-91

 For brown bears 4-91

 For yellow-legged frogs 4-91

 For lynx and cutthroat trout..... 4-91

 For butterflies 4-91

 For bears and wolves in the Cooper River Delta 4-91

618.Public Concern: The Forest Service should determine the degree to which native trout are linked to undeveloped areas on public lands. 4-91

619.Public Concern: The Forest Service should reintroduce and protect predators..... 4-91

 Grizzly bears 4-91

620.Public Concern: The Forest Service should make the black bear the national wild animal. 4-91

621.Public Concern: The Forest Service should prohibit the killing of black bear. 4-92

622.Public Concern: The Forest Service should prevent wolf populations from expanding..... 4-92

623.Public Concern: The Forest Service should consider that the reintroduction of coyotes, wolves and bears to certain areas is upsetting the balance between people and animals.4-92

624.Public Concern: The Forest Service should use elk as a management indicator species.4-92

Funding.....4-92

625.Public Concern: The Forest Service should more effectively utilize funds earmarked for protection of wild horses.4-92

626.Public Concern: The Forest Service should recognize that building roads in the Skagit River watershed would route funds away from salmon recovery efforts.4-93

Effects of Activities/Disturbance on Wildlife4-93

627.Public Concern: The Forest Service should recognize that wildlife is resilient to Active Management.4-93

628.Public Concern: The Forest Service should recognize that roads do not harm wildlife.....4-93

 Fish4-93

 The desert tortoise4-93

 Roads do not impede wildlife movement.....4-94

629.Public Concern: The Forest Service should recognize that vehicles do not disturb wildlife.4-94

630.Public Concern: The Forest Service should recognize that the impacts of road fragmentation are greater than the impacts of fire.4-94

631.Public Concern: The Forest Service should not use elk forage enhancement as an excuse for timber removal.4-94

632.Public Concern: The Forest Service should address the effects of fire on fisheries.4-94

633.Public Concern: The Forest Service should allow trapping as a wildlife management tool.4-95

Positive Effects4-95

634.Public Concern: The Forest Service should allow timber removal.....4-95

 For the benefit of wildlife4-95

 To encourage the growth of huckleberries for grizzly bears4-95

635.Public Concern: The Forest Service should allow thinning.....4-96

 To promote plant growth and feed for wildlife and birds.....4-96

636.Public Concern: The Forest Service should provide retaining pools when installing culverts.....4-96

 For wildlife in the dry season.....4-96

637.Public Concern: The Forest Service should retain dams and fix fish passage ladders.....4-96

638.Public Concern: The Forest Service should recognize the beneficial impact of ranch management on wildlife.4-96

639.Public Concern: The Forest Service should recognize the benefits of fire, disease, and insects to bird species.4-96

Negative Effects.....4-96

640.Public Concern: The Forest Service should address the negative effects of roads on wildlife. 4-96
 On non-native birds and plants..... 4-97
 Decreased population viability..... 4-97

641.Public Concern: The Forest Service should address the negative effects of roads on fish..... 4-97
 Sedimentation 4-97
 Loss of spawning habitat..... 4-97
 Stocking non-native species, access by livestock, overfishing, and disease transmission 4-98

642.Public Concern: The Forest Service should close roads. 4-98
 To maintain unfettered migration routes for wildlife 4-98
 To increase elk populations..... 4-98

643.Public Concern: The Forest Service should address the negative effects of off-road vehicles on wildlife. 4-98

644.Public Concern: The Forest Service should address the negative effects of inadequate stream culverts on fish passage. 4-98
 Stop constructing new roads until existing roads and culverts are repaired 4-99

645.Public Concern: The Forest Service should prohibit all Active Management and Resource Use. 4-99
 To protect wildlife..... 4-99

646.Public Concern: The Forest Service should address the negative effects of timber removal on wildlife..... 4-99
 Forest interior birds..... 4-99
 Salamanders 4-100

647.Public Concern: The Forest Service should restrict hiking in roadless areas. 4-100
 In areas where calving occurs 4-100

648.Public Concern: The Forest Service should address the effects of fire on species extinction. 4-100

Wildlife Habitat 4-100
 Wildlife Habitat General 4-101

649.Public Concern: The Forest Service should manage forests for habitat rather than for “values.”..... 4-101

650.Public Concern: The Forest Service should more adequately describe desired future conditions to reflect wildlife habitat. 4-101

651.Public Concern: The Forest Service should consider the size of inventoried roadless areas..... 4-101
 To make sure their size is consistent with the habitat requirements of interior-dwelling species 4-101

652.Public Concern: The Forest Service should address the negative effects of habitat fragmentation on wildlife..... 4-102
 Bears 4-102

653.Public Concern: The Forest Service should protect roadless areas. 4-102
 For wetland species protection..... 4-102

For elk reintroduction4-102

For migratory bird habitat4-102

For interior species habitat4-102

For Kenai peninsula habitat.....4-103

For Clearwater Basin habitat.....4-103

To preserve habitat for indigenous wildlife4-103

To preserve salmon habitat.....4-103

To preserve trout habitat4-104

To preserve trophic webs4-104

654.Public Concern: The Forest Service should preserve fish and
wildlife habitat as a priority.4-104

By reducing the effects of human encroachment on wildlife habitat....4-104

By avoiding development of wetland sites.....4-105

By retaining standing dead and downed trees4-105

By addressing landscape-scale habitat needs for wildlife4-105

By providing wildlife corridors between roadless areas4-105

By providing wildlife corridors in exurban and suburban zones.....4-105

By protecting critical winter and migratory range.....4-105

By increasing elk forage4-105

By protecting high volume creek habitat4-105

By identifying and mapping critical salmon habitat.....4-105

By diverting funding from stocking efforts to habitat restoration and
environmental pollution prevention efforts.....4-106

By compensating citizens willing to set aside their land for habitat4-106

By allowing continued maintenance of wildlife habitat improvements .4-106

655.Public Concern: The Forest Service should provide habitat for
umbrella species.4-106

656.Public Concern: The Forest Service should provide natural habitat
for wolf and fox.4-106

657.Public Concern: The Forest Service should address the loss of
habitat through canopy closure.4-106

Through the forest planning process.....4-106

658.Public Concern: The Forest Service should prevent habitat
fragmentation.4-106

By protecting roadless areas.....4-106

By establishing roadless areas where the greatest connectivity can
be achieved.....4-107

By prohibiting road building4-107

To reduce aggressive animal encounters4-107

659.Public Concern: The Forest Service should provide a brochure
that identifies prime habitat in all states.....4-108

Effects of Activities/Disturbance on Wildlife Habitat.....4-108

Positive Effects4-108

660.Public Concern: The Forest Service should allow various activities
due to their positive effects on wildlife habitat.4-108

Limited timber removal.....4-108

The use of fire or some other means to clear out old growth..... 4-108

Dredging..... 4-108

661.Public Concern: The Forest Service should recognize the beneficial impacts of timber removal, grazing, and road building on wildlife habitat. 4-108

662.Public Concern: The Forest Service should allow even age management..... 4-108

To maintain habitat diversity..... 4-108

Negative Effects..... 4-109

663.Public Concern: The Forest Service should prohibit various activities due to their negative effects on wildlife habitat..... 4-109

All active management activities 4-109

Road construction..... 4-109

Thinning..... 4-109

Mining..... 4-109

664.Public Concern: The Forest Service should address the negative effects of log transfer facilities on aquatic habitats..... 4-110

665.Public Concern: The Forest Service should address the negative effects of roads on wildlife habitat. 4-110

On American marten 4-110

On beaver..... 4-110

666.Public Concern: The Forest Service should close roads after timber removal. 4-110

To protect wildlife habitat..... 4-110

667.Public Concern: The Forest Service should address “edge effects” on songbird populations..... 4-110

Threatened and Endangered Species..... 4-111

Threatened and Endangered Species General..... 4-111

668.Public Concern: The Forest Service should protect roadless areas. 4-111

As endangered species habitat 4-111

As spotted owl habitat 4-112

As bald eagle habitat..... 4-112

As grizzly bear habitat 4-112

To prevent costly listing of species under the Endangered Species Act 4-113

669.Public Concern: The Forest Service should manage roadless areas in accordance with the Canada Lynx Conservation Agreement. 4-113

670.Public Concern: The Forest Service should address habitat improvement for threatened and endangered species in forest plans. 4-113

671.Public Concern: The Forest Service should not designate roadless areas in endangered species habitat. 4-114

672.Public Concern: The Forest Service should recognize that species extinction is a natural occurrence. 4-114

Effects of Activities/Disturbance on Threatened and Endangered Species. 4-114

673.Public Concern: The Forest Service should permit wildlife rescue operations in roadless areas.4-114
 To protect threatened and endangered species.....4-114

674.Public Concern: The Forest Service should prohibit hunting of threatened or endangered species.....4-114

675.Public Concern: The Forest Service should relocate endangered fish species during times of drought.4-114

Positive Effects4-115

676.Public Concern: The Forest Service should recognize the importance of flooding to salmonids.4-115

Negative Effects.....4-115

677.Public Concern: The Forest Service should consider the negative impacts of various activities/disturbance on threatened and endangered species.4-115
 Roads.....4-115
 Timber removal4-115
 Wildfire4-115

Vegetation and Botanical Resources4-116

Vegetation and Botanical Resources General4-116

678.Public Concern: The Forest Service should identify the vegetative cover affected by the Roadless Area Conservation Rule.4-116

679.Public Concern: The Forest Service should protect roadless areas. .4-117
 To prevent the spread of invasive species4-117
 To prevent habitat loss4-117
 To protect endemic plants4-117
 To allow old growth to return4-117
 For native forbs, lichens, and fungi4-117

680.Public Concern: The Forest Service should protect old-growth forests.....4-117
 For their ecological values.....4-118
 To compensate for global losses of old growth4-118
 To help lessen global warming.....4-118
 To preserve plant and animal species and genetic diversity4-118
 To protect against natural disasters4-119
 Because they are not replaceable.....4-119
 Because that is what the majority of citizens want4-119

681.Public Concern: The Forest Service should recognize that old growth cannot be preserved.4-119

682.Public Concern: The Forest Service should recognize the value of forest fungi.....4-120

683.Public Concern: The Forest Service should recognize that deforestation leads to desertification.4-120

684.Public Concern: The Forest Service should protect forests to prevent single-species monocultures.4-120
 Because they provide little habitat for bird and plant species and do not draw tourists.....4-120

Because they are not conducive to species diversity 4-120

Because there is already enough land devoted to single species 4-120

685.Public Concern: The Forest Service should promote regeneration
in previously harvested areas. 4-120

To replace valuable timber 4-120

686.Public Concern: The Forest Service should protect national
grasslands. 4-121

Because they are endangered and fragmented 4-121

687.Public Concern: The Forest Service should recognize that forest
cover is increasing. 4-121

688.Public Concern: The Forest Service should allow local
decisionmakers to develop unique approaches to managing
successional disturbance..... 4-121

Vegetation and Botanical Resources – Species Specific Considerations ... 4-121

689.Public Concern: The Forest Service should protect black spruce.... 4-121

690.Public Concern: The Forest Service should increase the amount of
aspen forest. 4-121

691.Public Concern: The Forest Service should protect lower elevation
hardwood forests. 4-121

692.Public Concern: The Forest Service should plant more oak trees. ... 4-121

693.Public Concern: The Forest Service should discontinue the
practice of replacing hardwoods with pine. 4-122

Effects of Activities/Disturbance on Vegetation and Botanical Resources .. 4-122

694.Public Concern: The Forest Service should manage vegetation
with longer harvest rotations. 4-122

Positive Effects 4-122

695.Public Concern: The Forest Service should allow selective timber
removal. 4-122

To encourage growth of young trees 4-122

696.Public Concern: The Forest Service should thin second growth
forests. 4-122

To promote old growth characteristics..... 4-122

697.Public Concern: The Forest Service should allow even-aged
management..... 4-122

As a method for regenerating even-aged forests 4-122

Negative Effects..... 4-123

698.Public Concern: The Forest Service should address the negative
effects of roads on vegetation..... 4-123

Introduction of invasive species..... 4-123

Effects on rare plant species 4-123

699.Public Concern: The Forest Service should recognize the negative
effects of tree farms on adjacent areas..... 4-123

700.Public Concern: The Forest Service should recognize the role of
animals in spreading noxious weeds. 4-123

701.Public Concern: The Forest Service should address the effects of
livestock grazing on vegetation..... 4-123

SOCIAL ENVIRONMENT AND VALUES.....4-124

 Social Values of Roadless Areas4-124

Social Values of Roadless Areas General4-126

 702.Public Concern: The Forest Service should protect roadless areas

 with a national roadless rule.4-126

 For their natural grandeur and beauty4-127

 For their intrinsic value4-127

 For their replacement value.....4-128

 For their non-monetary values4-128

 For the American experience4-129

 For the western experience4-129

 For their freedom value4-129

 For rural communities’ quality of life4-129

 For overall quality of life4-130

 For true conservative values4-130

 For spiritual renewal4-130

 To uphold religious tenets4-131

 For escape from modern pressures4-131

 For escape from capitalism4-132

 For solitude4-132

 For natural quiet4-132

 For their ability to reveal the interconnectedness of humans and

 nature4-133

 For the personal challenge in their inaccessibility4-133

 For escape from motorized vehicles4-133

 For family togetherness.....4-134

 For human sustenance4-134

 For human survival.....4-134

 For scientific research4-135

 703.Public Concern: The Forest Service should protect roadless areas. .4-135

 Due to increased population.....4-135

 Due to the high number of immigrants4-135

 Due to urban/suburban sprawl4-136

 704.Public Concern: The Forest Service should work with other

 government officials to promote population control.4-137

 705.Public Concern: The Forest Service should not implement a

 national roadless rule.4-137

 Because roadless areas have no intrinsic value4-137

 Because it threatens western traditions and culture4-137

 Because it restricts family stability and togetherness4-137

 Because it reduces motorized users’ quality of life.....4-138

 Because it runs counter to America’s modern, fast-paced lifestyle4-138

 Because a wilderness experience is no longer possible due to

 technology4-139

 Because it will cause emotional distress to mining industry

 employees due to loss of contact with nature.....4-139

706.Public Concern: The Forest Service should ensure that activities on private inholdings are compatible with the social values associated with surrounding lands..... 4-139

Bequest Values..... 4-139

707.Public Concern: The Forest Service should protect roadless areas for future generations..... 4-139

By using tree farms for timber needs..... 4-140

708.Public Concern: The Forest Service should continue traditional multiple use management of roadless areas for future generations. 4-140

709.Public Concern: The Forest Service should protect national forests for the present population. 4-140

710.Public Concern: The Forest Service should exploit national forest resources for the present population. 4-140

Educational Values 4-140

711.Public Concern: The Forest Service should consider the educational potential of remaining wild forests. 4-140

712.Public Concern: The Forest Service should educate children regarding our dependence on undisturbed natural systems. 4-141

Access for Special Populations..... 4-141

713.Public Concern: The Forest Service should not implement a national roadless rule that restricts access for the mobility-impaired. 4-141

The elderly..... 4-141

The disabled..... 4-141

714.Public Concern: The Forest Service should not implement a national rule that closes existing roads. 4-142

Because it would restrict access for the mobility-impaired 4-142

715.Public Concern: The Forest Service should not use access for the elderly and disabled as an excuse to build roads in roadless areas. 4-143

Because ample access exists in roaded areas..... 4-143

716.Public Concern: The Forest Service should protect roadless areas from timber removal. 4-144

To preserve opportunities for the disabled to experience unspoiled natural areas 4-144

717.Public Concern: The Forest Service should allow some exceptions to a national rule to facilitate access by the disabled. 4-144

718.Public Concern: The Forest Service should exempt ski areas from a national rule. 4-145

To ensure environmental justice to low-income families..... 4-145

Health and Wellness Values 4-145

719.Public Concern: The Forest Service should protect roadless areas. 4-145

For human health and welfare 4-145

For physical and emotional rejuvenation 4-145

For women’s safety 4-145

For human safety 4-146

For wilderness therapy opportunities for young people 4-146

720.Public Concern: The Forest Service should not implement a national roadless rule.4-146
 That would hamper search and rescue efforts4-146

721.Public Concern: The Forest Service should protect roadless areas and discourage motorized recreation.4-146
 To help combat the national obesity epidemic4-146

722.Public Concern: The Forest Service should make special land use permits available to citizens disabled by Toxicant Induced Loss of Tolerance.4-146

Noise4-147

723.Public Concern: The Forest Service should establish baseline sound levels and quantifiable noise standards for roadless areas. ...4-147
 To reduce stress4-147

724.Public Concern: The Forest Service should establish a reasonable decibel limit for exhaust systems.4-147
 To decrease conflicts between motorized users and other recreationists.....4-147

725.Public Concern: The Forest Service should not arbitrarily require roadless areas to have semi-primitive core areas in order to qualify as inventoried.4-147
 Because a complete absence of sights and sounds from surrounding areas is not possible, particularly in the East4-147

Adequacy of Analysis.....4-148

726.Public Concern: The Forest Service should reconsider sociology studies that portray rural residents in a negative light.....4-148

727.Public Concern: The Forest Service should consider that commercial resource users create negative social impacts in rural communities.4-148

ECONOMIC ENVIRONMENT AND VALUES4-149

Economic Environment and Values General.....4-149

728.Public Concern: The Forest Service should make sound economic decisions.4-149
 By adopting the Roadless Area Conservation Rule4-149

729.Public Concern: The Forest Service should promote only economically viable activities within national forests.4-149

Economic Evaluation of Roadless Areas4-150

730.Public Concern: The Forest Service should consider only economic values.....4-150

731.Public Concern: The Forest Service should not base the value of the land on the value of the resources that can be removed.4-150
 Do not consider the historic economic commodity values of the last fifty years.....4-150

732.Public Concern: The Forest Service should describe values in terms of cost/benefits or some other economically definable method.4-151

Because values are meaningless without an economic analysis that can be peer reviewed 4-151

733.Public Concern: The Forest Service should consider relevant economic factors in second-stage roadless area evaluations..... 4-151

734.Public Concern: The public should evaluate roadless areas, first according to economic considerations and second by social considerations..... 4-151

735.Public Concern: The Forest Service should give equal weight to the economic value of roadless areas as intact ecosystems as to other economic values..... 4-151

736.Public Concern: The Forest Service should recognize that roadless areas do not contain economically viable timber resources..... 4-152

737.Public Concern: The Forest Service should recognize that it has already demonstrated that the commodity values of roadless areas are insignificant as compared to recreation and non-commodity values..... 4-153

738.Public Concern: The Forest Service should not consider economic factors when evaluating roadless areas..... 4-153

Comparative Costs and Benefits of Ecosystem Protection and Resource Extraction 4-154

739.Public Concern: The Forest Service should consider long-term costs/benefits a higher priority than short-term costs/benefits..... 4-154

740.Public Concern: The Forest Service should not place economic interests above other interests..... 4-154

By managing for the protection of forests rather than for profit..... 4-155

741.Public Concern: The Forest Service should allow profitable natural resource management in roadless areas..... 4-155

In such a way as to offset environmental impacts 4-156

742.Public Concern: The Forest Service should ensure that moneymaking projects on National Forest System lands are a by-product of managing for long-term forest sustainability and biodiversity..... 4-156

743.Public Concern: The Forest Service should manage roadless areas for long-term local economic stability rather than short term benefits..... 4-156

Include the Tongass National Forest..... 4-157

744.Public Concern: The Forest Service should consider that tourism and recreation produce more revenue than commodity use..... 4-157

745.Public Concern: The Forest Service should consider that local communities would benefit more from investing in new technologies than from relying on forest commodity jobs..... 4-158

Adequacy of Analysis 4-158

Adequacy of Analysis General 4-159

746.Public Concern: The Forest Service should produce competent, unbiased economic analyses..... 4-159

747. Public Concern: The Forest Service should refocus its cost benefit analysis on economic consequences when evaluating a national roadless rule.....4-159

748. Public Concern: The Forest Service should conduct adequate cost benefit analyses before issuing a new rule.....4-159

 By analyzing the costs and risks associated with developed activities in roadless areas4-160

 By considering economic ecosystem values of natural resources4-160

 By accounting for resource damage from commodity uses.....4-160

 By considering the commercial interests of local areas.....4-160

 By analyzing likely trends in the future values of recreational amenities and natural resource commodities, and lost option value inherent in further development.....4-160

749. Public Concern: The Forest Service should consider both market and non-market values in its economic analysis.4-160

750. Public Concern: The Forest Service should base its economic analysis on real data rather than inaccurate models.4-161

751. Public Concern: The Forest Service should improve socioeconomic input/output modeling in updated or amended forest plans.....4-161

 In collaboration with other agencies.....4-161

752. Public Concern: The Forest Service should provide information regarding maintenance costs of roaded and unroaded areas.4-161

753. Public Concern: The Forest Service should adopt a quantitative valuation formula for spiritual value in evaluating roadless areas.....4-161

754. Public Concern: The Forest Service should consider the positive effects of ski areas on local economies in greater depth.4-162

755. Public Concern: The Forest Service should incorporate the positive contribution of wilderness to nearby real estate values into its economic analysis.....4-162

756. Public Concern: National Forest System lands should be appraised and taxed like private lands.4-162

 Include non-market economic values in appraisals.....4-162

757. Public Concern: The Forest Service should consider the economic value of healthy ecosystems.4-163

 Including the economic benefit of existence values4-164

 Including quantified economic values for clean water4-165

Adequacy of Analysis – Economic Effects of a National Roadless Rule..... 4-165

758. Public Concern: The Forest Service should quantify recreation-based economic effects of a national roadless rule.....4-165

759. Public Concern: The Forest Service should analyze the impacts of a national rule on recreation-related economic activity.....4-166

 Negative effects of a national rule are underestimated4-166

 Positive effects of a national rule are underestimated.....4-166

760. Public Concern: The Forest Service should analyze the impacts of a national rule on agency employment levels.....4-167

761.Public Concern: The Forest Service should address the impacts of a national rule on fair housing and lending provisions. 4-167

762.Public Concern: The Forest Service should assess the cost of withdrawing millions of acres from the country’s natural resource base..... 4-167

Analysis of Analysis – the Roadless Area Conservation Rule EIS..... 4-167

763.Public Concern: The Forest Service should better explain the methods and data used in the economic analysis for the Roadless Area Conservation Rule EIS. 4-167

764.Public Concern: The Forest Service should correct the Roadless Area Conservation Rule EIS timber-related job data to account for the fact that most employment resulted from taxpayer subsidies of below cost sales. 4-168

765.Public Concern: The Forest Service should correct the Roadless Area Conservation Rule EIS timber program cost analysis to include payments to counties..... 4-168

Economic Effects..... 4-168

General Effects on Local Communities and Economies 4-171

766.Public Concern: The Forest Service should consider the economic benefits of roadless protection to state and local economies..... 4-171

Due to their importance to companies seeking locations with high quality of life 4-172

767.Public Concern: The Forest Service should protect roadless areas to prevent future financial burdens caused by flooding..... 4-172

768.Public Concern: The Forest Service should consider the economic impacts of weakening protection for roadless areas in the White Mountains. 4-173

Effects on Resource Dependent Communities and the Timber Industry..... 4-173

769.Public Concern: The Forest Service should consider the negative economic impacts of roadless protection on the economy. 4-173

On resource-dependent rural communities 4-173

On timber-dependent businesses..... 4-174

770.Public Concern: The Forest Service should consider the economic benefits provided by the timber industry. 4-175

771.Public Concern: The Forest Service should act to create a more streamlined legal process to dispose of frivolous legal challenges to timber sales. 4-175

In order to maintain the viability of small mills 4-175

772.Public Concern: The Forest Service should acknowledge that sustained yield has never been practiced, with prior over-harvest leading to current reductions in commercial timber volume. 4-175

773.Public Concern: The Forest Service should reiterate that negative economic impacts from reduced timber removal will be minimal. 4-176

774.Public Concern: The Forest Service should focus timber removal in roaded areas..... 4-176

To support local mills..... 4-177

775.Public Concern: The Forest Service should implement a national rule to encourage private forest landowners to make more efficient use of their resources.4-177

776.Public Concern: The Forest Service should not implement a national roadless rule because it will further encourage overharvest of private lands.4-177

777.Public Concern: The Forest Service should help local mills retool to maximize benefits to local economies.4-177

778.Public Concern: The Forest Service should consider the small number of jobs created by chip mills versus those created by conventional saw mills.....4-177

779.Public Concern: The Forest Service should allow resource development in roadless areas to meet the needs of American consumers.4-177

780.Public Concern: The Forest Service should stop claiming that the lumber needs of American consumers justify timber removal in roadless areas.4-178

781.Public Concern: The Forest Service should consider the negative economic impacts of roadless protection on the economy.4-178

 On the homebuilding industry.....4-178

Effects on the Agricultural and Ranching Sector.....4-178

782.Public Concern: The Forest Service should consider the social, cultural, and historic value of the sustained use of these areas and the local communities they support.4-178

783.Public Concern: The Forest Service should consider the negative economic impacts of roadless protection on the economy.4-178

 On ranchers4-178

784.Public Concern: The Forest Service should address the effects of aquatic species protection on agricultural areas.....4-179

Effects on the Mining, Oil, and Gas Industries.....4-179

785.Public Concern: The Forest Service should consider the negative economic impacts of roadless protection on the economy.4-179

 On mining-dependent communities.....4-179

786.Public Concern: The Forest Service should prepare an Energy Impact Statement for mining-dependent communities with inelastic economies.4-179

787.Public Concern: The new rulemaking process should reevaluate coal leasing restrictions in the West Elk Roadless Area.4-179

 Due to the importance of mining to the regional economy4-179

 Due to potential impacts on the West Elk Mine4-180

788.Public Concern: The Forest Service should adequately consider impacts to the Utah coal industry.4-181

789.Public Concern: The Forest Service should allow access for mining to protect investments made by the industry.....4-181

 In Nevada gold mines4-181

790.Public Concern: The Forest Service should consider negative economic impacts to the oil and gas industry.	4-181
In North Dakota	4-181
791.Public Concern: The Forest Service should consider negative economic impacts to the phosphate mining industry.	4-182
792.Public Concern: The Forest Service should abandon the Roadless Area Conservation Rule.....	4-182
Due to negative economic impacts to the hardrock mining industry...	4-182
793.Public Concern: The Forest Service should consider the conclusions of the National Academy of Sciences report on hardrock mining.	4-182
794.Public Concern: The Forest Service should refute the allegation that coal mining results in higher road costs to the Agency.	4-182
Because industry reclamation bonds finance maintenance.....	4-182
795.Public Concern: The Forest Service should discourage boom and bust oil and gas development.	4-182
796.Public Concern: The Forest Service should reiterate that a national roadless rule will not impact the nation's energy supplies.	4-183
<i>Effects on the Recreation Sector</i>	<i>4-183</i>
797.Public Concern: The Forest Service should consider the economic benefits of roadless protection to state and local economies.....	4-183
Due to their importance to the tourism industry	4-183
Due to their importance to recreational non-motorized users	4-184
Due to their importance to the mountain biking community	4-184
Due to their importance to recreational fishing and hunting.....	4-184
Due to their importance to photography-related businesses	4-185
Due to their importance to outfitter-guides.....	4-185
Due to their importance to the outdoor gear industry.....	4-185
798.Public Concern: The Forest Service should refute the claim that roadless area protection will harm recreation-dependent communities due to loss of visitors.	4-186
799.Public Concern: The Forest Service should protect big game habitat.....	4-186
Due to the contribution of hunting to the local economy	4-186
800.Public Concern: The Forest Service should consider the negative economic impacts of roadless protection on the economy.	4-186
On the recreation-dependent tourism industry	4-186
On ski area-dependent communities	4-187
On the motorized recreation-dependent tourism industry.....	4-187
801.Public Concern: The Forest Service should exempt the proposed Pelican Butte ski area from the Roadless Area Conservation Rule. .	4-187
To help revive the depressed local economy	4-187
802.Public Concern: The Forest Service should not reduce trail access to recreational horse riders.	4-187
Because this user group has a significant impact on the U.S. economy	4-187

Effects on Employment..... 4-188

803.Public Concern: The Forest Service should protect roadless areas. .4-188
 To contribute to the health and diversification of local economies4-188
 To encourage extractive industries to replace unsustainable
 business practices with sustainable ones4-188

804.Public Concern: The Forest Service should consider the effects of
 timber export on employment.4-189

805.Public Concern: The Forest Service should consider the effects of
 timber import from low-wage countries on domestic employment.4-189

806.Public Concern: The Forest Service should act to preserve local
 jobs by keeping roadless areas available for timber removal.4-189

807.Public Concern: The Forest Service should act to preserve high-
 paying local jobs.4-189
 By keeping roadless areas accessible to mining.....4-189

808.Public Concern: The Forest Service should consider that low-wage
 recreation-based jobs are no substitute for commodity-based high-
 wage ones.4-190

809.Public Concern: The Forest Service should provide assistance in
 diversifying local rural economies.....4-190

810.Public Concern: The Forest Service should provide career
 assistance.4-190
 Retrain forest workers4-190
 Provide restoration-related career opportunities to displaced timber
 and mining workers4-191
 Provide career opportunities to environmentalists.....4-191

811.Public Concern: The Forest Service should recognize that its
 management decisions are not responsible for local timber-related
 job losses.4-192
 Automation and the timber industry are to blame4-193

812.Public Concern: The Forest Service should consider that raw log
 exports lead to domestic job losses in manufacturing.4-193

813.Public Concern: The Forest Service should not attempt to protect
 timber jobs.....4-193

814.Public Concern: The Forest Service should place a higher value
 on roadless areas than logging and mill jobs.....4-194

Effects on Tax Receipts/Funding to Communities 4-194

815.Public Concern: The Forest Service should discuss impacts of a
 national roadless rule on Bankhead Jones payments to states and
 counties.4-194

816.Public Concern: The Forest Service should continue removing
 timber to fund schools.4-194

817.Public Concern: The Forest Service should work to change the
 rural school financing system.4-194
 To reduce the need for high timber removal levels4-194

818.Public Concern: The Forest Service should support a 100 percent tax on lumber to reduce demand and support affected local communities..... 4-195

819.Public Concern: The Forest Service should ensure that counties understand the impacts of the Conservation and Reinvestment Act on their tax base. 4-195

820.Public Concern: The Forest Service should not reduce minerals royalty payments and income to local governments by restricting access through a national roadless rule. 4-195

821.Public Concern: The Forest Service should exempt Utah school trust land coal resources from a national rule. 4-196

Because they were intended to compensate for Grand Staircase Escalante National Monument restrictions 4-196

822.Public Concern: The Forest Service should recognize the positive contributions of ski areas to local and federal government revenues. 4-197

823.Public Concern: The Forest Service should recognize its responsibility to rural western communities harmed by the Roadless Area Conservation Rule..... 4-197

824.Public Concern: The Forest Service should provide a fund to benefit communities impacted by roadless designations. 4-197

825.Public Concern: The Forest Service should not make payments to counties in lieu of harvest receipts..... 4-197

826.Public Concern: The Forest Service should not attempt to buy the support of affected communities with transition payments..... 4-198

827.Public Concern: The Forest Service should not develop a plan to relocate affected residents in compensation for a national roadless rule..... 4-198

Impacts on the Global Economy 4-198

828.Public Concern: The Forest Service should consider the potential transfer of environmental effects of timber removal to other countries with lower standards..... 4-198

Support international sustainable forestry programs 4-198

829.Public Concern: The Forest Service should allow timber removal in roadless areas. 4-199

To reduce dependence on foreign sources 4-199

830.Public Concern: The Forest Service should allow mineral development in roadless areas..... 4-199

To reduce dependence on foreign sources 4-199

To avoid vulnerability to supply disruptions from political and military activity abroad 4-200

831.Public Concern: The Forest Service should consider the effects of its management decisions on the global economy. 4-200

Exporting our natural resources continues our dependence on foreign sources..... 4-200

832.Public Concern: The Forest Service should provide a model for other countries on how to preserve national forests from short-term economic benefits.4-201

User Fees4-201

833.Public Concern: The Forest Service should raise funds through user fees.....4-201

From timber removal and road usage4-202

834.Public Concern: The Forest Service should implement a user fee system based upon relative impact.4-202

To help defray the expenses of road and trail maintenance and law enforcement4-202

835.Public Concern: The Forest Service should not charge user fees for recreational use of national forests.....4-202

Because they are unfair to low-income families4-202

Because consumptive users do not pay their fair share.....4-202

836.Public Concern: The Forest Service should end the fee demonstration project.4-203

837.Public Concern: The Forest Service should consider the economic impacts of user fees.4-203

838.Public Concern: The Forest Service should ensure equal hunting and fishing fees in all states.4-203

Subsidies and Agency Expenditures.....4-203

839.Public Concern: The Forest Service should not subsidize extractive industries on public lands.4-204

Because the real value of forest lands lies in the ecosystem services they provide4-204

Because subsidization amounts to corporate welfare4-205

Because it is unfair competition with private forest owners4-205

Because it is unfair competition with recycled products4-205

840.Public Concern: The Forest Service should recognize that the value of removing timber is outweighed by the cost of mitigation measures made necessary by harvesting.4-206

841.Public Concern: The Forest Service should not allow below cost timber sales to occur.4-206

Add a directive that no timber sales will be allowed when full costs exceed returns by more than 10 percent.....4-206

Because it is unfair to taxpayers4-206

Because the U.S. is facing budget deficits4-206

Because tax dollars are needed for other programs4-207

Because they produce roads that the Forest Service lacks the funding to maintain.....4-207

842.Public Concern: The Forest Service should revise funding and staffing incentive policies that allow timber management to dominate forest values.4-207

843.Public Concern: The Forest Service should implement a national roadless rule.....4-208

To counteract reverse economic incentives at the local level..... 4-208

844.Public Concern: The Forest Service should eliminate below-cost
timber sales and raw log exports on the Tongass National Forest. ... 4-208

845.Public Concern: The Forest Service should improve methods for
calculating true market demand for Tongass timber. 4-208

 Include the cost of subsidies 4-208

846.Public Concern: The Forest Service should consider additional
factors in timber sale decisions..... 4-209

 Continual and growing cash flow losses..... 4-209

 Rapidly increasing road rebuilding costs 4-209

847.Public Concern: The Forest Service should impose greater fiscal
requirements on timber companies..... 4-209

 Require timber companies to cover the full cost of any road
construction, removal, or restoration 4-209

 Require timber companies to post bonds for restoration 4-210

 Require timber companies to remove slash after logging..... 4-210

 Require timber companies to assume direct financial liability for
environmental damage now and in the future..... 4-210

 Place all timber contract payments in escrow until full stand
replacement is verified..... 4-210

848.Public Concern: The Forest Service should ensure that sales of
resources are competitive..... 4-210

 By eliminating long-term contracts 4-210

849.Public Concern: The Forest Service should recognize the
budgetary benefits of prohibiting timber removal and road building
in roadless areas. 4-210

850.Public Concern: The Forest Service should regulate all
commercial activities as monopolistic public utilities with fixed
rates of fair return. 4-211

851.Public Concern: The Forest Service should disperse subsidies
directly to local workers rather than remove unprofitable timber..... 4-211

852.Public Concern: The Forest Service should buy back timber sale
contracts. 4-211

 To help communities adapt economically 4-211

853.Public Concern: The Forest Service should provide economic
incentives for responsible use of natural resources in roaded
areas..... 4-211

854.Public Concern: The Forest Service should subsidize commercial
tree farming as an alternative to logging public lands. 4-212

855.Public Concern: The Forest Service should devote more money
and time to conservation..... 4-212

856.Public Concern: The Forest Service should subsidize wildlands
restoration..... 4-212

857.Public Concern: The Forest Service should not subsidize ranching. 4-212

HERITAGE RESOURCES..... 4-213

 Heritage Resources General..... 4-213

858.Public Concern: The Forest Service should preserve America’s national heritage.4-213
 By protecting roadless areas.....4-213
 By preserving historic structures and traditions in roadless areas.....4-214

859.Public Concern: The Forest Service should identify historic properties which may be affected by a national roadless rule, and assess and resolve any adverse impacts.4-214
 In consultation with state historic preservation offices, American Indian tribes, and the Advisory Council on Historic Preservation4-214

860.Public Concern: The Forest Service should preserve cultural resources.....4-214
 By protecting roadless areas.....4-214
 By prohibiting road building in the Tongass National Forest4-214

861.Public Concern: The Forest Service should ensure motorized access to historic sites in roadless areas.4-214

862.Public Concern: The Forest Service should provide a detailed analysis of paleontological resources in roadless areas covered by a national rule.....4-215
 In Wyoming4-215

CHAPTER 5 FOREST MANAGEMENT 5-1

FOREST MANAGEMENT5-1

Forest Management General5-1

863.Public Concern: The Forest Service Chief should guide the Agency in the direction of balanced management.....5-2
 Emphasizing recreational improvements rather than traditional extractive uses5-2

864.Public Concern: The Forest Service should manage National Forest System lands for a wide variety of uses.5-2
 Because taxpayers have a right to use public land5-2

865.Public Concern: The Forest Service should assure consistent decisionmaking for all national forests.....5-2
 Because they are all a part of the National Forest System5-2

866.Public Concern: The Forest Service should use the Sierra Nevada Framework policy as a model for management of the entire public lands system.5-3
 Until active management is prohibited5-3

867.Public Concern: The Forest Service should adopt a management approach similar to that used to delineate and manage wetlands.5-3

868.Public Concern: The Forest Service should employ a new “wilderness ethic.”.....5-3
 By emphasizing a light restorative approach to sustainable management based on indigenous practices5-3

869.Public Concern: The Forest Service should be flexible in its management.5-3
 To reflect changing needs5-3

870.Public Concern: The Forest Service should afford local citizens the opportunity to carry out land management activities..... 5-4
 By allowing them to help with controlled burns and salvage operations..... 5-4
 By allowing carefully managed personal use timber and firewood removal..... 5-4

871.Public Concern: The Forest Service should enter into non-traditional forms of management agreements..... 5-4
 To benefit local economies and forest health 5-4

872.Public Concern: The Forest Service should support the Generational Land Stewards. 5-4

873.Public Concern: The Forest Service should pursue tree-planting restoration projects in old neighborhoods. 5-5

874.Public Concern: The Forest Service should consolidate national forests..... 5-5
 So that areas of similar economic, social, geographic, and vegetative systems are administered together 5-5

875.Public Concern: The Forest Service should either actively manage public lands or relinquish its authority. 5-5

876.Public Concern: The Forest Service should consider privatization of public lands..... 5-5
 Auction to the highest bidder 5-5

Adequacy of Analysis 5-5

877.Public Concern: The Forest Service should analyze the risks of eliminating timber removal and roading as management tools in roadless areas. 5-6

878.Public Concern: The Forest Service should compare the value of management activities versus the value of leaving areas roadless. 5-6
 By using the “Choosing By Advantages” method 5-6
 On a roadless area-by-roadless area basis..... 5-6

879.Public Concern: The Forest Service should use large scale analysis to provide guidelines in establishing the role of national forests..... 5-7

880.Public Concern: The Forest Service should evaluate the impacts of land management decisions with respect to impacts on other public lands in the area..... 5-7

881.Public Concern: The Forest Service should consider that reduced road access would increase costs of forest management. 5-7

Roadless Areas Management General 5-7

882.Public Concern: The Forest Service should implement the Roadless Area Conservation Rule without political interference..... 5-8
 Base management decisions only on science..... 5-8

883.Public Concern: The Forest Service should explain why there are provisions for managing uninventoried roadless areas..... 5-8
 Because if areas are uninventoried, ground conditions and needed management is unknown..... 5-8

Authority for Roadless Area Management.....5-8

884.Public Concern: The Forest Service should consider that there is no statutory direction for managing areas as roadless.5-8

Because it is prohibited by law from creating buffer zones around wilderness5-9

885.Public Concern: The Forest Service should clarify that there is statutory direction for managing areas as roadless.5-10

Through the forest planning process.....5-10

886.Public Concern: The Forest Service should not involve Congress in management of roadless areas.5-10

Because involving Congress politicizes management.....5-10

Because Congress is unable to identify with those most affected by roadless designations5-10

General Direction of Roadless Area Management.....5-10

887.Public Concern: The Forest Service should immediately cancel all planned active management projects in roadless areas.....5-10

888.Public Concern: The Forest Service should consider that forest management activities can take place in roadless areas while still preserving roadless area characteristics and values.5-10

889.Public Concern: The Forest Service should use the Black Hills National Forest as a model for managing roadless areas.5-11

890.Public Concern: The Forest Service should not manage roadless areas as if it were the National Park Service.5-11

891.Public Concern: The Forest Service should turn protection of roadless areas over to the U.S. Department of the Interior.5-11

ACTIVITIES (QUESTION 7).....5-12

Activities General5-12

Activity Management General.....5-13

892.Public Concern: The Forest Service should seek public input regarding activities that should be allowed or prohibited.5-13

893.Public Concern: The Forest Service should govern activities through the National Environmental Policy Act process.5-13

894.Public Concern: The Forest Service should allow existing individual forest plans to govern activities in roadless areas.5-13

Until these plans have been amended or revised5-13

895.Public Concern: The Forest Service should use the Roadless Area Conservation Rule to govern which activities should be permitted.....5-13

896.Public Concern: The Forest Service should consider the current and historic uses of roadless areas.5-13

897.Public Concern: The Forest Service should base land management activities on several established systems.5-14

Recreation Opportunity Spectrum, visual quality objectives, and the ecological capacity of the land5-14

Adequacy of Analysis5-14

898.Public Concern: The Forest Service should research references about management of resources and public uses.5-14

Travel Management Bringing People and Places Together and The Outdoor Recreation in American Life, A National Assessment of Demand and Supply Trends..... 5-14

Allow Activities 5-14

899.Public Concern: The Forest Service should permit a variety of activities in roadless areas..... 5-14

 In designated areas 5-15

 In areas appropriate to the activities..... 5-15

 Unless the activities are damaging an area..... 5-15

900.Public Concern: The Forest Service should not exempt activities listed in a Schedule of Proposed Actions..... 5-16

901.Public Concern: The Forest Service should permit the same activities in roadless areas that are currently allowed in other areas of National Forest System lands. 5-16

 To the extent that current forest management plans allow 5-16

902.Public Concern: The Forest Service should permit currently allowed activities in roadless areas to continue. 5-16

903.Public Concern: The Forest Service should protect local communities from sudden restrictions and bans from activities that had previously been legal. 5-16

904.Public Concern: The Forest Service should allow some people to live by themselves, in roadless areas. 5-16

 In small numbers 5-16

Do Not Allow/Restrict Activities 5-17

905.Public Concern: The Forest Service should prohibit certain activities in roadless areas..... 5-17

 Activities that are harmful to the environment or that present a liability concern 5-17

 Activities that require roads 5-17

 Activities that cause excessive noise..... 5-17

 Drug related activities 5-17

 Military training 5-17

 Military testing 5-18

906.Public Concern: The Forest Service should not allow individual forest plans to make exceptions for specific activities..... 5-18

Travel Management General..... 5-18

Access 5-19

907.Public Concern: The Forest Service should provide access to roadless areas. 5-19

 Beyond narrow corridors along a few major roads 5-19

 To the boundaries of roadless areas 5-20

908.Public Concern: The Forest Service should not allow the presence of an endangered species to block access to lands..... 5-20

909.Public Concern: The Forest Service should prohibit new road construction and regulate commercial ventures, but continue to allow access on existing routes. 5-20

910.Public Concern: The Forest Service should not penalize the whole population because of the irresponsible actions of a few.5-21

911.Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule does not affect access.5-21
 To Alaska’s national forests, because there is unique marine access5-21

Adequacy of Analysis5-21

912.Public Concern: The Forest Service should document visitor usage on forest travelways.5-21

913.Public Concern: The Forest Service should use the FS-643 Roads Analysis publication.5-22
 To determine the specific values of each motorized road and trail.....5-22

914.Public Concern: The Forest Service should consider the impacts of roads described in “Conservation Biology.”5-22

915.Public Concern: The Forest Service should carefully examine and evaluate the entire road system.5-22
 For effective long-term management5-22
 By evaluating the use of each road5-22
 To determine which existing roads are needed for effective long-term management, what new roads should be built, and which roads should be obliterated5-22
 To determine the environmental effects of the routes in their current conditions5-23
 Through individual forest plans5-23
 In North Dakota5-23

916.Public Concern: The Forest Service should recognize that the evaluation of road impacts in the Roadless Area Conservation Rule is flawed.5-23
 Because most roads in roadless areas are temporary roads5-23

917.Public Concern: The Forest Service should consider that the analysis on road impacts in the Roadless Area Conservation Rule is adequate.....5-23

918.Public Concern: The Forest Service should compare the effects of roads with other less intrusive access and recognize the basic principles of ecology.5-24

919.Public Concern: The Forest Service should address benefits to the Appalachian National Scenic Trail.5-24
 For roadless areas in the vicinity of the trail5-24

920.Public Concern: The Forest Service should ensure that if an illegally created route is to be reclassified as a trail, it must first undergo site-specific, National Environmental Policy Act analysis.5-24
 To gain classified status under the trail system.....5-24

Funding.....5-24

921.Public Concern: The Forest Service should increase the budget to fix the road system, restore degraded areas, and impose much

stricter standards on any new road construction in the Tongass National Forest. 5-24

If the Tongass National Forest is exempted from a national roadless rule..... 5-24

922.Public Concern: The Forest Service should allocate funds according to specific road priority. 5-24

923.Public Concern: The Forest Service should not charge fees for road use..... 5-25

924.Public Concern: The Forest Service should request funding to support trail programs..... 5-25

Travelways..... 5-25

925.Public Concern: The Forest Service should remember the purpose of the national forest transportation system. 5-25

To support management activities and access needs into the foreseeable future..... 5-25

926.Public Concern: The Forest Service should base road management decisions on the individual merits of each travelway..... 5-25

Because the cumulative effects of not analyzing each road and trail are significant 5-25

927.Public Concern: The Forest Service should establish a multiple use review board to guide travel management decisions. 5-25

928.Public Concern: The Forest Service should allow only temporary access ways in roadless areas. 5-26

Which are obliterated within a year of construction 5-26

929.Public Concern: The Forest Service should not be responsible for road and trail management. 5-26

930.Public Concern: The Forest Service should make parking areas available. 5-26

Roads..... 5-26

931.Public Concern: The Forest Service should incorporate management directions for public roads which are under the jurisdiction of local governments..... 5-26

932.Public Concern: The Forest Service should give due consideration to the position of local authorities regarding road rights..... 5-26

933.Public Concern: The Forest Service should respect states’ section line laws. 5-26

North Dakota’s laws..... 5-26

934.Public Concern: The Forest Service should address roads which appear on older system maps, roads which are of local importance, and Revised Statute 2477 rights-of-way. 5-27

935.Public Concern: The Forest Service should acknowledge the existence of every access road..... 5-27

936.Public Concern: The Forest Service should not imply there are more roads than there are. 5-27

937.Public Concern: The Forest Service should consider temporary/short-term roads for non-timber management objectives.5-28
 Such as wildlife habitat improvement projects, fuel treatments, preventative treatments for insect and disease problems, etc.....5-28

938.Public Concern: The Forest Service should acknowledge that the Roadless Area Conservation Rule does not close roads or prevent the construction of new roads in already roaded areas.5-28

939.Public Concern: The Forest Service should approve the location of roads at the national level.....5-28
 Following proposals from local authorities5-28

940.Public Concern: The Forest Service should place the burden of proof on those proposing roads as roadless areas are evaluated.5-28

Trails.....5-28

941.Public Concern: The Forest Service should explain how trail rules work with roadless designation.....5-28

942.Public Concern: The Forest Service should rotate trails in roadless areas.5-28
 To prevent resource damage5-28

943.Public Concern: The Forest Service should stop turning existing trails into roads.5-29
 To restore traditional uses.....5-29

944.Public Concern: The Forest Service should eliminate the 50-inch trail rule.....5-29

945.Public Concern: The Forest Service should reconsider its elimination of the 40-inch rule.....5-29
 And restore traditional trails that have been damaged by off-road vehicles5-29

946.Public Concern: The Forest Service should recognize that trails which are not authorized through a public planning process are illegal.5-29

Road/Trail Construction5-29

Road/Trail Construction General5-31

947.Public Concern: The Forest Service should construct and maintain an adequate system of roads and trails.....5-31
 As required by the Multiple Use and Sustained Yield Act.5-31

Funding.....5-31

948.Public Concern: The Forest Service should tell the truth regarding the availability of funds for road construction.....5-31

949.Public Concern: The Forest Service should revise the way the accounting department handles road construction.5-31
 By calculating depreciation over the life of the road5-31

950.Public Concern: The Forest Service should shift funding priority to trail construction and maintenance.5-31

951. Public Concern: The Forest Service should divide Green Sticker and gasoline tax funds equally between management costs and new trail costs. 5-32

Road Construction 5-32

952. Public Concern: The Forest Service should determine needed road construction at the local level..... 5-32

 Based on situation and need 5-32

953. Public Concern: The Forest Service should examine the need for new road construction on a case-by-case basis. 5-32

 By ecologists unassociated with the agency or commodity interests.... 5-32

954. Public Concern: The Forest Service should specify whether road construction and reconstruction in other unroaded areas is to be under the jurisdiction of local land managers..... 5-32

955. Public Concern: The Forest Service should complete a management plan for existing roads before banning new road construction. 5-32

956. Public Concern: The Forest Service should revise its discussion of roads in the Roadless Area Conservation Rule Draft EIS to reflect current improvements in road construction and maintenance. 5-32

957. Public Concern: The Forest Service should protect roadless areas. .. 5-33

 To reduce the backlog of improperly constructed roads 5-33

Allow Road Construction..... 5-33

958. Public Concern: The Forest Service should allow road construction and maintenance in roadless areas. 5-33

 To provide access to users..... 5-33

 To disperse recreation users 5-33

 To spare local governments the cost of repairs to maintain needed access to utility sites..... 5-33

 To provide access for non-timber forest product gathering 5-34

 When needed to add to the transportation infrastructure that is essential to the security and economic health of the nation 5-34

 Under specific exceptions..... 5-34

 Both permanent and temporary roads 5-35

 Two-track roads..... 5-35

 When needed for public safety 5-35

 In Central Utah 5-36

959. Public Concern: The Forest Service should not use the maintenance backlog as an excuse to forego road construction. 5-36

Do Not Allow/Restrict Road Construction..... 5-36

960. Public Concern: The Forest Service should prohibit road construction in roadless areas. 5-36

 Because roads lead to increased active management 5-37

 Because roads lead to increased natural resource use..... 5-37

 Because roads lead to excessive gathering 5-37

 Because roads lead to increased motorized use 5-37

 Because roads lead to increased illegal activity 5-37

Because roads provide an avenue for abusive human behavior..... 5-37

Because increased access will lead to increased need for rescue operations 5-38

Because roads contribute to trail destruction 5-38

Because roads contribute to landslide danger 5-38

Because the difficult terrain in most roadless areas impedes road construction..... 5-38

Because the Forest Service lacks the funding to maintain existing roads 5-39

In sensitive areas 5-40

Near wilderness areas 5-40

Once inventoried areas are mapped accurately..... 5-40

Until new forest plans are in place 5-40

Until the Agency is able to better manage the existing road network 5-40

Allow Trail Construction 5-40

961.Public Concern: The Forest Service should construct more recreational trails. 5-40

962.Public Concern: The Forest Service should allow trail construction. ... 5-40

 Rather than road construction 5-40

 Less than six feet wide 5-40

963.Public Concern: The Forest Service should turn unneeded roads into less damaging trails. 5-40

964.Public Concern: The Forest Service should reroute “problem” trails rather than close them..... 5-41

965.Public Concern: The Forest Service should establish connector trails..... 5-41

 To avoid dead-end trails..... 5-41

966.Public Concern: The Forest Service should construct hiking paths and trail shelters. 5-41

 Rather than roads 5-41

967.Public Concern: The Forest Service should allow trail users to construct trails. 5-41

 Because the Forest Service is unable to construct them efficiently..... 5-41

968.Public Concern: The Forest Service should work with off-road vehicle users in developing and maintaining trails..... 5-41

 To ensure environmentally responsible usage and rider safety and satisfaction 5-41

Road/Trail Maintenance/Reconstruction 5-41

Road/Trail Maintenance/Reconstruction General 5-42

 969.Public Concern: The Forest Service should establish a uniform checklist and a clearly defined process to govern road and trail maintenance..... 5-42

Funding..... 5-42

 970.Public Concern: The Forest Service should provide adequate funding for road maintenance..... 5-42

 By using national highway gas tax funds 5-43

971.Public Concern: The Forest Service should eliminate all road maintenance backlogs. 5-43
 By reprioritizing funding..... 5-43
 By considering cost-saving measures for maintenance..... 5-43
 972.Public Concern: The Forest Service should tie adequate road maintenance funding to best management practices for timber removal. 5-43
 973.Public Concern: The Forest Service should justify its claim that there is an \$8.6 billion road maintenance backlog. 5-43
 974.Public Concern: The Forest Service should seek funding for trail maintenance from states. 5-43
Road Maintenance/Reconstruction 5-44
 975.Public Concern: The Forest Service should provide new direction for road maintenance. 5-44
 In the Forest Service Manual..... 5-44
 976.Public Concern: The Forest Service should clarify what road restoration activities will be allowed under the Roadless Area Conservation Rule. 5-44
 For roads significantly damaged by natural hazards 5-44
 977.Public Concern: The Forest Service should address road maintenance needs in the Tongass National Forest..... 5-44
 978.Public Concern: The Forest Service should sign unmaintained roads indicating user liability. 5-45
Allow Road Maintenance/Reconstruction..... 5-45
 979.Public Concern: The Forest Service should maintain existing roads..... 5-45
 By rerouting roads that are causing damage..... 5-45
 By waterproofing needed roads..... 5-45
 By bringing roads up to standard..... 5-45
 980.Public Concern: The Forest Service should maintain roads that charge special use fees. 5-45
 981.Public Concern: The Forest Service should allow off-highway clubs to maintain roads that counties and states cannot. 5-45
 Because too much land and roads have been taken from the people..... 5-45
 982.Public Concern: The Forest Service should assist Permit Holders in road maintenance. 5-46
Allow Trail Maintenance/Reconstruction 5-46
 983.Public Concern: The Forest Service should maintain all existing trails in the Forest Service trail inventory. 5-46
 As part of a conservation process 5-46
 984.Public Concern: The Forest Service should clear trails early in the year..... 5-46
 To ensure maximum access and reduction of damage 5-46
Road/Trail Closure/Obliteration/Restoration 5-46
 Road/Trail Closure/Obliteration/Restoration General..... 5-47

985.Public Concern: The Forest Service should close all user-created routes. 5-47
 Until site-specific analysis can be completed to determine what status they should have 5-47

986.Public Concern: The Forest Service should obliterate non-system roads and trails. 5-47
 After they are adequately mapped 5-47
 To avoid unintentional trespassing..... 5-47

987.Public Concern: The Forest Service should work with off-road vehicle groups. 5-48
 To avoid unnecessary road or trail closures..... 5-48

988.Public Concern: The Forest Service should provide adequate signs to indicate that a road or trail has been closed..... 5-48
 Signs should state a legitimate reason for the closure 5-48

Funding..... 5-48

989.Public Concern: The Forest Service should not close roads that it does not have the funding to maintain..... 5-48

Road Closure/Obliteration/Restoration 5-48

990.Public Concern: The Forest Service should clarify the evaluation process for closing unclassified roads. 5-48

991.Public Concern: The Forest Service should consider public comment before closing roads. 5-49

992.Public Concern: The Forest Service should not include roads associated with mining activities in the backlog of roads needing to be reclaimed..... 5-49
 Due to the requirements for reclamation under federal and state regulation 5-49

993.Public Concern: The Forest Service should recognize that, absent recreational needs, roads built for timber removal could be closed after logging..... 5-49
 Because roads built solely for logging do not require the high construction standards necessary for roads which serve recreational purposes..... 5-49

994.Public Concern: The Forest Service should clarify whether certain roads will be closed due to their roadless designation..... 5-50
 The road near southern Arizona’s Pena Blanca Lake 5-50

995.Public Concern: The Forest Service should reconsider decisions that turned specific existing roads into trails. 5-50
 Trail 67 5-50

Allow Road Closure/Obliteration/Restoration..... 5-50

996.Public Concern: The Forest Service should decommission existing roads. 5-50

997.Public Concern: The Forest Service should eliminate from the travel plan roads that are not currently shown on maps. 5-51

998.Public Concern: The Forest Service should clearly state in the Roadless Area Conservation Rule that any road constructed in

compliance with the exceptions must be closed and rehabilitated
as soon as possible. 5-51

Do Not Allow/Restrict Road Closure/Obliteration/Restoration..... 5-51

999. Public Concern: The Forest Service should not decommission
existing roads..... 5-51

Roads that are main arteries to other areas 5-51

Because access to large areas disperses impact..... 5-51

In association with other actions..... 5-51

1000. Public Concern: The Forest Service should not use the fact
that roads are not maintained properly as an excuse to
decommission them..... 5-52

Because primitive tracks are more fun to drive than high-speed
routes 5-52

1001. Public Concern: The Forest Service should remove all gates
on federal land..... 5-52

1002. Public Concern: The Forest Service should not obliterate
bridges..... 5-52

Where roads are already present 5-52

Natural Resources General 5-52

Natural Resources Management General..... 5-53

1003. Public Concern: The Forest Service should responsibly
manage natural resources. 5-53

As an impartial advocate for the public good..... 5-53

To protect areas not yet damaged..... 5-53

To preserve resources fundamental to our survival..... 5-54

To sustain the population and ecological balance of the planet 5-54

By managing non-wilderness lands with varying degrees of
intensity, depending on resource potential 5-54

1004. Public Concern: The Forest Service should make sound
resource management decisions..... 5-54

Based on science 5-54

Based on expert opinion..... 5-54

Based on new technology 5-54

Based on best management practices 5-55

1005. Public Concern: The Forest Service should promote future
sustainable yields in management of roadless areas. 5-55

By implementing sustainable management practices..... 5-55

By defining areas where sustained yield will be the management
objective 5-55

By harvesting areas that have already been cultivated 5-55

By shifting to forestry practices outlined by the Pacific Northwest
Research Station..... 5-55

1006. Public Concern: The Forest Service should prevent further
degradation of roadless areas and natural resources..... 5-55

By encouraging conservation and recycling 5-56

By developing alternative forms of energy..... 5-56

1007. Public Concern: The Forest Service should provide national oversight of forest management.5-57
 In deciding where timber sales and other commercial operations can take place5-57

1008. Public Concern: The Forest Service should consider that roadless areas account for very little of the nation’s timber, oil, and gas resources.5-57

1009. Public Concern: The Forest Service should recognize that allowing active management sets the precedent for more resource removal.....5-58

1010. Public Concern: The Forest Service should support legislation that regulates natural resource consumption.....5-58

1011. Public Concern: The Forest Service should reach decisions on development proposals in a timely manner.5-58

1012. Public Concern: The Forest Service should limit active management while accommodating reasonable local practices.5-58

1013. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule will make it difficult to meet resource requirements for the future.5-59

1014. Public Concern: The Forest Service should monitor resource use.....5-59
 Maintain access so the public can monitor resource management5-59

1015. Public Concern: The Forest Service should develop a national roadless rule.5-59
 Because it will stimulate new industry innovations5-59

Adequacy of Analysis5-59

1016. Public Concern: The Forest Service should evaluate the cumulative impacts of road closures.....5-59
 On fire and timber management, and firewood gathering5-59

1017. Public Concern: The Forest Service should determine when land use activities are approaching a management threshold.....5-60
 A threshold established in the forest plan to ensure resource sustainability and maintenance of land management continuity.....5-60

Funding.....5-60

1018. Public Concern: The Forest Service should fund the development of better technology.5-60
 To aid in resource conservation5-60

Allow Active Natural Resource Management.....5-60

1019. Public Concern: The Forest Service should construct temporary roads for resource management activities.....5-60

1020. Public Concern: The Forest Service should allow regulated removal of forest products.5-61
 Which does not require road building or inflict environmental damage, such as ginseng and morel harvest.....5-61

Do Not Allow/Restrict Active Natural Resource Management5-61

1021. Public Concern: The Forest Service should prohibit resource removal in roadless areas..... 5-61
 Because of overwhelming public support for the Roadless Area Conservation Rule 5-61
 Because industrial exploration and wilderness preservation are mutually exclusive 5-61
 Because of the need to act for the long term..... 5-62
 Because of the intrinsic value of forests 5-62
 By adding a supplemental prohibition to the existing Roadless Area Conservation Rule 5-62

1022. Public Concern: The Forest Service should not use maintenance of private property access as an excuse to allow resource removal. 5-63

1023. Public Concern: The Forest Service should recognize that commodity production is not the best use of public lands. 5-63
 Due to the harsh conditions in many roadless areas 5-63

1024. Public Concern: The Forest Service should prohibit the removal of forest products. 5-63
 Natural materials 5-63
 Secondary forest products..... 5-63

1025. Public Concern: The Forest Service should replace logging and mining with environmentally sound alternatives..... 5-63

1026. Public Concern: The Forest Service should close land previously opened to commercial interests. 5-64
 Because it is time to stop destroying our natural resources 5-64

1027. Public Concern: The Forest Service should prohibit gardening of vegetation for commercial purposes. 5-64

Timber Removal 5-64
Timber Removal General 5-66

1028. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule..... 5-66
 To provide forestry professionals with adequate timber removal options..... 5-66

1029. Public Concern: The Forest Service should consider that keeping roadless areas in the timberland base allows the over-cutting of more productive land..... 5-66

1030. Public Concern: The Forest Service should consider that timber companies have an adequate timber supply..... 5-66
 Their largest concerns are foreign competition and a glutted market ... 5-66

1031. Public Concern: The Forest Service should collaborate with timber companies. 5-66
 In the use of sustainable timber practices 5-66

1032. Public Concern: The Forest Service should consider that if it allows timber removal in roadless areas only by skid roads, it will not allow timber removal for long. 5-67
 Due to the environmental damage caused by skid roads 5-67

1033. Public Concern: The Forest Service should consider public comment prior to timber sales.5-67

1034. Public Concern: The Forest Service should consider that most roadless areas are unsuitable for timber removal.....5-67
Because they are steep, remote, and the trees have little commercial value5-67

1035. Public Concern: The Forest Service should acknowledge that the Roadless Area Conservation Rule would decrease timber removal on federal lands by only two percent.5-68

1036. Public Concern: The Forest Service should replant clear-cut areas.5-68
To avoid harvesting other areas.....5-68

1037. Public Concern: The Forest Service should monitor timber removal.....5-68

1038. Public Concern: The Forest Service should encourage the development of alternatives to wood.5-68

1039. Public Concern: The Forest Service should recognize the conflict of interest involved in its management of timber.5-69

1040. Public Concern: The Forest Service should explain why it is preparing and implementing timber removal projects in roadless areas.5-69
Given its expressed commitment to conserving wild forests5-69

Adequacy of Analysis5-69

1041. Public Concern: The Forest Service should analyze the impacts of removing land from sustained yield management.5-69

1042. Public Concern: The Forest Service should not evaluate timber removal during roadless evaluation5-69

1043. Public Concern: The Forest Service should analyze the impact of timber sales on lands adjacent to roadless areas.....5-69

1044. Public Concern: The Forest Service should require logging companies to perform environmental impact studies.....5-69
To prevent environmental damage.....5-69

Funding.....5-69

1045. Public Concern: The Forest Service should not charge a fee for dead timber gathering permits.5-69

1046. Public Concern: The Forest Service should not sell fiber.....5-70
Chip the brush and leave it on the forest.....5-70

Allow Timber Removal.....5-70

1047. Public Concern: The Forest Service should permit timber removal in roadless areas.5-70
Because it would require more acres elsewhere to replace the timber volume.....5-70
Because of the centrality of wood products to our culture5-70
To sustain turkey farms.....5-70
As part of ecological restoration efforts5-70

As long as the Forest Service replaces each harvested tree with five planted trees 5-71

As long as it is not commercialized..... 5-71

1048. Public Concern: The Forest Service should permit timber removal by various methods. 5-71

 With roads 5-71

 Through a harvesting system that does not require additional roads ... 5-71

 Through the construction of temporary logging railroads..... 5-71

 By helicopter..... 5-72

 By horse 5-72

 By elephant 5-72

 Harvest saw logs and small trees 5-72

 Harvest small-diameter timber from roaded areas 5-72

 Selective timber removal 5-72

 Salvage timber removal..... 5-73

1049. Public Concern: The Forest Service should permit timber removal in certain areas. 5-73

 In Wisconsin 5-73

 In Sierra County 5-73

 In roaded areas of the Tongass National Forest 5-73

 In the Rogue River/Siskiyou National Forest 5-74

 On private lands 5-74

 Only in areas that are already accessible by existing roads 5-74

1050. Public Concern: The Forest Service should consider a categorical exclusion for some routine activities. 5-75

 Such as timber removal..... 5-75

1051. Public Concern: The Forest Service should implement existing forest plans. 5-75

 To meet harvest levels adopted during the forest planning process..... 5-75

1052. Public Concern: The Forest Service should support a sustainable timber industry. 5-75

 By supporting sustainable timber removal practices..... 5-75

 By managing second growth in the Tongass National Forest..... 5-75

 By removing restrictions and limitations 5-75

1053. Public Concern: The Forest Service should allow timber removal on other forest lands to replace lost timber volumes due to roadless designations. 5-76

 In Oregon 5-76

1054. Public Concern: The Forest Service should not place restrictions on timber removal on privately owned forest lands adjacent to state and national forests. 5-76

 Because the Forest Service’s refusal to thin National Forest System lands will result in more wildfires 5-76

1055. Public Concern: The Forest Service should enlist the public to help clear and thin the forests..... 5-76

 As it promotes community and cultural involvement..... 5-76

1056. Public Concern: The Forest Service should allow wood gathering in roadless areas.5-76
Do Not Allow/Restrict Timber Removal.....5-77

1057. Public Concern: The Forest Service should prohibit timber removal in roadless areas.5-77
 During the ANPR comment period5-77

1058. Public Concern: The Forest Service should prohibit all timber removal methods.....5-77
 Helicopter logging5-77
 Salvage logging.....5-77
 Clear cutting5-77

1059. Public Concern: The Forest Service should prohibit timber removal in certain areas.5-78
 In Washington State5-78
 In areas containing less than 50 percent suitable timber base.....5-78
 In the Skykiomish Wild Country.....5-78

1060. Public Concern: The Forest Service should prohibit timber companies from harvesting virgin timber on National Forest System lands.....5-78

1061. Public Concern: The Forest Service should stop preparing timber sales in the Tongass National Forest.5-78
 Which are in violation of the Roadless Area Conservation Rule5-78
 On Prince of Wales and Gravina Islands5-79

1062. Public Concern: The Forest Service should adjust the annual sale quantity downward.5-79
 To prevent further biological and recreational problems in roaded areas5-79
 To reflect the interests of special interest groups and small scale gatherers5-79

1063. Public Concern: The Forest Service should prohibit wood gathering in roadless areas.5-79
 Unless the area is a buffer zone.....5-79

Mining, Oil, and Gas Development5-79
Mining, Oil, and Gas Development General5-81

1064. Public Concern: The Forest Service should revise management of mining leases in inventoried roadless areas.5-81

1065. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule.5-81
 Because it will make mineral exploration less feasible5-81
 Because it will make mineral exploration impossible.....5-82

1066. Public Concern: The Forest Service should recognize that the Surface Mining Control and Reclamation Act of 1977 obviates the need to apply the Roadless Area Conservation Rule to coal mining.....5-82

1067. Public Concern: The Forest Service should exclude mining lease renewal and modification from application of a roadless designation. 5-83

1068. Public Concern: The Forest Service should recognize that oil and gas leasing is not a project-level decision requiring additional National Environmental Policy Act analysis. 5-84

1069. Public Concern: The Forest Service should address short-term safety issues regarding mining activities..... 5-84
 Until the Roadless Area Conservation Rule is finalized..... 5-84

1070. Public Concern: The Forest Service should not subject existing mining leases to communalization agreements. 5-84

1071. Public Concern: The Forest Service should hold companies responsible for environmental damage from oil and gas development. 5-84

1072. Public Concern: The Forest Service should recognize the efforts of the mining industry to preserve the environment and beauty of the grasslands..... 5-84

Adequacy of Analysis..... 5-84

1073. Public Concern: The Forest Service should improve post-plan monitoring of oil and gas developments. 5-84
 include development of an inventory of resource data 5-84

1074. Public Concern: The Forest Service should prepare a reasonably foreseeable development scenario for analysis of effects of oil and gas development. 5-85
 Which analyzes the net effect of long-term surface disturbance rather than the number of wells to be drilled..... 5-85

1075. Public Concern: The Forest Service should obtain input from the Bureau of Land Management regarding leasing areas included in the roadless inventory..... 5-86

1076. Public Concern: The Forest Service should address the amount of oil reserves which lie under National Forest System lands. 5-86

1077. Public Concern: The Forest Service should use accurate data to estimate the percentage of coal that comes from National Forest System lands..... 5-87

1078. Public Concern: The Forest Service should analyze oil and gas resource potential in roadless areas. 5-87
 Through a public lands inventory of hydrocarbon potential 5-88

1079. Public Concern: The Forest Service should accurately assess the impact of the Roadless Area Conservation Rule on energy potential. 5-88
 On the Little Missouri National Grassland 5-88
 In Wyoming 5-88

1080. Public Concern: The Forest Service should address the overall process of mineral exploration. 5-88

Through detailed studies addressing mineral potential in roadless areas5-88

1081. Public Concern: The Forest Service should provide a legal review to determine whether the Roadless Area Conservation Rule can prohibit access to mining claims.5-89

1082. Public Concern: The Forest Service should justify its claim that inventoried roadless areas would be among the last areas entered for exploration and development.5-89

Allow Mining, Oil, and Gas Development.....5-89

1083. Public Concern: The Forest Service should ensure access for mining5-89

As required by law.....5-89

As required by the Forest Service Manual and Regulations5-89

Except in wilderness areas.....5-90

1084. Public Concern: The Forest Service should allow mineral, oil, and gas exploration and extraction in roadless areas.....5-90

To help lower the costs of fuel in the United States5-91

Because hardrock minerals are critical components for defense technologies5-91

Only if companies agree to clean up existing super-fund sites.....5-91

1085. Public Concern: The Forest Service should allow mineral, oil, and gas exploration and extraction by various methods.....5-91

By slant drilling or other techniques which do not disturb the surface ...5-91

By manual means only5-91

1086. Public Concern: The Forest Service should allow mineral, oil, and gas exploration and extraction in certain areas.5-91

In the Rocky Mountains.....5-91

In the Rocky Mountain States5-91

In Colorado and Utah5-92

In Utah5-92

In the national monument in Utah5-93

In the Manti LaSal National Forest5-93

In Montana5-93

In North Dakota5-93

In the Dakota Prairie Grasslands5-93

In Alaska5-94

In the Absaroka-Beartooth Wilderness.....5-94

In Big Springs and Jerrit Canyon.....5-94

By mining operations controlled by the Stillwater Mining Company5-94

By mining operations controlled by Burlington Resources Oil and Gas Company I.P.5-95

1087. Public Concern: The Forest Service should clarify that mining leases issued by the Bureau of Land Management will not be affected by the Roadless Area Conservation Rule.5-95

In Gunnison County5-95

1088. Public Concern: The Forest Service should exempt geothermal leases from the Roadless Area Conservation Rule. 5-95
Including new geothermal resource areas identified by the Bureau of Land Management..... 5-95
Do Not Allow/Restrict Mining, Oil, and Gas Development..... 5-96

1089. Public Concern: The Forest Service should not allow mineral exploration in roadless areas. 5-96

1090. Public Concern: The Forest Service should not allow mineral exploration by various methods. 5-97
Acid mine draining..... 5-97
Gold mining techniques 5-97
Recreational mining..... 5-97

1091. Public Concern: The Forest Service should not allow mineral exploration in certain areas..... 5-97
In the Tongass National Forest 5-97
In the Humboldt-Toiyabe National Forest 5-97
In the southern Appalachians 5-97
In North Dakota 5-98
In the George Washington and Jefferson National Forests 5-98

1092. Public Concern: The Forest Service should prohibit mining activities in roadless areas..... 5-98
Due to the asbestos fibers carried by miners into homes and towns.... 5-98

1093. Public Concern: The Forest Service should revoke inactive mining claims. 5-98

1094. Public Concern: The Forest Service should prohibit drilling in the National Forest System..... 5-99
In the New York National Fingerlakes Forest region 5-99

1095. Public Concern: The Forest Service should oppose oil drilling in the Alaska National Arctic Wildlife Refuge. 5-99
Because it will not provide long-term benefits 5-99

Grazing..... 5-99
Grazing General..... 5-100

1096. Public Concern: The Forest Service should address how grazing in roadless areas will be handled in the future. 5-100

1097. Public Concern: The Forest Service should insist that ranchers accept the risk that their herds will be subject to natural predators... 5-100
By not demanding that predators be destroyed or relocated 5-100

1098. Public Concern: The Forest Service should analyze the impact of roadless designations on rangeland health and management..... 5-100
In the national grasslands..... 5-100

1099. Public Concern: The Forest Service should ensure that grazing rights do not automatically go to the same rancher every decade. 5-100

Funding..... 5-101

1100. Public Concern: The Forest Service should sell unneeded grazing land. 5-101
To people who hold leases..... 5-101

Allow Grazing..... 5-101

1101. Public Concern: The Forest Service should allow grazing in roadless areas..... 5-101

 To prevent fuels from accumulating 5-101

 By including specific statements to that effect in the Roadless Area Conservation Rule..... 5-101

 In North Dakota 5-101

1102. Public Concern: The Forest Service should protect access to livestock and range facilities..... 5-101

Do Not Allow/Restrict Grazing 5-102

1103. Public Concern: The Forest Service should regulate grazing in roadless areas..... 5-102

 In riparian areas and recreational campsites..... 5-102

1104. Public Concern: The Forest Service should not allow grazing on National Forest System lands..... 5-102

 Because of environmental damage..... 5-102

1105. Public Concern: The Forest Service should restrict off-road vehicle use by ranchers on National Forest System lands. 5-102

 For the purpose of monitoring livestock 5-102

Utility Corridors 5-102

Utilities General 5-103

1106. Public Concern: The Forest Service should consult with the Federal Energy Regulatory Commission and the Federal Communications Commission regarding the effects of proposed regulation on public utilities. 5-103

 To ensure acknowledgement of existing rights-of-way..... 5-103

Allow Utilities..... 5-103

1107. Public Concern: The Forest Service should allow power line construction in roadless areas..... 5-103

1108. Public Concern: The Forest Service should allow access to power lines and hydroelectric facilities. 5-103

 Through the construction of temporary roads..... 5-103

 Facilities controlled by The Tennessee Valley Authority 5-103

1109. Public Concern: The Forest Service should maintain existing roads. 5-104

 To allow local governments access to their water systems..... 5-104

 Raywood Flat Area..... 5-104

1110. Public Concern: The Forest Service should allow motorized vehicles in roadless areas. 5-105

 To maintain water system structures..... 5-105

Do Not Allow/Restrict Utilities 5-105

1111. Public Concern: The Forest Service should prohibit power-lines and pipelines in roadless areas. 5-105

1112. Public Concern: The Forest Service should prohibit the construction of wireless telecommunications facilities. 5-105

1113. Public Concern: The Forest Service should prohibit hydroelectric facilities in roadless areas. 5-106

1114. Public Concern: The Forest Service should not allow maintenance of existing dams. 5-106

1115. Public Concern: The Forest Service should prohibit water extraction from roadless areas..... 5-106

1116. Public Concern: The Forest Service should limit water withdrawal that threatens to lower the water table. 5-106

Other Natural Resource Concerns 5-106

1117. Public Concern: The Forest Service should recognize the possible medicinal values available in forest products..... 5-106

1118. Public Concern: The Forest Service should revise the leasing process. 5-106

To allow more equitable expense sharing 5-106

1119. Public Concern: The Forest Service should prohibit various activities in roadless areas..... 5-107

Construction of commercial facilities 5-107

Dumping of waste materials 5-107

Nuclear testing, power generation, and eco-terrorism 5-107

Nuclear waste storage..... 5-107

1120. Public Concern: The Forest Service should recognize that the most effective use of grasslands is food production. 5-107

Recreation General 5-108

Recreation Management General..... 5-109

1121. Public Concern: The Forest Service should take a leadership position in managing National Forest System lands. 5-109

Because it has a statutory duty to provide outdoor recreation opportunities to the public under the National Forest Management Act 5-109

1122. Public Concern: The Forest Service should acknowledge that its goal is to provide the maximum amount of recreational opportunities. 5-109

As long as they do not cause significant, irreversible harm 5-109

1123. Public Concern: The Forest Service should consider various recreational values..... 5-110

Non-wilderness, semi-primitive, motorized, and non-motorized 5-110

The value of dispersed recreation 5-110

1124. Public Concern: The Forest Service should devote more attention to recreation planning..... 5-110

Especially in the Tongass National Forest..... 5-110

1125. Public Concern: The Forest Service should manage roadless areas for primitive recreation. 5-110

1126. Public Concern: The Forest Service should manage to reduce fuel loading and wildfire risk..... 5-110

Because of its devastating impacts on recreational opportunities 5-110

1127. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule.5-111
 Because it does not adequately consider recreation.....5-111
 Because it will be overly restrictive toward recreation uses.....5-111

1128. Public Concern: The Forest Service should manage roadless areas to reduce recreation pressures on designated wilderness areas.5-111
 By providing non-motorized recreational opportunities5-111
 By providing for a wider variety of activities, including motorized.....5-111

1129. Public Concern: The Forest Service should manage for multiple use.5-112
 To promote recreational diversity5-112

1130. Public Concern: The Forest Service should open non-wilderness areas to dispersed recreation.5-112
 Including roadless areas5-112

1131. Public Concern: The Forest Service should encourage recreational development of private lands.5-112
 To enhance recreation opportunities on public lands5-112

1132. Public Concern: The Forest Service should emulate the Ten Lakes Roadless Area management.....5-112

1133. Public Concern: The Forest Service should prepare a Winter Recreation Use Plan as part of the forest planning process.5-113
 To develop a system of land use allocations.....5-113

Adequacy of Analysis5-113

1134. Public Concern: The Forest Service should acquire data on the increasing recreational use of National Forest System lands.5-113

1135. Public Concern: The Forest Service should evaluate recreation potential in roadless areas.....5-113
 By using accurate maps.....5-113

1136. Public Concern: The Forest Service should provide an evaluation of seasonal suitability for various activities.....5-113
 Including motorized and non-motorized recreation5-113

Funding.....5-113

1137. Public Concern: The Forest Service should request adequate funding for recreational programs.....5-113
 In order to maintain recreational facilities without visitor fees.....5-114

1138. Public Concern: The Forest Service should use money allocated for roads to fund recreational facilities.....5-114

1139. Public Concern: The Forest Service should use funds from timber sales to build new recreational facilities.....5-114

Recreation Access.....5-114

1140. Public Concern: The Forest Service should not restrict recreation access to National Forest System lands.....5-114
 By ensuring no net loss to public land and public access5-114

1141. Public Concern: The Forest Service should allow access to roadless areas by local citizens.....5-115

As the only exception to access restrictions 5-115

1142. Public Concern: The Forest Service should ensure equal access among different user groups..... 5-115

1143. Public Concern: The Forest Service should allocate land acreage proportionally based on numbers of users for each activity..... 5-115

Balanced with a need and cost/benefit analysis 5-115

1144. Public Concern: The Forest Service should grant proportional access among user groups based on need for solitude..... 5-115

Allocate more land area for non-motorized users..... 5-115

1145. Public Concern: The Forest Service should take into consideration the available opportunities for activities on other public lands when making allocation decisions..... 5-116

User Conflicts..... 5-116

1146. Public Concern: The Forest Service should designate separate areas for competing uses. 5-116

To minimize user conflicts 5-116

For non-motorized and motorized uses 5-116

For different motorized uses..... 5-117

That allow motorized users to view non-motorized areas..... 5-117

By adjusting roadless area boundary lines 5-117

1147. Public Concern: The Forest Service should not confuse use conflicts with user conflicts..... 5-117

1148. Public Concern: The Forest Service should allow activities according to the landscape’s ability to tolerate them. 5-118

1149. Public Concern: The Forest Service should alleviate crowding... 5-118

By making more land available for recreation..... 5-118

By implementing the Roadless Area Conservation Rule 5-118

Motorized Recreation 5-119

Motorized Recreation General 5-120

1150. Public Concern: The Forest Service should require local forest managers to determine the appropriate use of motorized vehicles... 5-120

Based on science rather than socio-economic factors 5-120

1151. Public Concern: The Forest Service should implement rules on proper and responsible motorized use..... 5-120

To allow access to private and public lands 5-120

1152. Public Concern: The Forest Service should create a standard signing convention. 5-120

To avoid confusion regarding seasonal motor vehicle restrictions 5-120

Adequacy of Analysis..... 5-121

1153. Public Concern: The Forest Service should evaluate the type of motorized experiences desired by users. 5-121

1154. Public Concern: The Forest Service should evaluate the available mileage of off-road vehicle trails versus the available mileage of non-motorized trails and cross-country opportunities. 5-121

1155. Public Concern: The Forest Service should address the current level of motorized recreation on classified and unclassified roads within roadless areas.....5-121
 In order to assess the costs of closing these areas and concentrating use in other areas5-121

1156. Public Concern: The Forest Service should include accurate emissions readings in EISs.5-121

Education.....5-121

1157. Public Concern: The Forest Service should educate the public. ..5-121
 About responsible motorized recreation.....5-121

Cumulative Impacts on Motorized Recreationists5-122

1158. Public Concern: The Forest Service should evaluate the cumulative impacts to motorized users of reduced motorized access.5-122
 In conjunction with other management proposals5-122
 Include the impacts of all past motorized closures and road and trail obliterations.....5-123
 Include impacts of motorized closures as a result of wildfire.....5-123
 Include impacts associated with environmental justice5-123
 Include negative economic impacts5-123

1159. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule.5-123
 Because it unfairly impacts motorized users5-123
 Because roadless status will trump existing forest designations5-124

1160. Public Concern: The Forest Service should develop a management alternative which incorporates all existing motorized roads and trails and restricts motorized travel to those travelways. ..5-124
 To avoid contributing to further cumulative impacts on motorized recreationists.....5-124

1161. Public Concern: The Forest Service should close certain areas to prevent user-created trails while allowing use of existing motorized routes.....5-124
 Because the cumulative impacts of the travel plan and the rulemaking process on motorized recreationists have been significant5-124

1162. Public Concern: The Forest Service should reclassify roadways to restricted-width or unrestricted-width motorized trails. ..5-124
 To avoid contributing to the cumulative impacts on motorized recreation5-124

Allow Motorized Recreation5-125

1163. Public Concern: The Forest Service should develop a comprehensive inventory of all existing motorized routes.5-125
 To assist in preserving motorized access.....5-125

1164. Public Concern: The Forest Service should designate land for motorized and mechanized access.5-125
 Where environmental damage will be minimal.....5-125

1165. Public Concern: The Forest Service should allow motorized vehicles in roadless areas.....	5-125
Motorcycles	5-125
Six or eight wheeled vehicles	5-125
Battery-operated vehicles for the handicapped	5-126
To access and maintain grazing areas	5-126
To carry out big game for processing	5-126
Depending on the terrain in the area	5-126
As required by the National Environmental Policy Act.....	5-126
1166. Public Concern: The Forest Service should enhance opportunities for motorized recreation.	5-126
1167. Public Concern: The Forest Service should revise Management Areas 11 and 12 to allow motorized recreation.	5-126
1168. Public Concern: The Forest Service should not use disturbance of wildlife as a reason to deny motorized access.	5-127
Because studies have shown that hikers disturb wildlife more than motorized visitors.....	5-127
1169. Public Concern: The Forest Service should allow airplanes in roadless areas.	5-127
Those that can land on water	5-127
By maintaining primitive backcountry airstrips.....	5-127
By maintaining airstrips at ranger stations.....	5-127
1170. Public Concern: The Forest Service should allow competitive motorized events in roadless areas.	5-128
<i>Do Not Allow/Restrict Motorized Recreation</i>	5-128
1171. Public Concern: The Forest Service should prohibit motorized vehicles in roadless areas.....	5-128
Two-cycle engines.....	5-128
Gasoline, diesel, and alcohol engines	5-128
Vehicles that require more than a single track.....	5-129
On new but closed roads.....	5-129
To eliminate user created trails	5-129
Due to increased vandalism and crime.....	5-129
Due to animal harrassment	5-129
Due to increased wildfire danger	5-129
1172. Public Concern: The Forest Service should prohibit helicopters and airplanes in roadless areas.....	5-129
1173. Public Concern: The Forest Service should prohibit powerboats in roadless areas.....	5-129
<i>Other</i>	5-130
1174. Public Concern: The Forest Service should seize vehicles that violate regulations in wilderness areas.	5-130
1175. Public Concern: The Forest Service should prohibit the development of recreational vehicle parks.....	5-130
1176. Public Concern: The Forest Service should clarify how roadless area designation would impact backcountry airstrips.	5-130

Motorized Recreation – Off-Road Vehicles5-130

Off-Road Vehicles General.....5-131

 1177. Public Concern: The Forest Service should use Executive Order 11909 as a management tool to govern management of off-road vehicles.5-131

 To maintain resources while providing diverse off-road vehicle recreational opportunities5-131

Funding.....5-131

 1178. Public Concern: The Forest Service should develop a plan to use gas tax money to address the needs of off-highway vehicle recreationists.5-131

 1179. Public Concern: The Forest Service should use funds to enforce the exclusion of off-road vehicles from nondesignated areas.5-131

Allow Off-Road Vehicles5-132

 1180. Public Concern: The Forest Service should allow off-road vehicle use in roadless areas.5-132

 Because both user conflicts and environmental damage are minimal.....5-132

 Allow off-road vehicles not licensed for the street5-132

 In California5-132

Do Not Allow/Restrict Off-Road Vehicles.....5-132

 1181. Public Concern: The Forest Service should restrict off-road vehicle use.5-132

 By requiring off-road vehicle users to have permits5-132

 1182. Public Concern: The Forest Service should prohibit off-road vehicles in inventoried roadless areas.....5-133

 In the Shawnee National Forest5-133

Motorized Recreation – Snowmobiles5-133

Adequacy of Analysis5-133

 1183. Public Concern: The Forest Service should reevaluate the number of user days for snowmobiling.5-133

 In Wisconsin.....5-133

Allow Snowmobiles.....5-133

 1184. Public Concern: The Forest Service should allow snowmobiles in roadless areas.5-133

 Because they do not create roads and trails and their tracks melt away in the spring5-134

 In the Hiawatha National Forest5-134

Do Not Allow/Restrict Snowmobiles.....5-134

 1185. Public Concern: The Forest Service should not allow snowmobiles in roadless areas.5-134

Non-Motorized Recreation5-134

Non-motorized Recreation General5-135

 1186. Public Concern: The Forest Service should acknowledge that the need for non-motorized recreation opportunities is low.5-135

Non-motorized recreation does not depend on large unroaded areas 5-135

Allow Non-motorized Recreation..... 5-135

1187. Public Concern: The Forest Service should allow non-motorized activities in roadless areas. 5-135

1188. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule..... 5-136

Because it will discourage hiking 5-136

1189. Public Concern: The Forest Service should allow non-motorized, backcountry recreation..... 5-136

For individuals and groups of less than 12 people 5-136

Do Not Allow/Restrict Non-motorized Recreation 5-136

1190. Public Concern: The Forest Service should prohibit non-motorized recreation in roadless areas..... 5-136

Jogging..... 5-136

1191. Public Concern: The Forest Service should impose a freeze on any new classification of public land as non-motorized. 5-136

Because large areas of public land currently closed to motorized recreation are severely underused 5-136

Mechanized Recreation..... 5-136

Allow Mechanized Recreation..... 5-137

1192. Public Concern: The Forest Service should allow mountain biking in roadless areas. 5-137

In the Cleveland National Forest 5-137

Do Not Allow/Restrict Mechanized Recreation..... 5-137

1193. Public Concern: The Forest Service should restrict mountain biking. 5-137

In erosion-prone areas 5-137

Ski Area Development..... 5-138

Ski Area Development General..... 5-138

1194. Public Concern: The Forest Service should review ski area requests for expansion. 5-138

With a panel advisory committee..... 5-138

1195. Public Concern: The Forest Service should use specific language to clarify its position on ski area operations..... 5-139

1196. Public Concern: The Forest Service should address ski ways, ski runs, and ski trails and the use of snowcats or other off-highway vehicles in inventoried roadless areas adjacent to ski areas..... 5-139

1197. Public Concern: The Forest Service should not implement a national roadless rule that would alter current ski area special use permit rights. 5-139

1198. Public Concern: The Forest Service should allow alpine skiing in roadless areas adjacent to existing ski areas..... 5-139

Allow Ski Area Development..... 5-139

1199. Public Concern: The Forest Service should permit ski area expansion.5-139
 Due to growing demand for outdoor recreation5-140
 Because ski area operations can be compatible with roadless protection5-140
 Expansions that do not require road construction5-141

1200. Public Concern: The Forest Service should permit ski area expansion in certain areas.....5-141
 In the eastern Sierra.....5-141
 In the Granite Mountain/Slab Butte area of the Payette National Forest.....5-141
 Pelican Butte.....5-142
 Sipapu5-142

Do Not Allow/Restrict Ski Area Development5-143

1201. Public Concern: The Forest Service should not allow ski area expansion.5-143
 Outside of current ski area permit boundaries.....5-143
 Because there is no need for expansion5-143

1202. Public Concern: The Forest Service should not allow ski area expansion in certain areas.....5-143
 In California5-143

1203. Public Concern: The Forest Service should review ski use permits and manage such areas in a more restrictive manner.5-144

Hunting and Fishing5-144

Hunting and Fishing General5-145

1204. Public Concern: The Forest Service should consider hunting and fishing values.....5-145

1205. Public Concern: The Forest Service should require that hunting and fishing licenses be issued by the federal government.5-145

1206. Public Concern: The Forest Service should protect roadless areas.5-145
 For game species habitat5-145
 To prevent hunting behavior problems5-145

1207. Public Concern: The Forest Service should address the negative effects of roads on game species.5-146

1208. Public Concern: The Forest Service should not decommission existing roads.5-146
 Because roaded access is needed for hunting.....5-146

1209. Public Concern: The Forest Service should allow timber removal for habitat management.5-147
 To maintain quality hunting and fishing5-147

Funding.....5-147

1210. Public Concern: The Forest Service should use the fees collected from hunters and anglers to benefit hunters and anglers. ..5-147

Allow Hunting and Fishing5-147

1211. Public Concern: The Forest Service should allow hunting and fishing. 5-147

 By maintaining free access..... 5-148

 In wilderness areas..... 5-148

 Because people depend on the food they obtain 5-148

1212. Public Concern: The Forest Service should allow hunting and fishing. 5-148

 Mountain lion hunting 5-148

 Commercial fishing 5-148

 Trapping 5-148

 Sport shooting 5-148

1213. Public Concern: The Forest Service should manage fish and wildlife habitat as valuable lands that should remain open to hunters and anglers. 5-149

1214. Public Concern: The Forest Service should open closed roads for bear hunters. 5-149

 If they are opened for deer hunters 5-149

Do Not Allow/Restrict Hunting and Fishing 5-149

1215. Public Concern: The Forest Service should prohibit hunting in roadless areas. 5-149

 Within two miles of private property..... 5-149

 Because it is not well regulated and restrictions are poorly enforced . 5-149

 Because it is not effective for wildlife management 5-150

1216. Public Concern: The Forest Service should prohibit hunting in roadless areas. 5-150

 With dogs 5-150

 Trapping 5-150

1217. Public Concern: The Forest Service should prohibit fishing in roadless areas. 5-150

 In areas with endangered species..... 5-150

1218. Public Concern: The Forest Service should close off-road vehicle trails to hunters. 5-150

1219. Public Concern: The Forest Service should regulate hunting..... 5-151

 By regulating the number of tags sold 5-151

 For hunting that damages predator-prey dynamics 5-151

Outfitter-Guides 5-151

Allow Outfitter-Guides 5-151

1220. Public Concern: The Forest Service should allow commercial outfitters in roadless areas..... 5-151

1221. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule..... 5-151

 Because it will benefit outfitter-guides 5-151

Do Not Allow/Restrict Outfitter-Guides 5-152

1222. Public Concern: The Forest Service should prohibit commercially directed group tours and expeditions. 5-152

1223. Public Concern: The Forest Service should prohibit outfitters from charging large fees for using public lands.5-152

Equestrian Use5-152

Allow Equestrian Use.....5-152

1224. Public Concern: The Forest Service should allow equestrian use in roadless areas.5-152

Horseback riding5-152

Pack animals.....5-152

1225. Public Concern: The Forest Service should allow users to transport horses to existing trailheads.....5-152

1226. Public Concern: The Forest Service should preserve equestrian access in roadless areas.5-153

Through maintenance and mapping.....5-153

1227. Public Concern: The Forest Service should allow historical and recreational pack and saddle stock use.....5-153

As allowed under the Wilderness Act.....5-153

Do Not Allow/Restrict Equestrian Use5-153

1228. Public Concern: The Forest Service should prohibit equestrian use.....5-153

Horseback riding5-153

Pack animals.....5-153

In the Shawnee National Forest5-153

Camping/Shelters/Accommodations/etc.5-153

Camping/Shelters/Accommodations/etc. General5-154

1229. Public Concern: The Forest Service should address privatization of forest facilities.....5-154

Campgrounds.....5-154

1230. Public Concern: The Forest Service should reevaluate the use of campgrounds by private companies.5-154

Allow Camping/Shelters/Accommodations/etc......5-154

1231. Public Concern: The Forest Service should allow camping in roadless areas.5-154

By expanding facilities.....5-154

1232. Public Concern: The Forest Service should allow the construction and maintenance of Adirondack shelters in roadless areas.5-154

1233. Public Concern: The Forest Service should provide shelters for maintenance equipment and survival gear.5-154

1234. Public Concern: The Forest Service should allow the development of small-scale tourist accommodations.5-154

Do Not Allow/Restrict Camping/Shelters/Accommodations/etc.5-155

1235. Public Concern: The Forest Service should require permits for those camping in backcountry areas.5-155

To reduce human-caused wildfire5-155

1236. Public Concern: The Forest Service should restrict camping in roadless areas.5-155

To small groups 5-155

Special Use Permits 5-155

 1237. Public Concern: The Forest Service should address issues
 related to special use permits. 5-155

 Recreation activities that are proposed, in development, or in place
 but which are not currently covered in special use permits 5-155

 Modifications or renewals of special use permits 5-155

 1238. Public Concern: The Forest Service should streamline the
 permit process for state agencies. 5-155

Other Recreation Concerns..... 5-156

 1239. Public Concern: The Forest Service should prohibit various
 activities in roadless areas..... 5-156

 Sporting events 5-156

 Fireworks 5-156

 Dog sleds 5-156

 Activities that involve cleated hiking boots..... 5-156

 Golf area development 5-156

 1240. Public Concern: The Forest Service should set conservative
 carrying capacity limits in the Western Sound. 5-156

DESIGNATING AREAS (*QUESTION 8*) 5-157

 Designating Management Categories General 5-157

 1241. Public Concern: The Forest Service should base management
 allocations on science..... 5-158

 By assigning different management prescriptions based on ecotype. 5-158

 By basing levels of protection on a scientific environmental
 assessment 5-158

 1242. Public Concern: The Forest Service should consider
 ecosystem dynamics when creating land use designations..... 5-158

 1243. Public Concern: The Forest Service should acknowledge that
 Question 8 is not an either/or issue, and no changes to the
 Roadless Area Conservation Rule are needed..... 5-158

 1244. Public Concern: The Forest Service should consider a full
 range of management alternatives for roadless areas, not just
 “roadless” or “recommended wilderness.” 5-159

 Both roaded and unroaded categories 5-160

 Unroaded categories only 5-160

 1245. Public Concern: The Forest Service should determine roadless
 area allocations on a site-specific basis..... 5-160

 1246. Public Concern: The Forest Service should assign land uses
 that are compatible with uses being implemented by adjoining
 landowners. 5-161

 On the Tongass National Forest..... 5-161

 1247. Public Concern: The Forest Service should remove from
 debate the roadless areas already designated for continued
 protection in existing forest plans..... 5-161

1248. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule regardless of the current land classification status of roadless areas.5-161

1249. Public Concern: The Forest Service should apply the same planning process to both roaded and roadless areas.5-161

1250. Public Concern: The Forest Service should make land use designation decisions in a timely manner.5-162

Wilderness Recommendations5-162

Wilderness Recommendations General5-163

1251. Public Concern: The Forest Service should make decisions to recommend areas to Congress for wilderness designation through the forest planning process.5-163

1252. Public Concern: The Forest Service should designate qualifying areas as wilderness study areas until Congress takes action on them.5-164

1253. Public Concern: The Forest Service should reverse its institutional resistance to recommending roadless areas for wilderness designation.5-164

1254. Public Concern: The Forest Service should allow temporary withdrawal of wilderness status for resource commodity use followed by restoration to wilderness condition.5-165

 During wartime5-165

1255. Public Concern: The Forest Service should allow local communities to decide whether to establish roadless and wilderness areas.....5-165

1256. Public Concern: The Forest Service should subject all wilderness recommendations to a binding vote at the county, state, and congressional district level.5-165

Do Recommend Roadless Areas for Wilderness Designation.....5-166

1257. Public Concern: The Forest Service should recommend all roadless areas for wilderness status.5-166

 To preserve what wild areas are still left5-166

 To strike a balance between roaded and unroaded areas5-166

 To ensure the least possible damage to the environment.....5-167

 To ensure their continuing preservation through changing administrations5-167

 To ensure sustainability of human life5-167

1258. Public Concern: The Forest Service should recommend all roadless areas for wilderness status.5-167

 To reduce costs.....5-167

1259. Public Concern: The Forest Service should recommend as many wilderness areas as possible.5-167

1260. Public Concern: The Forest Service should recommend additional wilderness areas on a site-specific basis.5-167

 Each time a forest plan is revised5-167

 Because local input is needed.....5-168

1261. Public Concern: The Forest Service should recommend qualifying roadless areas to Congress for wilderness designation.... 5-168
 To comply with existing law 5-168
 To preserve their wild characteristics for the long term 5-168
 To prevent developers from building there 5-168
 Because forest plans have no teeth 5-168

1262. Public Concern: The Forest Service should recommend qualifying roadless areas to Congress for wilderness consideration and allocate other areas for roadless management..... 5-169
 To best protect large wild complexes 5-169

1263. Public Concern: The Forest Service should recommend specific roadless areas for wilderness designation. 5-170
 In conjunction with the Bureau of Land Management, recommend all roadless areas in Oregon for wilderness Through a comprehensive state wilderness bill 5-171

1264. Public Concern: The Forest Service should manage some roadless areas under specific management prescriptions and some under wilderness designation..... 5-171
Do Not Recommend Roadless Areas for Wilderness Designation..... 5-171

1265. Public Concern: The Forest Service should not recommend roadless areas for wilderness designation. 5-171
 Because roadless area conservation will protect the same characteristics that make these areas special, but without eliminating access 5-171
 Because it would eliminate too many activities..... 5-172
 Because it would eliminate mountain biking 5-172
 Because it would restrict state wildlife management flexibility..... 5-172
 Because it would lock up needed natural resources..... 5-172
 Because it is elitist, favoring the young and wealthy 5-172
 Because there are enough wilderness areas already..... 5-173

1266. Public Concern: The Forest Service should not recommend additional specific areas for wilderness designation. 5-174

1267. Public Concern: The Forest Service should drop recommended wilderness status for roadless areas if Congress fails to act after a reasonable amount of time. 5-174
Wilderness Recommendation Criteria..... 5-174

1268. Public Concern: The Forest Service should follow the established legal criteria regarding recommendation of wilderness areas..... 5-174
 Forest Service Handbook 5-174
 Wilderness Act 5-174

1269. Public Concern: The Forest Service should use the Wilderness Attribute Rating System from RARE I and II if further evaluation is necessary. 5-175

1270. Public Concern: The Forest Service should recommend roadless areas for wilderness designation based on location criteria.....5-175
 Areas that are adjacent to existing wilderness5-175

1271. Public Concern: The Forest Service should recommend roadless areas for wilderness designation based on ecological criteria.....5-175
 Areas with underrepresented lower-elevation ecosystem types.....5-175
 Areas that contain endangered species5-176
 Areas that are ecologically sensitive5-176
 Areas that are 1,000 acres or larger that are ecologically sensitive5-176

1272. Public Concern: The Forest Service should recommend roadless areas for wilderness designation based on size criteria.5-176
 Areas of less than 5,000 acres5-176
 Areas of 1,000 acres or more.....5-176
 Areas of 640 acres or more.....5-176
 5,000 acres in the West, 1,000 acres in the East5-176

1273. Public Concern: The Forest Service should recommend roadless areas for wilderness designation based on practical management criteria.....5-177
 Areas that are large enough to maintain the role of fire without threatening managed areas5-177
 Areas that contain no roads5-177

1274. Public Concern: The Forest Service should recommend previously overlooked roadless areas for wilderness designation.5-177
 Based on changes in forest condition, public values, and scientific understanding5-177

1275. Public Concern: The Forest Service should continually reevaluate roadless areas for wilderness characteristics.5-178
 Make new recommendations expeditiously5-178

Management of Roadless Areas That Do Not Meet Wilderness Criteria5-178

1276. Public Concern: The Forest Service should collaborate with organizations regarding management of areas not suitable for wilderness designation.5-178

1277. Public Concern: The Forest Service should maintain areas that do not qualify for wilderness under a roadless category.....5-178
 To allow mechanical forest maintenance equipment, but not roads or resource extraction5-178
 To protect these areas from commercial development5-178

1278. Public Concern: The Forest Service should drop areas not eligible for wilderness designation from roadless status.....5-179
 In order to fulfill the Forest Service goal of multiple use5-179

1279. Public Concern: The Forest Service should assign different designations to areas that do not qualify for wilderness status.....5-179
 General forest5-179

Non-motorized prescriptions consistent with the Roadless Area Conservation Rule 5-179

Relationship of Roadless and Wilderness Management..... 5-179

1280. Public Concern: The Forest Service should bear the burden of proof that roadless areas should be entered. 5-179

1281. Public Concern: The Forest Service should manage roadless areas to preserve wilderness characteristics. 5-179

To ensure that they continue to qualify for congressional designation 5-180

To prevent off-road vehicle use and motorized trails from threatening recommended wilderness status 5-180

Because recreation pressures have become intense and damaging . 5-180

By allowing only activities such as hiking, horseback riding, and hunting..... 5-180

By managing them as wilderness with respect to forest health treatments 5-180

By treating fires only when they threaten structures or human life 5-181

1282. The Forest Service should manage roadless areas to preserve wilderness characteristics. 5-181

Because wilderness areas contribute to the social, economic, and environmental values of a region..... 5-181

1283. Public Concern: The Forest Service should manage areas recommended for wilderness designation to preserve wilderness characteristics..... 5-181

1284. Public Concern: The Forest Service should keep all roadless areas unroaded regardless of recommended wilderness status..... 5-181

1285. Public Concern: The Forest Service should maintain inventoried roadless areas in the same condition as they appeared when inventoried..... 5-181

1286. Public Concern: The Forest Service should manage roadless areas 5,000 acres or larger as wilderness and allow limited management activities in areas of less than 5,000 acres. 5-182

1287. Public Concern: The Forest Service should not manage inventoried roadless areas as de facto wilderness. 5-182

1288. Public Concern: The Forest Service should not manage uninventoried roadless areas as de facto wilderness. 5-182

Because it is contrary to congressional intent 5-182

1289. Public Concern: The Forest Service should only consider roadless units that have been recommended as wilderness but rejected by Congress through inaction. 5-183

Roadless Designation 5-183

Roadless Designation General 5-186

1290. Public Concern: The Forest Service should clarify that designating areas to a roadless management category does not preclude future designation as wilderness. 5-186

1291. Public Concern: The Forest Service should implement a national roadless rule to maintain wild and scenic river eligibility for streams in roadless areas.5-186

1292. Public Concern: The Forest Service should not create special roadless designations without legislation from Congress.5-186

1293. Public Concern: The Forest Service should obtain the consent of local counties before designating any lands purchased under the Weeks Act as roadless.5-186

1294. Public Concern: The Forest Service should not create de facto wilderness through roadless area designation.5-186

1295. Public Concern: The Forest Service should emphasize that the Roadless Area Conservation Rule does not create de facto wilderness.5-187
 Because far more activities are allowed5-187

1296. Public Concern: The Forest Service should consider that since many roadless areas have not been recommended for wilderness, a national roadless rule is unwarranted.5-187
 On the national grasslands.....5-187

1297. Public Concern: The Forest Service should reject the argument that many roadless areas do not deserve protection under a national roadless rule.5-187
 Because they have not yet been recommended for wilderness5-187

1298. Public Concern: The Forest Service should follow the model used in the Olympic National Forest Plan.....5-188
 With respect to roadless area designation and management.....5-188

1299. Public Concern: The Forest Service should use other terms instead of “roadless.”5-188
 Use “reserve”5-188
 Use “wild”5-188

1300. Public Concern: The Forest Service should increase roadless areas.5-188
 By removing roads in currently roaded, high integrity areas to maximize the biological and ecological importance of the final suite of protected areas5-188
 By evaluating other unroaded areas for possible roadless designation.....5-188
 By making roadless areas as large as possible5-188
 By restoring lands to their roadless character5-189

1301. Public Concern: The Forest Service should address the low percentage of roadless acreage in the southern Appalachians relative to the national average.5-189

1302. Public Concern: The Forest Service should not expand roadless areas by restoring roaded areas.5-189

1303. Public Concern: The Forest Service should reduce the number and size of roadless areas proposed.....5-189

Adequacy of Analysis5-190

1304. Public Concern: The Forest Service should evaluate roadless areas to see if they are large enough to serve as viable repositories of our natural heritage. 5-190
 Place emphasis on enlarging or linking roadless areas that are too small to support healthy forests..... 5-190

1305. Public Concern: The Forest Service should include assessments that would qualify or disqualify each inventoried roadless area for such status..... 5-190
 As part of each forest’s next scheduled forest plan revision process . 5-190

1306. Public Concern: The Forest Service should ensure that the roadless area evaluation process accurately presents land ownership and mineral rights information. 5-190

1307. Public Concern: The Forest Service should correct errors in forest roadless statistics that inflate the acreage of inventoried roadless areas and non-motorized categories. 5-190

1308. Public Concern: The Forest Service should accurately list all National Forest System acreage included under management categories emphasizing environmental protection. 5-191
 To allow the public to make informed comment 5-191

1309. Public Concern: The Forest Service should revise the Roadless Area Conservation Rule Final EIS Appendix C to acknowledge that many roadless areas do not qualify for wilderness status. 5-191

1310. Public Concern: The Forest Service should recognize that science does not support the idea of resource protection through roadless designation..... 5-191

Do Designate Roadless Areas 5-191

1311. Public Concern: The Forest Service should remove all wilderness designations and use a modified roadless designation... 5-191

1312. Public Concern: The Forest Service should manage roadless areas under a specific roadless management designation. 5-192
 To resolve ongoing wilderness controversies..... 5-192
 To resolve problems of competing interests 5-192

1313. Public Concern: The Forest Service should manage roadless areas under a specific roadless management designation. 5-192
 Which would allow mechanized recreational activities not permissible in wilderness areas..... 5-192
 Which would allow some administrative activities not permissible in wilderness areas..... 5-193
 Which would serve as a non-motorized transition zone between wilderness and roaded areas 5-194
 Which would serve as a motorized transition zone between wilderness and roaded areas 5-194

1314. Public Concern: The Forest Service should create a dynamic roadless designation..... 5-194

Require different levels of National Environmental Policy Act analysis based on the type of entry proposed5-194

Allow boundary modifications5-195

1315. Public Concern: The Forest Service should create multiple roadless prescriptions that can be applied based on site-specific conditions.5-195

1316. Public Concern: The Forest Service should allow local forest plans to add additional prohibitions to roadless management prescriptions.5-195

1317. Public Concern: The Forest Service should allow local forest plans to allocate roadless areas to prescriptions that do not contain the exemptions in the national rule.5-196

1318. Public Concern: The Forest Service should only use roadless as a temporary designation.5-196

Do Not Designate Roadless Areas5-196

1319. Public Concern: The Forest Service should not create a specific roadless area designation.....5-196

Because conditions and situations vary5-196

Because the presence or absence of roads is not sufficient justification5-197

Because it will strain forest budgets5-197

Because it is an unnecessary layer of regulation5-197

1320. Public Concern: The Forest Service should not designate additional roadless areas.....5-197

Because it would negatively impact recreational access.....5-197

Until it learns to manage existing wilderness areas.....5-198

1321. Public Concern: The Forest Service should not use inadequate road maintenance funding as an excuse for declaring an area roadless.5-198

Roadless Area Designation Criteria.....5-198

1322. Public Concern: The Forest Service should develop objective evaluation criteria for local roadless area planning and management.5-198

1323. Public Concern: The Forest Service should clarify the criteria for identification of roadless areas in the Forest Service Handbook to ensure consistency.....5-199

For roadless areas in the East5-199

1324. Public Concern: The Forest Service should amend the Forest Service Handbook.5-200

To reflect the change in purpose for identifying roadless areas5-200

1325. Public Concern: The Forest Service should provide up-to-date, consistent criteria for the delineation and use of roadless areas.5-200

With all mapping being ground validated5-200

With the deletion of roaded portions of inventoried roadless areas.....5-201

1326. Public Concern: The Forest Service should develop criteria for identification of unroaded areas outside of inventoried roadless areas..... 5-201

1327. Public Concern: The Forest Service should develop criteria in the Forest Service Handbook for identifying areas to be excluded from the Roadless Area Conservation Rule..... 5-201
 Due to prior development activities..... 5-201

1328. Public Concern: The Forest Service should designate areas as roadless based on inventory status. 5-201
 All areas identified in past and present inventories 5-201
 Areas identified in all forest assessments for which inventory data exists 5-202
 Areas cleared through the National Environmental Policy Act process at the time of the roadless inventory and which remain roadless..... 5-202
 Areas of de facto roadless land adjacent to the inventoried areas 5-203
 Uninventoried roadless areas 5-203

1329. Public Concern: The Forest Service should designate areas as roadless based on scarcity on a forest-by-forest basis. 5-203

1330. Public Concern: The Forest Service should designate areas as roadless based on ecological characteristics..... 5-204
 Smaller roadless areas of ecological importance 5-204
 Underrepresented lower-elevation ecosystem types 5-204
 Areas with biological integrity and ecological significance..... 5-205

1331. Public Concern: The Forest Service should provide an independent scientific assessment of roadless areas 1,000 acres or more and ecologically significant areas less than 1,000 acres. 5-205
 Permanently protect these areas..... 5-205

1332. Public Concern: The Forest Service should designate areas as roadless based on size considerations. 5-205
 Areas 10,000 acres or more in Idaho 5-205
 Areas 5,000 acres or more 5-205

1333. Public Concern: The Forest Service should include smaller unroaded areas in a national roadless rule. 5-206
 Areas less than 5,000 acres 5-206
 Areas less than 2,000 acres 5-207
 Areas 1,000 acres or more 5-207
 Areas 1,000 acres or more with a minimum width of 1/2 mile 5-208
 Areas 1,000 acres or less 5-208
 Areas 500 acres or more 5-208
 Areas 150 to 200 acres or more 5-209
 Areas large enough to allow natural processes to work 5-209

1334. Public Concern: The Forest Service should exclude unroaded areas from roadless designation based on size considerations..... 5-209
 Exclude areas smaller than 5,000 acres..... 5-209
 Exclude areas smaller than 500 acres..... 5-210

1335. Public Concern: The Forest Service should attempt to designate roadless areas in close proximity to each other.5-210

1336. Public Concern: The Forest Service should designate additional areas as roadless based on current forest plan designations.5-210

 All areas under consideration for research natural area or special interest area status, regardless of proximity to roads5-210

1337. Public Concern: The Forest Service should designate areas as roadless despite existing infrastructure.5-210

 Areas with primitive roads or off-road vehicle routes.....5-210

 Areas with ghost roads or ways5-210

 Areas with roads that are closed or not in use5-210

1338. Public Concern: The Forest Service should not designate areas with existing infrastructure as roadless.5-211

 Areas with roads5-211

 Areas containing roads that might qualify as valid Revised Statute 2477 rights-of-way.....5-211

 Areas with trails.....5-211

1339. Public Concern: The Forest Service should designate areas as roadless despite historic motorized use.....5-211

1340. Public Concern: The Forest Service should not designate areas with specific resources as roadless.5-212

 Areas with natural resources.....5-212

1341. Public Concern: The Forest Service should not designate areas surrounding private property as roadless.5-212

Inclusion/Exclusion of Specific Areas from a National Roadless Rule5-212

 Inclusion5-213

1342. Public Concern: The Forest Service should not allow any exemptions or exclusions from the Roadless Area Conservation Rule.5-213

 Include each national forest district.....5-214

1343. Public Concern: The Forest Service should replace any area exempted from roadless designation with equal acreage in smaller roadless areas.5-214

1344. Public Concern: The Forest Service should include certain geographic areas in a national roadless rule.5-214

 Include areas in the eastern United States5-214

1345. Public Concern: The Forest Service should include roadless areas in a national roadless rule based on proximity to other protected areas.5-215

 Include areas adjacent to national parks and designated wilderness areas5-215

 Include areas that cross administrative boundaries5-215

1346. Public Concern: The Forest Service should include roadless areas in a national roadless rule regardless of forest plan revision status.....5-215

1347. Public Concern: The Forest Service should include roadless areas in a national roadless rule based on environmental characteristics..... 5-216
 Include areas that are returning to a wild condition 5-216

1348. Public Concern: The Forest Service should include Alaskan national forests in a national roadless rule for social values. 5-217
 For future generations 5-217

1349. Public Concern: The Forest Service should include Alaskan national forests in a national roadless rule for recreational values.... 5-217

1350. Public Concern: The Forest Service should include Alaskan national forests in a national roadless rule to protect the environment. 5-218
 From destructive activities 5-218
 Because it would prevent costly and environmentally damaging state highway construction projects..... 5-220
 Because the Alaska State Forest Practices Act is ineffective..... 5-220

1351. Public Concern: The Forest Service should include Alaskan national forests in a national roadless rule to protect environmental values. 5-220
 To protect ecological characteristics..... 5-220
 To protect biodiversity 5-221
 To protect old growth..... 5-221
 To protect wildlife habitat..... 5-222
 To safeguard primary fish habitat 5-223
 To protect native species..... 5-223

1352. The Forest Service should include Alaskan national forests in a national roadless rule..... 5-223
 To reestablish the balance of multiple resource use..... 5-223
 Because these forests should be treated the same as all other forests..... 5-224
 Because there is public support for protection of these forests 5-224
 As a commitment to global rainforest conservation 5-224

1353. The Forest Service should include Alaskan national forests in a national roadless rule for economic reasons..... 5-225
 Because of their importance to the local economy 5-225
 Because many Alaskans rely on subsistence food..... 5-226
 Because timber sales are not economically viable 5-226
 Because tourism industries depend on the Tongass National Forest. 5-227
 Because roadless areas support the commercial fisheries in Alaska . 5-227

1354. Public Concern: The Forest Service should immediately implement the Roadless Area Conservation Rule in the Tongass National Forest. 5-228
 Scheduled timber sales make the Rule even more necessary 5-228

1355. Public Concern: The Forest Service should not use the fact that the Tongass National Forest has a recently revised forest plan as a reason to exclude it from a national roadless rule..... 5-228

Exclusion 5-231

1356. Public Concern: The Forest Service should develop additional criteria to provide guidance to forest managers regarding areas that should be excluded from the Roadless Area Conservation Rule. 5-231

 Due to prior development activities 5-231

1357. Public Concern: The Forest Service should exclude certain roadless areas from roadless designation/protection based on development potential. 5-231

 Exclude areas adjacent to developed recreational sites 5-231

 Exclude special use permit areas or master development plan areas 5-231

 Exclude areas with existing or future operations at four-season resorts within or adjacent to existing or future special use permit boundaries of ski areas 5-232

 Exclude areas used for pipeline transportation and oil and gas development..... 5-233

1358. The Forest Service should exclude certain roadless areas from roadless designation/protection based on geographical location. 5-234

 Exclude areas in the western United States..... 5-234

 Exclude national grasslands..... 5-234

1359. The Forest Service should exclude certain roadless areas from roadless designation/protection based on forest plan status. 5-234

 Exclude areas that have recently completed forest management plans 5-234

1360. Public Concern: The Forest Service should exclude Alaskan national forests from a national roadless rule. 5-235

 Because inclusion of Alaska's national forests would be contrary to Alaska state and federal laws..... 5-235

1361. Public Concern: The Forest Service should recognize that it cannot supercede land allocations on the Tongass National Forest with a national roadless rule. 5-236

1362. Public Concern: The Forest Service should exclude the Alaskan national forests from a national roadless rule. 5-236

 Because The Tongass National Forest has just revised its Land Management Plan 5-236

 Because decisions should be made through the local forest planning process 5-237

 Because extensive local forest planning has been completed 5-238

 Because the Tongass Land Management Plan is currently under appeal 5-239

 Because the Chugach National Forest is now at the stage of releasing a Final EIS 5-239

 Because the proposed Rule was not addressed in the Chugach National Forest plan revision process 5-239

1363. Public Concern: The Forest Service should exclude Alaskan national forests from a national roadless rule for environmental reasons..... 5-240

 Because roadless values have been more than adequately provided for with non-development land use designations 5-240

 Because the unique and isolated terrain provides inherent protection..... 5-241

1364. Public Concern: The Forest Service should exclude Alaskan national forests from a national roadless rule for forest health reasons..... 5-241

 Fire hazard reduction..... 5-241

1365. Public Concern: The Forest Service should exclude Alaskan national forests from a national roadless rule. 5-242

 Because they should be managed for Traditional multiple use 5-242

1366. Public Concern: The Forest Service should exclude Alaskan national forests from a national roadless rule for economic reasons..... 5-243

 Because roadless areas must be available to provide for the basic infrastructure needs of the region..... 5-243

 Because communities depend on the Tongass National Forest..... 5-244

 To protect the timber job base 5-245

Use of Existing Forest Plan Designations 5-246

1367. Public Concern: The Forest Service should use appropriate existing management categories to protect roadless qualities..... 5-246

 Recommend qualifying areas for wilderness and allocate the rest to forest plan categories that preserve roadless character 5-246

 Designate roadless areas as backcountry non-motorized 5-246

 Designate roadless areas as backcountry winter non-motorized 5-247

 Do not allocate to categories that allow summer motorized use..... 5-247

 Do not allow inventoried roadless areas to be designated matrix or general forest 5-247

1368. Public Concern: The Forest Service should allow individual forests to allocate roadless areas to any management prescriptions that are consistent with a national roadless rule..... 5-247

 Create or modify prescriptions if needed 5-247

1369. Public Concern: The Forest Service should assign roadless areas to the most protective designation possible. 5-247

 That will prevent road building 5-248

1370. Public Concern: The Forest Service should assign roadless areas to the category that will ensure protection as quickly and easily as possible..... 5-248

1371. Public Concern: The Forest Service should assign roadless areas to a modified National Conservation Area prescription. 5-248

 With teeth to restrict resource extraction and development..... 5-248

Other New Management Categories 5-248

1372. Public Concern: The Forest Service should classify roadless areas as recreation areas.....5-249
 Allow recreational activities but no resource extraction.....5-249

1373. Public Concern: The Forest Service should manage roadless areas as backcountry recreation areas.....5-249
 To provide a range of recreational activities that are prohibited in wilderness5-250
 To provide motorized recreation opportunities5-250

AGENCY ORGANIZATION AND FUNDING.....5-251
 Agency Organization.....5-251
Agency Organization General.....5-251

1374. Public Concern: The Forest Service should restructure itself to focus on ecosystem values rather than commodity production.5-251

1375. Public Concern: The Forest Service should allow forests to provide inspection and oversight of district administrative and management functions.5-251
 And develop and disperse budgets.....5-251
Forest Service Personnel/Training.....5-252

1376. Public Concern: The Forest Service should employ staff trained in all forest uses.....5-252

1377. Public Concern: The Forest Service should improve screening of personnel for education and experience.....5-252

1378. Public Concern: The Forest Service should require local personnel to have at least 10 years experience on the forest before granting them decisionmaking authority.5-252

1379. Public Concern: The Forest Service should employ scientific-minded managers.....5-252
 In order to provide multiple use management5-252

1380. Public Concern: The Forest Service should encourage professionals trained in the new disciplines to join the Agency.5-252

1381. Public Concern: The Forest Service should educate personnel...5-253
 In principles of conservation biology5-253
 To advance collaborative community forestry5-253
 To implement laws5-253
 To care for the forests5-253
 To manage timber removal and transportation.....5-253
 To protect communities.....5-254
 To effectively communicate the new planning direction5-254

1382. Public Concern: The Forest Service should provide adequate staff and resources in the field.....5-254
 To implement forest plans5-254
 To ensure that prohibited activities do not occur in roadless areas.....5-254

1383. Public Concern: The Forest Service should dispose of its weapons.5-254

1384. Public Concern: The Forest Service should not employ archeologists.5-255

1385. Public Concern: The Forest Service should halt staff downsizing efforts.	5-255
1386. Public Concern: The Forest Service should ensure that employees support multiple use.	5-255
1387. Public Concern: The Forest Service should allow local personnel to perform their duties.	5-255
In order to save taxpayers' money.....	5-255
1388. Public Concern: The Forest Service should allow its employees to voice their views without fear of recrimination.....	5-255
1389. Public Concern: The Forest Service should analyze the potential impacts on its employees resulting from implementation of the Roadless Area Conservation Rule.	5-255
1390. Public Concern: The Forest Service should reduce the paperwork required of its personnel.....	5-256
Agency Funding	5-256
<i>Agency Funding General</i>	5-256
1391. Public Concern: The Forest Service should be adequately funded.....	5-256
1392. Public Concern: The Forest Service should request adequate funding.....	5-256
1393. Public Concern: The Forest Service should efficiently allocate its funding.	5-257
<i>Funding Sources</i>	5-257
1394. Public Concern: The Forest Service should seek more dependable funding.	5-257
1395. Public Concern: The Forest Service should continue to removal timber in roadless areas to support the Agency's budget....	5-257
1396. Public Concern: The Forest Service should not rely on timber sales to support the Agency's budget.	5-257
1397. Public Concern: The Forest Service should insist that income from non-timber products stay within the Agency.	5-257
1398. Public Concern: The Forest Service should ensure that funding for individual forests is not dependent on extractive industries.	5-257
<i>Funding Priorities</i>	5-258
1399. Public Concern: The Forest Service should manage its funding for certain purposes.	5-258
For ranger stations	5-258
For educating the public	5-258
1400. Public Concern: The Forest Service should use tax dollars for certain purposes.	5-258
To foster environmental and human values.....	5-258
1401. Public Concern: The Forest Service should not use taxpayer funds for certain purposes.	5-258
To maintain areas that are restricted to the public.....	5-258
To settle lawsuits filed by environmental groups	5-258

To revise the Roadless Area Conservation Rule and the Planning Regulations5-258

To purchase agency vehicles.....5-258

1402. Public Concern: The Forest Service should be concerned only with raising money to pay down the national debt.5-258

1403. Public Concern: The Forest Service should adequately identify the costs and benefits of the Roadless Area Conservation Rule.5-259

Including the costs of implementing the Roadless Area Conservation Rule.....5-259

1404. Public Concern: The Forest Service should not allow the cost of road obliteration to take away from other funding priorities.5-259

1405. Public Concern: The Forest Service should use money designated for the Advance Notice of Proposed Rulemaking for forest improvements.5-259

Financial Accountability5-259

1406. Public Concern: The Forest Service should be accountable for its expenditures.5-259

1407. Public Concern: The Forest Service should take no action that cannot be paid for with funds raised by that action.....5-259

Monitoring/Enforcement5-260

1408. Public Concern: The Forest Service should monitor abuse.5-260

1409. Public Concern: The Forest Service should engage the public in identifying abuses.5-260

1410. Public Concern: The Forest Service should enforce land use policies.5-260

To ensure environmental integrity5-261

To provide funds from citations5-261

By strengthening and enforcing pollution and anti-dumping laws.....5-261

By providing adequate manpower5-261

By providing funding for additional law enforcement needs5-261

By using money allocated for administration to prosecute those who abuse the forest5-261

Before prohibiting further uses5-261

1411. Public Concern: The Forest Service should prevent the interference of legal uses of forest resources.....5-262

CHAPTER 6 PROTECTING FORESTS, COMMUNITIES, AND PROPERTY ACCESS 6-1

PROTECTING FORESTS (*QUESTION 3*)6-1

Natural Disturbance Processes and Forest Health General.....6-1

Forest Health Management General.....6-3

1412. Public Concern: The Forest Service should follow the precautionary principle.6-3

To decide if additional timber removal will improve forest health6-3

To manage these areas minimally6-3

1413. Public Concern: The Forest Service should manage forest health according to land use designation and management restrictions. 6-3
 Allow more options for managing forest health in roadless areas than in wilderness areas..... 6-3

1414. Public Concern: The Forest Service should focus its management efforts on roaded areas rather than remote roadless areas..... 6-3
 By treating forest health in roaded areas..... 6-4
 By restoring roaded areas to sustainable levels 6-4
 By consulting with local supervisors, states, communities, and tribes..... 6-5

1415. Public Concern: The Forest Service should consider that wilderness areas cannot be properly managed for forest health..... 6-5

1416. Public Concern: The Administration should clarify its position on natural disaster management. 6-5

1417. Public Concern: The Forest Service should not allow excessive support for short-term visual values to prevent the implementation of forest health treatments. 6-5

Forest Health Management General – Management Strategies 6-5

1418. Public Concern: The Forest Service should develop a detection and prevention strategy for all natural disturbance events..... 6-5
 By defining the expectations or procedures in the forest plan and associated resource program plans..... 6-5
 By including descriptions of how disturbances are allowed or are purposefully carried out in plans for all roadless areas..... 6-6

1419. Public Concern: The Forest Service should have contingency plans in place to act quickly to manage disease, blowdown, and wildfires..... 6-6
 Including preparation of an EIS 6-6
 Include unexpected events in forest plans so the forests can be managed effectively and responsibly..... 6-7

1420. Public Concern: The Forest Service should develop plans and strategies similar to those used by the Federal Emergency Management Agency..... 6-7

Forest Health Management General – Public Involvement..... 6-7

1421. Public Concern: The Forest Service should employ local non-profit groups to observe forest health conditions. 6-7
 To offset the cost of forest health management 6-7
 If the Forest Service does not manage for forest health; a local nonprofit organization should do it..... 6-7

1422. Public Concern: The Forest Service should engage other government entities to educate and advocate practices to promote forest health. 6-7

1423. Public Concern: The Forest Service should not ask the public how to manage forest health on public lands..... 6-8

Leave it to professional Forest Service personnel.....6-8

Forest Health Management General – Roadless Areas6-8

1424. Public Concern: The Forest Service should consider forest health when managing roadless areas.....6-8

 By making it a top priority6-8

 By considering the health of the entire forest/region6-9

 By focusing on long-term forest health and ecosystem management6-9

 By using a stewardship forestry concept.....6-9

 By allowing decisions about forest health to be made at the local level.....6-9

 By conducting activities with clear procedures that are open to the public.....6-11

 By basing management decisions on roadless areas’ individual characteristics6-11

 To protect adjacent lands from insect, disease, and fire6-11

1425. Public Concern: The Forest Service should manage roadless areas no differently than the rest of the forest.6-12

1426. Public Concern: The Forest Service should not designate areas as roadless if they cannot manage those areas to keep them healthy.....6-12

1427. Public Concern: The Forest Service should determine federal management objectives achievable by a specific roadless area.6-13

 By collaborating with the public and adhering to federal designation goals6-13

1428. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule does not preclude management actions to control insects, disease, and fire.6-13

Adequacy of Analysis6-13

1429. Public Concern: The Forest Service should evaluate forest health.....6-13

 By inventorying current forest health conditions at the local level6-13

 By continuously collecting forest health data.....6-14

 By conducting a formal, localized risk assessment of the consequences of prohibiting active forest health management.....6-14

 By completing an inventory of all National Forest System Lands with full disclosure of the consequences of various management strategies.....6-14

 By analyzing the effects of management activities, the need for timber stand improvement treatments, and developing a strategy to address the backlog of vegetation management needs6-14

1430. Public Concern: The Forest Service should use up-to-date science conservation and biology principles.....6-15

 To restore ecological processes.....6-15

1431. Public Concern: The Forest Service should protect roadless areas as a baseline to gauge the effects of management techniques on forest health in other areas.....6-15

1432. Public Concern: The Forest Service should consider that our infrastructure programs, budgets, and knowledge of the best way to deal with forest health concerns are rudimentary.	6-15
1433. Public Concern: The Forest Service should define and publicize the forest health risks that will result from roadless designation.	6-16
To adjacent private and state lands.....	6-16
1434. Public Concern: The Forest Service should provide scientific data to support the claim that a national roadless rule will have a positive effect on fire and insect management.....	6-16
1435. Public Concern: The Forest Service should provide empirical studies to support the claim that thinning small-diameter trees will restore ecological processes, provide habitat for endangered species, and avert catastrophic wildfire.	6-16
Because otherwise, local employees may exploit areas in the name of forest health.....	6-16
1436. Public Concern: The Forest Service should bring together a bipartisan group to discuss forest management tools and to make science-based recommendations.	6-17
For forest health	6-17
1437. Public Concern: The Forest Service should allow staff scientists to make recommendations about forest health and other situations, and then allow the general public to comment on those recommendations.	6-17
<i>Adequacy of Analysis – Concepts</i>	6-17
1438. Public Concern: The Forest Service should define “healthy.”.....	6-17
As the meaning may vary according to an industrial or an ecological perspective	6-17
As the meaning may vary according to management objectives on each site	6-18
1439. Public Concern: The Forest Service should go beyond the traditional concept of “healthy forests” to embrace the concept of healthy ecosystems and natural processes.	6-18
1440. Public Concern: The Forest Service should measure forest health in terms of clean water, biodiversity, and solitude.....	6-19
1441. Public Concern: The Forest Service should define temporary and short-term treatments.	6-19
1442. Public Concern: The Forest Service should acknowledge the concept of natural disturbance regimes.	6-19
<i>Funding</i>	6-19
1443. Public Concern: The Forest Service should consider that policy changes, and attendant litigation, have cost a great deal of money that could have gone to forest health treatments.....	6-19
1444. Public Concern: The Forest Service should hold litigants responsible for the damages caused by their lawsuits that prevent forest health treatment or management activities.	6-20

Because management of national forests will continue to be stifled,
 further exacerbating forest health..... 6-20

Active Management..... 6-20

1445. Public Concern: The Forest Service should actively manage
 natural resources in roadless areas..... 6-20

By evaluating practices in other states 6-20

By using information from its extensive database on wildfire and
 insect risk and elements from the national fire plan 6-20

By considering the site-specific characteristics of each forested
 area 6-20

By actively managing to control insects, disease, and fire 6-21

By taking specific areas out of roadless designation to minimize
 insects, disease, and fire..... 6-22

By allowing the responsible harvest of trees and wildlife 6-22

By cleaning up woody debris..... 6-22

By relying on access other than roads 6-22

By working with state and local governments to actively improve
 forests and rangelands..... 6-23

Because unmanaged lands and wildlife will suffer 6-23

1446. Public Concern: The Forest Service should allow helicopters in
 roadless areas..... 6-23

To harvest dead trees and fuels or to pile and burn 6-23

Ecosystem/Restoration Management..... 6-23

1447. Public Concern: The Forest Service should utilize best
 management practices..... 6-23

To reduce the risk of catastrophic events..... 6-23

1448. Public Concern: The Forest Service should restore forest
 health..... 6-24

1449. Public Concern: The Forest Service should recognize that
 forest health does not require the destruction of old growth
 vegetation..... 6-24

1450. Public Concern: The Forest Service should use conditions that
 existed just prior to Euro-American contact as a baseline for
 management. 6-24

To avoid unforeseen and negative consequences..... 6-24

1451. Public Concern: The Forest Service should consider that
 permitting states and local jurisdictions to develop lands adjacent
 to national forests interferes with natural forest health processes. 6-24

1452. Public Concern: The Forest Service should replant burned or
 cut timber areas..... 6-24

1453. Public Concern: The Forest Service should find a variety of
 low-resource using, non-polluting alternatives to road-based
 management practices..... 6-25

Ecosystem/Restoration Management – Roadless Areas..... 6-25

1454. Public Concern: The Forest Service should protect roadless
 areas. 6-25

Because once areas are roaded, they are extremely difficult to restore 6-25

1455. Public Concern: The Forest Service should not actively manage natural resources in roadless areas. 6-25

 Allow natural ecosystem processes to operate 6-25

 Remove barriers to natural processes..... 6-26

 Because of the lack of funding 6-26

1456. Public Concern: The Forest Service should restore roadless areas damaged by past management practices. 6-26

 By allowing natural processes to operate 6-26

 To improve forest health..... 6-27

1457. Public Concern: The Forest Service should close loopholes in the Roadless Area Conservation Rule for stewardship logging and fire suppression. 6-27

1458. Public Concern: The Forest Service should consider that human activities cause more damage in roadless areas than natural processes. 6-28

 Roaded access causes more damage 6-28

 Timber removal causes more damage 6-29

Management Exceptions..... 6-30

1459. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule provides resource management exceptions..... 6-30

 To restore ecological processes..... 6-30

 To preserve access rights 6-31

 To control fires and insects..... 6-31

1460. Public Concern: The Forest Service should consider that the road building and timber removal exceptions to the Rule are too narrow to provide the needed flexibility..... 6-31

 Include a policy statement that allows local forest supervisors to tailor forest plans and respond to local circumstances 6-31

1461. Public Concern: The Forest Service should define specific national criteria for management exceptions requiring roads in designated roadless areas..... 6-31

1462. Public Concern: The Forest Service should constrain exceptions to Roadless Area Conservation Rule regulations by specific conditions and restrictions. 6-31

 Including time limits, spatial limits, detailed descriptions, and monitoring and reporting..... 6-31

Roads/Access – Forest Health Management 6-33

Roads/Access General 6-33

 1463. Public Concern: The Forest Service should address the impacts of new roads in roadless areas on forest fires. 6-33

Funding..... 6-33

 1464. Public Concern: The Forest Service should consider that budget constraints and prohibitions on road development and

maintenance will render many projects unfeasible and impose unacceptable risk on many roadless areas. 6-33

Allow Roads/Access 6-34

1465. Public Concern: The Forest Service should allow road construction/access. 6-34

For forest health management 6-34

For resource management 6-35

For fire hazard reduction 6-35

For the use of helicopters for fire management 6-36

For firefighter and public safety 6-36

For pest management 6-36

To allow response to additional hazards such as landslides, earthquakes, etc. 6-36

To allow cost-effective forest health treatments that can provide long-term protection of watershed quality 6-37

To Remove dead timber 6-37

With the restriction that roads be open only for fire protection and emergencies 6-37

Because otherwise state agencies may not allow their firefighters to assist with firefighting efforts on federal lands 6-37

1466. Public Concern: The Forest Service should allow road construction/access. 6-38

Low impact roads 6-38

Temporary roads 6-38

1467. Public Concern: The Forest Service should include an alternative in the National Environmental Policy Act process that gives direction for road construction. 6-38

For forest health management 6-38

1468. Public Concern: The Forest Service should allow the use of motorized vehicles. 6-38

For forest health management 6-38

For forest health management only, with access prohibited unless authorized by a forest plan 6-39

Allow heavy equipment for fire containment and other management needs 6-39

To facilitate firefighting in wilderness areas 6-39

1469. Public Concern: The Forest Service should comply with Revised Statute 2477. 6-39

To maintain motorized access for forest health management 6-39

1470. Public Concern: The Forest Service should modify the criteria for roadless designation to allow the construction of new roads for fire and disease management. 6-39

Because they are less damaging than roads constructed during firefighting 6-39

1471. Public Concern: The Forest Service should maintain trails. 6-39

For forest health 6-39

Do not Allow Roads/Access 6-40

1472. Public Concern: The Forest Service should not use forest health as an excuse to build roads in roadless areas. 6-40

 Because it is cost prohibitive 6-40

 Because fires will burn areas regardless of their roaded/roadless designation 6-40

 In the Tongass National Forest 6-40

1473. Public Concern: The Forest Service should prohibit road construction. 6-41

 Because roads can spread disease and noxious weeds 6-41

 Because roads and disturbances enable exotic plants and animals to enter previously undisturbed areas..... 6-42

 Because boat trailers can introduce exotic species to watersheds and lakes 6-42

 Because adequate roads exist and are not needed for fire suppression 6-42

 Because Forest Service personnel can access roadless areas by other means 6-43

 Because helicopters can be used for controlled burns and air tankers can be used for fire suppression..... 6-43

 Because roads won't stop fires..... 6-43

 As a good way to manage wildfires 6-44

1474. Public Concern: The Forest Service should obliterate any roads or temporary access required for forest health management as soon as possible after the event. 6-44

1475. Public Concern: The Forest Service should prohibit vehicles in roadless areas. 6-45

 To prevent arson and wildfires 6-45

 To prevent the spread of plant pathogens 6-45

Timber Removal 6-46

Timber Harvest General..... 6-47

 1476. Public Concern: The Forest Service should not allow volume and revenue targets to drive silvicultural decisions..... 6-47

 Because commercial harvesting usually takes the most fire-resistant trees 6-47

Adequacy of Analysis..... 6-47

 1477. Public Concern: The Forest Service should recognize that fuel buildup and undergrowth is natural for forest progression and forest ecology. 6-47

 Do not place blame on commercial timber removal..... 6-47

 Consider other factors that contribute to fuel build up 6-47

 1478. Public Concern: The Forest Service should analyze the benefits and harm of thinning and clearing projects..... 6-48

 Before undertaking any action 6-48

 1479. Public Concern: The Forest Service should consider that scientific evidence does not support the hypothesis that intensive

salvage, thinning, and other harvesting activities reduce the risk of catastrophic fire.6-48

Funding..... 6-48

1480. Public Concern: The federal government should fund Forest Service thinning projects.6-48

 To remove fuel build up.....6-48

1481. Public Concern: The Forest Service should address the increased costs of fuel treatment.....6-48

1482. Public Concern: The Forest Service should fine previous timber harvesters.....6-48

 To recover any future loss due to severe wildfires, buildup of hazardous fuels, and any insect or disease damage6-48

Allow Timber Removal..... 6-49

1483. Public Concern: The Forest Service should allow timber removal.....6-49

 To reduce fires, insects, and disease.....6-49

 To restore a natural fire regime.....6-50

 To ensure firefighter safety.....6-50

 By removing 24” trees on the stump and using the money to pay for road repair.....6-51

 By removing timber less than 14 inches in diameter or 50 years of age.....6-51

 By removing mature trees before their commercial value is gone, accompanied by controlled burning to reduce fuel.....6-51

 By removing old growth.....6-51

 By removing every sixty years and clearing underbrush every twenty years.....6-51

 By allowing small scale timber removal.....6-51

 By identifying and removing timber that can be harvested without environmental harm6-52

 By employing sustainable timber harvesting techniques for forest health6-52

 With helicopters.....6-52

 With horses6-53

1484. Public Concern: The Forest Service should reduce the basal area index of stands of trees.6-53

 To make trees more resistant to insects and disease6-53

1485. Public Concern: The Forest Service should allow clear cutting.....6-53

 In less than five acre, widely dispersed parcels6-53

1486. Public Concern: The Forest Service should allow salvage removal.....6-53

 For forest health6-53

 As soon as possible after a fire6-54

 To utilize the timber before it rots6-54

 To thin old growth.....6-54

 Without creating new roads.....6-55

With environmentally friendly techniques 6-55
 In areas where insect and disease outbreaks will be intense 6-55

1487. Public Concern: The Forest Service should allow selective
 timber harvest. 6-55
 To keep forests thinned and fire free 6-56
 To remove dead and dying timber 6-56
 To provide barriers to fires and provide a safe haven for wildlife 6-56

1488. Public Concern: The Forest Service should thin fuels. 6-56
 As necessary 6-56
 Ten percent every ten years 6-56
 Year-round 6-56
 Thin trees and brush less than ten inches in diameter 6-57
 Allow restoration thinning programs 6-57
 Pile the brush and burn in the winter 6-57
 To reduce unnatural fuel loads in roaded areas 6-57
 If studies indicate thinning is beneficial 6-58
 Within a half mile of major developed areas 6-58
 In the urban interface area 6-58
 In wilderness areas 6-58

1489. Public Concern: The Forest Service should allow firewood
 collection. 6-58
 To reduce fuel loads and fire hazards 6-58
 Allow farmers, ranchers, and low-income people to harvest, at no
 cost, diseased, damaged, or excess trees for firewood rather than
 using controlled burning as a fuel reductions tool 6-59

1490. Public Concern: The Forest Service should allow hand removal
 of woody debris and small diameter understory trees 6-59

1491. Public Concern: The Forest Service should create defensible
 fuel zones. 6-59
 With profitable timber sales conducted with over-the-snow
 equipment 6-59

Do Not Allow/Restrict Timber Removal 6-59

1492. Public Concern: The Forest Service should not use forest
 health as an excuse to remove timber. 6-59
 Do not claim harvesting is needed to reduce insect infestation 6-59
 Do not claim harvesting is needed to reduce fuel buildup and
 undergrowth 6-59

1493. Public Concern: The Forest Service should prohibit timber
 removal. 6-60
 Because timber removal increases fire severity 6-60
 Prohibit commercial timber removal 6-60

1494. Public Concern: The Forest Service should prohibit even age
 management 6-61
 Because it increases wildfire risk 6-61

Because the broken mosaic boundaries of clear cuts increase the mortality of beneficial species and allow insect encroachment on surrounding areas6-61

1495. Public Concern: The Forest Service should prohibit salvage removal.....6-61

1496. Public Concern: The Forest Service should prohibit thinning.....6-62

In moist or high elevation fir, hemlock, spruce, and cedar forests.....6-62

Because thinning to reduce overgrown forests is cost prohibitive.....6-62

Because silvicultural activities do more harm than good.....6-62

Because roadless areas should not be disturbed.....6-63

Fire Management.....6-63

Fire Management General.....6-65

1497. Public Concern: The Forest Service should address fire management.6-65

Because fire impacts regions differently.....6-65

1498. Public Concern: The Forest Service should address fire management in a national roadless rule.....6-65

Relative to the national fire program6-65

Relative to the federal interagency wildland fire policy, the national fire plan, and the 10-year federal/state strategy to address forest ecosystem health6-65

Because the effect of fire varies by area6-66

1499. Public Concern: The Forest Service should review the recommendations of the General Accounting Office on reducing wildfire threats and take immediate action.....6-66

1500. Public Concern: The Forest Service should consider that national grasslands are also at risk for fire danger.6-66

Because fires threaten homes, range improvements, oil and gas structures, vegetation and wildlife habitat, and outlying farm and ranch structures6-66

1501. Public Concern: The Forest Service should prohibit fires in dry areas.6-66

Ban outdoor burning when there is a lack of moisture6-66

1502. Public Concern: The Forest Service should consider that the Roadless Area Conservation Rule will not likely result in an increase of wildfires in California.6-67

In addition, continued implementation of the National Fire Plan and the California Fire Plan will increase protection of forests and communities6-67

Fire Management General – Management Strategies.....6-67

1503. Public Concern: The Forest Service should implement various fire policies and plans.6-67

Implement the 1995 wildlands fire policy.....6-67

Implement the national fire strategy6-68

Implement the National Fire Plan6-68

1504. Public Concern: The Forest Service should change traditional Smokey the Bear fire suppression policies. 6-68
 To solve wildfire problems 6-68

1505. Public Concern: The Forest Service should specify, to the extent possible, the roadless areas in which fire reduction management exceptions would apply 6-69
 In the forest plan revision process 6-69

1506. Public Concern: The Forest Service should work with all federal agencies, including the National Park Service and the Bureau of Land Management, to set sound and consistent policies for fire management..... 6-70
 In national parks, wilderness areas, and roadless areas 6-70

1507. Public Concern: The Forest Service should employ the same forest management strategies in roadless areas that are used to protect communities and private property from fires beginning on other lands..... 6-70
 Because forest fires often begin on developed private lands 6-70

Adequacy of Analysis..... 6-70

1508. Public Concern: The Forest Service should evaluate wildfire risks. 6-70
 Consider that roadless areas do not have a higher risk of wildfire 6-70
 Consider that there is no causal link between uncontrolled wildfires and the presence or absence of roads 6-72
 Consider that the majority of roadless areas are not situated in areas of high fire risk 6-72
 Consider that fire frequency increases as road density increases..... 6-73

1509. Public Concern: The Forest Service should conduct more studies about how to control fires. 6-73
 So that fires do not get out of hand as a result of the many variables that can affect them..... 6-73

1510. Public Concern: The Forest Service should consider the impact of human activities on fire intensity and severity..... 6-73

1511. Public Concern: The Forest Service should consider other factors which may increase fuel loads and fire hazards..... 6-74
 Wind 6-74
 Weather 6-74
 Slash piles 6-74
 Some tree species have a naturally severe fire regime 6-74

Adequacy of Analysis – Management Strategies..... 6-75

1512. Public Concern: The Forest Service should evaluate its firefighting practices. 6-75

1513. Public Concern: The Forest Service should fairly and fully consider the effects of fuel management. 6-76
 Before a final decision on managing areas as roadless is made 6-77

1514. Public Concern: The Forest Service should adequately analyze the appropriateness and need for prescribed fire. 6-77

In the unique settings of the roadless areas..... 6-77

1515. Public Concern: The Forest Service should fully analyze restoration projects designed to address catastrophic wildfires..... 6-77

To ensure adequate safeguards are taken to preserve roadless and wilderness qualities of inventoried roadless areas 6-77

1516. Public Concern: The Forest Service should address the cumulative impacts of the fire suppression program on national forests, and how it has impacted roadless areas..... 6-77

1517. Public Concern: The Forest Service should reassess vegetation management on the national grasslands. 6-78

Because increasing vegetation height and shrub structure on the uplands affects fire control and suppression 6-78

1518. Public Concern: The Forest Service should evaluate the impacts of no management versus the impacts of roading or other management activities..... 6-78

1519. Public Concern: The Forest Service should conduct ecological assessments. 6-78

For all fuel reduction projects 6-78

1520. Public Concern: The Forest Service should categorize inventoried roadless areas in accordance with fire regime, condition class, vegetation, and risk of disease..... 6-78

Areas at greater risk of ecosystem damage from catastrophic fires should be prioritized for appropriate treatment..... 6-78

Then create a management plan to obtain and maintain desired future conditions..... 6-79

1521. Public Concern: The Forest Service should consider that thinning has not been shown to systematically reduce the intensity of wildfires. 6-79

1522. Public Concern: The Forest Service should allow public review of the Wildland Fire Management Policy. 6-79

Funding..... 6-79

1523. Public Concern: The Forest Service should evaluate costs and funding associated with fire management. 6-79

Fire suppression costs 6-79

Fire suppression costs and controlled burn funding 6-80

Funding for firefighting 6-80

The use of funds appropriated for fuels reduction projects in the wild-urban interface zone 6-81

Consider that reduced access increases firefighting expenses..... 6-81

Consider that the majority of firefighting funds are spent on protecting structures in developed areas 6-81

1524. Public Concern: The Forest Service should not use tax dollars to fund firefighters and their equipment. 6-81

Brought in from distant places rather than the local area 6-81

Use the money for other purposes 6-82

1525. Public Concern: The Forest Service should not use tax dollars for fire suppression and timber removal..... 6-82
 In roadless areas located far from residents..... 6-82

1526. Public Concern: The Forest Service should contract with an independent organization to analyze expenses associated with fire management if roads are destroyed. 6-82

1527. Public Concern: The Forest Service should consider that as fuel loads increase in roadless areas, firefighting costs also increase. 6-82

1528. Public Concern: The Forest Service should provide funding to conduct controlled burns and non-commercial thinning..... 6-82
 To reduce wildfire 6-82

1529. Public Concern: The Forest Service should take into account the effects of a national roadless rule on the costs of fire management..... 6-83
 Negative effects..... 6-83

1530. Public Concern: The Forest Service should ensure that emergency funds are spent in areas where wildfire truly threatens communities..... 6-83

1531. Public Concern: The Forest Service should continue its current fire plan funding to treat fuels in the wild-urban interface..... 6-83

1532. Public Concern: The Forest Service should take legal action against organizations which have blocked fuel load removal. 6-83
 To recover costs for fires that have resulted from such lack of action..... 6-83

Education 6-83

1533. Public Concern: The Forest Service should educate the public. ... 6-83
 About fire safety 6-83
 About the reasons for controlled burning..... 6-83
 About the role of fire and disturbance in forests 6-84
 About what is needed to support firefighting efforts..... 6-84

Active Management 6-84

1534. Public Concern: The Forest Service should use various techniques for fire prevention..... 6-84
 If required by management objectives..... 6-84
 Monitoring..... 6-84
 Grazing..... 6-84

1535. Public Concern: The Forest Service should control fire size and frequency on public lands to approximately that of pre-settlement conditions..... 6-85
 By reducing fuel loads through thinning, grazing, and prescribed burning, and by maintaining natural and engineered firebreaks 6-85

1536. Public Concern: The Forest Service should reduce fire hazards..... 6-85
 By employing young people 6-85
 By actively managing to reduce fire hazards 6-86

By developing a fire management plan 6-86

By allowing the clearing of underbrush during the interim 6-86

By allowing many small burns 6-87

By clearing fuel in areas 40-100 meters surrounding communities 6-87

In already roaded and accessible areas adjacent to roadless areas 6-87

Because fires often do more harm than good 6-87

1537. Public Concern: The Forest Service should use prescribed burning techniques as a tool to reduce fire danger..... 6-87

In areas outside of wilderness or roadless areas 6-88

In late fall..... 6-88

In forests which border communities..... 6-88

Every four to five years 6-88

At low-risk times of the year 6-88

With guidelines established in the forest planning process 6-89

Only after preventative steps to reduce fuel loads are taken, such as harvesting, thinning, and grazing..... 6-89

To reduce the ecological impacts of fires and firefighting..... 6-89

Use techniques that adhere to local fire management plans and that contain monitoring provisions to assess the usefulness of the burns 6-89

1538. Public Concern: The Forest Service should carry out controlled burns. 6-89

To manage forest health 6-89

In strips of forest that have previously been harvested, similar to a crop rotation management activity 6-90

In areas where fires have been artificially suppressed 6-90

In areas where the risk for extreme temperatures and intensive volumes of smoke have been addressed..... 6-90

Where possible, otherwise thin timber without building new roads 6-90

1539. Public Concern: The Forest Service should construct firebreaks..... 6-90

Only if really necessary 6-90

By using roads as firebreaks 6-90

By decommissioning some roads and managing the remaining as a defensible perimeter against wildland fire 6-91

By clearing dead timber and thinning stands next to private property to an appropriate width..... 6-91

By creating a boundary around roadless areas with multiple use, motorized trails..... 6-91

By maintaining fire lanes but closing them to all but foot traffic..... 6-91

By encouraging volunteers to assist with fire break maintenance 6-91

Outside of roadless areas 6-91

1540. Public Concern: The Forest Service should allow ski areas located on the fringes of roadless areas to help provide defense zones..... 6-91

Which allow for development while decreasing fuel loads 6-91

1541. Public Concern: The Forest Service should maintain existing fire trails. 6-92
 In the Shawnee National Forest 6-92

1542. Public Concern: The Forest Service should suppress forest fires. 6-92
 Because letting forests burn is not responsible land management..... 6-92
 By using chemicals to extinguish fires 6-92
 By allowing fires to burn to a certain landscape feature before suppressing them 6-92
 By enlisting military aircraft converted into water tankers as a suppression tool 6-93

1543. Public Concern: The Forest Service should concentrate firefighting efforts in urban-forest interface areas..... 6-93
 Because these areas are already roaded and pose the greatest threat to life and personal property 6-93

1544. Public Concern: The Forest Service should enlist prisoners to clean up dead and dying timber and brush and to construct and maintain trails..... 6-93
 Materials collected could be used to operate a co-generation power plant..... 6-93

1545. Public Concern: The Forest Service should specify the criteria under which the Roadless Area Conservation Rule exceptions would apply..... 6-94
 For management activities to reduce the threat of wildfire 6-94

Ecosystem/Restoration Management 6-94

1546. Public Concern: The Forest Service should acknowledge that wildfire is a component of a healthy forest..... 6-94

1547. Public Concern: The Forest Service should not suppress forest fires..... 6-95
 Because natural fire maintains diverse forests and wildlife habitat..... 6-95
 Because fire rejuvenates ecosystems 6-95
 Because natural fire regimes should be restored 6-95
 Because firefighting is a waste of money, dangerous, and harms the environment..... 6-95
 Because dead timber is a critical part of the forest ecosystem..... 6-95
 Except in the event of insect or disease infestation that is uncontrollable by natural means..... 6-95
 Except in the event it is not possible to control the fire, then rely on more air-power 6-95
 Except in the event the fire is human induced 6-96
 In remote areas 6-96
 In wilderness areas..... 6-96
 Prohibit firebreaks and retardant dumping..... 6-96

1548. Public Concern: The Forest Service should reintroduce fire into forest ecosystems..... 6-96

1549. Public Concern: The Forest Service should manage fire in roadless areas following wilderness fire management policies.6-97
 By extending the “let burn” policy to roadless areas.....6-97

1550. Public Concern: The Forest Service should ban the use of fire in roadless areas.6-98

1551. Public Concern: The Forest Service should avoid artificial fires, backburning, and prescribed burning.6-98
 Because forests in the southeastern United States do not have a fuel load.....6-98

1552. Public Concern: The Forest Service should protect roadless and roaded areas.6-98
 By designing restoration projects to manage potential catastrophic wildfires6-98

1553. Public Concern: The Forest Service should allow a categorical exemption for restoring burned areas.6-99
 Including needed road building, salvage logging, soil preparation, seeding, planting, riparian restoration, and follow up work to help the survival of seedlings6-99

Other.....6-99

1554. Public Concern: The Forest Service should utilize burned timber as biomass energy.6-99

Insects, Disease, and Noxious Plants6-99

Insects, Disease, and Noxious Plants General.....6-100

1555. Public Concern: The Forest Service should not weaken the Roadless Area Conservation Rule.6-100
 Because the Rule will aid federal, state, and local efforts to combat the spread of noxious weeds.....6-100

1556. Public Concern: The Forest Service should ensure that its policies support rather than hinder the campaign to minimize damage caused by invasive exotic plants.6-100

1557. Public Concern: The Forest Service should implement standards for insect and disease control.6-101
 As part of the forest planning process.....6-101

1558. Public Concern: The Forest Service should consider that roadless area and transportation regulations and policies interfere with local grazing associations’ work in controlling noxious weeds. ..6-101
 Which are a persistent problem on the national grasslands6-101

1559. Public Concern: The Forest Service should not require horses to be diapered.6-101
 Because deer and elk also spread seeds in the forest.....6-101

Adequacy of Analysis6-101

1560. Public Concern: The Forest Service should evaluate the role of insects and disease in a forest ecosystem.6-101

1561. Public Concern: The Forest Service should examine insect and disease outbreaks.6-102

By enlisting the aid of hikers/volunteers to monitor and report outbreaks..... 6-102

By examining outbreaks on foot, horseback, or with the use of aircraft 6-102

By establishing an entomological collection station at the borders of National Forest System lands..... 6-103

With regular surveys..... 6-103

And then act accordingly 6-103

1562. Public Concern: The Forest Service should fairly evaluate all sources that contribute to the noxious plant problem..... 6-103

Including hikers, mountain bikers, equestrians, wildlife, and natural processes 6-103

Including roads 6-103

1563. Public Concern: The Forest Service should reevaluate insect and disease risk..... 6-104

And incorporate specific direction for insect and disease response within the unroaded and roadless areas..... 6-104

1564. Public Concern: The Forest Service should expand its studies of ecosystem interactions. 6-104

Because few areas are in danger from insects and disease 6-104

Funding 6-104

1565. Public Concern: The Forest Service should direct its funding to the management of disease, insects, and noxious plants..... 6-104

Insects and diseases of livestock and mammals..... 6-104

1566. Public Concern: The Forest Service should increase funding for research and development of biological means of preventing and controlling insect and disease..... 6-104

1567. Public Concern: The Forest Service should reallocate money earmarked for timber removal to hiring a staff large enough, and capable enough, of recognizing forest health problems early on..... 6-105

1568. Public Concern: The Forest Service should acknowledge the financial contribution made by off-road vehicle users to noxious plant abatement programs..... 6-105

Active Management 6-105

1569. Public Concern: The Forest Service should control insects, disease, and noxious plants..... 6-105

To reduce fire hazards..... 6-105

To save game range..... 6-105

By prescribing and implementing treatments through the forest planning process 6-105

By reintroducing fire to roadless areas 6-105

By implementing reasonable fire policies in roadless areas 6-106

By prohibiting single-species replanting 6-106

With proper forest management and protection practices to prevent the spread to adjoining private lands 6-106

With advice from professionals..... 6-107

With the implementation and enforcement of U.S. Department of
Agriculture recommended initiatives6-107
With multiple methods6-107
With chemicals and other solutions6-108
With aerial applications6-108
In roaded areas identified as suitable for logging6-108
Outside of roadless areas6-108
Except in large-scale tracts of land6-108
At the local level6-108
1570. Public Concern: The Forest Service should allow even age
management only in areas experiencing an onslaught of pests.6-109
Ecosystem/Restoration Management6-109
1571. Public Concern: The Forest Service should acknowledge that
native insects and diseases are part of a healthy ecosystem.....6-109
Because they are vital to ecological sustainability and biodiversity.....6-109
By explaining the role insects play in forest nutrient cycling and
renewal.....6-109
By not assuming roadless areas are in an unhealthy state6-109
1572. Public Concern: The Forest Service should control insects,
disease, and noxious plants.6-110
With natural remedies6-110
With species diversity and multi-age stands.....6-110
By prohibiting road construction in roadless areas6-110
By encouraging a proliferation of songbirds and other natural
predators that feed on insects6-111
By closing roads6-111
1573. Public Concern: The Forest Service should allow wildfires to
destroy insects and disease.6-111
Rather than using timber removal to destroy them.....6-111
1574. Public Concern: The Forest Service should not use pesticides
and herbicides.6-111
1575. Public Concern: The Forest Service should control only exotic
or non-native insects and diseases.6-111
1576. Public Concern: The Forest Service should protect roadless
areas.6-112
To curtail invasions by exotic or alien species of plants6-112
1577. Public Concern: The Forest Service should not use forest
health as an excuse to harvest timber.6-113
Do not claim harvesting is needed to prevent insects and disease6-113
Because insects and disease rarely rise to epidemic levels.....6-113
PROTECTING COMMUNITIES (*QUESTION 4*)6-115
Private Property Protection6-115
Private Property Protection General6-118
1578. Public Concern: The Forest Service should consider that there
are few concentrated populations of either individuals or
communities near inventoried roadless areas.6-118

Due to these low population densities, a fire spreading from an inventoried roadless area would have little opportunity to endanger human life or property..... 6-118

1579. Public Concern: The Forest Service should consider that the Roadless Area Conservation Rule will have no impact on protecting communities from forest fires. 6-118

Near the San Juan National Forest 6-118

1580. Public Concern: The Forest Service should provide accurate maps depicting the location of private lands within roadless areas... 6-118

1581. Public Concern: The Forest Service should formulate a very limited management plan to address fuels reduction in stands of trees close to towns. 6-119

Adequacy of Analysis..... 6-119

1582. Public Concern: The Forest Service should conduct a formal risk assessment of the consequences of prohibiting active management within roadless areas. 6-119

1583. Public Concern: The Forest Service should complete an inventory of communities at risk..... 6-119

With the cooperation of other firefighting organizations..... 6-119

Management..... 6-119

1584. Public Concern: The Forest Service should protect private property in accordance with the Roadless Area Conservation Rule. 6-119

Because it allows activities to protect adjacent lands 6-119

1585. Public Concern: The Forest Service should continue to use the same basic fire-fighting policies it has in place now for protecting communities and homes. 6-120

With the exception of road building..... 6-120

1586. Public Concern: The Forest Service should not allow timber removal in the name of fire prevention for private property..... 6-120

1587. Public Concern: The Forest Service should reconsider its policy to temporarily suspend wilderness standards regarding wildfire suppression. 6-120

When communities are threatened..... 6-120

1588. Public Concern: The Forest Service should assign a land use category to protected areas which allows locally specific management activities. 6-120

To protect communities in the urban-forest interface zone..... 6-120

1589. Public Concern: The Forest Service should retract policies that interfere with local fire suppression and control..... 6-121

1590. Public Concern: The Forest Service should allow management activities on national forests..... 6-121

To ensure the protection of private lands 6-121

1591. Public Concern: The Forest Service should establish different wildfire management policies for areas where there are whole functioning communities on or near national forests..... 6-121

1592. Public Concern: The Forest Service should be forthcoming with information regarding management of private property and surrounding areas.....6-121

1593. Public Concern: The Forest Service should not seek to manage private lands.6-121

1594. Public Concern: The Forest Service should scrutinize the appropriateness of roadless designations near private property.6-121

1595. Public Concern: The Forest Service should balance private development with open space and critical wildlife habitat.....6-122

1596. Public Concern: The Forest Service should not risk human life to save private property.6-122

Land Use Ordinances/Building Codes6-122

1597. Public Concern: The Forest Service should encourage development of land use ordinances which keep residential development away from public lands.....6-122

1598. Public Concern: The Forest Service should discourage settlement in roadless areas due to natural disaster risks.6-122

By making private developments less qualifiable for recovery insurance.....6-122

1599. Public Concern: The Forest Service should revise building codes.....6-122

To set a standard for construction in fire-prone areas6-122

To prohibit cedar shingles for roofing6-122

1600. Public Concern: The Forest Service should work with the homebuilding industry to ban roofs that put people at risk from fires.....6-123

1601. Public Concern: The Forest Service should alleviate fire danger to private property through integration of diverse biological systems into the building material’s infrastructure.6-123

1602. Public Concern: The Forest Service should require property owners to consent to a conservation easement on their property.6-123

To emphasize protection and preservation of natural forests.....6-123

Urban-Forest Interface.....6-123

1603. Public Concern: The Forest Service should identify urban-forest interface areas and develop appropriate management prescriptions for them.6-123

To reduce the risk from wildfire6-123

1604. Public Concern: The Forest Service should protect roadless areas as a buffer between wilderness and the urban-forest interface.....6-123

1605. Public Concern: The Forest Service should establish buffer zones between private property and roadless areas.6-123

That are 500 feet wide6-124

In the form of a reverse greenbelt6-124

By maintaining minimally urbanized areas as buffer zones.....6-124

By purchasing inholdings6-124

If the adjacent private property values warrant such protection..... 6-124

1606. Public Concern: The Forest Service should allow private communities to construct buffer zones. 6-125

 To protect private property 6-125

1607. Public Concern: The Forest Service should consider ski areas located adjacent to communities as modifications supporting and complementing fire protection..... 6-125

 In the urban-forest interface 6-125

1608. Public Concern: The Forest Service should not fragment roadless areas by constructing buffer zones..... 6-125

1609. Public Concern: The Forest Service should recognize that extensive vegetation management in forest-urban interface areas does not reduce potential home fire losses. 6-125

1610. Public Concern: The Forest Service should focus on other management activities besides urban-forest interface activities. 6-125

 In Region 5 6-125

Urban-Forest Interface – Funding 6-126

1611. Public Concern: The Forest Service should stop its misuse of the emergency fuels management funding earmarked for the urban-forest interface zone..... 6-126

Public Collaboration 6-126

1612. Public Concern: The Forest Service should work with local agencies to plan for and combat natural disasters near private property. 6-126

 Through local fire management plans 6-126

 Through an established educational plan 6-126

 Through fire prevention seminars..... 6-126

 By consulting officials in New Mexico and Montana 6-126

1613. Public Concern: The Forest Service should work with other federal agencies to implement better land use planning..... 6-127

1614. Public Concern: The Forest Service should keep a log of nearby property owners. 6-127

 In order to send them a list of emergency contacts 6-127

1615. Public Concern: The Forest Service should view private inholders as partners in forest stewardship..... 6-127

Responsibility for Protecting Private Property 6-127

Responsibility of the Forest Service 6-128

1616. Public Concern: The Forest Service should protect private property from natural disasters. 6-128

 After determining the risk involved..... 6-129

 Through coordination between residential and rural fire-fighting teams..... 6-129

 Through science-based management decisions 6-129

 By revising regulations and legal authority as necessary to secure timely measures to protect private resources 6-129

 By establishing quick response procedures 6-129

By providing adequate maps of roadless areas6-129

By conducting an inventory of communities located near roadless areas6-129

By allowing forest management decisions to be made at the local level.....6-130

By enlisting the aid of the National Guard6-130

By enlisting the aid of Forest Service research stations6-130

By allocating resources6-130

By management activities6-130

By constructing roads for access6-130

By constructing temporary roads for access6-131

By thinning dense stands near communities6-131

By reintroducing fire6-131

By prescribed burns6-131

By maintaining a ‘defensible space’ from the boundary of private property to the forest6-131

By zoning and prohibition of structures within 200 feet of private property boundaries6-131

By clearing hazardous materials 200 meters from communities6-132

By clearing hazardous materials 40-100 meters from communities6-132

By creating jobs that enable people to remove fuelwood6-132

By providing local water access for fire hoses.....6-132

For homes that existed prior to inclusion in the National Forest System6-132

On the Little Missouri National Grasslands6-132

At the Brundage Mountain Ski Resort6-132

1617. Public Concern: The Forest Service should educate private property owners regarding the dangers that exist in roadless areas.6-132

And the steps they should take to protect their property6-132

By using *Living With Fire* as a guide6-133

By hiring displaced timber workers to train landowners6-133

1618. Public Concern: The Forest Service should protect federal property with private improvements from natural disasters.6-133

Ski resorts6-133

1619. Public Concern: The Forest Service should hold forest managers accountable for decisions that create dangerous situations.6-133

Responsibility of Private Property Owners.....6-134

1620. Public Concern: Private property owners should be responsible for protecting their property from natural disasters.6-134

By digging trenches around their property6-134

By providing fire lookouts6-134

By establishing fire and rescue departments.....6-134

By developing fire management plans and stricter building and zoning codes6-134

1621. Public Concern: The Forest Service should allow private property owners to clear a safe area around their property.	6-135
Up to 100 yards away.....	6-135
<i>Financial Responsibility.....</i>	<i>6-135</i>
1622. Public Concern: The Forest Service should pay for damages to private property if they allow disease or insects to spread.....	6-135
1623. Public Concern: The Forest Service should pay private property owners for property damaged by wildfire.	6-135
1624. Public Concern: The Forest Service should provide funding to private property owners.	6-135
To clear fuels around their home.....	6-135
1625. Public Concern: The Forest Service should provide royalties from extractive industries to communities near roadless areas.	6-135
1626. Public Concern: The Forest Service should use federal funds to relocate private property owners to safe areas.	6-135
In the event of a natural disaster	6-135
1627. Public Concern: Private property owners, not taxpayers, should bear the cost of fire protection.	6-136
1628. Public Concern: The Forest Service should charge private property owners an annual fee and service charge for assistance. ...	6-136
1629. Public Concern: States should raise property taxes for homes near forested areas.....	6-136
To cover fire fighting costs.....	6-136
1630. Public Concern: The Forest Service should encourage private insurance companies to either increase rates or refuse coverage for homes built in locations at risk of wildfire.....	6-136
1631. Public Concern: The Forest Service should encourage fire insurance carriers to offer reduced rates to those that meet fire danger reduction standards.	6-137
<i>Other.....</i>	<i>6-137</i>
1632. Public Concern: Organizations opposed to access to roadless areas should protect communities and private property and assume liability for any loss.	6-137
PROTECTING ACCESS TO PROPERTY (<i>QUESTION 5</i>).....	6-138
Protecting Access to Property General	6-138
1633. Public Concern: The U.S. Department of the Interior and Bureau of Land Management should survey the boundaries of private and federal property.....	6-139
To establish adjoining boundaries	6-139
1634. Public Concern: The Forest Service should ensure access to private property.....	6-139
Through the forest planning process	6-139
Through special use permits	6-139
On a case-by-case basis	6-139
1635. Public Concern: The Forest Service should avoid additional delays regarding decisions on access to private property.	6-139

1636. Public Concern: The Forest Service should notify private property owners when considering changes that could affect access to their property.6-140
 To allow property owners to ascertain the impacts of road policies6-140

1637. Public Concern: The Forest Service should spell out conditions of ingress and egress in forest plans.6-140

1638. Public Concern: Local governments should ensure that properties for sale are guaranteed access.6-140

1639. Public Concern: The Forest Service should address access to parcels not presently accessible by road.....6-140
 On a case-by-case basis.....6-140

1640. Public Concern: The Forest Service should oversee local residential access decisions.6-140
 To ensure compliance with statutory federal residential requirements, protections, and planning processes6-140

1641. Public Concern: The Forest Service should require private property owners to prevent interloping along routes of ingress and egress to their property.....6-141

1642. Public Concern: The Forest Service should ensure that private property owners do not conduct activities that harm adjacent ownerships.6-141

1643. Public Concern: The Forest Service should allow the advocates of non-wilderness use to compete for access to privately held lands.....6-141

Roadless Area Management6-141

1644. Public Concern: The Forest Service should address, on a forest-by-forest basis, the potential impacts of roadless area management on access.6-141
 To other public and private lands6-141

1645. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule has no impact on access to state and private inholdings.....6-142
 Because access is already protected by existing law.....6-142

1646. Public Concern: The Forest Service should retain the provision in the Roadless Area Conservation Rule which provides exceptions to the prohibitions on road construction when necessary to maintain access to inholdings.6-142

1647. Public Concern: The Forest Service should revise the Roadless Area Conservation Rule.6-142
 To ensure that reasonable access routes to private property are maintained.....6-142

1648. Public Concern: The Forest Service should identify roadless areas in private property deeds.6-142

1649. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule has adverse impacts on private property access.6-143

1650. Public Concern: The Forest Service should prohibit home building in roadless areas.	6-143
Access to National Forest System Lands Through Private Property	6-143
1651. Public Concern: The Forest Service should prevent public lands from being landlocked by private lands.	6-143
In the Los Padres National Forest	6-143
1652. Public Concern: The Forest Service should maintain public rights-of-way through private property.	6-143
When public land is bordered on all sides by private land	6-143
1653. Public Concern: The Forest Service should prevent private property owners from blocking access to other private inholdings....	6-144
1654. Public Concern: The Forest Service should allow public access through private or tribal grazing allotments.	6-144
Maintenance of Routes through National Forest System Lands to Private Property.....	6-144
1655. Public Concern: The Forest Service should provide access routes to private property.	6-145
By maintaining existing roads.....	6-145
By allowing private property owners to build roads	6-145
By constructing low-impact roads.....	6-146
By maintaining historically accessible routes.....	6-146
By establishing the shortest route	6-146
By defining levels of vehicular access	6-146
By patterning access routes after the National Park Service.....	6-146
By constructing minimum sized trails.....	6-146
By allowing foot and horseback trails	6-146
By allowing <i>only</i> foot and horseback trails.....	6-147
By enforcing regulations	6-147
By complying with Revised Statute 2477.....	6-147
By training personnel regarding laws governing private property access	6-147
By allocating more funds to preserve access	6-147
By refraining from creating small areas of protected roadless regions.....	6-147
By not designating areas adjacent to private property as roadless	6-147
Only if public access to public land is preserved	6-147
Only if public access to National Forest System lands in general is preserved	6-147
Within ten days of a property owner's request.....	6-148
Through geodetic grid lines	6-148
Through established access points	6-148
Through non-motorized easements.....	6-148
Through airstrips and helispots	6-148
Through an exception to the Roadless Area Conservation Rule	6-148
Through the forest planning process	6-148
Through meetings with individual stakeholders	6-149

Through collaboration with county sheriffs6-149

Through the National Forest Management Act.....6-149

By conducting a case-by-case access alternatives analysis for each inholding.....6-149

To restore the public’s faith in government6-149

While preventing access by unauthorized parties6-149

In Alaska6-149

In North Dakota6-149

Lands controlled by the Stimson Timber Company.....6-150

1656. Public Concern: The Forest Service should allow property owners seasonally unrestricted ground-based access.6-150

 Within environmentally reasonable constraints6-150

1657. Public Concern: The Forest Service should provide access routes to state-owned lands.6-150

 In Minnesota.....6-150

 In Montana6-150

1658. Public Concern: The Forest Service should grant access to property owners previously denied.....6-150

1659. Public Concern: Local authorities should determine permissible access routes to private property.6-151

1660. Public Concern: The Forest Service should manage access routes in a way that contributes to a feeling of inaccessibility.....6-151

1661. Public Concern: The Forest Service should not require private property owners to comply with wilderness standards.....6-151

 With regard to access6-151

1662. Public Concern: The Forest Service should not require fees for access to private property.6-151

1663. Public Concern: The Forest Service should block access to ecologically damaging groups.6-151

1664. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule has no impact on access to state and private inholdings.....6-151

 In Idaho6-151

Road Construction/Maintenance.....6-152

1665. Public Concern: The Forest Service should permit road construction to land that was privately owned prior to the government’s ownership of surrounding property.....6-152

1666. Public Concern: The Forest Service should not construct roads for the sole purpose of providing access to private inholdings.6-152

1667. Public Concern: The Forest Service should address its contradictory statements regarding special use permits and public roads.6-152

Road Construction/Maintenance – Funding.....6-153

1668. Public Concern: Private property owners should bear the cost of constructing or maintaining access roads.....6-153

Legal Considerations6-153

1669. Public Concern: The Forest Service should ensure access to private property as required by existing law.....	6-153
By abiding by the requirements of the Alaska Native Claims Settlement Act	6-154
By abiding by the requirements of Revised Statute 2477	6-154
By abiding by the requirements of the Alaska National Interest Lands Conservation Act	6-154
By issuing non-appealable decisions.....	6-154
1670. Public Concern: The Forest Service should review current laws governing private property access.....	6-154
To ensure that access is maintained	6-154
1671. Public Concern: The Forest Service should disclose its legal obligations to provide access routes under existing laws.	6-155
To avoid misleading the public	6-155
1672. Public Concern: The Forest Service should familiarize personnel with laws regarding access to private lands.....	6-155
1673. Public Concern: The Forest Service should consider that state statutes already ensure access to private property.....	6-155
Colorado State statutes	6-155
1674. Public Concern: The Forest Service should uphold valid existing rights.....	6-155
On the Chugach National Forest	6-155
1675. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule.....	6-155
Because it adequately protects valid existing rights	6-155
1676. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule.....	6-156
Because it will not protect valid existing rights.....	6-156
1677. Public Concern: Private property owners should have the right to appeal unreasonable constraints on access.....	6-156
1678. Public Concern: The Forest Service should ensure consistent treatment of inholders with respect to the appeals process.....	6-156
Over the establishment of ownership rights.....	6-156
Land Exchanges/Purchases.....	6-156
<i>Land Exchanges/Purchases General</i>	6-157
1679. Public Concern: The Forest Service should cease acquiring more private property within inventoried roadless areas.....	6-157
Until it has regained control over other resources, such as its roads and maintenance backlog.....	6-157
1680. Public Concern: The Forest Service should condemn private property located in roadless areas.....	6-157
To obtain inholdings	6-157
<i>Land Exchanges</i>	6-157
1681. Public Concern: The Forest Service should exchange other federal land for private inholdings located in roadless areas.	6-157
Exchange peripheral federal land.....	6-158

To prevent private interests from influencing management activities ..6-158

1682. Public Concern: The Forest Service should exchange federal land outside roadless areas for state lands within roadless areas.....6-158

Because the cumulative effect of national management rules would prevent reasonable access to inholdings in roadless areas6-158

1683. Public Concern: The Forest Service should exchange other federal land for private inholdings located in wilderness areas.....6-158

1684. Public Concern: The Forest Service should not designate an area roadless unless all private inholders first agree to a land exchange.....6-159

Purchases.....6-159

1685. Public Concern: The Forest Service should purchase private inholdings.6-159

If the area is to be declared wilderness6-159

Only if other areas are to be reopened to multiple uses6-159

With Land and Water Conservation Fund money6-159

To build connections between roadless areas and designated wilderness areas6-159

In the Tongass National Forest6-160

1686. Public Concern: The Forest Service should either buy private property or negotiate an access schedule with property owners.6-160

If traffic levels escalate the environmental impact of access6-160

1687. Public Concern: The Forest Service should not use Conservation and Reinvestment Act funding to purchase privately owned forest lands.6-160

1688. Public Concern: The Forest Service should not force private landowners to sale their property.6-160

For the reason of obtaining inholdings6-160

1689. Public Concern: The Forest Service should discourage private profiteering over the Agency’s purchase of private property in roadless areas.....6-160

1690. Public Concern: The Forest Service should not succumb to blackmail by private property owners.6-160

Who threaten to construct large buildings on inholdings6-160

1691. Public Concern: The price of private property within roadless areas should reflect the presence or absence of an access route to the property.6-161

Appendix D Demographics

Introduction

CAT demographic analysis presents an overall picture of respondents; specifically, where they live, their general affiliation to organizations or government agencies, and the manner in which they respond. CAT's database organizes public comments under subject categories (see Appendix B) and demographic information. A report can be generated from the database to show public comments from certain geographic locations or to show comments associated with certain types of organizations. Thus demographic coding combined with comment coding allows use of the database to focus on specific areas of public concern that are linked to geographic areas, organizational affiliations, and response formats.

The total number of responses is as follows:

52,432	original responses
674,008	organized campaign responses
726,440	total responses

It is important to recognize that public comment analysis is not a vote-counting process in which the outcome is determined by the majority opinion. Because respondents are self-selected, they do not constitute a random or representative public sample. The National Environmental Policy Act (NEPA) encourages all interested parties to submit comment as often as they wish regardless of age, citizenship, or eligibility to vote. Respondents may therefore include businesses, people from other countries, children, and people who submit multiple responses. Therefore, caution should be used when interpreting the numbers provided in this report. While demographic information can provide insight into the perspectives and values of respondents, it does not necessarily reveal the desires of society as a whole. All input is considered and the analysis team strives to identify the concerns raised by all respondents.

CAT identifies several categories for demographic purposes. Responses are the individual letters, postcards, emails, etc., received. Respondents are the individual response writers. Signatures refer to the people (respondents) who signed these individual responses. The number of signatures may be greater than the number of responses as there may be more than one signature per response. Likewise, the number of total responses may be larger than the number of total respondents due to multiple submissions by the same respondents. CAT determines the number of responses received for a given project, the number of respondents, and the number of signatures.

Organizational Affiliation

Organizational affiliation is tracked for each response.

Table D-1 displays, by organization type, the number of responses and signatures. The first box indicates respondents who write on behalf of themselves or whose affiliation is unclear.

Table D-1. Number of Responses and Signatures by Organization Type

Organization Type	Number of Responses	Number of Signatures
Individual/Unaffiliated	51,036	55,763
University/Professional Society	56	59
Federal Agency/Elected Official	45	70
State Agency/Elected Official	114	116
County Agency/Elected Official	204	209

Response Type

CAT tracks response formats. The public uses a variety of response formats including letters, emails, faxes, petitions, resolutions, action alerts, and organized response campaign letters. Tracking response formats allows CAT and its clients to be better prepared for what future projects may bring in terms of number of responses, human resource needs, and computer system needs.

Table D-2 displays, by response format, the number of original responses and signatures. The majority of responses received were letters, followed by emails, faxes, and petitions.

Table D-2. Number of Responses and Signatures by Response Format

Response Format	Number of Responses	Number of Signatures
Letter	39,154	42,375
Email	12,601	13,303
Fax	632	847
Petition	38	4,327
Resolution	6	7
Action Alert	1	1
Total Responses	52,432	60,860

Geographic Representation

Geographic representation is tracked for each response. For petitions, geographic representation is not tracked for each individual signature. Instead, petition signatures are all assigned to the state of the person or organization originating the petition.

Table D-3 displays, by origin, the number of responses and signatures. Note that 3,009 responses did not indicate geographic information.

Table D-3. Number of Responses and Signatures by Origin

State	Number of Responses	Number of Signatures

Appendix E

Organized Response Report

Organized responses represent 93 percent of the total responses received during the public comment period for the Advance Notice of Proposed Rulemaking (674,008 out of 726,440). Five or more responses received from different individuals but containing identical text, or identical text plus brief additional comments similar in content, are defined as organized response campaigns.

Organized Response Campaigns

Five or more responses, received separately but containing identical text, constitute an organized response campaign. Once an organized response campaign letter is identified, a “master” is entered into the database with all of the content information. All responses with matching text are then linked to this master within the database with a designated number. If a response does not contain all of the text presented in a given organized response, or if it includes additional text, it is entered as an individual letter. Identical responses from four or fewer respondents are also entered as individual letters.

Organized responses are identified with a number. The following table presents the total number received of each organized response campaign letter and summarizes the concerns found therein. Note: Some of the letters show less than five received; this is because a number of organized response campaign letters were submitted by government officials and their numbers are included in Table D-1 in Appendix D.

Table E-1. Organized Response Campaigns

Organized Response Campaign Letter Number	Total Received	Summary of Organized Response Campaign Letter
1	119	Supports the immediate implementation of a roadless area policy that applies to all roadless areas 1,000 acres and larger, and that restricts road construction, timber harvest, and other harmful activities in roadless areas.
2	39,482	Supports the Roadless Area Conservation Rule as it provides a balanced approach to forest conservation. Opposes forest-by-forest decisions on timber harvest and development in roadless areas and requests the inclusion of the Tongass National Forest.
3	1586	Expresses concern regarding past damages to roadless areas. Supports the Roadless Area Conservation Rule as it provides a balanced approach to forest conservation. Opposes forest-by-forest decisions on timber harvest and development in roadless areas and requests the inclusion of the Tongass National Forest.
4	7114	Suggests restricting timber harvest, mining, and drilling in roadless areas. Also suggests that oil and gas companies should not be given local influence in the management of roadless areas. Supports the Roadless Area Conservation Rule as it was adopted after sufficient public input. Also describes important values of

		roadless areas such as wildlife habitat and watershed protection.
5	4	Suggests that the Roadless Area Conservation Rule was the most important accomplishment of the Clinton Administration and that governmental restrictions are the only hope to protect natural beauty and balance. Also suggests that roadless areas are buffers against pollution and environmental damage. Expresses support for any agency or elected representative who protects and preserves natural lands.
6	114	Requests the full protection of grizzly bears and their habitat through the implementation of the Roadless Area Conservation Rule. Also requests that any process that leads to clearcutting or development of roadless areas be prohibited.
7	1067	Supports immediate implementation of the Roadless Area Conservation Rule as written. Suggests that all roadless areas be protected from timber harvest, roadbuilding, and mining and that the Rule include the Tongass and Chugach National Forests.
8	6597	Letter does not support the Roadless Area Conservation Rule, suggesting it was part of a flawed National Environmental Policy Act process. Requests the Rule be revised to adequately address forest health concerns, access to private and state inholdings, and local input. Also requests that roadless areas be accurately mapped at the forest level including an inventory of classified and unclassified roads. Modifications to the Rule must also take into consideration the need to access national forests to provide for congressionally mandated multiple uses. Includes responses to the ten questions which generally oppose the Rule.
9	13	Suggests that the Roadless Area Conservation Rule should be revised to address the issues of recreational access, forest health, access to private and state inholdings, and local input. Also suggests that modifications to the Rule must take into account the need to access national forests to provide for Congressionally-mandated multiple uses. Supports local forest-level decisionmaking. Provides responses to the ten questions which generally oppose the Rule.
10	6685	Supports the Roadless Area Conservation Rule and urges abandonment of efforts to weaken roadless area protections. Opposes forest-by-forest decisionmaking and suggests that the Rule already contains the exemptions necessary to protect forest health, communities, homes and property and access to inholdings.
11	817	Letter does not support the Roadless Area Conservation Rule, suggesting it was part of a flawed National Environmental Policy Act process. Requests the Rule be revised to adequately address forest health concerns, access to private and state inholdings, and local input. Also requests that roadless areas be accurately mapped at the forest level including an inventory of classified and unclassified roads. Modifications to the Rule must also take into consideration the need to access national forests to provide for congressionally mandated multiple uses. Other suggestions include the need to use up-to-date criteria for delineation of roadless areas, deletion of roaded portions of inventoried roadless areas from the inventory, evaluation of economic and social relationships impacting working families and local communities, and inclusion of a full range of management alternatives. Suggests that wilderness recommendations and local forest level decision making should also be addressed.
12	167	Provides responses to the ten questions. Responses suggest that forest plans must

		provide for multiple use and protect forest resources from fire and insects through local planning. Also suggests that public hearings be held to involve all parties in the process, that the protection of communities should be the primary factor in determining the way a fire is fought, and that roadless areas should be managed no differently than any other area of the forest.
13	7210	Letter does not support the Roadless Area Conservation Rule as it was the product of a flawed National Environmental Policy Act process. Suggests the Rule be revised to adequately address forest health concerns, access to private and state inholdings, and local input. Also requests that roadless areas be accurately mapped at the forest level including an inventory of classified and unclassified roads. Modifications to the Rule must also take into consideration the need to access national forests to provide for congressionally mandated multiple uses. Other suggestions include the need to use up-to-date criteria for delineation of roadless areas, deletion of roaded portions of inventoried roadless areas from the inventory, and evaluation of economic and social relationships impacting working families and local communities. Requests a process to allow those most affected by management decisions on public lands to be heard.
14	2532	Supports the Theodore Roosevelt Conservation Alliance's "Square Deal Initiative #1." Suggests that the 58 million acres under consideration should be kept roadless and that criteria should be carefully defined for the consideration of any exceptions for providing road access for forest management. Also suggests that decisionmaking should include the interests of local people while the final decision authority to build roads in roadless areas should be retained by the Chief of the Forest Service.
15	2230	Expresses disappointment and distrust toward the Bush Administration's attempt to weaken forest protections and ignore public input. Requests the immediate implementation of the Roadless Area Conservation Rule.
16	485	Supports the Roadless Area Conservation Rule and all efforts to oppose the weakening of forest protections. Suggests that roadless areas are valuable for high quality fish and wildlife habitat, backcountry recreation, and clean water supplies.
17	4	Opposes the Gravina Island timber sale as it is in violation of the Roadless Area Conservation Rule. Suggests that this timber sale will harm the wilderness character and pose a threat to the historical, cultural, and recreational values of the area. Also suggests that significant damage to the native historical uses and cultural resources will result from this timber harvest as well as damage to fish and wildlife habitat.
18	32,728	Expresses disappointment and distrust toward the Bush Administration's attempt to weaken forest protections and ignore public input. Requests the immediate implementation of the Roadless Area Conservation Rule.
19	184	Supports the Roadless Area Conservation Rule and urges abandonment of efforts to weaken roadless area protections. Opposes forest-by-forest decisionmaking and suggests that the Rule already contains the exemptions necessary to protect forest health, communities, homes and property, and access to inholdings. Also suggests that previous public involvement processes have proven public support for roadless area protections.
20	129	Supports the Roadless Area Conservation Rule to protect all roadless areas, including the Tongass and Chugach National Forests. Suggests that roadless areas

		are vulnerable to development and should be protected for future generations and clean drinking water.
21	522	Provides responses to the ten questions. Responses suggest that the management of roadless areas should be determined in forest plans on a site-specific basis, that effective communication is conducted at the forest level, and that road access is necessary for forest health management and private inholdings. Provides an extensive list of factors that should be considered in the evaluation of roadless areas. Suggests that a full range of alternatives should be considered for the management of roadless areas.
22	36	Requests that the flaws in the Roadless Area Conservation Rule be fixed to address forest health, public access, local input, the mapping and classification of roads, and congressionally mandated multiple uses. Suggests that concern for each forest requires active local management.
23	730	Supports the continuance and protection of dispersed recreation opportunities in roadless areas. Provides responses to some of the ten questions that have a direct impact on recreation and offers suggestions regarding appropriate management of motorized recreation.
24	73	Opposes the Roadless Area Conservation Rule as it is excessively restrictive regarding access to lands for recreational use. Supports the court ruling that the Rule was predetermined and violated the National Environmental Policy Act. Requests that the Rule be withdrawn.
25	4	Opposes the Roadless Area Conservation Rule as it is illegal, politically driven, and ignores legitimate access concerns. Suggests that protection of access to public lands should be done through a program of thinning and timber harvest management. Also suggests that environmental protection should take into account the realities about multiple use and recreational opportunities and that roadless area decisions should occur at the local level.
26	26	Supports the Roadless Area Conservation Rule as it strikes a balance between preserving wildlands and accommodating competing uses. Expresses specific concerns about roadless areas in the Los Padres and Six Rivers National Forest. Opposes forest-by-forest decisionmaking regarding roadless area management.
27	41,413	Opposes any changes to the Roadless Area Conservation Rule that would allow timber harvest in pristine areas of any national forest, especially the Tongass National Forest. Also opposes forest-by-forest decisionmaking for roadless area management. Suggests that the Tongass is valuable for abundant wildlife and should be protected. Also suggests that previous public support for the Rule should not be ignored.
28	1722	Supports the Roadless Area Conservation Rule as it strikes a balance between preserving wildlands and accommodating competing uses. Opposes forest-by-forest decisionmaking regarding roadless area management. Suggests that most national forests are already open to development and that the last remaining wildlands should be preserved.
29	129	Suggests that all roadless areas should be managed to prohibit timber harvest and roadbuilding. Requests implementation of the Roadless Area Conservation Rule.
30	9	Suggests that the Roadless Area Conservation Rule enjoys overwhelming public

		support and should be implemented because local planning has failed to adequately protect roadless areas. Describes the value of roadless areas to be sources of clean drinking water, wildlife habitat, areas for scientific research and study, and to provide open space and areas for cultural observances. Also suggests that the Rule received adequate public support, already provides exceptions for forest health management, has no affect on access to inholdings, and should be retained and implemented as is. Includes a list of specific areas in Texas to be included in the roadless area inventory.
31	105,980	Supports the Roadless Area Conservation Rule as it protects roadless areas in the national forests, especially the Tongass National Forest. Opposes any changes that would weaken the January Rule including forest-by-forest decision-making.
32	275	Supports the Roadless Area Conservation Rule as it strikes a balance between preserving wildlands and accommodating competing uses. Opposes forest-by-forest decisionmaking regarding roadless area management. Also suggests that previous public support for the Rule should not be ignored, and the Rule should be implemented to preserve roadless areas for future generations.
33	18	Requests that roadless areas be closed to timber harvest, mining, road building, and drilling and that previous public comment on the Roadless Area Conservation Rule be included in this analysis. Suggests that roadless areas should be kept roadless because wildfires are more likely to start in areas with roads, because roadless area conservation is important to the diversification of rural economies, and because roadless areas provide clean water and wildlife habitat.
34	5	Supports the Roadless Area Conservation Rule as it received much public support. Suggests that we need to preserve forest areas rather than mine and harvest them.
35	300	Supports the Roadless Area Conservation Rule, as roadless areas are critical fish and wildlife habitat. Suggests that fishing and hunting values should be considered in decisions regarding roadless area management. Also suggests that economic values of roadless areas should be considered because fishing contributes to the nation's economy. Requests that roadbuilding should be prohibited in roadless areas because roads threaten vital fish habitat by increasing sediment in streams.
36	404	Supports the Roadless Area Conservation Rule and its immediate implementation on all national forests. Suggests that adequate public support for the Rule has already been exhibited and all interested parties had the opportunity to address their concerns about roadless values. Also suggests that the Rule provides for the protection of forest values while adequately addressing local forest managers' communities' needs and competing interests.
37	28	Suggests that only a national rule can adequately protect roadless areas. Also suggests that the Roadless Area Conservation Rule allows forest health management, ensures access to inholdings, and considers the economic benefit of revenue from recreational activities.
38	1	Supports the Roadless Area Conservation Rule. Suggests that the Rule is a compromise between protection and industrial development and provides a balance between recreational and extractive uses. Suggests that the White Mountain National Forest provides solitude and recreational value for its residents as well as visitors and that the Rule helps protect biological, economic, and private property resources.

39	7	Supports the Roadless Area Conservation Rule. Suggests that protecting roadless areas is important for outdoor experiences. Also suggests that local forest planning has failed to provide adequate protection and that the Rule has overwhelming public support.
40	7	Supports the Theodore Roosevelt Conservation Alliance's Square Deal Initiatives. Suggests balancing accessibility to National Forest System lands with management requirements. Also suggests increasing funding and accountability for fish and wildlife habitat management programs at all levels.
41	149	Requests implementation of the Roadless Area Conservation Rule and supports permanent protection for roadless areas in the Plumas National Forest. Suggests that roadless areas provide clean drinking water, recreational opportunities, and critical wildlife habitat.
42	120	Provides responses to the ten questions. Responses suggest that decisions be made at the local level with adequate public involvement, that fire breaks, thinning and fuel reduction should be performed, and that access needs should be met. Also suggests that natural resources should not be wasted, that recreation should be accommodated, that Congress should designate roadless areas, and that the Forest Service should recognize the increasing demand for roads.
43	1420	Suggests that the recreational community was not given adequate opportunity to comment on the Roadless Area Conservation Rule. Requests that local communities have the opportunity to have their view incorporated into management plans and that national forests remain open to responsible recreational activities.
44	29	Supports the Roadless Area Conservation Rule and provides responses to the ten questions. Responses suggest that local forest planning has not adequately protected roadless areas and that the Rule is needed to provide additional protection. Also suggests that the Rule received adequate public support, already provides exceptions for forest health management, has no affect on access to inholdings, and should be retained and implemented as is.
45	6	Supports the Roadless Area Conservation Rule as a national Rule is essential to safeguarding roadless areas. Opposes local control by timber, mining, and extraction interests.
46	24	Requests implementation of the Roadless Area Conservation Rule. Suggests that the role of local forest planning is to add additional restrictions to the Rule based on local situations. Also suggests that the Rule sufficiently addresses forest health management, public involvement, roadless area values, and economic considerations. Requests that off-road vehicles and mining should be prohibited.
47	19	Supports the Roadless Area Conservation Rule as it stands for ensuring wilderness and wild rivers. Also supports permanent protection of the Chugach and Tongass National Forests. Suggests that these forests are valuable for economic resources, healthy fisheries, clean water, wildlife, cultural heritage, and recreational opportunities.
48	7	Expresses concern that the Roadless Area Conservation Rule was rushed through and public meetings were not adequately announced. Suggests that roadless area decisions should be made on a forest-by-forest basis within the forest planning process. Also suggests that there is a forest health crisis in Idaho that must be

		addressed through proper forest management. Provides responses to the ten questions which generally support local forest management and active forest health management.
49	228	Supports the Roadless Area Conservation Rule as roadless areas are important for recreational experiences and ecosystem protection. Suggests that the Rule is the result of extensive participation and adequately addresses issues of fire management, forest health, access, and local input.
50	3021	Supports the scientific management of fish and wildlife habitat that will remain open to hunters and anglers. Requests that existing roads be fixed while roadless areas remain roadless.
51	835	Requests that roadbuilding be restricted in 58.5 million acres, that fish and wildlife be a priority in habitat management, and that decisions be made on science rather than politics. Suggests that all comments should be given equal weight.
52	75	Supports the Roadless Area Conservation Rule as it is the product of an extensive federal rulemaking with overwhelming public support. Suggests that the Rule represents a balanced approach to forest conservation and adequately addresses the issues of fire management, forest health, access, and local input. Opposes forest-by-forest decisionmaking on roadless area development.
53	6	Supports the Roadless Area Conservation Rule because Montanans have voiced strong support for permanent roadless area protection.
54	24	Letter does not support the Roadless Area Conservation Rule, suggesting it was part of a flawed National Environmental Policy Act process. Requests the Rule be revised to adequately address recreational access, forest health concerns, access to private and state inholdings, and local input. Also requests that roadless areas be accurately mapped at the forest level including an inventory of classified and unclassified roads. Modifications to the Rule must also take into consideration the need to access national forests to provide for congressionally mandated multiple uses. Other suggestions include the need to use up-to-date criteria for delineation of roadless areas, deletion of roaded portions of inventoried roadless areas from the inventory, and inclusion of a full range of management alternatives. Suggests that wilderness recommendations and local forest level decisionmaking should also be addressed.
55	9	Supports the Roadless Area Conservation Rule because forests and wildlife are precious and should be protected. Suggests that roadless area protection reflects the desires of the citizens of Oregon.
56	1	Supports the Roadless Area Conservation Rule as it provides a balanced approach to forest conservation. Suggests that the previous public involvement process should ensure decision makers of public support for the Rule. Opposes forest-by-forest decisions on timber harvest and development in roadless areas.
57	215	Supports the Roadless Area Conservation Rule because it would protect areas in the White River National Forest. Suggests that the Rule is a sound compromise between protection and development. Opposes forest-by-forest decisions on roadless area development.
58	3245	Supports the Roadless Area Conservation Rule because individual forest planning

		has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
59	5120	Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
60	3466	Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
61	2544	Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
62	7	Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
63	339	Supports the Roadless Area Conservation Rule without proposed amendments as it is a balanced approach to forest conservation and adequately addresses issues of

		fire management, forest health, access, and local input.
64	10	Opposes roadless area designation. Suggests that roadless areas endanger forest health because timber cannot be adequately managed or protected. Also suggests that the forest is for the use and enjoyment of all people, not for a select few.
65	399	Letter does not support the Roadless Area Conservation Rule, suggesting it was part of a flawed National Environmental Policy Act process. Requests the Rule be revised to adequately address forest health concerns, access to private and state inholdings, and local input. Also requests that roadless areas be accurately mapped at the forest level including an inventory of classified and unclassified roads. Modifications to the Rule must also take into consideration the need to access national forests to provide for congressionally mandated multiple uses. Suggests that modifications adequately address the forest health crisis threatening our national forests and supports individual forest plan decisions for management of roadless areas. Includes responses to the ten questions which reflect the above information.
66	24,261	Supports the Roadless Area Conservation Rule. Expresses distrust toward the Bush Administration for refusal to implement the Rule.
67	787	Suggests that roads be kept out of roadless areas and that roadless areas should be managed for fish and wildlife habitat. Also suggests that roadless areas be open to hunting and fishing and that existing forest roads be maintained.
68	1580	Requests immediate implementation of the Roadless Area Conservation Rule, including protection of the Tongass National Forest. Opposes forest-by-forest decisions on timber harvest and development. Suggests that roadless areas should be protected from road building and commercial extraction.
69	13	Requests immediate implementation of the Roadless Area Conservation Rule, including the protections for the Tongass National Forest. Suggests that roadless areas are valuable for drinking water, ecosystem protection, scientific study, and biodiversity. Also suggests that the economic value of roadless areas comes from recreation and environmental quality of life.
70	51	Opposes the Roadless Area Conservation Rule as it was imposed without going through proper channels of local public input. Suggests that road closures put undue hardship on local economies and eliminates currently available motorized recreation uses.
71	25	Supports the Roadless Area Conservation Rule because one million people voiced support for the Rule. Suggests that roadless areas have the highest quality fish and wildlife habitat, backcountry recreation, and clean water supplies. Also suggests that many areas not included in the Rule should be included and all off-road vehicle use in roadless areas should be prohibited.
72	8	Supports the Roadless Area Conservation Rule because roadless areas have the highest quality fish and wildlife habitat, backcountry recreation, and clean water supplies. Opposes forest-by-forest decisions on roadless area development. Letter provides opportunity to respond to the ten questions.
73	0	Supports the Roadless Area Conservation Rule as it protects roadless areas in our national forests, especially the Tongass National Forest. Opposes any changes that would weaken the January Rule including forest-by-forest decision-making.

74	462	Supports the Roadless Area Conservation Rule.
75	10	Suggests that the Roadless Area Conservation Rule was based on a process that was poorly and hastily executed. Also suggests that the Rule should be fixed by allowing for greater local input, by providing an assessment of the long-term impact of withdrawing lands from the resources base, and by compliance with congressionally mandated multiple uses of the forests. Supports individual forest plan level decisions for roadless area management. Provides responses to the ten questions which generally reflect the above concerns.
76	4	Supports the Roadless Area Conservation Rule because one million people voiced support for the Rule. Suggests that roadless areas have the highest quality fish and wildlife habitat, backcountry recreation, and clean water supplies. Also suggests that many areas not included in the Rule should be included and all off-road vehicle use in roadless areas should be prohibited.
77	3	Provides responses to the ten questions. Responses suggest that local managers should manage roadless areas, that local people should control forest decisions, that forest management access should be maintained, and that social and economic considerations should play a large role in roadless area evaluations. Also suggests that ski areas should be allowed in roadless areas, that roadless areas should not be proposed for wilderness designation, and that great emphasis should be placed on local impacts.
78	164	Provides responses to the ten questions. Responses suggest that the role of local forest planning is to enforce the Roadless Area Conservation Rule. Also suggests that the Rule received adequate public support, has no effect on fire management, access to inholdings, or wilderness considerations, and has adequately identified roadless area values. Requests that roadbuilding, timber harvest, drilling, mining, and off-road vehicles be prohibited in roadless areas. Also requests that the Forest Service should stop preparing timber sales in the Tongass National Forest and stop undermining the legality of the Rule.
79	174,220	Supports the Roadless Area Conservation Rule as it protects pristine areas and is a compromise between protection and development. Opposes forest-by-forest decisions on timber harvest and development in roadless areas.
80	99	Supports the Roadless Area Conservation Rule as it is the result of an extensive public involvement process. Suggests that roadless areas are a great treasure and should be preserved for future generations.
81	1057	Supports the Roadless Area Conservation Rule as it is ecologically necessary and immensely popular. Suggests that the ten questions are biased and may undermine a fair comment process. Also suggests that the Rule adequately addresses issues of fire management, forest health, access, and local input.
82	324	Letter does not support the Roadless Area Conservation Rule, suggesting it was part of a flawed National Environmental Policy Act process. Requests the Rule be revised to adequately address forest health concerns, access to private and state inholdings, and local input. Also requests that roadless areas be accurately mapped at the forest level including an inventory of classified and unclassified roads. Modifications to the Rule must also take into consideration the need to access national forests to provide for congressionally mandated multiple uses. Other suggestions include the need to use up-to-date criteria for delineation of

		roadless areas, deletion of roaded portions of inventoried roadless areas from the inventory, evaluation of economic and social relationships impacting working families and local communities, and inclusion of a full range of management alternatives. Suggests that wilderness recommendations and local forest level decisionmaking should also be addressed.
83	98	Suggests that roadless areas provide clean water, high quality fish and wildlife habitat and should be protected by implementation of the Roadless Area Conservation Rule. Opposes forest-by-forest decisions on roadless area management.
84	25	Letter contains no text.
85	866	Supports the Roadless Area Conservation Rule because National Forests deserve protection from destructive activities. Suggests that roadless areas are valuable for high quality fish and wildlife habitat, backcountry recreation, and clean water supplies.
86	31	Opposes the Roadless Area Conservation Rule. Suggests that road access should be maintained to control and prevent fire and that controlled burns to improve forest health are good. Also requests that National Forests provide wildlife habitat, recreation, and watershed management.
87	74	Suggests that management decisions should be made in the forest plans. Expresses concerns regarding the lack of data to support the assertion that existing roads are having significant negative effects on the environment and the lack of consideration of alternatives to minimize road maintenance. Suggests that the quantity of water delivered at the forest boundary should be increased by silvicultural practices.
88	96	Suggests that the recreational community was not given adequate opportunity to comment on the roadless issue. Supports developing specific management plans for each national forest that allow local needs to be met. Also suggests the importance of motorized access to National Forest System lands.
89	6	Opposes the Roadless Area Conservation Rule because it will devastate forest health, cripple rural communities, and lead to future undue lawmaking regarding access to inholdings. Suggests that the Rule should be revised to address forest health, permit access, and allow for local input. Also suggests that forest management decisions should be made at the local level.
90	994	Suggests that roadless areas provide clean water, high quality fish and wildlife habitat and should be protected by implementation of the Roadless Area Conservation Rule. Opposes forest-by-forest decisions on roadless area management.
91	14,965	Supports the Roadless Area Conservation Rule as it protects pristine areas while still allowing access for forest health management. Opposes forest-by-forest decisions on timber harvest and development in roadless areas.
92	153	Requests implementation of the Roadless Area Conservation Rule and that the Camp Hutchins area be included as a roadless area. Suggests that the role of local forest planning is to add additional restrictions to the Rule based on local situations. Also suggests that the Rule sufficiently addresses forest health management, public involvement, roadless area values, and economic

		considerations. Requests that off-road vehicles and mining should be prohibited.
93	20	Supports the Roadless Area Conservation Rule as it is the product of an extensive federal Rulemaking with overwhelming public support. Suggests that the Rule represents a balanced approach to forest conservation and adequately addresses the issues of fire management, forest health, access, and local input. Requests the inclusion of the Tongass National Forest.
94	27	Supports protecting roadless areas in the Green Mountain and White Mountain National Forests and opposes weakening of the Roadless Area Conservation Rule. Suggests that roadless areas should be protected from roadbuilding, mining, and timber harvest.
95	245	Supports repealing all prohibitions regarding roadless areas because local economies would be damaged by not allowing timber harvest companies to harvest dead wood. Also expresses concern regarding limited ability to manage for forest health due to restricted road access to roadless areas. Suggests that more local control is needed, that Congress should designate roadless areas, and that competing interests should be resolved by considering who the decision affects the most.
96	7	Supports the Roadless Area Conservation Rule as it protects 60 million acres from commercial extraction industries. Suggests that these industries do not own National Forest System lands and that citizens have spoken in support of protecting roadless areas. Also suggests that the Rule represents a balanced approach to forest conservation and adequately addresses forest issues.
97	155	Provides responses to the ten questions. Responses suggest that roadless area Rulemaking should be postponed until the Planning Rule changes are finalized, that each roadless area should be managed individually to preserve the exact composition of each area, and that decisions must be made to minimize the risk of wildfire, insects, and disease. Also suggests that the Forest Service should avoid acquiring more property within roadless areas. The Forest Service should consider the nation's needs for lumber, motorized and non-motorized recreational opportunities, size and character of a roadless area, historic use, economic impacts, and overall health of the area when evaluating roadless areas. Suggests that decisions regarding allowable activities should be made on a case-by-case basis, and that sound science should prevail when working with competing interests.
98	11	Letter does not support the Roadless Area Conservation Rule, suggesting it was part of a flawed National Environmental Policy Act process. Requests the Rule be revised to adequately address forest health concerns, access to private and state inholdings, and local input. Also requests that roadless areas be accurately mapped at the forest level including an inventory of classified and unclassified roads. Modifications to the Rule must also take into consideration the need to access national forests to provide for congressionally mandated multiple uses. Supports individual forest plan decisions for roadless area management.
99	20	Suggests that the Roadless Area Conservation Rule was developed with adequate public input and review and that it received overwhelming public support. Also suggests that local planning processes have failed to adequately protect roadless areas. The Rule adequately addresses issues regarding local involvement, access to inholdings, forest management, fire management, and recreational opportunities. Requests that roadbuilding, timber harvest, mining, off-road vehicle

		use and commercial extraction be prohibited in all roadless areas 1,000 acres and larger.
100	12	Expresses concern that the primary impacts of the Roadless Area Conservation Rule are a loss of local forest planning ability and a corresponding loss of consideration of local needs and concerns. Provides responses to the ten questions. Responses suggest that the local forest planning process should continue to decide roadless area management, that local plans should contain provisions for addressing natural events, that reasonable access to inholdings should be provided, and that a full range of factors should be considered in evaluating roadless areas. Requests that any review of roadless policy should be coordinated with reviews of forest planning regulations and the forest transportation policy.
101	5	Supports the Roadless Area Conservation Rule, including protection for the Tongass National Forest, as it adequately addresses fire management, forest health, access, and local input. Opposes forest-by-forest decisions on development in roadless areas.
102	8	Supports the Roadless Area Conservation Rule and urges the prohibition of all development projects in roadless areas. Suggests that local management is insufficient to protect wilderness characteristics of national forests.
103	37	Supports the Roadless Area Conservation Rule and opposes forest-by-forest decisions on timber harvest and development in roadless areas. Provides responses to the ten questions. Responses suggest that local forest planning has failed to protect roadless areas, that the Rule was developed with adequate public involvement, and that the Rule provides exceptions that allow forest health management. Suggests that property owners should be educated about fire proofing their property, that roadbuilding, mining, timber harvest, and off-road vehicle use be prohibited in roadless areas, and requests the immediate implementation of the Rule to abide by the will of the public.
104	5	Requests implementation of a strong roadless area policy that would permanently halt roadbuilding, timber sales, mining, and oil and gas development in roadless areas 1,000 acres or larger.
105	522	Opposes the Roadless Area Conservation Rule because it is a thinly disguised effort to reduce the multiple use of forests. Suggests that roads are necessary for forest health management access as well as access to harvest raw materials. Expresses concern regarding the ability to fight fires in roadless areas.
106	420	Supports the Roadless Area Conservation Rule as it offers a balanced approach to forest conservation without compromising public health and safety or access to inholdings. Opposes forest-by-forest decisions on roadless area management.
107	28	Suggests that the Roadless Area Conservation Rule is the result of a misguided attempt to produce a healthier forest. Requests that the Rule be revised to address the forest health crisis, the need to access forests for multiple use, and to support individual forest plan decisions. Suggests that the decisionmaking process should include people directly affected by the decision.
108	12	Supports the Roadless Area Conservation Rule and expresses concern regarding the Bush Administration's attempt to thwart preservation of wildlands. Requests that trapping activities be prohibited within roadless areas because leghold traps are precarious and inhumane. Suggests that additional road development will

		encroach upon wildlife habitat.
109	5988	Supports the Roadless Area Conservation Rule, including protection for the Tongass National Forest, as it adequately addresses fire management, forest health, access, and local input. Opposes forest-by-forest decisions on development in roadless areas.
110	4163	Supports the Roadless Area Conservation Rule and its immediate implementation and inclusion of the Tongass National Forest. Suggests that the public rejects changes to the Rule.
111	629	Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that local forest planning has failed to adequately protect roadless areas and that the Rule was developed through an extensive public involvement process. Also suggests that the Rule already provides exceptions for forest health management, that forest fires should be left to burn in most cases, and that access to private property is already ensured in the Rule. Letter provides a list of environmental, social, and cultural values associated with roadless areas and requests that timber harvest, mining, oil drilling, off-road vehicle use, and pack animals should be banned. Suggests that the ten questions are highly biased and unnecessary because the public has already spoken in support of the Rule.
112	236	Supports the Theodore Roosevelt Conservation Alliance's "Square Deal Initiative #1." Suggests that the 58 million acres under consideration should be kept roadless and that criteria should be carefully defined for the consideration of exceptions for providing road access for forest management. Also suggests that decisionmaking should include the interests of local people while the final decision authority to build roads in roadless areas should be retained by the Chief of the Forest Service.
113	115	Expresses belief that the remaining roadless areas should be spared from the consumption of exhaustible resources because they are critical for drinking water, air quality, spaces of unspoiled beauty, and recreational opportunities. Suggests that ecosystems should be allowed to exist for their intrinsic value. Supports the Roadless Area Conservation Rule and opposes forest-by-forest decisions on roadless area management.
114	13	Requests protection of all National Forest Inventoried Roadless Areas through a national policy that prohibits road construction and timber harvest in these areas, specifically in the Colville and Umatilla National Forests.
115	20	Opposes the Roadless Area Conservation Rule because it will restrict multiple use and have a negative effect on rural economies. Expresses concern that fuel loading and fire risk as well as forest health are not adequately addressed by the Rule. Suggests that the roadless plan be managed through the local forest planning process with emphasis on protecting the local economy. Emphasizes the need to solicit and include local input in decisionmaking and apply a system that gives higher priority to those that are most impacted by the decisions. Suggests that public resources should be protected from insect, disease and wildfire that affect adjacent communities, homes, businesses, and property. Also includes concerns regarding firewood permits and dead tree removal, access to property, use of tax dollars for road and trail closure, and the designation of roadless areas as wilderness.

116	12	Supports the Roadless Area Conservation Rule because it adequately addresses issues of fire management, forest health, access, and local input. Opposes forest-by-forest decisionmaking as well as road building, timber harvest, and other development in roadless areas as they provide critical sources of clean water, healthy fisheries, and wildlife habitat. Suggests that the backlog of road maintenance should justify the implementation of the Rule. Also suggests that roadless areas are a source of employment and income for thousands of local businesses in the Northern Rockies.
117	541	Mentions that 95 percent of Americans support the Roadless Area Conservation Rule. Requests that actions be taken to ensure that the Rule is not undermined and that the Forest Service listen to the will of the American people. Requests that the Rule be implemented immediately and without exemption.
118	298	Requests that the Forest Service fix the Roadless Area Conservation Rule as it is the product of a flawed NEPA process, and is contrary to the agency's legal authority. Suggests that the process also ignored substantial concerns raised by local, state, and federal elected officials. Requests that the Rule be revised to adequately address forest health concerns, access to private and state inholdings, local input, and that roadless areas be accurately mapped at the forest level. Supports forest management at the local level as well as individual forest plan decisions for management of roadless areas. Requests that a process be put into place that allows those who are most affected by management decisions on public lands to be included and heard. Includes a listing of the ten questions with no responses.
119	208	Opposes the Roadless Area Conservation Rule because it will threaten the harvesting of diseased trees to be used for commercial purposes. Expresses concern that the Rule will cause a loss of jobs as well as keep people out of the housing market due to soaring lumber prices. Suggests that harvesting dead and dying timber helps prevent forest fires, and provides space for new tree growth. Also suggests that the Roadless Area Conservation Rule will prevent recreational use by the elderly and handicapped citizens as well as take land away from Americans.
120	134	An action alert sent out by the Sierra Club which encourages people to send in comments requesting that the Forest Service keep the Roadless Area Conservation Rule intact.
121	8	Opposes the Roadless Area Conservation Rule suggesting that locking up vast areas in a roadless condition causes them to die from fires and/or diseases. Requests that forests be managed for multiple use by professionals.
122	7	Supports the Roadless Area Conservation Rule, including protection for the Tongass National Forest, as it provides a balanced approach to forest conservation. Suggests that roadless areas are healthier than roaded forests and are less prone to devastating wildfires and insect damage.
123	7	Supports the Roadless Area Conservation Rule including protection for the Tongass National Forest. Opposes forest-by-forest decisions on timber harvest, road building, and other developments. Suggests that people residing near national forests should have no more influence on forest plans than other citizens living far from forests.
124	6	Requests immediate implementation of the Roadless Area Conservation Rule

		including protection for the Tongass National Forest. Requests protection in order to preserve drinking water, provide family activities, and protect fish and wildlife habitat. Suggests that the Rule already contains provisions to address wildfires and forest health. Supports national guidelines for roadless areas and opposes modifying the Rule to allow forest-by-forest decisionmaking on timber harvest, roadbuilding, or development in pristine areas.
125	6	Supports the Roadless Area Conservation Rule as it protects millions of acres of roadless forest from road construction, timber harvest, and mining. Suggests the need for the United States to set an example to other countries regarding conservation of wild areas. Also suggests the importance of maintaining areas of untouched wilderness.
126	25	Same as form 118 and includes responses to the ten questions. Responses generally oppose the Roadless Area Conservation Rule.
127	3515	Supports the Roadless Area Conservation Rule as it protects forests from timber harvest, mining, and drilling activities already allowed on most National Forest System lands. Makes reference to the extensive public support and involvement for the Rule. Suggests that the Rule adequately addresses issues of fire management, forest health, and access, and gives local decision makers the necessary flexibility for sound forest management. Requests inclusion of protection for the Tongass National Forest and asserts that letting the Rule stand is the best way to protect roadless values.
128	4	Supports the Roadless Area Conservation Rule. Requests protection of the last of America's wild national forests from timber harvest, road building, and mining.
129	6	Supports the Roadless Area Conservation Rule and makes reference to the extensive public support and involvement regarding the Rule. Lists a number of negative environmental impacts that have taken place over the last 150 years. Suggests that the Rule adequately addresses issues of fire management, forest health, and access, and gives local decision makers the necessary flexibility for sound forest management. Requests inclusion of protection for the Tongass National Forest and suggests that letting the Rule stand is the best way to protect roadless values.
130	12	Supports the Roadless Area Conservation Rule and requests that all development projects be immediately halted that are inconsistent with the Rule. Expresses concern about the negative environmental impacts that timber harvest projects will have in national forests. Opposed to forest-by-forest decisionmaking on roadless area management as it has resulted in thousands of miles of roads and an \$8.5 million dollar maintenance backlog at cost to the taxpayer. Includes responses to the ten questions. Responses express opposition to local forest planning, satisfaction with the extensive public involvement process used to develop the Rule, and opposition to road building to prevent wildfire. Responses also assert that the Rule will have no effect on access to property, note the economic value of recreation and environmental quality of life, oppose exceptions for destructive activities, support the wilderness recommendation process, provide suggestions for how to move towards forest restoration while providing economic benefits, suggest that timber sales be halted in the Tongass National Forest as they are a violation of the Roadless Area Conservation Rule, and finally, request that a vigorous defense be set up against the lawsuits challenging the Rule.
131	17	Supports the Roadless Area Conservation Rule and opposes forest-by-forest

		decisionmaking for the management of roadless areas.
132	6	Supports the Roadless Area Conservation Rule and opposes forest-by-forest decisionmaking for the management of roadless areas.
133	4	Opposes any changes to the Roadless Area Conservation Rule that would allow timber harvest in forests protected by the Rule, especially the Tongass National Forest. Also opposes allowing individual forests to opt out of the Rule and allowing timber harvest, road building, and other development of these pristine areas. Requests that the Rule be implemented immediately and defended against industry and other lawsuits to preserve the Tongass National Forest and other forests for future generations.
134	230	Supports the Roadless Area Conservation Rule as it protects 4.4 million acres in Colorado. Mentions the overwhelming number of comments, 28,000 of them from Coloradoans. Suggests that the Rule adequately addresses fire management, forest health, access, and local input. Opposes the weakening of national forest protection through forest-by-forest decisionmaking and requests the protection of roadless areas from road construction, timber harvest, and drilling.
135	959	Opposes the Roadless Area Conservation Rule, as it will negatively impact public access to forest lands. Supports access to recreational roads and trails, as they provide opportunities for families to spend time together. Expresses concern that road closures will be detrimental to the economic well being of the nation. Disappointed that the Rule will limit use of our national forests by older and disabled Americans. Opposes closing more land on the Ottawa National Forest as proposed in the 1986 Forest Plan. Also suggests that diverse recreational opportunities are important to rural economies.
136	136	Requests that the Forest Service fix the Roadless Area Conservation Rule as it is the product of a flawed NEPA process, and is contrary to the agency’s legal authority. Suggests that the process also ignored substantial concerns raised by local, state, and federal elected officials. Requests that the Rule be revised to adequately address forest health concerns, access to private and state inholdings, local input, and that roadless areas be accurately mapped at the forest level. Supports forest management at the local level as well as individual forest plan decisions for management of roadless areas. Also requests that the Forest Service provide access to private and state lands. Suggests that the Forest Service provide up to date criteria for the delineation of roadless areas, as well as remove roaded portions of inventoried roadless areas from the inventory. Also suggests that economic and social relationships be evaluated, including those that directly impact working families and local communities. Requests a process be put into place that allows those who are most affected by management decisions on public lands to be included and heard.
137	1209	Requests protection of all national forest roadless areas through a national policy to prohibit road construction and timber harvest.
138	10	An action alert that requests input regarding a list of questions. Responses to the questions are included in the alert. Some of the responses include concerns regarding the need for decisions to be made at the local level, establishing “fire breaks” to contain fires, fuel reduction through thinning, contacting stakeholders to ensure that needs are met, providing access, and providing multiple use. Supports more roads as well as systematic timber harvest.

139	29	Opposes the Roadless Area Conservation Rule, as it is the product of a flawed NEPA process, conducted without accurate information about roadless areas. Requests revision of the Rule to address recreation access, forest health, access to private and state inholdings, local input, and accurate mapping of roadless areas at the forest level. Supports forest management the local level as well as a “Backcountry” land use designation that offers motorized and non-motorized recreation choices together with resource protection and management for forest health. Also includes responses to the ten questions that mainly focus on the need for local control for forest planning.
140	5	Requests that the Forest Service fix the Roadless Area Conservation Rule as it is the product of a flawed NEPA process, and is contrary to the agency’s legal authority. Suggests that the process also ignored substantial concerns raised by local, state, and federal elected officials. Requests that the Rule be revised to adequately address forest health concerns, access to private and state inholdings, local input, and accurate mapping of roadless areas at the forest level. Supports forest management at the local level as well as individual forest plan decisions for the management of roadless areas. Also requests that the Forest Service provide access to private and state lands. Suggests that the Forest Service provide up to date criteria for the delineation of roadless areas, as well as remove roaded portions of inventoried roadless areas from the inventory. Also suggests that economic and social relationships be evaluated, including those that directly impact working families and local communities. Requests a process be put into place that allows those who are most affected by management decisions on public lands to be included and heard.
141	4	Requests that the Forest Service scientifically manage all fish and wildlife habitat in the National Forest System as lands that will remain open to hunters, anglers, and other public users. Expresses concern about the need for accessibility and comments on the need to keep roadless areas unroaded. Supports science-based exceptions in the Rule for local and regional forest health as well as forest restoration. Suggests that roadless areas be kept roadless, that public process should decide how areas should be used, that criteria should be carefully defined for consideration of any exception regarding roads and forest management, and that the interests of local people should be included in decisionmaking.
142	25	Supports the Roadless Area Conservation Rule, as it is the product of the most extensive federal rulemaking in history. Comments on the quality recreational opportunities provided by roadless lands in Colorado. Suggests that the Rule provides a balanced approach to forest conservation as well as addresses issues of fire management, forest health, access, and local input. Opposes forest-by-forest decisionmaking as it weakens forest protection. Supports preservation of roadless areas for recreational experiences.
143	1281	Requests that roadless areas in the Shoshone National Forest be considered for wilderness designation. Suggests that the Forest Service should protect all roadless areas for recreation and wildlife, and restrict oil and gas development, taxpayer subsidized timber harvest, and increased off-road vehicle use.
144	7	Generally supports the Roadless Area Conservation Rule with a few exceptions. Expresses disappointment that the Rule does not prohibit timber harvest in inventoried roadless areas, exempts the Tongass National Forest, provides no immediate protection for uninventoried roadless areas greater than 1,000 acres, and does not protect roadless areas from mining or off-road vehicles. Requests a final policy that adequately protects roadless areas by immediately prohibiting road building and timber harvest in all national forest roadless areas, includes the

		Tongass National Forest in the prohibition on road building and timber harvest, and provides interim protection from destructive activities for all non-inventoried roadless areas of 1,000 acres or larger.
145	14	Requests a final roadless policy that provides immediate and lasting protection for all roadless areas, including those in the Tongass National Forest. Also requests that the policy permanently stop all road building and timber sales along with mining, oil and gas development, off road vehicle use and other destructive activities in roadless areas larger than 1,000 acres.
146	43	Supports implementation of the Roadless Area Conservation Rule. Provides responses to the ten questions. Responses include support for national roadless area protection, comments regarding the extensive public involvement and support for the Rule, suggestions for keeping roadless areas roadless for forest health, a discussion of discretion given to forest managers to thin small diameter trees where needed to restore ecological processes, and the suggestion that the Rule has no effect on access to state and private inholdings. Suggests that roadless area values have already been identified through the public involvement process and that the real economic value of national forests comes from recreation and environmental quality of life. Requests protection from road building, commercial timber harvest, off-road vehicle use, and hard-rock mining, and suggests the need for evaluation of roadless areas for wilderness potential. Comments on the overwhelming public involvement and support for the Rule. Requests that the Forest Service stop preparing timber sales in the Tongass National Forest.
147	8	Opposes having millions of acres held in a roadless status. Suggests there is no need for this if resource managers are allowed to manage for legal uses. Requests that road decisions be made locally and guided by NFMA.
148	4	Opposes the Roadless Area Conservation Rule as it circumvents the intent of Congress and existing forest plans and was formulated with inadequate public involvement at the local level. Provides responses to the ten questions. Responses support local forest management, active management for forest health, request a complete inventory of forest stands, request that recreation potential evaluation must utilize accurate maps, and suggest using the collaborative concept at the beginning of the planning process. Responses also suggest that sustainable healthy forests should be the goal of all management by including descriptions for how disturbances can take place. Provides suggestions for private property management and access as well as suggestions for wilderness management and general forest management. Includes more discussion on public involvement and managing competing interests.
149	9	Supports the Roadless Area Conservation Rule. Suggests that wilderness should be preserved for generations to come as well as for its intrinsic value.
150	10	Requests that roadless areas be kept off-limits to timber harvest, mining, new road development and drilling. Mentions the overwhelming public response and support for the Roadless Area Conservation Rule. Suggests that local forest plans should identify roadless areas omitted from current inventories as well as prevent damage from off-road vehicles. Also suggests that most roadless areas should be preserved as wilderness and remain roadless in order to help prevent wildfires. Suggests that roadless area conservation is important to local economies because of the large amount of revenue generated from recreation. Also suggests that the Roadless Area Conservation Rule represents a balanced approach to forest management, and recommends that the Forest Service stop preparing timber sales that violate the Rule in the Tongass National Forest.

151	4	Supports the Roadless Area Conservation Rule and suggests that the Forest Service should protect roadless areas, including Alaska's National Forest, from timber harvest, road building, and mining.
152	3	Expresses support for TRCA's "Square Deal Initiative #1" which includes support for scientific management of fish and wildlife habitat, forest health, and restoration. Requests accessibility to forest lands for public use, especially hunters and anglers, while maintaining a functioning forest system and keeping roadless areas roadless. Supports a public process to determine designation of use. Suggests that criteria should be carefully defined for consideration of any exception regarding roads and forest management, that the interests of local people should be included, and that more wilderness areas should not be created by declaring them roadless.
153	20	Supports the Roadless Area Conservation Rule as it stands and expresses concern that the Bush Administration wants to undermine this policy by opening public wildlands to industrial development. Suggests that the policy should remain as it is in order to respect the will of the people.
154	9	Supports the Roadless Area Conservation Rule as a means to stop unsustainable activities by the timber industry. Expresses concern that although timber harvest creates jobs, it kills living organisms and makes it difficult for future generations to subsist. Questions the need to break into protected roadless areas when timber harvest opportunities already exist. Requests that the mapping error for Sallery Bay and Crab Bay in Tenakee inlet and others be fixed so that protected land is not exploited.
155	10	Opposes changes to the Roadless Area Conservation Rule that would weaken protection of roadless areas in the Tongass National Forest, specifically Crab and Sallery Bays in the Tenakee Inlet. Suggests that timber harvest in these areas would affect views, employment, tourism, and recreation due to restricted access to salmon streams. Lists specific areas where mapping areas need to be fixed as well as areas where roadless protection should be expanded. Requests that the Forest Service listen to the people of Alaska as it is "their" land.
156	6	Supports the Roadless Area Conservation Rule and mentions the overwhelming public response and support for the Rule. Opposes forest-by-forest decisionmaking and requests immediate protection of roadless areas including the Tongass National Forest.
157	11	Supports the Roadless Area Conservation Rule and mentions the overwhelming public response and support for the Rule. Opposes forest-by-forest decisionmaking and requests immediate protection of roadless areas including the Tongass National Forest.
158	199	Supports the Roadless Area Conservation Rule as it stands and opposes any changes that might weaken the Rule. Specifically mentions the social and economic importance of Alaska's Tongass and Chugach National Forests and the opportunities they provide for clean water, recreational and visitor opportunities, and habitat. Opposes forest-by-forest decisionmaking on timber harvest and mining because it puts corporate interests before public interest.
159	8	Supports road building and maintenance in proposed roadless areas. Suggests that forests be managed for multiple use as activities can benefit local people and local

		economies. Considers it wasteful for us not to use our natural resources as best we know how.
160	11	Requests that the Roadless Area Conservation Rule be immediately implemented, including the Tongass National Forest, to protect roadless areas from road construction, timber harvest, mining, and other forms of commercial extraction. Mentions the large number of public comments and support for protection of remaining roadless areas on national forests.
161	12	Expresses concern that the Roadless Area Conservation Rule did not give the recreational community enough opportunity to express concerns. Supports motorized and non-motorized use of national forests using local management along with NFMA and NEPA to tailor each area with appropriate management prescriptions. Suggests that roadless areas be set aside to increase water production in the future. Supports collaboration at the local level, forest protection through prescribed fire, timber harvest and allocations made in context of the forest plan, and consideration of the importance of resources to local areas and the nation. Requests that the Forest Service not prohibit activities and supports road building when necessary. Roadless areas should not automatically be proposed to Congress for Wilderness designation and should not be maintained under a specific designation for roadless area management under the forest plan. Suggests that regulations for roadless area management be general, short, and simple and guide the allocation process.
162	4	Provides a list of the ten questions and one-sentence responses to each which do not support the Roadless Area Conservation Rule. Some of the comments include, a request for no more roadless areas, the need to keep public land public, as well as the need for forest management access.
163	33	Requests immediate implementation of the Roadless Area Conservation Rule as it stands including the Tongass National Forest, and mentions the large number of public comments and support for the Rule. Supports road building to ensure forest health and access to state and private lands. Opposes weakening of roadless protection through forest-by-forest decisionmaking because this approach has cost taxpayers an \$8.4 million dollar backlog on the existing road system. Requests protection of roadless areas from road construction, timber harvest, mining, and other activities that compromise social and ecological values.
164	5	Supports the Roadless Area Conservation Rule and expresses concern regarding development in national forests. Requests that mining and timber industries stop destroying public land and that roadless areas should remain pristine and undeveloped to provide quieter forms of recreation. Opposes forest-by-forest decisionmaking because a national policy can provide quality experiences for all. Supports inclusion of the Tongass National Forest.
165	0	Supports the Roadless Area Conservation Rule as it represents a balanced approach to forest conservation. Suggests that preserving open space is a high priority for the residents of Lake County and has become a precious commodity. Opposes forest-by-forest decisions on timber harvest and development in roadless areas and requests the implementation of the Rule.
166	10	Responds to five questions supporting the Roadless Area Conservation Rule. Responses support a national policy to avoid local interests caving to timber interests. Mentions the overwhelming public support for the Rule and suggests that adherence to the Rule will allow local forest rangers to restore ecological

		processes and avert catastrophic wildfires. Supports prohibition of timber harvest, snowmobiling, and off-road vehicles; supports wilderness designation where criteria is met; and supports inclusion of the Tongass National Forest.
167	4	Opposes the Roadless Area Conservation Rule and requests that forests be managed by a pre-1994 policy. Expresses concern that the Rule is part of a Clinton-Gore agenda that caters to environmental groups without the consent of Congress. Also expresses concern about the negative impact that the Rule may have on Alaskan taxpayers and employment. Mentions the effect of the Dwyer Injunction (spotted owl study) on fire management and how this study resulted in the Los Alamos and Cloud Croft fires. Expresses concerns regarding Chief Dombeck and his political agenda.
168	17	Supports the Roadless Area Conservation Rule because roadless areas are priceless. Repeatedly mentions the overwhelming public involvement and support for the Rule.
169	15,697	Supports the Roadless Area Conservation Rule as it provides roadless area protection while maintaining public access to national forest land and adequately addresses issues of fire management, forest health, access, and local input. Opposes forest-by-forest decisionmaking as well as road building, timber harvest and other development in roadless areas. Also supports inclusion of the Tongass National Forest.
170	14	Supports the Roadless Area Conservation Rule as it protects roadless areas from road building and timber harvest. Disappointed in the reopening of public comment after the overwhelming response and support previously shown suggesting that adequate opportunities for input have already taken place. Opposes taxpayer subsidies for timber harvest and road building. Supports inclusion of the Tongass National Forest.
171	3	Supports the Roadless Area Conservation Rule and mentions the overwhelming public response and support for the Rule. Suggests that local planning does not provide adequate protection against roadbuilding and timber harvest and suggests that these activities should be prohibited. Also suggests that road building and timber harvest provide no economic advantage due to loss of revenue from recreation. Comments that fire suppression is not an issue, the Rule will have no effect on access to private land inholdings as well as no effect on the nation's energy supplies. Requests the Forest Service stop preparing timber sales on the Tongass National Forest as well as in Colorado.
172	78,479	Requests the Roadless Area Conservation Rule be implemented as written, including the Tongass National Forest. Mentions the large public response and support for the Rule. Opposes forest-by-forest decisionmaking regarding timber harvest, road construction, and other development in these pristine areas.
173	4	Opposes any changes to the Roadless Area Conservation Rule that would allow timber harvest in forests protected by the Rule, especially the Tongass National Forest. Also opposes allowing individual forests to opt out of the Rule and allow timber harvest, road building, and other development of these pristine areas.
174	1040	Supports the Roadless Area Conservation Rule as it stands. Opposes any changes that might weaken the Rule, suggesting that the Rule adequately addresses fire management, forest health, access, and local input. Specifically mentions the importance of Alaska's Tongass and Chugach National Forests and the

		opportunities they provide for clean water, recreational and visitor opportunities, and habitat.
175	5	Supports the Roadless Area Conservation Rule.
176	9	Supports the Roadless Area Conservation Rule as it protects 4.4 million acres in California. Mentions the overwhelming number of comments, 140,000 of them from Californians. Suggests that the Rule adequately addresses fire management, forest health, access, and local input. Opposes the weakening of national forest protection through forest-by-forest decisionmaking and requests protection from road construction, timber harvest, and drilling. Lists specific potential wilderness areas for protection as well as specific eligible and potential Wild and Scenic River sections. Requests the maintenance of scenic and recreational qualities of California.
177	24	Requests that forest roads and trails be maintained for expected use as an important part of forest management. Expresses concern that the Roadless Area Conservation Rule will lock up federal lands, negatively impacting recreation. Requests a "Back Country Recreation Area designation" to provide protection of natural resources as well as enhance back country recreation opportunities. Lists high points about responsible OHV recreationists and requests funding to support recreation and trail programs. Opposes the use of the term "roadless" for areas currently used. Suggests the importance of recreation to rural economies.
178	15	Supports every effort to protect roadless areas from exploitation, specifically road building and timber harvest. Expresses concern about development of roadless areas and the potential for subsidies at cost to the taxpayer. Supports the Roadless Area Conservation Rule due to overwhelming public support and asserts that environmental protection should be the top priority.
179	0	Suggests that the protection of national forests is crucial for clean water and air, wildlife habitat, biodiversity, recreation, and economic values. Supports the Roadless Area Conservation Rule as a first step toward conservation but requests the further protection of all roadless areas 1,000 acres and greater through wilderness designation.
180	65	Supports the Roadless Area Conservation Rule as it stands for wilderness and wild rivers, and specifically for protection of the Tongass and Chugach National Forests.
181	32	Supports the Roadless Area Conservation Rule as it protects 4.4 million acres in Colorado. Mentions the overwhelming number of comments, 28,000 of them from Coloradoans. Suggests that the Rule adequately addresses fire management, forest health, access, and local input. Opposes the weakening of national forest protection through forest-by-forest decisionmaking and requests protection from road construction, timber harvest, and drilling. Requests immediate protection of wildlife sanctuaries and immediate implementation of the Roadless Area Conservation Rule.
182	5	Supports the Roadless Area Conservation Rule, as it is not only ecologically necessary but has overwhelming public response and support as well. Suggests that the ten questions are biased and seem to invite opposition to the policy. Opposes forest-by-forest decisionmaking and suggests a national policy is needed to protect roadless areas. Suggests that the policy adequately addresses issues of fire management, forest health, access, and local input. Requests inclusion of the

		Tongass National Forest.
183	67	Supports the Roadless Area Conservation Rule because only national protection will guarantee that wildlands remain intact regardless of changing politics and personnel.
184	784	Supports implementation of the Roadless Area Conservation Rule. Provides responses to the ten questions. Responses include support for national roadless area protection, comments regarding the extensive public involvement and support for the Rule, support for keeping roadless areas roadless for forest health, discussion of discretion given to forest managers to thin small diameter trees where needed to restore ecological processes, that the Rule has no effect on access to state and private inholdings, assertion that roadless values have already been identified through the public process and that the real economic value of national forests comes from recreation and environmental quality of life, request that road building and commercial timber harvest be prohibited, and the roadless areas be evaluated for wilderness potential. Requests that the Forest Service stop preparing timber sales in the Tongass National Forest.
185	18	Opposes all trapping activities in roadless areas as they have been banned in many areas and have been deemed inhumane. Expresses concern that trapping is poorly regulated and not enforced and identifies some of the inhumane ways in which animals are treated throughout the trapping process.
186	0	Supports the Roadless Area Conservation Rule. Suggests that the Rule is a compromise between protection and industrial development and provides a balance between recreational and extractive uses. Suggests that the White Mountain National Forest provides solitude and recreational value for its residents as well as visitors and that the Rule helps protect biological, economic, and private property resources.
187	20	Requests that truth and facts be used when the final decision is made regarding the Roadless Area Conservation Rule. Expresses concern that special interest groups will do anything underhanded to get what they want and for that reason, the comment period has be reopened given that some procedures and protocols may not have been followed.
188	4	Suggests forest management should take place at the local level, and that the current planning process already requires consultation with local parties. Requests access for forest health management as well as unrestricted access to private and state inholdings. References ANILCA and the need to protect social and economic values in Alaska, including the direction no more lands in Alaska be proposed for wilderness designations. Requests that Alaska National Forests be reviewed by local officials in order to reestablish a reliable timber base for jobs that depend on the Tongass National Forest.
189	23	Expresses distrust toward the Administration's lack of desire to consider previous public comment and the Administration's actions to continue to seek comments in order to cater to industrial interests. Supports the Roadless Area Conservation Rule.
190	5	Requests protection of America's Heritage Forests by prohibiting timber harvest, road construction, and mining in all roadless areas with no exclusions or exemptions. Supports the Roadless Area Conservation Rule as it provides protection for roadless areas by providing clean air and water for our nation as

		well as habitat for rare, threatened, endangered, and sensitive species. Also mentions the overwhelming public response and support for the Rule.
191	20	Opposes all trapping activities in roadless areas as they have been banned in many areas and have been deemed inhumane.
192	721	Supports the Roadless Area Conservation Rule as forest protection is vital to the sustainability to the outdoor industry that supports over one million jobs. Supports long-term forest preservation without forest-by-forest review in order to avoid postponing preservation.
193	19	Supports immediate implementation of the Roadless Area Conservation Rule including protection for the Tongass National Forest since the Rule adequately addresses issues of fire management, forest health, access, and local input. Expresses opposition to forest-by-forest decisionmaking as well as road building, timber harvest, and other development in roadless areas. Requests protection of roadless areas from road construction, timber harvest, and mining.
194	22	Supports the Roadless Area Conservation Rule with no exemptions.
195	6	Supports the Roadless Area Conservation Rule with no exemptions or exclusions. Specifically requests protection for the Copper Mountain Roadless Area, the proposed Copper Salmon Wilderness, and all presently unroaded areas of the Elk River watershed.
196	20	Opposes any changes to the Roadless Area Conservation Rule that would allow timber harvest or road building on forests protected by the Rule, especially the Tongass National Forest. Also opposes allowing individual forests to opt out of the Rule and allow development of these pristine areas. Requests that the Rule be implemented immediately and defended in court to preserve the Tongass National Forest and other forests for future generations. Suggests that consideration of new comments is just a delaying tactic because two million Americans have already gone on record as supporting the Rule.
197	7296	Opposes weakening of the Roadless Area Conservation Rule, as it is already a compromise in that it allows road building, timber harvest, mining, and drilling. Also opposes forest-by-forest decisionmaking regarding development of roadless areas. Along with 95% of Americans who commented on this policy, supports protection of pristine forests, especially the Tongass National Forest,
198	24	Requests consideration of responses from the fourth volume of the Roadless Area Conservation Final Environmental Impact Statement. Recommends that national forest land be managed to provide a broad range of activities that reflect the diversity of our nation. Includes responses to the ten questions including concerns regarding local forest planning, community partnerships, fuel load buildup, sustaining forest health, access to private property, flexible management for changing conditions, wilderness designation, the need to base decisions on scientific data, litigation, reclamation of roads, and implementation based on a case-by-case basis.
199	4	Provides responses to the ten questions. Responses suggest the need to accommodate local needs and interests through public meetings with local residents, the need for wildfire and insect and disease management, landowners to be responsible, and the need for access to private property. Also recommends no new road construction, seeking input from all types of user groups, and managing

		lands for long-term renewal for wildlife and present use.
200	13	Requests that the Forest Service fix the Roadless Area Conservation Rule as it is the product of a flawed NEPA process, and is contrary to the agency's legal authority. Suggests that the process also ignored substantial concerns raised by local, state, and federal elected officials. Requests that roadless areas be accurately mapped at the forest level with access provided to private and state inholdings. Supports forest management at the local level to ensure forest health and wildlife protection. Suggests that economic and social relationships be evaluated, including those that directly impact working families and local communities. Also suggests a full range of management alternatives for forest plan revisions.
201	6	Opposes the Roadless Area Conservation Rule as it does not provide adequate information and is the result of a deeply flawed NEPA process. Suggests that the process also ignored substantial concerns raised by local, state, and federal elected officials. Requests that the Rule be revised to adequately address forest health concerns, access to private and state inholdings, and local input. Suggests that designated areas are poorly mapped and that areas should be returned to multiple use.
202	27	Supports the Roadless Area Conservation Rule as it is the product of an extensive federal rulemaking. Suggests that industrial extraction is allowed in more than half of National Forest System lands and that protecting remaining roadless areas allows diverse recreational opportunities. Opposes forest-by-forest decisionmaking on timber harvest and development in roadless areas.
203	11	Supports the Roadless Area Conservation Rule to safeguard forests from all roadbuilding, timber harvest, mining, and industrial development. Suggests that an overwhelming majority of comments support the Rule.
204	34	Suggests that the Advance Notice of Proposed Rulemaking is an inadequate alternative to protecting roadless areas. Suggests that wilderness cannot be commodified and that timber harvest, mining, and destructive activities should be prohibited on public lands.
205	8	Suggests that the Advance Notice of Proposed Rulemaking is an inadequate alternative to protecting roadless areas. Suggests that wilderness cannot be commodified and that timber harvest, mining, and destructive activities should be prohibited on public lands. Provides responses to the ten questions. Responses suggest that local planning has failed to provide adequate protection of roadless areas and that the Rule is needed to provide additional protection. Also suggests that the Rule received adequate public support, already provides exceptions for forest health management, has no affect on access to inholdings, already identifies roadless area values, and should be retained and implemented as is.
206	6	Expresses distrust toward President Bush regarding his disregard of public opinion for roadless areas. Suggests that certain ecosystems are unique to this country and should be protected for their intrinsic value as well as for the enjoyment of citizens. Supports the Roadless Area Conservation Rule to protect all roadless areas from timber harvest, roadbuilding, and mining.
207	13	Requests the Roadless Area Conservation Rule remain intact with no exemptions for the Tongass National Forest or any other roadless area on any national forest.
208	4	Supports the Roadless Area Conservation Rule with inclusion of protection for the

		Tongass National Forest. Opposes forest-by-forest decisionmaking as the Rule adequately upholds valid existing rights to property landowners. Mentions the overwhelming public comment and support for the Rule.
209	4	Requests a final roadless policy that provides immediate and lasting protection for all national forest roadless areas, including those in the Tongass National Forest. Also requests that the policy prohibit all road building and timber sales along with mining, oil and gas development, off-road vehicle use, and other destructive activities in roadless areas larger than 1,000 acres.
210	102	Lists five statements with options underneath to circle the level of support the individual gives to the statement. Strongly agrees in the following areas. First, the Roadless Area Conservation Rule failed to address concerns of local, state and federal officials; second, the Rule must be revised to better address forest health concerns at the local level; third, mapping of roadless areas needs to be improved and the Rule must address access to private and state lands; fourth, social and economic effects must be considered with special attention given to local communities surrounding roadless areas; and finally, requests exemption of the Black Hills National Forest from the Rule.
211	227	Expresses concern regarding plans to drill for oil in wildlife refuges because it would be unjust to native cultures and wildlife species. Requests that roadless areas be protected from roadbuilding and timber harvest and that the Endangered Species Act be strengthened. Suggests that the above concerns should be addressed for spiritual reasons.
212	4	Requests the Roadless Area Conservation Rule be kept in place as is.
213	388	Requests permanent protection of America's wild places by adding them to the country's National Wilderness Preservation System. Requests that wildlands receive permanent protection from timber harvest, mining, suburban sprawl, over-development, oil and gas drilling, off-road vehicles, air and water pollution, and the effects of climate change.
214	6	Requests that the Roadless Area Conservation Rule be immediately implemented, including the Tongass National Forest, to protect roadless areas from road construction, timber harvest, mining, and other forms of commercial extraction. Mentions the large number of public comment and support for protection of remaining roadless areas on national forests. Requests protection of remaining roadless areas in Oregon, especially Roaring River and Helso.
215	18	Requests that the Roadless Area Conservation Rule be immediately implemented, including the Tongass National Forest, to protect roadless areas from road construction, timber harvest, mining, and other forms of commercial extraction. Mentions the large volume of public comments and support for the protection of remaining roadless areas.
216	26	Provides responses to the ten questions. Responses suggest that local planning has failed to provide adequate protection of roadless areas and that the Roadless Area Conservation Rule is needed to provide additional protection. Also suggests that the Rule received adequate public support, already provides exceptions for forest health management, has no affect on access to inholdings, already identifies roadless area values, and should be retained and implemented as is.
217	8	Requests that national forests be protected from commercial timber harvest and

		other destructive activities. Supports a final roadless protection policy that immediately protects all national forest roadless areas of more than 1,000 acres and smaller areas of special biological importance. Requests the policy include the Tongass and Chugach National Forests and areas not previously inventoried as roadless. Also requests protection for all roadless areas from new road construction, timber harvest, mining, off-road vehicle use, oil and gas development, and other harmful activities.
218	4	Supports the Roadless Area Conservation Rule to protect national forests. Requests protection of the Tongass National Forest and opposes forest-by-forest decisionmaking in order to prevent timber harvest. Suggests that timber companies grow their own trees and not take the public's forest.
219	5	Supports the Roadless Area Conservation Rule in order to protect national forests from timber harvest, road building, and other developments. Mentions the large volume of public comment and support for the Rule as well and opposes forest-by-forest decisionmaking.
220	2	Requests that the Roadless Area Conservation Rule be revised to adequately address issues of recreational access, forest health, access to private and state inholdings, and local input. Also requests that roadless areas be mapped at the forest level with an inventory of classified and unclassified roads and that recreationists be involved in that process.
221	4	Requests immediate implementation of the Roadless Area Conservation Rule with no modifications, exemptions, or deletions.
222	102	Opposes all trapping activities in roadless areas as they have been banned in many areas and have been deemed inhumane.
223	1557	Supports the Roadless Area Conservation Rule as it provides a balanced approach to forest conservation from timber harvest, mining, and drilling activities in national forests.
224	6	Supports the Roadless Area Conservation Rule, mentioning the 47,000 Illinois residents who asked for a strong policy during the original comment period. Requests the Camp Hutchins area in the Shawnee National Forest be included as a roadless area. Includes responses to the ten questions. Responses identify additional roadless areas; and suggest protection of wildlife habitat and recreational values, maintenance of existing roads before building new ones, development of an adequate policy for forest management and private property access, public involvement, consideration of economic and recreational values, and request for prohibition of timber harvest, road construction, and off-road vehicles.
225	18	Requests a strengthened policy that provides immediate and lasting protection of roadless areas by prohibiting road building and timber harvest in national forests, including the Tongass National Forest. Also requests a moratorium on destructive activities in unroaded areas pending local forest plan revisions.
226	5702	Supports the Roadless Area Conservation Rule and mentions the overwhelming public support for the Rule. Requests that Congress oppose any attacks that attempt to undermine the protection of publicly owned forests and the environment.

227	5	Opposes restrictions that the Roadless Area Conservation Rule may have on recreational access in national forests. Supports wilderness designation, as it will protect sensitive areas while allowing other areas to provide recreational opportunities.
228	13,658	Letter contains text from Form 169 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as it provides roadless area protection while maintaining public access to national forest land, and adequately addresses issues of fire management, forest health, access, and local input. Opposes forest-by-forest decisionmaking as well as road building, timber harvest, and other development in roadless areas. Also supports inclusion of the Tongass National Forest.
229	53	Letter contains text from Form 169 plus extra comments that suggest the need for a national roadless Rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Roadless Area Conservation Rule as it provides roadless area protection while maintaining public access to national forest land. It adequately addresses issues of fire management, forest health, access and local input. Opposes forest-by-forest decisionmaking as well as road building, timber harvest and other development in roadless areas. Also supports inclusion of the Tongass National Forest.
230	1161	Letter contains text from Form 127 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as it protects forests from timber harvest, mining, and drilling activities already allowed on most National Forest System lands. Makes reference to the extensive public support and involvement for the Rule. Suggests that the Rule adequately addresses issues of fire management, forest health, and access, and gives local decision makers the necessary flexibility for sound forest management. Requests inclusion of protection for the Tongass National Forest and asserts that letting the Rule stand is the best way to protect roadless values.
231	968	Letter contains text from Form 127 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule as it protects forests from timber harvest, mining, and drilling activities already allowed on most National Forest System lands. Makes reference to the extensive public support and involvement for the Rule. Suggests that the Rule adequately addresses issues of fire management, forest health, and access, and gives local decision makers the necessary flexibility for sound forest management. Requests inclusion of protection for the Tongass National Forest and asserts that letting the Rule stand is the best way to protect roadless values.
232	3630	Letter contains text from Form 169 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule as it provides roadless area protection while maintaining public access to national forest land, and adequately addresses issues of fire management, forest health, access, and local input. Opposes forest-by-forest decisionmaking as well as road building, timber harvest, and other development in roadless areas. Also supports inclusion of the Tongass National Forest.
233	1484	Letter contains text from Form 172 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Requests the Roadless Area Conservation Rule be implemented as written including the Tongass National Forest. Mentions the large public response and support for the Rule. Opposes forest-by-forest

		decisionmaking regarding timber harvest, road construction, and other development in these pristine areas.
234	1275	Letter contains text from Form 172 plus extra comments that express concerns regarding trust and integrity. Requests the Roadless Area Conservation Rule be implemented as written including the Tongass National Forest. Mentions the large public response and support for the Rule. Opposes forest-by-forest decisionmaking regarding timber harvest, road construction, and other development in these pristine areas.
235	1272	Letter contains text from Form 172 plus extra comments that express concerns regarding future generations. Requests the Roadless Area Conservation Rule be implemented as written including the Tongass National Forest. Mentions the large public response and support for the Rule. Opposes forest-by-forest decisionmaking regarding timber harvest, road construction, and other development in these pristine areas.
236	2960	Letter contains text from Form 172 plus extra comments that express concerns regarding general environmental issues. Requests the Roadless Area Conservation Rule be implemented as written including the Tongass National Forest. Mentions the large public response and support for the Rule. Opposes forest-by-forest decisionmaking regarding timber harvest, road construction, and other development in these pristine areas.
237	449	Letter contains text from Form 197 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Opposes weakening the Rule, as it is already a compromise in that it allows road building, timber harvest, mining, and drilling. Also opposes forest-by-forest decisionmaking regarding development of these pristine areas. Along with 95% of Americans who commented on this policy, supports protection of pristine forests, especially the Tongass National Forest
238	641	Letter contains text from Form 197 plus extra comments that express concerns regarding trust and integrity. Opposes weakening the Rule, as it is already a compromise in that it allows road building, timber harvest, mining, and drilling. Also opposes forest-by-forest decisionmaking regarding development of these pristine areas. Along with 95% of Americans who commented on this policy, supports protection of pristine forests, especially the Tongass National Forest
239	311	Letter contains text from Form 197 plus extra comments that express concerns regarding future generations. Opposes weakening the Rule, as it is already a compromise in that it allows road building, timber harvest, mining, and drilling. Also opposes forest-by-forest decisionmaking regarding development of these pristine areas. Along with 95% of Americans who commented on this policy, supports protection of pristine forests, especially the Tongass National Forest
240	749	Letter contains text from Form 197 plus extra comments that express concerns regarding general environmental issues. Opposes weakening the Rule, as it is already a compromise in that it allows road building, timber harvest, mining, and drilling. Also opposes forest-by-forest decisionmaking regarding development of these pristine areas. Along with 95% of Americans who commented on this policy, supports protection of pristine forests, especially the Tongass National Forest
241	471	Letter contains text from Form 174 plus extra comments that express concerns

		regarding general environmental issues. Supports the Roadless Area Conservation Rule as it stands. Opposes any changes that might weaken the Rule, suggesting that the Rule adequately addresses fire management, forest health, access and local input. Specifically mentions the importance of Alaska's Tongass and Chugach National Forests and the opportunities they provide for clean water, recreational and visitor opportunities, and habitat.
242	215	Letter contains text from Form 174 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule as it stands. Opposes any changes that might weaken the Rule, suggesting that the Rule adequately addresses fire management, forest health, access, and local input. Specifically mentions the importance of Alaska's Tongass and Chugach National Forests and the opportunities they provide for clean water, recreational and visitor opportunities, and habitat.
243	145	Letter contains text from Form 174 plus extra comments that suggest the need of a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule as it stands. Opposes any changes that might weaken the Rule, suggesting that the Rule adequately addresses fire management, forest health, access and local input. Specifically mentions the importance of Alaska's Tongass and Chugach National Forests and the opportunities they provide for clean water, recreational and visitor opportunities, and habitat.
244	68	Letter contains text from Form 174 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule as it stands. Opposes any changes that might weaken the Rule, suggesting that the Rule adequately addresses fire management, forest health, access, and local input. Specifically mentions the importance of Alaska's Tongass and Chugach National Forests and the opportunities they provide for clean water, recreational and visitor opportunities, and habitat.
245	670	Letter contains the text from Form 79 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as it protects pristine areas and is a compromise between protection and development. Opposes forest-by-forest decisions on timber harvest and development in roadless areas.
246	385	Letter contains the text from Form 79 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule as it protects pristine areas and is a compromise between protection and development. Opposes forest-by-forest decisions on timber harvest and development in roadless areas.
247	334	Letter contains the text from Form 79 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule as it protects pristine areas and is a compromise between protection and development. Opposes forest-by-forest decisions on timber harvest and development in roadless areas.
248	232	Letter contains the text from Form 79 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule as it protects pristine areas and is a compromise between protection and development. Opposes forest-by-forest decisions on timber harvest and development in roadless areas.

249	418	Letter contains the text from Form 169 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule as it provides roadless area protection while maintaining public access to national forest land and adequately addresses issues of fire management, forest health, access, and local input. Opposes forest-by-forest decisionmaking as well as road building, timber harvest and other development in roadless areas. Also supports inclusion of the Tongass National Forest.
250	515	Letter contains the text from Form 109 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule, including protection for the Tongass National Forest, as it adequately addresses fire management, forest health, access, and local input. Opposes forest-by-forest decisions on development in roadless areas.
251	462	Letter contains the text from Form 109 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule, including protection for the Tongass National Forest, as it adequately addresses fire management, forest health, access, and local input. Opposes forest-by-forest decisions on development in roadless areas.
252	875	Letter contains the text from Form 109 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule, including protection for the Tongass National Forest, as it adequately addresses fire management, forest health, access, and local input. Opposes forest-by-forest decisions on development in roadless areas.
253	408	Letter contains the text from Form 109 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule, including protection for the Tongass National Forest, as it adequately addresses fire management, forest health, access, and local input. Opposes forest-by-forest decisions on development in roadless areas.
254	504	Letter contains the text from Form 127 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule as it protects forests from timber harvest, mining, and drilling activities already allowed on most National Forest System lands. Makes reference to the extensive public support and involvement for the Rule. Suggests that the Rule adequately addresses issues of fire management, forest health, and access, and gives local decision makers the necessary flexibility for sound forest management. Requests inclusion of protection for the Tongass National Forest and asserts that letting the Rule stand is the best way to protect roadless values.
255	274	Letter contains the text from Form 127 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule as it protects forests from timber harvest, mining, and drilling activities already allowed on most National Forest System lands. Makes reference to the extensive public support and involvement for the Rule. Suggests that the Rule adequately addresses issues of fire management, forest health, and access, and gives local decision makers the necessary flexibility for sound forest management. Requests inclusion of protection for the Tongass National Forest and asserts that letting the Rule stand is the best way to protect roadless values.
256	46	Letter contains the text from Form 2 plus extra comments that suggest the need for

		a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule as it provides a balanced approach to forest conservation. Opposes forest-by-forest decisions on timber harvest and development in roadless areas and requests the inclusion of the Tongass National Forest.
257	149	Letter contains the text from Form 2 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as it provides a balanced approach to forest conservation. Opposes forest-by-forest decisions on timber harvest and development in roadless areas and requests the inclusion of the Tongass National Forest.
258	100	Letter contains the text from Form 2 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule as it provides a balanced approach to forest conservation. Opposes forest-by-forest decisions on timber harvest and development in roadless areas and requests the inclusion of the Tongass National Forest.
259	53	Letter contains the text from Form 2 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule as it provides a balanced approach to forest conservation. Opposes forest-by-forest decisions on timber harvest and development in roadless areas and requests the inclusion of the Tongass National Forest.
260	29	Letter contains the text from Form 3 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Expresses concern regarding past damages to roadless areas. Supports the Rule as it provides a balanced approach to forest conservation. Opposes forest-by-forest decisions on timber harvest and development in roadless areas and requests the inclusion of the Tongass National Forest.
261	10	Letter contains the text from Form 3 plus extra comments that express concerns regarding trust and integrity. Expresses concern regarding past damages to roadless areas. Supports the Roadless Area Conservation Rule as it provides a balanced approach to forest conservation. Opposes forest-by-forest decisions on timber harvest and development in roadless areas and requests the inclusion of the Tongass National Forest.
262	4	Letter contains the text from Form 3 plus extra comments that express concerns regarding general environmental issues. Expresses concern regarding past damages to roadless areas. Supports the Roadless Area Conservation Rule as it provides a balanced approach to forest conservation. Opposes forest-by-forest decisions on timber harvest and development in roadless areas and requests the inclusion of the Tongass National Forest.
263	16	Letter contains the text from Form 3 plus extra comments that express concerns regarding future generations. Expresses concern regarding past damages to roadless areas. Supports the Roadless Area Conservation Rule as it provides a balanced approach to forest conservation. Opposes forest-by-forest decisions on timber harvest and development in roadless areas and requests the inclusion of the Tongass National Forest.
264	10	Letter contains the text from Form 7 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports immediate implementation of the Rule as written.

		Suggests that all roadless areas be protected from timber harvest, roadbuilding, and mining and that the Rule include the Tongass and Chugach National Forests.
265	8	Letter contains the text from Form 7 plus extra comments that express concerns regarding trust and integrity. Supports immediate implementation of the Roadless Area Conservation Rule as written. Suggests that all roadless areas be protected from timber harvest, roadbuilding, and mining and that the Rule include the Tongass and Chugach National Forests.
266	24	Letter contains the text from Form 7 plus extra comments that express concerns regarding general environmental issues. Supports immediate implementation of the Roadless Area Conservation Rule as written. Suggests that all roadless areas be protected from timber harvest, roadbuilding, and mining and that the Rule include the Tongass and Chugach National Forests.
267	10	Letter contains the text from Form 7 plus extra comments that express concerns regarding future generations. Supports immediate implementation of the Roadless Area Conservation Rule as written. Suggests that all roadless areas be protected from timber harvest, roadbuilding, and mining and that the Rule include the Tongass and Chugach National Forests.
268	4	Letter contains the text from Form 10 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule and urges abandonment of efforts to weaken roadless area protections. Opposes forest-by-forest decisionmaking and suggests that the Rule already contains the exemptions necessary to protect forest health, communities, homes and property, and access to inholdings.
269	5	Letter contains the text from Form 13 plus extra comments that express concerns regarding trust and integrity. Letter does not support the Roadless Area Conservation Rule as it was the product of a flawed NEPA process. Suggests the Rule be revised to adequately address forest health concerns, access to private and state inholdings, and local input. Also requests that roadless areas be accurately mapped at the forest level including an inventory of classified and unclassified roads. Modifications to the Rule must also take into consideration the need to access national forests to provide for congressionally mandated multiple uses. Other suggestions include the need to use up-to-date criteria for delineation of roadless areas, deletion of roaded portions of inventoried roadless areas from the inventory, and evaluation of economic and social relationships impacting working families and local communities. Requests a process to allow those most affected by management decisions on public lands to be heard.
270	5	Letter contains the text from Form 14 plus extra comments that express concerns regarding trust and integrity. Supports the Theodore Roosevelt Conservation Alliance's "Square Deal Initiative #1." Suggests that the 58 million acres under consideration should be kept roadless and that criteria should be carefully defined for the consideration of any exceptions for providing road access for forest management. Also suggests that decisionmaking should include the interests of local people while the final decision authority to build roads in roadless areas should be retained by the Chief of the Forest Service.
271	60	Letter contains the text from Form 14 plus extra comments that express concerns regarding general environmental issues. Supports the Theodore Roosevelt Conservation Alliance's "Square Deal Initiative #1." Suggests that the 58 million acres under consideration should be kept roadless and that criteria should be

		carefully defined for the consideration of any exceptions for providing road access for forest management. Also suggests that decisionmaking should include the interests of local people while the final decision authority to build roads in roadless areas should be retained by the Chief of the Forest Service.
272	31	Letter contains the text from Form 14 plus extra comments that express concerns regarding future generations. Supports the Theodore Roosevelt Conservation Alliance's "Square Deal Initiative #1." Suggests that the 58 million acres under consideration should be kept roadless and that criteria should be carefully defined for the consideration of any exceptions for providing road access for forest management. Also suggests that decisionmaking should include the interests of local people while the final decision authority to build roads in roadless areas should be retained by the Chief of the Forest Service.
273	5	Letter contains the text from Form 15 plus extra comments that express concerns regarding trust and integrity. Expresses disappointment and distrust toward the Bush Administration's attempt to weaken forest protections and ignore public input. Requests the immediate implementation of the Roadless Area Conservation Rule.
274	6	Letter contains the text from Form 16 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule and all efforts to oppose the weakening of forest protections. Suggests that roadless areas are valuable for high quality fish and wildlife habitat, backcountry recreation, and clean water supplies.
275	18	Letter contains the text from Form 18 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Expresses disappointment and distrust toward the Bush Administration's attempt to weaken forest protections and ignore public input. Requests the immediate implementation of the Rule.
276	42	Letter contains the text from Form 18 plus extra comments that express concerns regarding trust and integrity. Expresses disappointment and distrust toward the Bush Administration's attempt to weaken forest protections and ignore public input. Requests the immediate implementation of the Roadless Area Conservation Rule.
277	60	Letter contains the text from Form 18 plus extra comments that express concerns regarding general environmental concerns. Expresses disappointment and distrust toward the Bush Administration's attempt to weaken forest protections and ignore public input. Requests the immediate implementation of the Roadless Area Conservation Rule.
278	32	Letter contains the text from Form 18 plus extra comments that express concerns regarding future generations. Expresses disappointment and distrust toward the Bush Administration's attempt to weaken forest protections and ignore public input. Requests the immediate implementation of the Roadless Area Conservation Rule.
279	24	Letter contains the text from Form 19 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule and urges abandonment of efforts to weaken roadless area protections. Opposes forest-by-forest decisionmaking and suggests that the Rule already contains the exemptions necessary to protect forest

		health, communities, homes and property, and access to inholdings. Also suggests that previous public involvement processes have proven public support for roadless area protections.
280	36	Letter contains the text from Form 19 plus extra comments that express concerns regarding general environmental concerns. Supports the Roadless Area Conservation Rule and urges abandonment of efforts to weaken roadless area protections. Opposes forest-by-forest decisionmaking and suggests that the Rule already contains the exemptions necessary to protect forest health, communities, homes and property, and access to inholdings. Also suggests that previous public involvement processes have proven public support for roadless area protections.
281	17	Letter contains the text from Form 19 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule and urges abandonment of efforts to weaken roadless area protections. Opposes forest-by-forest decisionmaking and suggests that the Rule already contains the exemptions necessary to protect forest health, communities, homes and property, and access to inholdings. Also suggests that previous public involvement processes have proven public support for roadless area protections.
282	21	Letter contains the text from Form 27 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Opposes any changes to the Rule that would allow timber harvest in pristine areas of any national forest, especially the Tongass National Forest. Also opposes forest-by-forest decisionmaking for roadless area management. Suggests that the Tongass is valuable for abundant wildlife and should be protected. Also suggests that previous public support for the Rule should not be ignored.
283	27	Letter contains the text from Form 27 plus extra comments that express concerns regarding trust and integrity. Opposes any changes to the Roadless Area Conservation Rule that would allow timber harvest in pristine areas of any national forest, especially the Tongass National Forest. Also opposes forest-by-forest decisionmaking for roadless area management. Suggests that the Tongass is valuable for abundant wildlife and should be protected. Also suggests that previous public support for the Rule should not be ignored.
284	67	Letter contains the text from Form 27 plus extra comments that express concerns regarding general environmental issues. Opposes any changes to the Roadless Area Conservation Rule that would allow timber harvest in pristine areas of any national forest, especially the Tongass National Forest. Also opposes forest-by-forest decisionmaking for roadless area management. Suggests that the Tongass is valuable for abundant wildlife and should be protected. Also suggests that previous public support for the Rule should not be ignored.
285	15	Letter contains the text from Form 27 plus extra comments that express concerns regarding future generations. Opposes any changes to the Roadless Area Conservation Rule that would allow timber harvest in pristine areas of any national forest, especially the Tongass National Forest. Also opposes forest-by-forest decisionmaking for roadless area management. Suggests that the Tongass is valuable for abundant wildlife and should be protected. Also suggests that previous public support for the Rule should not be ignored.
286	4	Letter contains the text from Form 31 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule as it

		protects roadless areas in our national forests, especially the Tongass National Forest. Opposes any changes that would weaken the January Rule including forest-by-forest decision-making.
287	16	Letter contains the text from Form 31 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as it protects roadless areas in our national forests, especially the Tongass National Forest. Opposes any changes that would weaken the January Rule including forest-by-forest decision-making.
288	7	Letter contains the text from Form 31 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule as it protects roadless areas in our national forests, especially the Tongass National Forest. Opposes any changes that would weaken the January Rule including forest-by-forest decision-making.
289	64	Letter contains the text from Form 49 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule as roadless areas are important for recreational experiences and ecosystem protection. Suggests that the Rule is the result of extensive participation and adequately addresses issues of fire management, forest health, access, and local input.
290	26	Letter contains the text from Form 49 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule as roadless areas are important for recreational experiences and ecosystem protection. Suggests that the Rule is the result of extensive participation and adequately addresses issues of fire management, forest health, access, and local input.
291	19	Letter contains the text from Form 49 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as roadless areas are important for recreational experiences and ecosystem protection. Suggests that the Rule is the result of extensive participation and adequately addresses issues of fire management, forest health, access, and local input.
292	21	Letter contains the text from Form 49 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule as roadless areas are important for recreational experiences and ecosystem protection. Suggests that the Rule is the result of extensive participation and adequately addresses issues of fire management, forest health, access, and local input.
293	16	Letter contains the text from Form 58 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should

		respect the fact that the Rule enjoys overwhelming public support.
294	3	Letter contains the text from Form 58 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
295	7	Letter contains the text from Form 58 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
296	10	Letter contains the text from Form 59 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
297	8	Letter contains the text from Form 59 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
298	7	Letter contains the text from Form 59 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation

		Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
299	6	Letter contains the text from Form 60 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
300	5	Letter contains the text from Form 60 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
301	6	Letter contains the text from Form 61 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
302	6	Letter contains the text from Form 61 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that the role of local forest planning is to provide additional protection of roadless areas, that the Rule is the result of an extensive public involvement process, and that the Rule already

		adequately provides for forest health management, access to inholdings, wilderness designations, and identifies roadless area values. Also suggests that the economic value of roadless areas comes from recreation and environmental quality, that timber harvest and roadbuilding should be prohibited, and that the Bush Administration should respect the fact that the Rule enjoys overwhelming public support.
303	170	Letter contains the text from Form 68 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Requests immediate implementation of the Rule, including protection of the Tongass National Forest. Opposes forest-by-forest decisions on timber harvest and development. Suggests that roadless areas should be protected from road building and commercial extraction.
304	9	Letter contains the text from Form 68 plus extra comments that express concerns regarding trust and integrity. Requests immediate implementation of the Roadless Area Conservation Rule, including protection of the Tongass National Forest. Opposes forest-by-forest decisions on timber harvest and development. Suggests that roadless areas should be protected from road building and commercial extraction.
305	31	Letter contains the text from Form 68 plus extra comments that express concerns regarding future generations. Requests immediate implementation of the Roadless Area Conservation Rule, including protection of the Tongass National Forest. Opposes forest-by-forest decisions on timber harvest and development. Suggests that roadless areas should be protected from road building and commercial extraction.
306	42	Letter contains the text from Form 68 plus extra comments that express concerns regarding general environmental issues. Requests immediate implementation of the Roadless Area Conservation Rule, including protection of the Tongass National Forest. Opposes forest-by-forest decisions on timber harvest and development. Suggests that roadless areas should be protected from road building and commercial extraction.
307	32	Letter contains the text from Form 74 plus extra comments that suggest the need for a national roadless rule or suggest keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule.
308	8	Letter contains the text from Form 74 plus extra comments that express concerns regarding trust and integrity. Supports the Roadless Area Conservation Rule.
309	28	Letter contains the text from Form 74 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule.
310	37	Letter contains the text from Form 74 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule.
311	11	Letter contains the text from Form 80 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule as it is the result of an extensive public involvement process. Suggests that roadless areas are a great treasure and should be preserved for future generations.

312	20	Letter contains the text from Form 80 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule as it is the result of an extensive public involvement process. Suggests that roadless areas are a great treasure and should be preserved for future generations.
313	27	Letter contains the text from Form 80 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as it is the result of an extensive public involvement process. Suggests that roadless areas are a great treasure and should be preserved for future generations.
314	96	Letter contains the text from Form 83 plus extra comments that express concerns regarding future generations. Suggests that roadless areas provide clean water, high quality fish and wildlife habitat and should be protected by implementation of the Roadless Area Conservation Rule. Opposes forest-by-forest decisions on roadless area management.
315	12	Letter contains the text from Form 83 plus extra comments that express concerns regarding general environmental issues. Suggests that roadless areas provide clean water, high quality fish and wildlife habitat and should be protected by implementation of the Roadless Area Conservation Rule. Opposes forest-by-forest decisions on roadless area management.
316	4	Letter contains the text from Form 91 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule as it protects pristine areas while still allowing access for forest health management. Opposes forest-by-forest decisions on timber harvest and development in roadless areas.
317	4	Letter contains the text from Form 91 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as it protects pristine areas while still allowing access for forest health management. Opposes forest-by-forest decisions on timber harvest and development in roadless areas.
318	5	Letter contains the text from Form 106 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as it offers a balanced approach to forest conservation without compromising public health and safety or access to inholdings. Opposes forest-by-forest decisions on roadless area management.
319	7	Letter contains the text from Form 111 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that local forest planning has failed to adequately protect roadless areas and that the Rule was developed through an extensive public involvement process. Also suggests that the Rule already provides exceptions for forest health management, that forest fires should be left to burn in most cases, and that access to private property is already ensured in the Rule. Letter provides a list of environmental, social, and cultural values associated with roadless areas and requests that timber harvest, mining, oil drilling, off-road vehicle use, and pack animals should be banned. Suggests that the ten questions are highly biased and unnecessary because the public has already spoken in support of the Rule.
320	5	Letter contains the text from Form 111 plus extra comments that express concerns

		regarding trust and integrity. Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that local forest planning has failed to adequately protect roadless areas and that the Rule was developed through an extensive public involvement process. Also suggests that the Rule already provides exceptions for forest health management, that forest fires should be left to burn in most cases, and that access to private property is already ensured in the Rule. Letter provides a list of environmental, social, and cultural values associated with roadless areas and requests that timber harvest, mining, oil drilling, off-road vehicle use, and pack animals should be banned. Suggests that the ten questions are highly biased and unnecessary because the public has already spoken in support of the Rule.
321	4	Letter contains the text from Form 111 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule because individual forest planning has inadequately protected roadless areas. Provides responses to the ten questions. Responses suggest that local forest planning has failed to adequately protect roadless areas and that the Rule was developed through an extensive public involvement process. Also suggests that the Rule already provides exceptions for forest health management, that forest fires should be left to burn in most cases, and that access to private property is already ensured in the Rule. Letter provides a list of environmental, social, and cultural values associated with roadless areas and requests that timber harvest, mining, oil drilling, off-road vehicle use, and pack animals should be banned. Suggests that the ten questions are highly biased and unnecessary because the public has already spoken in support of the Rule.
322	14	Letter contains the text from Form 112 plus extra comments that express concerns regarding future generations. Supports the Theodore Roosevelt Conservation Alliance’s “Square Deal Initiative #1.” Suggests that the 58 million acres under consideration should be kept roadless and that criteria should be carefully defined for the consideration of exceptions for providing road access for forest management. Also suggests that decisionmaking should include the interests of local people while the final decision authority to build roads in roadless areas should be retained by the Chief of the Forest Service.
323	10	Letter contains the text from Form 112 plus extra comments that express concerns regarding general environmental issues. Supports the Theodore Roosevelt Conservation Alliance’s “Square Deal Initiative #1.” Suggests that the 58 million acres under consideration should be kept roadless and that criteria should be carefully defined for the consideration of exceptions for providing road access for forest management. Also suggests that decisionmaking should include the interests of local people while the final decision authority to build roads in roadless areas should be retained by the Chief of the Forest Service.
324	27	Letter contains text from Form 117 plus extra comments that express concerns regarding general environmental issues. Mentions that 95% of Americans support the Roadless Area Conservation Rule. Requests that actions be taken to ensure that the Rule is not undermined and that the Forest Service listen to the will of the American people. Requests that the Rule be implemented immediately and without exemption.
325	10	Letter contains text from Form 117 plus extra comments that express concerns regarding future generations. Mentions that 95% of Americans support the Roadless Area Conservation Rule. Requests that actions be taken to ensure that the Rule is not undermined and that the Forest Service listen to the will of the

		American people. Requests that the Rule be implemented immediately and without exemption.
326	36	Letter contains text from Form 134 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule as it protects 4.4 million acres in Colorado. Mentions the overwhelming number of comments, 28,000 of them from Coloradoans, supporting the Rule. Comments that the Rule adequately addresses fire management, forest health, access, and local input. Opposes the weakening of national forest protection through forest-by-forest decisionmaking and requests protection from road construction, timber harvest, and drilling.
327	16	Letter contains text from Form 134 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule as it protects 4.4 million acres in Colorado. Mentions the overwhelming number of comments, 28,000 of them from Coloradoans, supporting the Rule. Comments that the Rule adequately addresses fire management, forest health, access, and local input. Opposes the weakening of national forest protection through forest-by-forest decisionmaking and requests protection from road construction, timber harvest, and drilling.
328	70	Letter contains text from Form 134 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as it protects 4.4 million acres in Colorado. Mentions the overwhelming number of comments, 28,000 of them from Coloradoans, supporting the Rule. Comments that the Rule adequately addresses fire management, forest health, access, and local input. Opposes the weakening of national forest protection through forest-by-forest decisionmaking and requests protection from road construction, timber harvest, and drilling.
329	75	Letter contains text from Form 137 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Requests protection of all national forest roadless areas through a national policy to prohibit road construction and timber harvest.
330	25	Letter contains text from Form 137 plus extra comments that express concerns regarding general environmental issues. Requests protection of all national forest roadless areas through a national policy to prohibit road construction and timber harvest.
331	18	Letter contains text from Form 137 plus extra comments that express concerns regarding future generations. Requests protection of all national forest roadless areas through a national policy to prohibit road construction and timber harvest.
332	5	Letter contains text from Form 142 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule, as it is the product of the most extensive federal Rulemaking in history relating to public involvement and response. Comments on the quality recreational opportunities provided by roadless lands in Colorado. Also comments on how the Rule provides a balanced approach to forest conservation and addresses issues of fire management, forest health, access, and local input. Opposes forest-by-forest decisionmaking as it weakens forest protection and asserts that timber harvest leads to the degradation of these lands. Supports preservation of roadless areas for recreational experiences.

333	4	Letter contains text from Form 142 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule, as it is the product of the most extensive federal Rulemaking in history relating to public involvement and response. Comments on the quality recreational opportunities provided by roadless lands in Colorado. Also comments on how the Rule provides a balanced approach to forest conservation and addresses issues of fire management, forest health, access, and local input. Opposes forest-by-forest decisionmaking as it weakens forest protection and asserts that timber harvest leads to the degradation of these lands. Supports preservation of roadless areas for recreational experiences.
334	37	Letter contains text from Form 158 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as it stands and opposes any changes that might weaken the Rule. Specifically mentions the social and economic importance of Alaska's Tongass and Chugach National Forests and the opportunities they provide for clean water, recreational and visitor opportunities, and habitat. Opposes forest-by-forest decisionmaking on timber harvest and mining because it puts corporate interests before public interest.
335	7	Letter contains text from Form 180 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Supports the Rule as it stands for wilderness and wild rivers, specifically for protection of the Tongass and Chugach National Forests.
336	15	Letter contains text from Form 180 plus extra comments that express concerns regarding future generations. Supports the Roadless Area Conservation Rule as it stands for wilderness and wild rivers, specifically for protection of the Tongass and Chugach National Forests.
337	58	Letter contains text from Form 180 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule as it stands for wilderness and wild rivers, specifically for protection of the Tongass and Chugach National Forests.
338	5	Letter contains text from Form 215 plus extra comments that suggest the need for a national roadless rule or support keeping or strengthening the Roadless Area Conservation Rule. Requests that the Rule be immediately implemented, including the Tongass National Forest, to protect roadless areas from road construction, timber harvest, mining, and other forms of commercial extraction. Mentions the large number of public comments and support for protection of remaining roadless areas on national forests.
339	4	Letter contains text from Form 219 plus extra comments that express concerns regarding general environmental issues. Supports the Roadless Area Conservation Rule in order to protect national forests from timber harvest, road building, and other developments. Mentions the large number of public comments and support for the Rule and opposes forest-by-forest decisionmaking.

Appendix F

Site-Specific Requests for Inclusion/Exemption

The following tables list the specific places respondents request to be included in/excluded from national roadless area protection or to be recommended/not recommended to Congress for wilderness designation. Note that because respondents sometimes reference multiple areas, there is some overlap in the requests.

Table F-1. Site-Specific Requests that Areas be Included in National Roadless Area Protection

Region 1 Northern

Area	National Forest or Grassland	State
Idaho. (Conservation/Preservation Organization, Williams, OR - #A21210.45500)	Multiple	ID
Idaho's remaining 8 million acres of wild lands. (Business, Boise, ID - #A20362.10150)	Multiple	ID
Idaho's wild forests. (Individual, La Canada Flintridge, CA - #A803.90110)	Multiple	ID
Northern Rockies (Idaho). (Individual, Boise, ID - #A5873.90110)	Multiple	ID
I live in Idaho . . . I want to see all 9 million of those acres protected by the roadless rule. . . including the Boulder-White Clouds, the Pahsimeroi, the Pioneer Mountains, the Smokey Mountains, The Lost River Range. (Individual, Stanley, ID - #A16269.45620)	Multiple	ID
The Continental Divide Trail (Individual, Helena, MT - #A7359.45621)	Multiple	ID, MT
Areas of Montana, Idaho, and Washington, such as the Gallatin Range, the Big Belts, the Whitetail-Haystack-O'Neill roadless area, the White Sand and Cove-Mallard roadless areas, and the Kettle Range. (Conservation/Preservation Organization, Bozeman, MT - #A20601.45621)	Multiple	ID, MT, WA
The following National Forests: Beaverhead, Bitterroot, Clearwater, Custer, Deerlodge, Flathead, Gallatin, Helena, Idaho Panhandle (ID), Kootenai, Lewis and Clark, Lolo, Nez Perce (ID). (Individual, Missoula, MT- #A17281.45622)	Multiple	ID, MT, WA
All roadless areas including those encompassed in the Northern Rockies Ecosystem Protection Act and including one thousand acres in size should be protected to preserve their wilderness character and eligibility for congressional Wilderness designation, rather than being deferred later to the forest planning process. (Individual, Elmhurst, IL - #A15290.45320)	Multiple	ID, MT, WY
The Greater Yellowstone area. (Individual, Santa Monica, CA - #A9909.45331)	Multiple	ID, MT, WY
6 million acres in Greater Yellowstone. (Individual, Bozeman, MT - #A661.50510)	Multiple	ID, MT, WY
Cove/Mallard, Selkirk Mountain Roadless Area in Idaho, the South Fork Mountain Area, Quartzite Roadless Area, Kettle Range, Tucannon, Wenatchee Creek, Dark Divide, Long Swamp, Granite Mt., Jackson/Graphite, and Mt. Bonaparte in Washington are just a few designated roadless areas. (Business, Spokane, WA - #A22047.45621)	Multiple	ID, WA
Montana. (Individual, Lebanon, NH - #A4286.90110)	Multiple	MT
Roadless areas in Montana. (Individual, Missoula, MT - #A5604.45621)	Multiple	MT
6.4 million acres in Montana. . . the Bitterroot forest. (Individual, Hamilton, MT - #A5804.10150)	Multiple	MT
Timberlands in N.W. Montana. (Individual, Libby, MT - #A5586.90130)	Multiple	MT
The City of Bozeman lies in the heart of an area surrounded by spectacularly	Multiple	MT

beautiful—yet unprotected—roadless lands, including the Bridger Mountains, the Gallatin Range, the Tobacco Root Mountains, and portions of the Madison Range. (Joe N. Frost, Commissioner, Bozeman City Commission, Bozeman, MT - #A20731.45620)		
The Scotchman Peak area of the West Cabinets, the northern reaches of the Swan Mountains and the Bitterroots. (Individual, Kalispell, MT - #A21027.10111)	Multiple	MT
The 17.2 million acres of remaining Roadless Areas of the Northern Rockies—including but not limited to the Glacier National Park, the Swan Range, the Rocky Mountain Front, the Gallatin Range, the Absoroka-Beartooth Wilderness, the Rattlesnake Wilderness, and the Bitterroot Wilderness. (Individual, No Address - #A23580.45621)	Multiple	MT
Montana . . . Pryors, Snowies. . . (Individual, Missoula, MT - #A17700.45621)	Multiple	MT
The Scotchman Peaks, Cube Iron-Silcox, Trout Creek, Cabinet Additions, Cataract, Galena, Allen Peak, Roderick, Gold Hill, Northwest Peaks, Buckhorn Ridge . . . Montana. (Individual, Somers, MT - #A8210.45624)	Multiple	MT
Elkhorns, Big Belts, Continental Divide and Rocky Mountain Front. (James Smith, Commissioner, Helena City Commission, Helena, MT - #A20615.45621)	Multiple	MT
The Gallatin, Yellowstone and Madison Rivers. (Individual, San Antonio, TX - #A10116.45620)	Multiple	MT, WY
The Snake and Yellowstone Rivers. (Individual, Gladwyne, PA - #A10116.45620)	Multiple	MT, WY
Wyoming. (Individual, East Greenbush, NY - #A8821.90110)	Multiple	WY
I would like to see the Roadless Area Rule apply to <u>ALL</u> national forests (New England, Eastern, Midwest, Western, Alaskan Tongass, and other Alaskan forests etc.) (Individual, Endeavor, WI - #A8231.45622)	Multiple	Multiple
The North/West Big Hole and East/West Pioneers. (Individual, Butte, MT - #A16710.45624)	Beaverhead-Deerlodge	MT
Roadless areas in Montana. . . . Helena Forest Areas: Camas Lakes—Big Belt Mountains Mount Baldy—Big Belt Mountains Hedges Mountain—Big Belt Mountains Elkhorn Mountains Range Black Mountain—Near Helena Nevada Mountain—Continental Divide Silver King/Falls Creek Grassy Mountain—Big Belt Mountains Electric Peak/Blackfoot Meadows—Continental Divide. Lewis & Clark Forest Areas: All areas along the Rocky Mountain Front Lola Forest Area: Cuba Iron/Silcox Deerlodge/Beaverhead Forest Areas: Tobacco Root Mountains East Pioneer Mountains. (Individual, Helena, MT- #A29425.45620)	Beaverhead-Deerlodge, Lewis and Clark, Helena	MT
Places like the Bitterroot Selway. (Individual, Missoula, MT - #A16787.10150)	Bitterroot	ID, MT
Roadless lands in my area - the Bitterroot Valley. (Individual, Corvallis, MT - #A8285.50000)	Bitterroot	MT
Tepee Point lookout (Bitterroot Forest, Sula Dist.) . . . the Anaconda-Pintlar Wilderness . . . the Sapphires. (Individual, Billings, MT - #A8697.45621)	Bitterroot	MT
The Targhee, Boise, and Payette. (Conservation/Preservation Organization, Nevada City, CA - #A4941.45621)	Boise, Payette, Targhee	ID, MT, WY
The Great Burn Roadless Area of the Clearwater NF. (Individual, Moscow, ID - #A5712.45622)	Clearwater	ID
Idaho Panhandle National Forests: (only portions in the Big Wild Ecosystem, mainly the upper St. Joe River drainage are listed—others outside the ecosystem should also be protected) <u>Mallard-Larkins</u> (see Clearwater National Forest) <u>Meadow Creek/Vanderbilt-Upper St. Joe</u> (see Clearwater National Forest) <u>Mosquito Fly—1150.</u> <u>Midget Peak—1151.</u> This area borders the St. Joe River. . . . Simmons Creek is a tributary to the fabled St. Joe River.	Clearwater, Idaho Panhandle, Lolo	ID, MT, WA

<p><u>Sheep Mountain/State Line (also Lolo National Forest)—1779</u> . . . near the headwaters of the St. Joe River. . . the Bitterroot Crest. <u>Grandmother Mountain—1148</u>. . . around Widow Mountain. . . a corner of it drains into the St. Maries River. (Conservation/Preservation Organization, Moscow, ID - #A22654.25200)</p>		
<p><u>Clearwater National Forest</u> <u>The Great Burn—1301</u> (or Hoodoo also on the Lolo National Forest) . . . Kelly Creek and includes its confluence with Cayuse Creek. . . the North Fork of the Clearwater. . . Fish Lake . . . in the Jap, Siam, Boose and Shell Creek drainages. <u>Weitas Creek—1306</u> (Bighorn-Weitas) . . . along lower Weitas Creek. . . the North Fork Clearwater. . . Upper Cayuse Creek. (Conservation/Preservation Organization, Moscow, ID - #A22654.91220) <u>Pot Mountain—1304</u>. (Conservation/Preservation Organization, Moscow, ID - #A22654.50520) <u>Moose Mountain—1305</u>. (Conservation/Preservation Organization, Moscow, ID - #A22654.45310) <u>Meadow Creek/Vanderbilt and Rawhide—1302 and 1313</u> (also Idaho Panhandle and Lolo National Forests) . . . both the North Fork proper and the St. Joe Rivers . . . lakes like Trail, Oregon, and St. Joe Lakes. Closure of unneeded and deteriorating road 5428 was suggested to unite this area with the Rawhide Roadless Area in the Clearwater Forest Plan appendices (page C-224). This has been done and the two areas should be considered as one roadless area. . . the North Fork River. Selway-Bitterroot Additions: These are all logical additions to the Selway Bitterroot Wilderness and many were previously included in the old Selway Primitive Area. They contain crucial low elevation habitat and important wet meadow complexes. (Conservation/Preservation Organization, Moscow, ID - #A22654.25200) <u>White Sand Creek, North Fork—1309</u>. . . land near Beaver Creek. . . This is a wet, high elevation area in the upper Lochsa. <u>Sneakfoot—1314</u>. . . White Sand and part of the Lochsa Face <u>Lochsa Face—1311</u>. This is the steep face of the Lochsa River adjacent to the Selway-Bitterroot Wilderness. It contains the famous Jerry Johnson Hot Springs and important tributaries to the Lochsa River. <u>Lolo—1805</u> (mostly on the Lolo National Forest) This is part of a large roadless area that encompasses the north flank of Lolo Peak, the northern boundary of the Selway-Bitterroot Wilderness. (Conservation/Preservation Organization, Moscow, ID - #A22654.45310) <u>Section 16 Roadless—1310</u> This area is adjacent to the Selway-Bitterroot Wilderness and just south of the Lolo Creek area. (Conservation/Preservation Organization, Moscow, ID - #A22654.45400) <u>North Lochsa Country</u> This is the northern flank of the scenic Lochsa River. <u>Fish and Hungery Creek—1307</u> (also called North Lochsa Slope). . . the Lochsa River corridor. It also contains the only unroaded section of the Lewis and Clark trail remaining in the entire country. <u>Weir/Post Office—1308</u>. . . Ashpile Peak and Weir Creek Hot Springs and is adjacent to Indian Post Office. (Conservation/Preservation Organization, Moscow, ID - #A22654.45100) <u>Eldorado Creek—1312</u>. . . White Pine region. (Conservation/Preservation Organization, Moscow, ID - #A22654.45310)</p>	<p>Clearwater, Lolo</p>	<p>ID, MT</p>
<p>Clearwater, Nez Perce and St. Joe National Forest. (Individual, Moscow, ID - #A11643.45621)</p>	<p>Clearwater, Nez Perce, St. Joe</p>	<p>ID</p>
<p>Beartooth District. (Individual, Red Lodge, MT - #A12473.90130)</p>	<p>Custer</p>	<p>MT</p>
<p>The Beartooths, and the Bob. (Individual, Missoula, MT - #A6480.10150)</p>	<p>Custer, Flathead, Lewis and Clark</p>	<p>MT</p>
<p>Here on the Flathead National Forest the roadless areas of the Swan Front, Swan</p>	<p>Flathead</p>	<p>MT</p>

Crest, Mt. Hefty, Tuchuck, Thompson-Seaton, Nasukoin, Lost Jack, Jewel Basin, and Le Beau. (Individual, Kalispell, MT - #A28230.45621)		
Northwest Montana, between Glacier National Park and the Flathead National Forest. (Individual, Winnebago, IL - #A1471.90110)	Flathead, Glacier National Park	MT
Seeley Lake, Montana in the heart of the Swan Valley and near the Bob Marshall and Scapegoat Wilderness Areas. (Individual, Seeley Lake, MT - #A6434.45621)	Flathead, Helena, Lewis and Clark, Lolo	MT
The Lolo and Flathead National Forest. (Individual, Condon, MT - #A13397.45621)	Flathead, Lolo	MT
The Roadless Area on Lie Creek in the Gallatin National Forest. (Individual, Livingston, MT - #A6409.45621)	Gallatin	MT
The Montana side of Yellowstone. (Individual, Boulder, CO - #A9968.50000)	Gallatin	MT
Near Gallatin National Forest roadless areas. . . . The Crazy Mountains. (Individual, Gallatin Gateway, MT - #A19100.45622)	Gallatin	MT
The Gallatin-Yellowstone Divide Trail in the Gallatin N.F. (Individual, Madison, WI - #A866.91221)	Gallatin	MT
Gallatin Range . . . Wyoming & Montana. (Individual, Middlebury, VT - #A10033.45621)	Gallatin	MT, WY
The Shoshone and Gallatin National Forests. (Individual, Gardiner, MT - #A27498.45621)	Gallatin, Shoshone	MT, WY
Glacier Parks. (Individual, Littleton, CO - #A9935.45331)	Glacier National Park	MT
The Elkhorns, Big Belts, Continental Divide, and Rocky Mountain Front . . . the Helena National Forest. (Christian Kaufman, Representative, Helena, MT - #A30149.45621)	Helena	MT
The Ten Mile watershed on the Helena National Forest . . . from roadless tracts east of the Continental Divide in the Black Mountain Roadless Areas. (Christine Kaufman, Representative, Montana House of Representatives, Helena, MT - #A30149.45622)	Helena	MT
The Blackfoot Meadows and Avalanche Gulch to US 12 portions of the Helena NF. (Individual, Helena, MT - #A30941.10150)	Helena	MT
Roadless areas on the Idaho Panhandle National Forest. (Conservation/Preservation Organization, Couer d'Alene, ID - #A5697.90110)	Idaho Panhandle	ID, MT, WA
Idaho Panhandle National Forest. . . . timber sale (the Myrtle Cascade). (Conservation/Preservation Organization, Spokane, WA - #A18013.90520)	Idaho Panhandle	ID, MT, WA
The St. Joe R. D. of the Idaho Panhandle forest. (Individual, Saint Maries, ID - #A15516.45621)	Idaho Panhandle	ID, MT, WA
Lake Pend Oreille area . . . of the Northern Idaho Panhandle forest. (Individual, Sandpoint, ID - #A28585.90421)	Idaho Panhandle	ID, MT, WA
The Yaak, MT, watershed (a Kootenai tributary). (Individual, Troy, MT - #A13457.45624)	Kootenai	ID, MT
Roadless areas in the Kootenai National Forest in Western Montana. (Individual, Trout Creek, MT - #A10498.45622)	Kootenai	ID, MT
Montana's Yaak valley, in the northern half of the Kootenai National Forest. (Conservation/Preservation Organization, Missoula, MT - #A17234.45621)	Kootenai	ID, MT
The Ten Lakes Proposed Wilderness Area. . . . The areas surrounding the Cabinet Mountain Wilderness Area and the Bob Marshall Wilderness Complex. (Individual, Libby, MT - #A8346.45621)	Kootenai	ID, MT
In Montana's Rocky Mountain Front, on the inventoried roadless areas of the Lewis and Clark National Forest, Rocky Mountain Division, which is known to Montanans as the fabulous, wild Rocky Mountain Front. (Individual, Choteau, MT - #A5653.45621)	Lewis and Clark	MT
The Snowy Mts. Wilderness Study Area, Bitter Cr., Woodhawk. (Individual, Lewistown, MT - #A15660.45629)	Lewis and Clark	MT
Little Missouri National Grasslands. . . . The Theodore Roosevelt National	Little Missouri	ND

<p>Park’s South Unit, located within the boundaries of the Grasslands, is bordered by the Teddy Roosevelt Oil Field. The Park’s North Unit is similarly at risk. . . . Bell Lake and Wannagan Roadless Areas. . . . Dawson’s Waterhole Roadless Area’s east side. . . . Kinley Plateau and Bullion Butte, roadless areas the Dakota Prairie Grasslands Office deems unsuitable for Wilderness. Lone Butte and Bennett-Cottonwood Roadless Areas. (Conservation/Preservation Organization, Bismarck, ND - #A19108.45620)</p>	<p>National Grasslands, Theodore Roosevelt National Park</p>	
<p><u>Nez Perce National Forest</u> <u>River of No Return/Gospel Hump Additions.</u> These roadless areas are contiguous to the River of No Return and Gospel Hump Wilderness Areas (areas that are contiguous) and make logical additions. . . . Furthermore, the closure of the unneeded Magtruder Road would unite this largest wildland in the lower 48 with the Selway-Bitterroot and surrounding wildlands. <u>Cove and Mallard—1921 and 1847.</u> . . . Cove/Mallard timber sales. . . . four sales went forth and road reclamation should take place on the Noble, Jack, Grouse and Small sales roads. . . . part of the Salmon River country. (Conservation/Preservation Organization, Moscow, ID - #A22654.53110) <u>Gospel Hump Additions</u> This is the site of the Wing Creek/Twentymile Roadless Area (south Fork Clearwater drainage) . . . Tenmile and Johns Creeks. Other key additions include Indian Creek (southeast portion) which is a crucial tributary to the Salmon River, Boulder Creek (west), and the remaining roadless portion of the upper Crooked River (northeast). Furthermore, a roadless portion of upper Twentymile Creek (Lost Lake and Twentymile Butte). . . . <u>Selway-Bitterroot Additions</u> These are all logical additions to the Selway Bitterroot Wilderness. A portion of Meadow Creek was previously included in the old Selway Primitive Area. (Conservation/Preservation Organization, Moscow, ID - #A22654.45400) <u>Meadow Creek-1845.</u> . . . Meadow Creek is the major tributary to the Selway River. <u>Rackcliff-Gedney—1841</u> (also Clearwater National Forest) This large area occupies the divide between the Lochsa and Selway Rivers. (Conservation/Preservation Organization, Moscow, ID - #A22654.45100) <u>Upper Bear Creek.</u> . . . the headwaters of Bear Creek, contiguous to the Selway Bitterroot Wilderness and at the top of Lost Horse Canyon. (Conservation/Preservation Organization, Moscow, ID - #A22654.25200) <u>South Fork Clearwater</u> <u>Dixie Summit/Nut Hill—1235.</u> <u>Lick Point—1227.</u> This is the headwater of the American River. Selway-Middle Fork Clearwater These roadless areas drain into the Selway and Middle Fork Clearwater. <u>O’Hara Falls—1226.</u> O’Hara Creek. <u>Goddard Creek—1843.</u> . . . between O’Hara Falls and Middle Fork Face. <u>Middle Fork Face—1842.</u> . . . The Middle Fork sale . . . in the Horse Creek watershed. <u>Lower Salmon</u> These areas drain into the Salmon River . . . They form a transition between the Salmon River country to the east and the Blue Mountains to the west. . . . The Slate. (Conservation/Preservation Organization, Moscow, ID - #A22654.90310) <u>Clear Creek—1844.</u> <u>North Fork Slate—1850.</u> Slate Creek <u>Little Slate—1851.</u> . . . tributaries to Slate Creek . . . A unique lake in Nut Basin and an RNA in No Business Creek. <u>John Day—1852.</u> . . . John Day and Allison Creeks. <u>Kelly Mountain—1857.</u> This area drains into the Salmon east of Riggins.</p>	<p>Nez Perce</p>	<p>ID</p>

(Conservation/Preservation Organization, Moscow, ID - #A22654.45100)		
Cove/Mallard, Selkirk Mountain Roadless Area, South Fork Mountain Area, Quartzite Roadless Area. . . . roadless areas, such as Cove/Mallard in the Nez Perce National Forest in central Idaho. . . . the Myrtle-Cascade Project just west of Bonners Ferry . . . the Selkirk Roadless Area! (Conservation/Preservation Organization, Spokane, WA - #A2840.45614)	Nez Perce	ID
Roadless lands in Yellowstone Nat'l Park. (Individual, Southampton, PA - #A10089.45620)	Yellowstone National Park	WY
The areas in the National Grasslands need to be protected. . . . (Individual, Center, ND - #A6904.45621)	Multiple	ND

Region 2 Rocky Mountain

Area	National Forest or Grassland	State
Colorado's roadless areas. (Individual, Coal Creek, CO - #A15770.50000)	Multiple	CO
Colorado's wild forest. (Individual, Boulder, CO - #A21023.45620)	Multiple	CO
The Colorado Plateau and Southwest. (Individual, Burke, VA - #A30052.90130)	Multiple	CO
4.4 million acres in Colorado. (Business, Crested Butte, CO - #A31274.45300)	Multiple	CO
Southwest Colorado...San Juan County, Colorado. (Peter McKay, Commissioner, San Juan County Board of Commissioners, Silverton, CO - #A8590.10150)	Multiple	CO
The Bighorns, Medicine Bows and Wind River Mountains. (Individual, Casper, WY - #A21035.10111)	Multiple	CO, WY
The Continental Divide Trail. (Individual, Helena, MT - #A7359.45621)	Multiple	CO, WY
Wyoming. (Individual, Sheridan, WY - #A12145.10150)	Multiple	WY
Wyoming's national forest lands. (Individual, Cheyenne, WY - #A15034.10150)	Multiple	WY
The West, especially the Colorado Plateau. (Individual, Burke, VA - #A30052.90130)	Multiple	Multiple
The Rocky Mountains. (Individual, Rindge, NH - #A4812.90130)	Multiple	Multiple
The Southern Rockies. (Conservation/Preservation Organization, Boulder, CO - #A22130.90130)	Multiple	Multiple
Colorado—the Canyonlakes Ranger District of the Roosevelt National Forest. (Individual, Fort Collins, CO - #A21116.10111)	Arapaho-Roosevelt	CO
In the Front Range . . . the James Peak Area. (Individual, No Address - #A23544.45621)	Arapaho-Roosevelt	CO
The City of Boulder has a great interest in the protection of roadless areas in the Arapahoe and Roosevelt National Forests. . . . In Colorado . . . more than 4.4 million acres. (William R. Toor, Mayor, City of Boulder, Boulder, CO - #A21473. 45622)	Arapaho-Roosevelt	CO
Please, please, please protect all of our roadless areas in all of our national forests. Including the Arapaho-Roosevelt, my next door neighbor. (Individual, Boulder, CO - #A20728.45620)	Arapaho-Roosevelt	CO
Roadless areas on the Grand Mesa National Forest—the Salt Creek and Priest Mountain roadless areas. Moreover, three forests in Colorado—the Routt, Rio Grande, and Arapaho Roosevelt National Forests—as well as the Black Hills National Forest in South Dakota and Wyoming . . . Bushy Creek, Morrison Creek, and South Fork roadless areas on the Routt and the Beaver Park roadless area in the Black Hills. (Conservation/Preservation Organization, Missoula, MT - #A17234.45622)	Arapaho-Roosevelt, Black Hills, Grand Mesa, Medicine Bow-Routt, Rio Grande	CO, SD, WY
Bushy Creek and Morrison Creek (Morrison Creek Timber Sale—Routt National Forest); Salt Creek and Priest Creek (Sheep Flats Timber Sales, Grand Mesa-	Arapaho-Roosevelt, Grand Mesa-Uncompahgre-	CO, WY

Uncompahgre-Gunnison National Forest); Gunbarrel, Rampart and Thunder Butte (Upper South Platte Project, Pike-San Isabel National Forest); Nipple Peak North Roadless Areas and possibly others (Routt Bark Beetle Project, Routt National Forest); Cherokee Park (Sheep Creek Timber Sale, Arapaho-Roosevelt National Forest); Dome Peak (Dome Peak Timber Sale, White River National Forest); and HD Mountains (coalbed methane production, San Juan National Forest). (Conservation/Preservation Organization, Denver, CO - #A12008.45624)	Gunnison, Medicine Bow-Routt, Pike-San Isabel, San Juan, White River	
Grand County. (Individual, Watkins, CO - #A100.45400)	Arapaho-Roosevelt, Medicine Bow-Routt	CO, WY
WY's roadless areas. . . . the Bighorn Mtns. . . . the Rock Creek, Littlehorn Canyon and Devils playground areas. . . . Rock Creek and Buffalo Creek in the Med Bow area. (Individual, Sheridan, WY - #A16801.45620)	Big Horn, Medicine Bow-Routt	WY
Roadless areas in Wyoming . . . the deep canyon lands of the Rock Creek and Littlehorn Roadless Areas in the Bighorns . . . the Mt. Leidy Highlands and Wyoming Range Roadless Areas in the Bridger-Teton . . . forests of Rock Creek and Buffalo Peak Roadless Areas in the Medicine Bows . . . mountains of Deep Lake/Beartooth Plateau and Franc's Peak Roadless Areas in the Shoshone National Forest. (Individual, Jackson, WY - #A28333.45621)	Bighorn, Bridger-Teton, Medicine Bow-Routt, Shoshone	WY
Wyoming forests (Medicine Bow and Bighorn) . . . The Bridger-Teton and Shoshone National Forests. (Conservation/Preservation Organization, Sheridan, WY - #A17593.45622)	Bighorn, Bridger-Teton, Medicine Bow-Routt, Shoshone	WY, CO
Roadless Areas in the Shoshone, Big Horn and Medicine Bow National Forests. (Individual, Pinedale, WY - #A5307.45622)	Big Horn, Medicine Bow-Routt, Shoshone	CO, WY
The Shoshone National Forest and Bighorn National Forest roadless areas. (Conservation/Preservation Organization, Sheridan, WY - #A17593.45622)	Bighorn and Shoshone	WY
The Brent Creek area in Duboise. (Individual, Casper, WY - #A21049.45622)	Bridger-Teton Shoshone	WY
Custer and Shoshone National Forests. (Individual, Red Lodge, MT - #A5778.10150)	Custer, Shoshone	MT, SD, WY
Gunnison National Forest. (Conservation/Preservation Organization, Crested Butte, CO - #A21706.91221)	Grand Mesa-Uncompahgre-Gunnison	CO
The North Fork Valley. (Conservation/Preservation Organization, Paonia, CO - #A20478.90130)	Grand Mesa-Uncompahgre-Gunnison	CO
The Uncompahgre, HD Mountains 25 miles east of Durango and an area close to Fort Collins need to remain protected as Roadless Areas. (Individual, Aurora, CO - #A21657.45621)	Grand Mesa-Uncompahgre-Gunnison	CO
Troublesome Roadless Area (Routt NF). . . . San Juan National Forest... Salt Creek and Priest Mountain Roadless Areas (GMUG NF). (Individual, Boulder, CO - #A21450.45624)	Grand Mesa-Uncompahgre-Gunnison, Medicine Bow-Routt, San Juan	CO, WY
15 million acres in Colorado, of which more than 4.4 million acres are roadless. In Wyoming, national forests cover about 9.3 million acres, including 3.5 million acres of roadless lands. These roadless lands include such special places as the Dome Peak and Basalt Mountain Roadless Areas on the White River NF, the Salt Creek and Priest Mountain Roadless Areas on the Grand Mesa NF, the Turkey Creek Roadless Area on the San Juan NF, and Coon Creek on the Medicine Bow NF. (Conservation/Preservation Organization, Denver, CO - #A21367.45100)	Grand Mesa-Uncompahgre-Gunnison, Medicine Bow-Routt, San Juan, White River	CO, WY
National Forest roadless areas in the Southern Rockies . . .	Grand Mesa-	CO,

<p>Below is a partial list of pending threats to roadless areas in Colorado and southern Wyoming—these pending agency projects could move forward immediately, although they would be prohibited in their current form under the Roadless Rule:</p> <p>Sheep Flats Timber Sale would damage parts of the Salt Creek and Priest Mountain Roadless Areas - two of the three remaining roadless areas on the Grand Mesa National Forest.</p> <p>Jackson Mountain Timber Sale on the San Juan National Forest</p> <p>Trout Mountain Timber Sale on the Rio Grande National Forest</p> <p>Morrison Creek Timber Sale on the Routt National Forest</p> <p>On the White River National Forest, the proposed Dome Peak and South Quartzite timber sales both include some logging in roadless areas.</p> <p>The Upper Blue Stewardship Project on the White River NF would degrade the Ten Mile Roadless Area. . . .</p> <p>Oil and gas leasing and development would invade the HD Mountains Roadless Area on the San Juan National Forest.</p> <p>The West Elk Roadless Area and the Springhouse Park Roadless Area on the Gunnison National Forest. . . .</p> <p>A proposed timber sale on Basalt Mountain on the White River NF would damage the Basalt Mountain Roadless Area;</p> <p>The Upper South Platte Project on the Pike-San Isabel NF could damage parts of four inventoried roadless areas—the Gunbarrel, Green Mountain, Thunder Mountain, and Rampart Roadless Areas.</p> <p>On the Medicine-Bow National Forest in Wyoming, the Cold Springs Timber Sale proposed in 1998 would log 5.4 million board feet, including logging on more than 1,000 acres, in two RARE II areas—the Buffalo Peak and Deer Creek Roadless Areas. (Conservation/Preservation Organization, Denver, CO - #A21367.12440)</p>	<p>Uncompahgre-Gunnison, Medicine Bow-Routt, Rio Grande, San Juan, White River</p>	<p>WY</p>
<p>Areas of local concern that I would like to see remain roadless include the ED Mountains on the San Juan National Forest and all roadless areas on the White River and Grand Mesa National Forests. (Individual, Littleton, CO - #A29784.45620)</p>	<p>Grand Mesa-Uncompahgre-Gunnison, San Juan, White River</p>	<p>CO</p>
<p><u>Rock Creek Roadless Area (Medicine NF)</u>. . . . Rock Creek Roadless Area on the Medicine Bow National Forest (NF). (Individual, Boulder, CO - #A21450.45621)</p>	<p>Medicine Bow-Routt</p>	<p>CO, WY</p>
<p>On the Medicine Bow National Forest, roadless areas . . . Libby Creek and French Creek...the Snowy Range Roadless Area. . . . the Big and Little Sandstone, Huston Park Additions, and Solomon Creek roadless areas. . . . The Middle Fork and Rock Creek roadless areas. (Conservation/Preservation Organization, Laramie, WY - #A20904.45100)</p>	<p>Medicine Bow-Routt</p>	<p>CO, WY</p>
<p>Routt/Medicine Bow National Forest. . . . I am asking that you protect completely the remaining roadless areas in that forest, as well as in all national forests. (Individual, No Address - #A22378.10150)</p>	<p>Medicine Bow-Routt</p>	<p>CO, WY</p>
<p>Roadless areas on the Medicine Bow National Forest. The Tie Camp Timber Sale, Jack Creek Timber Sale and Cold Springs Timber Sale would seriously impact roadless areas on the Medicine Bow National Forest if allowed to go forward. (Conservation/Preservation Organization, Laramie, WY - #A20904.30100)</p>	<p>Medicine Bow-Routt</p>	<p>CO, WY</p>

Colorado's eastern plains. (Conservation/Preservation Organization, Littleton, CO - #A8829.45622)		
The Roadless Area Conservation Rule would protect 5.2 million acres across the Southern Rockies and 669,000 acres in the Pike and San Isabel National Forests. (Conservation/Preservation Organization, Denver, CO - #A8824.45622)	Pike-San Isabel	CO
The San Isabel National Forest. . . in the Wet Mountains. (Individual, Wetmore, CO - #A13477.45622)	Pike-San Isabel	CO
This summer I had the opportunity to map two areas of Colorado for possible roadless/wilderness inventory. One area, East of Twin Lakes, includes a large roadless area that is pristine, home to much wildlife, is used by hikers, runners, and backpackers, has two major Colorado trails and is in need of protection. (Individual, Evergreen, CO - #A17159.70400)	Pike-San Isabel	CO
The Pike-San Isabel National Forest. . . the Kreuzer-Princeton Roadless Area. (Individual, Colorado Springs, CO - #A25621.45622)	Pike-San Isabel	CO
This regards Gray Back Peak, a roadless area on the Pike-San Isabel National Forest which has consistently been overlooked in roadless inventory. This area should be included under the Roadless Conservation Rule when the current revision is finalized. . . This tract is in the upper watersheds of Little Fountain Creek and Rock Creek, centered on Gray Back Peak, near Colorado Springs on the Pikes Peak Ranger District. . . this tract is adjacent to the BLM's Beaver Creek Wilderness Study Area. . . (We again urge the U.S. Forest Service to inventory and include this area in the Roadless Area Conservation Rule.) (Conservation/Preservation Organization, Monument, CO - #A20695.45624)	Pike-San Isabel	CO
The lands the Rule protects are an excellent buffer to the Weminuche Wilderness area in our county. (Christine K. Smith, Chairperson, San Juan County Board of Commissioners, Silverton, CO - #A8596.45621)	Rio Grande, San Juan	CO
The Hermosa roadless area in southwest Colorado, 10 miles north of Durango . . . the Hermosa Creek Drainage. (Recreational Non-Motorized Organization, Boulder, CO - #A17233.45621)	San Juan	CO
The Hermosa Creek area—the largest unprotected roadless area in the San Juans. (Individual, Boulder, CO - #A3501.45100)	San Juan	CO
The San Juan Mountain Range in Hermosa. (Individual, Boulder, CO - #A3489.45621)	San Juan	CO
Several National Forest roadless areas are adjacent to the City of Durango or located nearby. These roadless areas on the San Juan National Forest provide some of the most cherished backcountry recreation opportunities for Durango city residents and visitors. Junction Creek is one such roadless area. The Colorado Trail begins at Junction Creek and offers popular hiking, mountain bicycling, and cross-country skiing trips for locals and tourists. Junction Creek comprises a portion of the Hermosa Roadless Area. The Haflin Creek and Missionary Ridge Trails are other popular trails just a few miles outside the Durango city limits. These trails are located in a roadless area adjacent to the Weminuche Wilderness Area. The Roadless Area Conservation Rule as originally published would maintain these undeveloped, roadless national forest lands in their present condition and perpetuate the roadless, backcountry settings cherished by our city's residents. (Virginia Castro, Council Member, City of Durango, Durango, CO - #A8598.45624)	San Juan	CO

On the south side of the same roadless area, at the headwaters of Devil's Hole Creek. . . I've hiked along the ridge overlooking Devil's Hole Creek from the south. The panorama north to Electric Peak and the Salt River Range is superlative. . . Commissary Ridge. (Individual, Salt Lake City, UT - #A2369.50000)	Bridger-Teton	WY
The Brent Creek area in Duboise. (Individual, Casper, WY - #A21049.45622)	Bridger-Teton, Shoshone	WY
Tippets Valley, an IRA, on the Cedar District . . . The Dixie (Individual, Las Vegas, NV - #A5694.45622)	Dixie	UT
The Targhee National Forest . . . Boulder Mountain on the Dixie National Forest in Utah is a 150,000+ acre uninventoried roadless area. Areas adjacent to Boulder Mountain comprise 60,000-80,000 acres of roadless lands that were not included in the Dixie inventory. All these areas should receive immediate protection and should not have to wait for the forest planning process. In a 1999 citizens' inventory of the Manti-La Sal National Forest in Utah, 30	Dixie, Manti-La Sal, Targhee, Uinta	ID, UT

percent more roadless areas were found in the La Sal mountains and 50 percent more were found in the Abajos than what is currently in the Forest Service's inventories. In a 1998 citizens' inventory of the Uinta National Forest 123,500 more acres of roadless lands were found than the Uinta's own 1999 inventory. These areas also deserve immediate protection. (Conservation/Preservation Organization, Missoula, MT - #A21359.45622)		
Fishlake National Forest and Manti-LaSal National Forest. (Individual, Apo, NY - #A27804.45622)	Fishlake, Manti-La Sal	UT
Boulder Mountain, Thousand Lake Mountain, Cascade Peak, Pump Ridge, Hammond Canyon and the LaSal High Peaks are just some of the magnificent and unprotected Forest Service roadless lands in Utah. (Individual, Salt Lake City, UT - #A2369.10150)	Fishlake, Manti-La Sal	UT
Gallatin Range . . . Wyoming and Montana. (Individual, Middlebury, VT - #A10033.45621)	Gallatin	MT, WY
The Spring Mountains in Nevada, which are part of the Toiyabe National Forest. (Individual, Henderson, NV - #A4904.45622)	Humboldt-Toiyabe	NV
The Humboldt-Toiyabe National Forest in Nevada . . . in the west part of the Grant Range and Clement Mountains. All of the roadless areas in the Schell Creek range. (Conservation/Preservation Organization, Missoula, MT - #A17234.45622)	Humboldt-Toiyabe	NV
Roadless areas on the Humboldt-Toiyabe National Forest in Nevada. . . These include: Arc Dome south, the Toiyabe crest, Bunker Hill, Georges Canyon, land directly adjacent to the Alta Toquima Wilderness, and Mahala Creek in the Independence Range. (Conservation/Preservation Organization, Nevada City, CA - #A4941.90720)	Humboldt-Toiyabe	NV
Inventoried Roadless Areas in Utah...roadless areas in the Moab and Monticello Ranger Districts in the Manti-La Sal National Forest . . . the Wasatch-Cache NF. (Conservation/Preservation Organization, Moab, UT - #A30528.45622)	Manti-La Sal, Wasatch-Cache	UT
Two logging projects, the North Valley and Fourmile timber sales, on the Payette National Forest threaten roadless areas in Idaho. The North Valley Sale, 10 miles northwest of New Meadows on the New Meadows Ranger District, calls for logging 8.8 mmbf and 3.1 miles of roads. Several of the cutting units are in the Rapid River roadless area, one of the areas set aside for tradeoff for dams near Hell's Canyon. The Fourmile Sale, five miles northeast of New Meadows in the New Meadows Ranger District, will log 637 acres and build eight miles of roads. Part of the sale is the Patrick Butte roadless area, and 80,000-acre roadless area that hugs close to the Salmon River and comes up to the high, mountainous country above. The sale area is critical for the migration of elk, moose, and bear. Other roadless areas in Idaho are at risk South Fork Snake, Deadwood River, St. Joe River, Long Canyon, and the greater Cove/Mallard-Jersey-Wing/Ten Mile area on the Nez Perce National Forest. (Individual, Boise, ID - #A20396.45621)	Payette	ID
Specifically the French Creek, Patrick Butte, Needles, Secech, Rapid River, Council Mountain, and Cuddy Mountain roadless areas need to be conserved in their entirety. . . . All the way from the desert-like canyon bottoms of Hells Canyon and the main Salmon River canyon to the alpine regions of Cuddy Mountain and Bear Pete. (Individual, Weiser, ID - #A15804.45624)	Payette	ID
French Creek and Patrick Butte Roadless areas. . . Elkhorn Creek areas . . . Lake and Partridge Creeks are the most pristine drainages aside from French Creek, and all three should remain roadless in perpetuity. The boundary should be extended to include the BLM property to the Salmon River. Hazard Creek and Hard Creek should be protected . . . Granite Mountain, at the south end of Patrick Butte, is threatened by a ski area and further random skiing but should remain roadless at least through the next planning period. The boundary of the roadless area is adequate up past Grassey Lakes and by Scribner Lake, Lave	Payette	ID

Butte, and Hershey Point. Beyond that point the boundary in the hydrogeologic boundary of Partridge Creek. In the French Creek drainage the roadless areas boundaries should follow Little French Creek as close as possible, skirting clearcuts and the road down to include the BLM property. From there the boundary following the French Creek road up to Burgdorf property. From there the boundary following the French Creek road on up to Burgdorf then to Nethger and Josephine lakes and Cloochman Saddle, following the paved road to near Copet Creek, missing Granite Reservoir and Fisher Creek Saddle then dipping south again to past Slab Butte and following along Brundage Mountain Road to near Hard Creek Lake and Upper Hazard Lake and back to Little French Creek. The clearcuts along Little French and French Creeks should be managed to favor habitat management. The utmost concern should be taken to include the hydrogeologic boundary of French Creek, especially along Klip Creek, where no timber management should be undertaken. The Slab Butte, Bruin Mountain, and Little French Creek country should not be managed for recreation, timber, or sheep, but rather for their plants and alpine habitat; it is fragile and in some cases burned. (Individual, Boise, ID - #A21369.45624)		
The Sawtooth Valley between the Sawtooth and White Cloud mountains. (Individual, Kittery, ME - #A21218.45621)	Sawtooth	ID
The Smokys are 347,800 acres, immediately south of the Sawtooths. They're from 5,000 in elevation by the South Fork of the Boise River to 10,000 feet beside "Big Peak". (Individual, Boise, ID - #A20514.45621)	Sawtooth	ID
Lake Tahoe. (Individual, Carnelian Bay, CA - #A1278.45621)	Tahoe	CA, NV
Roadless areas in the Sierra Nevada. . . . For example, the Tahoe National Forest . . . Devils Canyon . . . Lafayette Ridge . . . an area near Downieville and north of New York Ravine. (Individual, Oklahoma City, OK - #A17236.45621)	Tahoe	CA, NV

The forests I visit here in California . . . the Sierra Nevada. Roadless area	Multiple	CA

designation would protect San Diego County's Cypress, which does not grow anywhere else and is down to the last few. (Individual, La Mesa, CA - #A30753.45621)		
Roadless areas in the National Forests covered by the Northwest Forest Plan. (Conservation/Preservation Organization, Missoula, MT - #A17234.45621)	Multiple	CA, OR, WA
My concern is primarily in protecting the existing roadless status of the tracts of the National Forests of the Rocky Mountain and Pacific Coastal provinces. (Individual, El Granada, CA - #A5061.45621)	Multiple	Multiple
The Angeles National Forest. (Individual, Altadena, CA - #A13450.10150)	Angeles	CA
Areas of Eldorado and Tahoe forests. (Individual, Carmichael, CA - #A7051.45622)	Eldorado, Tahoe	CA, NV
The Eldorado NF, near my home contains the Desolation Wilderness. . . . In the Tahoe NF, very little of the spectacular country north of Interstate 80 is protected. Those wishing to enjoy nature as it is are crammed into the Castle Peak and Grouse Ridge areas. These areas are very heavily used and as yet do not have wilderness protection. (Individual, Sacramento, CA - #A8271.45622)	Eldorado, Tahoe	CA, NV
The Tulare County Democratic Central Committee has endorsed permanent protection for the eligible roadless area in Tulare County. These include Black and State Mountain, Dennison Peak, Moses, Ripcon, Monache Meadows, Woodpecker, Freeman Peak, Split Mountain, Chico, Redwood canyon, North Fork and Mineral King, and several Bureau of Land Management Wilderness Study Areas including the Sheep Ridge and Mild Ranch areas. . . . Other areas including potential additions to the Golden Trout Wilderness and State and Black Mountain . . . Already, the Moses area has been recommended for Wilderness designation in the Mediated Settlement Agreement of July 1990. (Tulare County Democratic Central Committee, Porterville, CA - #A41226.45621)	Inyo	CA
Roadless areas in the Sierra Nevada that deserve protection may not be spared from logging and road building. For example, the Tahoe National Forest, which has nearly 3,000 miles of roads, forest activists found that Devils Canyon, which contains the largest stand of old growth trees in Nevada County, Lafayette Ridge, which also has old growth, and an area near Downieville and north of New York Ravine, which is important springs habitat to four rare subspecies of Caddis fly, could be logged and roaded because all three areas are less than 5,000 acres and may be overlooked by the Regional Forester. (Individual, Boise, ID - #A20396.45621)	Tahoe	CA
Inyo and Toiyabe National Forests. (Individual, Bridgeport, CA - #A7075.30100)	Inyo, Toiyabe	CA, NV

[Areas adjacent to] Mammoth Mountain and Heavenly [ski areas] in California. (Individual, Alta, WY - #A19643.90820)	Inyo, Lake Tahoe Basin Management Unit	CA, NV
Roadless areas surrounding Lassen Volcanic National Parks, including the Heart Lake area, on the Lassen the Medicine Lake area on the Modoc National Forest; the roadless area between Hat Creek and East Lava Rim Roads (administered by the Shasta-Trinity National Forest); the forests of the McCloud River watershed; roadless areas surrounding the Shasta Lake National Recreation Area; roadless areas in the South Fork of the Trinity River watershed on the slopes of South Fork Mountain; The New River watershed; Mt. Eddy region, and other roadless areas adjacent to the Trinity Alps Wilderness. Roadless areas throughout the Klamath-Siskiyou region, on the Shasta-Trinity, Klamath, Modoc, Six Rivers, and Lassen National Forests. (Conservation/Preservation Organization, Kelsey,	Klamath, Lassen, Modoc, Shasta-Trinity, Siskiyou, Six Rivers	CA, OR

CA - #A15815.45000)		
I have recently enjoyed the Siskiyou Mountains, and the Los Padres National Forest in California. (Individual, Sacramento, CA - #A8254.45620)	Los Padres, Siskiyou	CA, OR
Roadless areas here, including those in Los Padres National Forest and Six Rivers National Forest . . . the Trinity Alps area. (Individual, San Francisco, CA - #A3058.45620)	Los Padres, Six Rivers	CA
Mendocino National Forest. (Individual, Willits, CA - #A12242.45622)	Mendocino	CA
I particularly support permanent protection for roadless areas such as Feather Falls, Bucks Lakes, Chips Creek in the Plumas National Forest, that are eligible for such designation. (Individual, Fairfax, CA - #A4539.45623)	Plumas	CA
Sequoia National Forests and also near sequoia groves in the Giant Sequoia National Monument. (Individual, No Address - #A16299.91221)	Sequoia	CA
The Shasta-Trinity Forest of Northern California . . . the Yolla-Bolly Middle Eel Wilderness. (Individual, Providence, RI - #A11681.90523)	Shasta-Trinity	CA
Roadless areas in California are also at risk. Timber sales in the Six Rivers and Shasta-Trinity National Forests are located in the largest concentration of ancient forest in the region, including unprotected roadless areas adjacent to the Trinity Alps Wilderness. (Conservation/Preservation Organization, Nevada City, CA - #A4941.45621)	Shasta-Trinity, Six Rivers	CA
The South Kalmiopsis and North Kalmiopsis Roadless Areas (among others) in the Siskiyou National Forest of Oregon, and about the Orleans Mountain Roadless areas in the Six Rivers and Shasta/Trinity National Forests. . . . in southwestern Oregon and northwestern California. (Individual, Los Angeles, CA - #A17161.45611)	Shasta-Trinity, Siskiyou, Six Rivers	CA, OR
Glasscreek Meadow, headwaters of the Owens River. (Individual, Mammoth lakes, CA - #A3816.45621)	Sierra	CA
I am especially concerned with protection of the roadless areas in the Elk and Sixes Rivers here where I live in southwest Oregon. There are two roadless areas in these adjoining coastal rivers, the Grassy Knob and Copper Mountain Roadless Areas I fully support creation of the Copper Salmon Wilderness Area that would essentially encompass the Copper Mountain Roadless Area and extend the protection currently afforded by the existing Grassy Knob Wilderness on up the river to include the upper portion of the Elk and adjacent portions of the Sixes. (Individual, Port Orford, OR - #A27697.45621)	Siskiyou, Six Rivers	CA, OR
Six Rivers National Forest in northern California. (Individual, Edmonds, WA - #A6927.45500)	Six Rivers	CA
Stanislaus National Forest. (Individual, No Address - #A4572.90310)	Stanislaus	CA
Tahoe National Forest (TNF) . . . two of our remaining Roadless Areas, Duncan Canyon, and the North Fork of the Middle Fork American River. (Individual, Dutch Flat, CA - #A22445.91221)	Tahoe	CA, NV
The Tahoe National Forest. (Individual, Nevada City, CA - #A1595.45621)	Tahoe	CA, NV

Region 6 Pacific Northwest

Area	National Forest or Grassland	State
Roadless areas in the National Forests covered by the Northwest Forest Plan. (Conservation/Preservation Organization, Missoula, MT - #A17234.45621)	Multiple	CA, OR, WA
Areas of Montana, Idaho, and Washington, such as the Gallatin Range, the Big Belts, the Whitetail-Haystack-O'Neill Roadless Area, the White Sand and Cove-Mallard roadless areas, and the Kettle Range. (Conservation/Preservation Organization, Bozeman, MT - #A20601.45621)	Multiple	ID, MT, WA
Cover/Mallard, Selkirk Mountain Roadless Area in Idaho, the South Fork Mountain Area, Quartzite Roadless Area, Kettle Range, Tucannon, Wenatchee	Multiple	ID, WA

Creek, Dark Divide, Long Swamp, Granite Mt., Jackson/Graphite, and Mt. Bonaparte in Washington are just a few designated Roadless Areas. (Business, Spokane, WA - #A22047.45621)		
Oregon. (Individual, Gresham, OR - #A14964.90110)	Multiple	OR
Oregon's National Forests. . . . Moose Creek Roadless Area of Pelican Butte. (Individual, Eugene, OR - #A14267.45621)	Multiple	OR
1.9 million acres of roadless areas in Oregon. (David Wu, United States Representative, Oregon, Washington, DC - #A15553.10150)	Multiple	OR
North and South Santian areas and lakes, Brietenbush River, Willamette Rivers, Siuslaw, Rogue and Umpqua Rivers, Nestuoca, Columbia, Clackamas. . . . the McKenzie. (Individual, Corvallis, OR - #A14589.45621)	Multiple	OR
Oregon. . . . Larch Mountain, Eagle Creek, and the Malheur River Canyon. . . . the Siskiyou Crest Wilderness, Hells Canyon Wilderness and Wallawa Mountains wilderness. (Individual, Portland, OR - #A13916.45624)	Multiple	OR
For completeness, we will list all the Oregon roadless areas that we wish to see undisturbed from commercial enterprises: Mill Creek Wilderness Additions, Marble Point Roadless Area, Lord Hat Roadless Area, Beaver Creek Roadless Area, Bachelor and Coffin Mountain Roadless Area, Canyon Creek and East Detroit Roadless Areas, Mouse Creek Roadless Area, Pyramid Mountain Roadless Area, Maiden Peak Roadless Area, Eagle Creek Roadless Area, Memalouse Creek Roadless Area, Roaring River Roadless Area, Brice Creek Roadless Area, Diamond Lake Ranger District Roadless Area, Hardesty Mountain Roadless Area (30 miles from Eugene, OR my residence), Kangaroo Roadless Area, Zane Grey Roadless Area, North and South Kalmiopsis Roadless Area, and Pelican Butte Roadless Area. . . . (Individual, Eugene, OR - #A30137.45614)	Multiple	OR
Oregon's wild forests. (Susan Castillo, State Senator, State of Oregon, Salem, OR - #A23660.45320)	Multiple	OR
Throughout the Willamette Valley and Oregon. (Individual, Corvallis, OR - #A19506.45621)	Multiple	OR
Washington State . . . 716,000 acres of inventoried roadless areas. (Individual, Redmond, WA - #A27191.10111)	Multiple	WA
In Washington State, King County and the rest of the United States. (Larry Phillips, Councilmember, Metropolitan King County Council, Seattle, WA - #A5761.10150)	Multiple	WA
Forests in Washington. (Individual, East Greenbush, NY - #A8821.90110)	Multiple	WA
I would like to see the Roadless Area Rule apply to <u>ALL</u> national forests (New England, Eastern, Midwest, Western, Alaskan Tongass, and other Alaskan forests etc.) (Individual, Endeavor, WI - #A8231.45622)	Multiple	Multiple
Pristine forests of my home state of Washington such as the Kettle Range Mountains in Northeast Ferry County. (Individual, Kirkland, WA - #A4832.45621)	Colville	WA
We believe that the Roadless Rule should be amended to decrease unreasonable access. For example, it is not reasonable to bulldoze roads into old growth, and a caribou or grizzly recovery area. Yet, this is happening on the Colville and Idaho National Forests, where the Stimson Access project is being allowed to proceed, in spite of endangered species living in the access areas. (Conservation/Preservation Organization, Spokane, WA - #A18013.40200)	Colville	WA
Roadless areas in Mount-Baker Snoqualmie, Okanogan, Wenatchee, Gifford Pinchot, Colville, Umatilla, Siskiyou . . . Lewis and Clark, Jefferson, and George Washington national forests, and hold each of them in equal esteem. (Individual, Bainbridge Island, WA - #A6010.45622)	Colville, George Washington, Gifford Pinchot, Jefferson, Lewis and Clark, Mt. Baker-Snoqualmie, Okanogan, Siskiyou, Umatilla, Wenatchee	ID, OR, WA

<p>In eastern Washington the following roadless areas are in peril: Colville National Forest Twin Sisters Hoodoo Canyon Thirteen Mile Salmon Priest Additions A & B Abercrombie-Hooknose South Fork Mountain Cougar Mountain Profanity Bald Snow Grassy Top Umatilla National Forest Upper Tucannon Sheep Willow Springs. (Individual, Boulder, CO - #A15473.45624)</p>	<p>Colville, Umatilla</p>	<p>OR, WA</p>
<p>The Umpqua, and . . . the Willamette and Deschutes National Forest. (Individual, Roseburg, OR - #A19127.45621)</p>	<p>Deschutes, Umpqua, Willamette</p>	<p>OR</p>
<p>On the Gifford Pinchot National Forest, there are 97 uninventoried roadless areas greater than 1,000 acres in size. (Conservation/Preservation Organization, Olympia, WA- #A12004.45622)</p>	<p>Gifford Pinchot</p>	<p>WA</p>
<p>The Gnat timber sale—located on the Mount St. Helens National Volcanic Monument—would log parts of the 8,500-acre Clearwater Creek Roadless Area and the Smith Butte Roadless Area. . . . In addition to the Acci and Gnat timber sales, the Forest Service has prepared dozens of other sales that compromise the integrity of roadless areas, including the Alpha, Beta/Omega, Goose Egg, Johnson, Kirk, LaRoux, Limbo, Lock, Swell, Silver Watch, Upper Greenhorn, Upper Iron, and Willame timber sales. (Conservation/Preservation Organization, Olympia, WA - #A12004.45320)</p>	<p>Gifford Pinchot</p>	<p>WA</p>
<p>Examples of other proposed roadless area timber sales in Region 6 include: Gifford Pinchot, Aloha, Cispus Flats, Dark Canyon, Johnson, Kirk, La Roux, Limbo, Omega, P/B, Papa Bare, Swill, Upper Iron Creek, Upper Greenhorn, Mt. Hood, Salmonberry, Umpqua, Felix. (Individual, Cottage Grove, OR - #A27337.45626)</p>	<p>Gifford Pinchot</p>	<p>WA</p>
<p>29,000-acre roadless area near Portland in southwest Washington. (Individual, Portland, OR - #A1736.90520)</p>	<p>Gifford Pinchot</p>	<p>WA</p>
<p>Dark Divide, Pompey, Siouxan, Silver Star, Bourbon, Big Lava Bed, Horseshoe, Dixon Mountain, Strawberry, Spencer Ridge, Bear Creek, South Midway, West Mount Adams, Gotchen Creek, Red Lake, Red Mountain, Backbone, Cortwright, Deer Creek, Walupt, Chambers, Packwood Lake, Angry Mountain, Coal Creek Bluff, Carlton Ridge, Laughingwater, White Pass, and Tumwater. (Individual, Vancouver, WA - #A5724.45620)</p>	<p>Gifford Pinchot</p>	<p>WA</p>
<p>The Red Lake and Red Mountain (RARE II # 6076). . . . these two parcels are adjacent and contiguous to the existing Indian Heaven Wilderness Area. (Conservation/Preservation Organization, Lyle, WA - #A13303.45620)</p>	<p>Gifford Pinchot</p>	<p>WA</p>
<p>The inventoried roadless areas within the Mount St. Helens National Volcanic Monument should come under the protection of the Roadless Area Conservation Rule: Mount Margaret, St. Helens, and Kipuka. (Individual, Vancouver, WA - #A5724.45621)</p>	<p>Gifford Pinchot</p>	<p>WA</p>
<p>Include the Mt Baker/Snoqualmie and Gifford Pinchot National Forests in Washington. (Individual, Seattle, WA - #A16860.45622)</p>	<p>Gifford Pinchot, Mt. Baker-Snoqualmie</p>	<p>WA</p>
<p>Middle Fork Snoqualmie Valley, the rugged South Cascades' Rock Creek, Myrtle Lake and Chelan roadless areas, Eastern Washington's Entiat, the soothing Mad River country, the amazing Dark Divide, the high elevation Kettle</p>	<p>Gifford-Pinchot, Wenatchee</p>	<p>WA</p>

Range, the wildlife rich, upper Tucannon, and in the Olympics, the lush Upper South Fork Skokomish River Valley. (Individual, Seattle, WA - #A4835.45621)		
Also, the Kalmiopsis . . . in Oregon. . . (Individual, Los Angeles, CA - #A19087.45622)	Siskiyou	OR
The Klamath-Siskiyou area. (Individual, Medford, OR - #A12075.90110)	Klamath, Siskiyou	OR
Klamath-Siskiyou ecoregion. (Conservation/Preservation Organization, Ashland, OR - #A20421.45310)	Klamath, Siskiyou	OR
The roadless areas in eastern Oregon. . . Greenhorn Mtn, Twin Mtn Myrtle-Silvies, Dixie Butte, Nipple Butte, Malheur Canyon, Utley Butte, Fox Creek, Aldrich Mtn, Dry Cabin, McClellan Mtn, Glacier Mtn, Pine Cr, Canyons (Ocheco), Flay Cr, North Fork Malheur, Lookout Mtn. (Individual, Bend, OR - #A21667.45621)	Malheur	OR
The Nature Conservancy of Washington recently acquired 387 acres along White Creek, which feeds into one of the Skagit's major tributaries, the Sauk River . . . Our purchase protects the majority of the portion of this watershed that lies outside the national forest boundary, and we are working to protect the remaining portion of the stream. . . The extraordinary health of this tributary is due to the fact that the upper watershed is almost solely contained within a roadless area of the MBSNF. (Conservation/Preservation Organization, Seattle, WA - #A21904)	Mt. Baker-Snoqualmie	WA
The Columbia Gorge Wilderness and Clackamas Wilderness. (Individual, No Address - #A13930.45621)	Mt. Hood	OR
The northwest side of Mt. Hood. . . From the wilderness boundary westward into the Bull Run Watershed. (Individual, Portland, OR - #A1337.90523)	Mt. Hood	OR
Our family has spent a fair amount of time in the Roaring River Roadless Area. This beautiful area deserves protection and offers so many benefits with its quality river, forests, and diversity of life. (Individual, Portland, OR - #A13938.45621)	Mt. Hood	OR
Please protect our remaining roadless areas in Oregon, especially Roaring River and Helso. (Individual, Portland, OR - #A41509.45621)	Mt. Hood	OR
The proposed Roaring River Wilderness in the Mt. Hood National Forest (Estacada Ranger District). (Individual, Portland, OR - #A13942.45622)	Mt. Hood	OR
Unroaded areas in the Mt. Hood, Willamette and Umpqua National Forests. (Individual, Eugene, OR - #A24155.45310)	Mt. Hood, Umpqua, Willamette	OR
Here in Oregon, areas such as the Roaring River and Twin Lakes roadless areas in the Mount Hood National Forest, Hardesty Mountain in the Willamette National Forest, and Pelican Butte in the Winema National Forest. (Conservation/Preservation Organization, Portland, OR - #A21669.45622)	Mt. Hood, Willamette, and Winema	OR
On the Olympic Peninsula the few remaining roadless areas around the National Park. (Individual, Sequim, WA - #A6258.50000)	Olympic	WA
Inventoried roadless areas in Olympic National Forest . . . Upper Skokomish, South Quinault Ridge, Moonlight Dome, Lightning Peak, Jefferson Ridge, Jupiter Ridge, Green Mountain, Mount Zion, Quilcene, and Rugged Ridge. (Individual, Bainbridge Island, WA - #A6010.45622)	Olympic	WA
Washington State . . . the Olympic Peninsula. The history of reducing the size of the original 2 million acre Olympic Forest Reserve, created in 1897, is a heartbreaking story of unhindered natural resources consumption without regard to sustenance and long term protection of our forest resources. From a low of 300,000 acres, following President Wilson's slashing the size of the Mount Olympus National Monument during World War I, we have slowly but steadily increased the number of protected acres. The USFS Roadless initiative will continue the positive public policy embodied in the Olympic National Park designation in 1938, addition of the ocean beaches to the Park in 1953 and the Olympic National Forest Wilderness designation activities of 1984. (Individual, Vashon, WA - #A4545.45611)	Olympic	WA

Oregon . . . McDonald Peak Roadless Area. (Individual, Ashland, OR - #A18705.45621)	Rogue River	OR
<p>Comment specific to Southern Oregon. Rogue Valley Audubon Society wishes to emphasize several vitally important roadless areas in southern Oregon.</p> <p>–Pelican Butte (Winema National Forest) . . . It provides cold, pure water to Upper Klamath Lake and thus into the Klamath Basin National Wildlife Refuge complex, one of the most important waterfowl migration areas in North America. . . .</p> <p>–McDonald Peak (Rogue River National Forest)—this area is also threatened by ski development, in this case a proposed expansion of the Mt. Ashland Ski Area. The McDonald Peak area, along with nearby roadless areas (Wagner Gap, Condrey Mountain, and Kangaroo) form a critical biological connectivity zone along the Siskiyou Crest, passing high-elevation species between the Cascades to the east and other ranges of the Klamath-Siskiyou Bioregion to the west.</p> <p>–Rough and Ready Creek (Siskiyou National Forest)—this area, part of the huge 105,000 acres South Kalmiopsis roadless area, is internationally known as a center of plant biodiversity. . . .</p> <p>–Copper Salmon (Siskiyou National Forest) . . . the headwaters of the Elk River. (Conservation/Preservation Organization, Ashland, OR - #A30398.45621)</p>	Rogue River, Siskiyou, Winema	OR
The South Kalmiopsis and North Kalmiopsis Roadless Areas (among others) in the Siskiyou National Forest of Oregon, and about the Orleans Mountain Roadless areas in the Six Rivers and Shasta/Trinity National Forests. . . . in southwestern Oregon and northwestern California. (Individual, Los Angeles, CA - #A17161.45611)	Shasta-Trinity, Siskiyou, Six Rivers	CA, OR
Six Rivers and Shasta-Trinity National Forests located in the largest concentration of ancient forests in the region and including unprotected roadless areas adjacent to the Trinity Alps Wilderness, near my home in southern Oregon. (Individual, Ashland, OR - #A23399.45622)	Shasta-Trinity, Six Rivers	CA, OR
Please protect our Siskiyou—Cascade Monument. (Individual, Gold Hill, OR - #A15303)	Siskiyou	CA, OR
I have visited one of these roadless areas, Wasson Creek in the Coast Range of Oregon. (Individual, Eugene, OR - #A19263.45621)	Siskiyou	CA, OR
Roadless Areas on the Siskiyou National Forest. (Individual, Grants Pass, OR - #A30000.45100)	Siskiyou	CA, OR
<p>The following roadless areas on the Siskiyou National Forest. . . . These inventoried roadless areas are:</p> <p>South Kalmiopsis . . . North Kalmiopsis . . . Kalmiopsis Additions . . . Shasta Costa—Steep slopes, major tributary to Rogue River . . . Windy Valley . . . Squaw Mountain . . . Briggs . . . Kangaroo - National Recreation Trail . . . Copper Mountain—Proposed Copper Salmon wilderness . . . Packsaddle . . . Mount Emily—Important salmon runs and contributor of quality water to Chetco River (Individual, Cave Junction, OR - #A1711045621)</p>	Siskiyou	CA, OR
Roadless Areas in the Kalmiopsis/Wild Rogue, Elk River/Grassy Knob, Red Butte, and High Siskiyou in southwestern Oregon. (Individual, Cave Junction, OR - #A5950.50000)	Siskiyou	CA, OR
The Wild & Scenic Elk River located in the Powers Ranger District of the Siskiyou National Forest. . . . fully protect the Copper Mountain Roadless Area, the proposed Copper Salmon Wilderness, and all presently unroaded areas of the Elk River watershed. (Individual, Portland, OR - #A22094.45621)	Siskiyou	CA, OR
The range that is known as the Josephine Sheet . . . the South Kalmiopsis and North Fork Smith (and other smaller, associated) roadless areas. (Conservation/Preservation Organization, Cave Junction, OR - #A17235.50500)	Siskiyou	CA, OR
I am especially concerned with protection of the roadless areas in the Elk and Sixes Rivers here where I live in southwest Oregon. There are two roadless areas in these adjoining coastal rivers, the Grassy Knob and Copper Mountain	Siskiyou, Six Rivers	CA, OR

Roadless Areas. . . . I fully support creation of the Copper Salmon Wilderness Area that would essentially encompass the Copper Mountain Roadless Area and extend the protection currently afforded by the existing Grassy Knob Wilderness on up the river to include the upper portion of the Elk and adjacent portions of the Sixes. (Individual, Port Orford, OR - #A27697.45621)		
In Siuslaw National Forest: Township 15S, Range 8W section 33, and Township 16S, Range 8W, sections 4 and 5. (Individual, Deadwood, OR - #A881.45621)	Siuslaw	OR
The Siuslaw and Willamette National forests. (Individual, Eugene, OR - #A3657.45622)	Siuslaw, Willamette	OR
Wildwood National Forest Park and Tryon Creek State Park. (Individual, Gresham, OR - #A14376.45000)	Tryon Creek State Park, Wildwood National Forest Park	OR
The “Lost Forest” in the southeast area of Oregon. (Individual, Gladstone, OR - #A14249.90130)	Umatilla	OR
The Umpqua’s designated roadless areas. (Individual, Queensbury, NY - #A4963.45622)	Umpqua	OR
Cottage Grove Ranger District of the Umpqua National Forest. . . . The areas such as those around Mt. June, Cedar Creek and Fairview Creek. (Individual, Cottage Grove, OR - #A6241.45621)	Umpqua	OR
Places like the Mt. Bailey roadless area, the largest unprotected roadless area on the Umpqua National Forest. (Individual, Roseburg, OR - #A1497.45622)	Umpqua	OR
Umpqua National Forest. . . . In particular, in the Umpqua National Forest the large roadless area west and north of Diamond Lake. . . . the roadless area west of Boulder Creek Wilderness and north of Highway 138. . . . roadless areas just south of the North Umpqua River on the western edge of the national forest. (Individual, Glide, OR - #A22303.45622)	Umpqua	OR
The McKenzie River basin. (Individual, Portland, OR - #A14265.45621)	Umpqua, Willamette	OR
Please leave areas such as Eagle Wilderness in northeastern Oregon as it is. (Individual, No Address - #A23521.45621)	Wallowa-Whitman	OR
Wenatchee National Forest. (Individual, Claremont, CA - #A15513.90520)	Wenatchee	WA
The Mad River country in the Wenatchee National Forest. (Individual, Seattle, WA - #A16824.45621)	Wenatchee	WA
Mission/Sand Creek Watersheds 1. Devil’s Gulch Roadless Area Ingalls Creek Watershed 2. Ingalls Creek 3. Wedge Mountain Icicle River Watershed 4. Snow Creek Cle-Elum Ranger District 5. Mt. Cashmere 6. Trout Creek 7. Icicle Ridge Nason Creek watershed 8. Chiwaukum Creek 9. White Pine 10. Nason Ridge White River & Little Wenatchee 11. Smith- Brock 12. Little Wenatchee 13. Canyon Creek Roadless Area Chiwawa River Watershed 15. Chiwawa 16. Rock Creek Entiat River Watershed 17. Myrtle Lake Roadless Area (10,918 acres)	Wenatchee	WA

<p>18. Entiat Roadless Area (72,526 acres) 19. Stormy Mountain Roadless Area 20. Slide Ridge Roadless Area Lake Chelan Watershed 21. South Shore 22. North Shore 23. Domke 24. Goat Rocks Adjacent (Conservation/Preservation Organization, Peshastin, WA - #A28181.45621)</p>		
<p>Bethel Ridge Roadless Area. (Individual, Peshastin, WA - #A28210.45621)</p>	<p>Wenatchee</p>	<p>WA</p>
<p>Blue Slide Roadless Area Boz Creek Roadless Area Mineral Creek Roadless Area Cooper River Roadless Area (Conservation/Preservation Organization, Peshastin, WA - #A28181.45621)</p>	<p>Wenatchee</p>	<p>WA</p>
<p>The Cornpatch Inventoried Roadless Area located on the Willamette National Forest. (Conservation/Preservation Oregon, Eugene, OR - #A21798.45621)</p>	<p>Willamette</p>	<p>OR</p>
<p>Roadless Areas in the Old Cascades/Middle Santiam of the central Willamette National Forest: Moose Lake RS, Gordon Meadows RA, Jumpoff Joe RA, Browder Ridge RA, Echo Mt. RA, Three Pyramids RA, Pyramid Creek RA and Big Meadows RA. (Conservation/Preservation Organization, Albany, OR - #A19057.45621)</p>	<p>Willamette</p>	<p>OR</p>
<p>Examples of current timber sales impacting roadless areas in the Willamette National Forest include: Moose Timber Sale, Sweet Home District, Willamette National Forest (EIS completed, Decision Notice signed). The sale includes commercial harvest in the</p>	<p>Willamette</p>	<p>OR</p>

<p>5,674 acres RARE I Moose Creek Roadless Area, which currently provides important connectivity for wildlife between the Menagerie and Middle Santiam Wilderness Areas. Moose Creek proper is eligible for designation as a Wild and Scenic River. . . .</p> <p>South Pyramid Timber Sale, Sweet Home District, Willamette National Forest (EA in scoping). . . . The Three Pyramids unroaded area is an extremely popular recreation destination and the Sough Pyramid Creek Trail travels through the heart of the planning area.</p> <p>Helldun Timber Sale, Middle Fork District, Willamette National forest (EA completed, currently offered as replacement volume to Scott Timber). . . .</p> <p>Currently, the Helldun ancient forest is part of a 2,000-acre block of fragmented ancient forest that connects the Waldo Wilderness with the RARE II inventoried Cornpatch roadless area. Combined, these roadless areas total over 35,000 acres, one of the largest intact forests in the Middle Fork District. The timber sale calls for logging over the popular Eugene to Crest Trail and degrading the Eagle Creek special Interest Area, one of only two special interest areas in the Willamette National forest. The planning area has also been proposed as a Research Natural Area to be preserved for scientific study of its unique ecological characteristics.</p> <p>Coffin Timber Sale, Detroit District, Willamette National Forest (EA completed, Decision Notice signed, sale unawarded). While the EA for the Coffin timber sale proposed logging 2.77 mmbf from 277 acres of the Coffin/Bachelor Mountain roadless “semiprimitive area” after the decision notice was signed, the volume doubled to 5.37 mmbf. The Coffin Mountain timber sale is located within the Marys Creek Sub-basin of the upper North Santaim watershed, which contributes to the municipal drinking water supply for over 165,000 Oregonians. (Conservation/Preservation Organization, Missoula, MT - #A17234.45626)</p>		
<p>The Willamette National Forest in Oregon is particularly egregious in their drive to log late seral and old growth where ever they can and much is in roadless areas. Moose Creek above Sweet Home is a low elevation roadless area, usable over an extended part of the year, scheduled for logging. South Pyramids is a higher elevation roadless area SE of Detroit (but within the Sweet Home Ranger District) which exhibits fabulous alpine character. Trails rise to this IRA from the Middle Cascades Wilderness with logging planned all along the way!</p> <p>Helldun on the Middle Fork of the Willamette is another. Why in the world log over the Eugene-to-Crest Trail and within sight of Waldo Lake? It also forms a significant connection through the Cornpatch IRA to the Waldo Lake Wilderness Area. There are timber sales planned in the Coffin/Bachelor Mountain IRA semi-primitive area in the Detroit Ranger District. This in the city of Salem municipal water supply!</p> <p>Mt. Hood logs incredible swaths in direct view from the lodge at Mt. Hood. Tourists ask what kind of place is this! Alpine vistas show the clearcuts in stark relief in the wintertime snows: from Mt. Hood, and on public roads through the Willamette.</p> <p>Further, there are wilderness areas such as Opal Creek which are islands within a sea of either IRA or unroaded areas (many in the 1000-5000 acre range). Cummins Creek and Drift Creek on the Siuslaw where I hike every winter (rainforests aren’t rainforests unless they are wet and drippy). I hike the Olympics and North Cascades National Parks, and again roadless areas, both IRA, and unroaded areas 1000-5000 acres in size define the boundaries of these incredible areas. I hike on trails in the Leavenworth area logged over in an IRA. (Individual, Corvallis, OR - #A15303.4561)</p>	<p>Willamette</p>	<p>OR</p>
<p>Areas in Oregon such as Moose and Hardesty roadless areas. (Individual, Eugene, OR - #A24106.45621)</p>	<p>Willamette</p>	<p>OR</p>
<p>(3 Pyramids Roadless Areas) or (Browder Ridge RA in the Willamette NF) (should not be exempted from protection.) (Conservation/Preservation</p>	<p>Willamette</p>	<p>OR</p>

<p>Organization, Albany, OR - #A19057.25200)</p>		
<p>Protection of the Willamette National Forests is crucial to Salem’s water supply in addition to the protection of habitat for threatened and endangered species, biodiversity, and recreation. (Mike Swain, Mayor, City of Salem, Salem, OR - #A23678.45622)</p>	<p>Willamette</p>	<p>OR</p>
<p>Roadless areas in the Willamette National Forest in Oregon. Many are listed in Appendix C of the FEIS of the Land and Resource Management Plan. –Bull of the Wood - Steep and mountainous, trails, adjacent to Bull of the Wood Wilderness. . . . –Elkhorn . . . Phantom Natural Bridge. –Mt. Jefferson North and South . . . adjacent to Mt. Jefferson Wilderness . . . –Echo Mountain—Six peaks over 5,000 feet including Crescent Mountain and Iron Mountain trails, meadows, wildflowers. –Moose Lake . . . Moose Lake and Creek. . . . –Gordon Meadows. . . . –Mt. Washington North, West, and South . . . adjacent to existing wilderness, trails, Santiam wagon Road. –Mt. Hagan. . . . –McLennon Mountain. . . . –Chucksney Mountain. . . . –Fuji Mountain, Salmon Creek, Many Prairies, Koch, Moolack. . . . –Cornpatch. . . . –Maiden Peak . . . Gold Lake Bog. . . . –Diamond Peak North and South - Lower slopes of Diamond Peak, adjacent to wilderness, trails, Lopez Lake. –Many others outside of the Willamette National Forest: Soda Mountain, Pelican Butte, Hells Canyon, John Day, Malheur Basin, Blue Mountains, Metolius River, Upper Deschutes, Newberry Crater, Wallowa Mountains. (Individual, Eugene, OR - #A13952.45624)</p>	<p>Willamette</p>	<p>OR</p>
<p>Pelican Butte. (Individual, Klamath Falls, OR - #A3651.10000)</p>	<p>Winema</p>	<p>OR</p>
<p>Our property is bordered on three sides by the 1.1 million acre Winema National Forest. Of that 1.1 million acres a mere 32,200 acres or 2.97% would be managed under the Roadless Area Conservation Rule. It is my belief that this is not enough, especially given the fragmented and disconnected nature of roadless areas in the Winema. . . . Water quality and quantity is the most important issue in the Klamath Basin. Pelican Butte is a Tier II Watershed and is recognized as a significant source of the highest quality water entering Upper Klamath Lake. It is also a critical element in the ecological health if the Upper Klamath Marsh and Wildlife Refuge. Pelican Butte would also become the largest continuous roadless area in the Winema National Forest and must be provided the highest level of protection afforded under Roadless Area Conservation. (Individual, Klamath Falls, OR - #A4970.45622)</p>	<p>Winema</p>	<p>OR</p>
<p>We live in Washington State, at the foot of Mt. Rainer, on the northwest corner of the National Park. Surrounding the mountain inside of Park is a VIRGIN, TEMPERATE, INLAND RAINFOREST, with well over 200 inches of annual rainfall. We live on our own privately owned lands in the middle of timber company holdings, just a few miles from the entrance to the Park. There are about 50 people that live in our unincorporated area of Fairfax. We see the atrocities that are inflicted on the forests during clear-cutting and spraying of poisons. We are first-hand witnesses to this destruction, because we see it everyday. Our VIRGIN TEMPERATE, INLAND RAINFOREST in the park is being affected by industry logging RIGHT UP TO IT’S BORDER in three separate sections on the north side, seven miles of the west places. We barely have one mile of Forest Service lands as a buffer for the Park in many places.</p>	<p>Mt. Baker-Snoqualmie</p>	<p>WA</p>

Clear-cutting was drastically escalated before the salmon plan kicked in. They logged all of our seven-mile INLAND, TEMPERATE, RAINFOREST valley in just a few short years. (We have only [small] sections that are public-owned 'islands' of land in our valley, and the oldest tree farm is just 28 years old.) (Conservation/Preservation Organization, South Prairie, WA - #A28978.65200)		
I would especially be opposing any logging in the Skykomish Wild Country near INDEX. (Individual, Seattle, WA - #A41071.90520)	Mt. Baker-Snoqualmie	WA
The Late Succession Reserves of the owl region. (Individual, Redmond, WA - #A27191.45000)	Multiple	WA

Include areas identified in the Southern Appalachian Assessment. (Conservation/Preservation Organization, Santa Fe, NM - #A22092.45400)	Multiple	Multiple
National forests and ranger districts with few or no roadless areas, such as those on the Alleghany NF, Daniel Boone NF, Mississippi NF, Clinch RD and other NFs in the Deep South, Midwest, and Piedmont and Coastal Plain should designate 35-40% of the NF or RD as "roadless restoration areas" where road obliteration, stream restoration, and other ecological restoration techniques are used to return the land to a healthy and wild condition. (Individual, Roanoke, VA - #A23081.10150)	Multiple	Multiple
I would like to see the Roadless Area Rule apply to <u>ALL</u> national forests (New England, Eastern, Midwest, Western, Alaskan Tongass, and other Alaskan forests etc.) (Individual, Endeavor, WI - #A8231.45622)	Multiple	Multiple
Smaller forests such as Angelina, Davy Crockett and Sabine here in Texas. (Individual, Shiro, TX - #A5015.10152)	Angelina, Davy Crockett, Sabine	TX
Here is a list of large areas you should include in the State of Texas: Long Leaf Ridge Special Area in the Angelina NF (32,300 acres) Little Lake Creek in the Sam Houston NF (671 adjacent acres) Big Creek Wilderness Area in the Sam Houston NF (1,920 acres) Winters Bayou Scenic Area in the Sam Houston NF (1,587 acres) Beech Ravines Scenic Area in the Sabine NF (1,020 acres) Upper Colorow Creek Scenic Area in the Sabine NF (230 acres)	Angelina, Davy Crockett, Sabine, Sam Houston	TX

<p>Mill Creek Cove Research Natural Area in the Sabine NF (301 acres) Bear Creek Special Bottomland Area in the Sabine NF (665 acres) Ayish Bayou Special Bottomland Area in the Angelina NF (3,500 acres) Attoyac Bayou Special Bottomland Area in the Angelina NF (3,500 acres) Upper Angelina River Special Bottomland Area in the Angelina NF (6,100 acres) Neches River Corridors, segments 1-4 on the Davy Crockett and Angelina NFs Turkey Creek Wilderness Area (152 acres adjacent to the east) Big Woods Area of the Sam Houston NF (1,250 acres south of F.R. 202 and east of F.R. 207). (Individual, Houston, TX - #A6735.45621)</p>		
<p>We want more Roadless Areas in the National Forests and Grasslands in Texas. Only 4,000 acres were proposed in the RPR for all four Texas National Forests. All 4,00 acres proposed were in Sam Houston National Forest. No Roadless Areas were proposed for Angelina, Davy Crockett, and Sabine National Forests. (Conservation/Preservation Organization, Bellaire, TX - #A883.10150)</p>	<p>Angelina, Davy Crockett, Sabine, Sam Houston</p>	<p>TX</p>
<p>In Texas I urge to do include the following areas in the areas protected by the Roadless Area Conservation Rule: . . . Upper Coloran Creek Scenic Areas in the Sabine. (Individual, Austin, TX - #A21855.45611)</p>	<p>Angelina, Sabine, Sam Houston</p>	<p>TX</p>
<p>In Texas areas threatened by NOT going forward with the Rule are: 1. Five areas in the Angelina National Forest, more than 37,000 acres, additionally four different linear segments along the Neches River. 2. Five areas in the Sam Houston National forest, about 5,428 acres. 3. Four areas in the Sabine National Forest approximately 2,216 acres. (Individual, Dallas, TX - #A15520.45622)</p>	<p>Angelina, Sabine, Sam Houston</p>	<p>TX</p>
<p>Bankhead National Forest. (Individual, Westminster, MD - #A1254.65200)</p>	<p>Bankhead</p>	<p>AL</p>
<p>The Chattahoochee National Forest. (Individual, Decatur, GA - #A19228.91221)</p>	<p>Chattahoochee-Oconee</p>	<p>GA</p>
<p>On the Chattahoochee National Forest the following inventoried roadless areas should be permanently protected: Kelly Ridge, Mountaintown, Patterson Gap, Rabin Bald, Rock Gorge, Three Forks. (Individual, Atlanta, GA - #A11595.45622)</p>	<p>Chattahoochee-Oconee</p>	<p>GA</p>
<p>Roadless Areas in Georgia such as Kelly Ridge, Mountaintown, Patterson Gap, Sarah's Creek, and Rock Gorge. . . . Patterson Gap, headwaters of the Chattooga River. (Conservation/Preservation Organization, Ellijay, GA - #A17692.54000)</p>	<p>Chattahoochee-Oconee</p>	<p>GA</p>
<p>Here in the Southern Appalachians, where only 15.4%, or 726,000 acres, of National Forest System lands still qualify as roadless, local forest planning has similarly failed to protect roadless areas. . . . Rabun Bald roadless areas on the Chattahoochee National Forest . . . including Rabun Bald which at 4,696 feet is the second highest peak in Georgia, and the famed Bartram National Recreation Trail. . . . in Tuckaluge Creek. . . . As little as 6,000 acres of Sarah's Creek, out of the original 16,000 acres Rabun Bald roadless area, is being considered for protective prescriptions Iron Mountain in the Cherokee National Forest of Tennessee provides another example of the rapid deterioration of the roadless resource in the Southern Appalachians. This large formerly roadless tract was inventoried at approximately 14,000 acres during RARE II. The Forest Service did not recommend wilderness for the area in RARE II, and shortly thereafter conducted road construction and logging operations in the area. As a result, only a tiny segment of the Iron Mountain roadless area remained. London Bridge, a 3,041 acre tract in the northern part of Iron Mountain, has retained its roadless character and was inventoried in the SAA. According to biologists who have studied the area, London Bridge is an area of critical importance to the ecology and wildlife of the area. It is perhaps the only viable corridor for black bear to travel between the Cherokee (TN) and the Jefferson (VA) National Forests. (Conservation/Preservation Organization, Charlottesville, VA - #A15659.45624)</p>	<p>Chattahoochee-Oconee, Cherokee, Jefferson</p>	<p>GA, TN</p>

<p>George Washington and Jefferson National Forests The proposed Ernie Dickerman Wilderness Area along Shenandoah Mountain. This area of 65,000 acres, as proposed by the Forests of the Central Appalachians Project, includes the 6,519 acres of the Ramseys Draft Wilderness. . . . Radar Mountain, above Reddish Knob. . . . Seng Mountain area is home to Rowlands Creek Falls. . . . Raccoon Branch features Dickey Knob which overlooks the small community of Sugar Grove. It contains several hundred acres of potential old-growth and offers solitude with 95 percent of this area retaining unspoiled qualities. Portions of the popular Mt. Rogers NRA Crest Zone are potential additions to the Little Wilson Creek Wilderness. . . . The Crawfish Valley, also referred to as Bear Creek, contains several hiking trails, including the Appalachian Trail, and horseback riding trails. . . . Garden Mountain offers scenic views into the historic Burke’s Garden area. Twenty-four miles of the Appalachian Trail traverses the area. . . . Brush Mountain East maintains 90 percent of its scenic beauty. Nearby is the monument to Audie Murphy, a World War II hero whose plane crashed on the mountain.</p> <p>Cherokee National Forest London Bridge is an important water source for the residents of Sutherland. This 3,431 acres offer views of Doe Valley, Rogers Ridge, and Mount Rogers. Beaverdam Creek. . . . Rogers Ridge contains the Rogers Ridge Scenic Area in addition to areas north and south. . . . The Bald Mountain . . . The Appalachian Trail crosses through the area. . . . Bald River offers one 1,737 acres area as an extension to the existing Bald River Gorge Wilderness. . . .</p> <p>Pisgah and Nantahala National Forests Bald Mountains includes both Big Creek and Seng Ridge comprising 13,000 acres along the Tennessee and North Carolina border. . . . Linville Gorge Wilderness extension to the east contains the headwaters of Irish Creek and Russell Creek. The North Carolina Mountain-to-Sea Trail crosses along the western border. Upper Wilson Creek lies north of the proposed Lost Cover Wilderness. . . . Black Mountains contains several rare species and has been a top priority for wilderness designation. Jarrett Creek contains the headwaters to its namesake Jarrett Creek as well as Pritchard Creek. . . . Mackey Mountain offers black bear habitat and good trout fishing in Curtis Creek. Woods Mountain is 11,000 acres. . . . Cheoah Bald is an area of 13,000 acres containing the Appalachian Trail, Nantahala River, Nantahala Gorge, and Cheoah Bald. Wesser Bald contains the Appalachian Trail. . . . Snowbird is a top priority for wilderness designation and contains Snowbird Creek which is a wild and scenic river candidate.</p> <p>Francis Marion and Sumter National Forests Elliott Rock I and II potential Wilderness areas. These 2000 acres contain a critical watershed for the Chattooga River. . . . Rock Gorge is 11,000 acres (6,500 acres in South Carolina and 4,500 acres in Georgia) of virtually undisturbed, wild land. It contains several trails and waterfalls including an 80 foot waterfall along King Creek. . . . Hell Hole Bay Wilderness 890 acres extension to the south. Little Wambaw Swamp Wilderness 530 acres extension west to Wambaw Swamp Wilderness.</p>	<p>Chattahoochee, Cherokee, Francis Marion, George Washington, and Nantahala, Pisgah, Sumter, Jefferson</p>	<p>Multiple</p>
--	---	-----------------

<p>Chattahoochee National Forest Rock Gorge is 11,000 acres (6,500 acres in South Carolina and 4,500 acres in Georgia). . . . The Rabun Bald area. . . . Patterson Gap is a rugged area of many high peaks including Wolf Knob, 3,979 ft. elevation. Persimmon Creek and Howard Branch provide wild trout . . . Kelly Ridge-Moccasin Creek contains Moccasin Creek. . . . Springer Mountain is the main feature of this 12,000 acres. It serves as the southern terminus of the Appalachian Trail. Mountaintown. . . . (Conservation/Preservation Organization, Roanoke, VA - #A10565.45624)</p>		
<p>We note that, relative to total woodlands in Tennessee, roadless area of the Cherokee National Forest make up only one-half of one percent. We urge its protection from future fragmentation, and similar protection of all the now designated areas in all our national forests. (Civic Group, Mountain Home, TN - #A28695.45622)</p>	Cherokee	TN
<p>Devil's backbone near the Hartford exit of I-40. (Individual, Knoxville, TN - #A2377.13212)</p>	Cherokee	TN

National forests in New England and Eastern US. (Individual, Southold, NY - #A6562.90110)	Multiple	Multiple
We were pleased that the final rule included roadless areas identified in the Southern Appalachian Assessment in the definition of inventoried roadless areas. However, the definition still omits many roadless areas both in the Southern Appalachians and elsewhere that have never been inventoried for one reason or another. Some areas, such as Dolly Sods in West Virginia and Lamb Brook in Vermont, were acquired by the Forest Service after the 1979 RARE II inventory and have not been inventoried in a forest plan or regional assessment. In Washington State, omitted roadless lands include entire areas such as Lookout Mountain (12,000 acres), lands adjacent to inventoried roadless areas such as Granite Mountain (27,000 acres), and lands adjacent to designated wilderness such as the Alpine Lakes Wilderness (75,000 acres). While it may not be possible to evaluate such areas in the final EIS, we recommend that the final policy direct the Forest Service to accord them interim protection and to include them in the roadless area inventory through project or plan revision processes. (Conservation/Preservation Organization, Missoula, MT - #A21359.45624)	Multiple	Multiple
Allegheny National Forest. (Individual, Aliquippa, PA - #A135.90520)	Allegheny	PA
Chippewa, Superior, and the Chequamegon-Nicolet. . . . National Forests east of the Mississippi will not be protected by the Roadless initiative. The Chippewa National Forest has NO roadless areas. The Superior, with 60,000 acres and the Chequamegon-Nicolet with 69,000 acres must have better protections not less protection. (Individual, Lake Tomahawk, WI - #A29653.45320)	Chequamegon-Nicolet, Chippewa, Superior	WI, MN
Roadless areas, here in Wisconsin. (Individual, Madison, WI - #A14290.65280)	Chequamegon-Nicolet	WI
The Leroy Creek area, adjacent to the Whisker Lake Wilderness, is considered to be the last big block of forest on the Nicolet National Forest. . . . Log Creek on the Great Divide district of the Chequamegon National Forest. (Individual, Lake Tomahawk, WI - #A29653.45100)	Chequamegon-Nicolet	WI
As for Wisconsin, there is very little left. Of the 69,000 acres of inventoried roadless area, all of it allows road construction. In fact, a recent timber sale, the Salvage Blowdown project, on the Eagle River-Florence District in the Tipler/Trout Springs area logged within one of the inventoried roadless areas. Comments raised were dismissed due to the fact logging in that area has gone on ever since RARE II came out. Wisconsin is a perfect example of why this area needs to be protected. Out of 1.5 million acres of National Forest land, only 43,000 acres is wilderness. (Individual, Lake Tomahawk, WI - #A29653.45620)	Chequamegon-Nicolet	WI
Wisconsin's Chequamegon-Nicolet National Forest. (Conservation/Preservation Organization, Nevada City, CA - #A4941.45621)	Chequamegon-Nicolet	WI
The Leroy Creek area, adjacent to the Whisker Lake Wilderness, is considered to be the last big block of forest on the Nicolet National Forest. And yet logging can occur in this area at any time. Outstanding trout streams, such as Log Creek on the Great Divide district of the Chequamegon National Forest should be permanently protected so that this resource is not degraded by logging, road building, and attendant sedimentation. (Individual, Minneapolis, MN - #A10523.45622)	Chequamegon-Nicolet	WI
Minnesota . . . home to the Superior and Chippewa National Forests. (Individual, Minneapolis, MN - #A8000.10111)	Chippewa, Superior	MN
In the Laurel Fork Area of the George Washington National Forest. . . . The Devil's Fork Area of the Jefferson National Forest. (Conservation/Preservation Organization, Johnson City, TN - #A20341.90720)	George Washington, Jefferson	VA, WV
60 million acres of wilderness around Glastonbury Mountain, Romance Mountain, and Lamb Brook. (Individual, Norwich, VT - #A15153.45624)	Green Mountain	NY, NY

Protect Taconic Mountain area in the Green Mountains National Forest in Vermont. (Individual, Waterbury, VT - #A15433.45430)	Green Mountain	VT

I urge you to protect Camp Hutchins, Burke Branch, and Ripple Hollow in the Shawnee National Forest as well as all other National Forests throughout our country. (Mike Quigley, Commissioner, Cook County Board of County	Shawnee	IL

Commissioners, Chicago, IL - #A4848.45621)		
Include all Wilderness areas in Illinois Shawnee Forest into the Roadless category, including adding Camp Hutchins. The Camp Hutchins Wilderness area, located in the Shawnee National Forest, currently does not have protection from the Rule. (Conservation/Preservation Organization, Alton, IL - #A13847.45622)	Shawnee	IL
The Superior National Forest in Northern Minnesota. (Individual, Clear Lake, IA - #A8886.45622)	Superior	MN
Boundary Waters Canoe Area of northern Minnesota. (Individual, Nashville, TN - #A12704.10111)	Superior	MN
Boundary Waters (BWCAW) and Quetico Provincial Park. (Individual, Delaware, OH - #A6096.45621)	Superior	MN
Minnesota is threatened by the lifting of the roadless ban on certain forms of logging. On the LaCroix district, the district ranger implemented a timber sale adjacent to a roadless area. . . . The Mississippi Creek area on the Gunflint District . . . areas, such as Cabin Creek and Phantom Lake, are not even wanted for timber production. The Crescent Lake Timber sale, approved last year on the Tofte District, implemented logging in the Brule Lake-Eagle Mountain RARE II area. . . . Kawishiwi Lake area. . . . area around Baldpate Lake. (Conservation/Preservation Organization, Minneapolis, MN - #A7116.45621)	Superior	MN
The value of protecting these special places is real. Here in Minnesota, for example, some of the inventoried roadless areas would, if kept roadless, provide important buffers to the Boundary Waters Canoe Area Wilderness. (Individual, Minneapolis, MN - #A30387.90110)	Superior	MN
New England. . . the WMNF [White Mountain National Forest]. . . land in the Wild River watershed. . . areas around the Caribou-Speckled Wilderness especially the unprotected portion of the valley of the West Branch of Pleasant River . . . the Pemigewasset Wilderness . . . the Sandwich Range Wilderness, the Presidential Range-Dry River Wilderness, the Great Gulf Wilderness, the Kilkenny area . . . Carr Mountain and Kinsman-Gordon Pond. (Individual, Lincoln, NH - #A5640.45624)	White Mountain	NH, ME
New Hampshire's White Mountains. (Individual, Keene, NH - #A5931.45621)	White Mountain	NH, ME
New England White Mts. (Individual, Weston, MA - #A4927.45622)	White Mountain	NH, ME
White Mountains National Forest in Maine and would like to see the Forest protected also. (Individual, Eclectic, AL - #A1390.45621)	White Mountain	NH, ME
I am familiar with the Wild River Roadless Area in the White Mountain Forest. I would like to see it protected under the Roadless Rule. (Individual, Salem, NH - #A8263.45621)	White Mountain	NH, ME
New Hampshire. (Individual, Rindge, NH - #A4812.90130)	White Mountain	NH, ME

Region 10 Alaska

The Alaska National Wildlife Area and the Tongass National Forest. (Individual, Newtown, A - #A19257.45621)	Alaskan National Wildlife Area, Tongass	AK
The Arctic National Wildlife Refuge. (Individual, Evergreen, CO - #A28071.45100)	Arctic National Wildlife Refuge	AK
Chugach National Forest in Alaska. . . . The Nellie Juan Wilderness Study Area, the College Fjord Wilderness Study Area, and especially the Copper River Delta. (Individual, Minneapolis, MN - #A8375.45624)	Chugach	AK
The Kenai Peninsula portion of the Chugach. (Conservation/Preservation	Chugach	AK

Organization, Anchorage, AK - #A17358.90130)		
The eastern Copper River delta. (Conservation/Preservation Organization, Cordova, AK - #A23229.45622)	Chugach	AK
Alaska. (Individual, Anchorage, AK - #A6640.45620)	Chugach, Tongass	AK
Southeast Alaska. (Individual, Juneau, AK - #A17173.90520)	Chugach, Tongass	AK
Protection of the Arctic. (Individual, Lopez Island, WA - #A15240.12120)	Chugach, Tongass	AK
Tongass and Chugach National Forest. (Individual, Juneau, AK - #A11676.45623)	Chugach, Tongass	AK
The western portion of our Chugach National Forest, including all of the Forest located on the Kenai Peninsula. . . . the Prince William Sound portion of the Chugach National Forests and the Tongass National Forest. (Conservation/Preservation Organization, Anchorage, AK - #A17358.45622)	Chugach, Tongass	AK
In the Tongass Forest, the Gravinas Forest, and the magnificent Chugach National Forests, or the beautiful Northwest Pacific Forests! (Individual, Melvindale, MI - #A30286.45622)	Chugach, Tongass	AK
An area in particular need of protection is the Tongass National Forest. . . . the Tracy Arm/Ford's Terror Wilderness Area. (Individual, No Address - #A2542845621)	Tongass	AK
Chugach and Tongass Nat. Forest. (Individual, Chugiak, AK - #A24467.45622)	Tongass	AK
In the Tongass National Forest, I urge roadless status for Berners Bay and other mainland areas north to the Chilkat Peninsula. (Individual, Anchorage, AK - #A30607.45621)	Tongass	AK
Protecting all roadless wildlands on the Tongass under the roadless policy would prevent costly and environmentally damaging state highway construction proposals. Instead of investing limited resources into construction of roads like those up the rugged Lynn Canal from Juneau to Skagway, from Sitka to Baranof Warm Springs, across the Cleveland Peninsula, or up the Bradfield Canal to Canada, devote those scarce funds to improving the most natural and cost-effective transportation route in Southeast Alaska-the Alaska Marine Highway System. (Conservation/Preservation Organization, Juneau, AK - #A23091.90120)	Tongass	AK
Specific named areas in the Sitka Subsistence Use region are: Lisa Creek Watershed (adjacent to Katlion Native logging), Kvuzof Island compiles, Hoonah Sound watershed, Ushk Bay-poison Cove, and Northwest Baronof Planning Area. (Individual, Sitka, AK - #A1056.12440)	Tongass	AK
Areas like . . . Chicken Creek . . . Cowee Creek . (Conservation/Preservation Organization, Port Alexander, AK - #A17301.45100)	Tongass	AK
Inventoried roadless areas on the Tongass, including . . . Bostwick Inlet and Creek on Gravina Island next to Ketchikan. (Individual, Cambridge, MA - #A19185.90520)	Tongass	AK
The Tongass National Forest. (Individual, Juneau, AK - #A1159.10150)	Tongass	AK
Native University of Alaska, and Mental Health Trust land grants. (Individual, Sitka, AK - #A1056.90522)	Tongass	AK
The Taku River, and the Juneau-Skagway roads. (Individual, Juneau, AK - #A13516.45614)	Tongass	AK
Tongass National Forest areas: The entirety of Sweetwater-Honker Divide, and Upper Duncan Canal (these have had to wait for too long!), East Kuiu Island (including Reid, Alvin, and No Name Bays, and Seclusion Harbor), portions of Tenakee Inlet (including Little Seal Creek and Crab Bay and areas between Goose Flats and Long Bay as well as Saltery Bay), Saltery and Sunny Coves and Clover Bay on east Prince of Wales Island, Cape Fanshaw and Farragut Bay on the mainland near Petersburg, North Cholmondeley, Moira Sound on the east side of Prince of Wales Island, Little Seal Bay, Emerald Bay on the Cleveland Peninsula north of Ketchikan, Davies Creek, Upper Lynn Canal, St. James Bay south to Pt. Couverden on the	Tongass	AK

Chilkat Peninsula, Taku Inlet and Harbor (and Windham Head) near Juneau, the area around Port Alexander, Baby Bear Bay, Totem and Douglas Bays on Kupreanof Island, Woewodski Island in Wrangell Narrows, Crittenden Creek on the mainland near Wrangell, Virginia Lake and Creek near Wrangell. (Individual, Minneapolis, MN - #A8375.45623)		
[Footnote 1: Other areas of special interest protected in the final 1999 TLMP decision include Calder-Holbrook/Mt. Francis, East Saook Bay, Salmon Bay Lake watershed, Keete, Mabel, Kassa Inlets and Nutkwa, Southeast Mitkof, Sukkwan Island, Poison Cove, Deep Bay, Broad Finger and Broad Creeks, Crab Bay, Northwest Dall Island, East Port Camden, Southeast Rocky Pass and Kushneahin Creek.]. . . Cape Fanshaw and Farragut Bay near Petersburg; North Cholmondeley and Moira Sound areas on eastern Prince of Wales Island Little Seal Bay near Tenakee Springs; Emerald Bay on the Cleveland Peninsula; St. James Bay and Pt. Couverden near Juneau; Baby Bear Bay near Sitka; Woewodski Island near Petersburg; Canal and Hoya Creeks next to the Anan Bear Observatory; Whales Tail on Etolin Island; Virginia Lake and Mill Creek near Wrangell; Bostwick Bay and Creek on Gravina Island, and Neka Mountain near Hoonah. These areas should be protected under the roadless policy. (Conservation/Preservation Organization, Juneau, AK - #A23091.45622)	Tongass	AK
Some of these areas include: Ushk Bay, Castle River, East Kuin, Poison Cove, Deep Bay, Port Houghton, NW Dall Island, Cleveland Peninsula, Upper Tenakee Inlet . . . I urge you to protect the following important community use areas, roadless areas, (and ALL roadless areas in forests across the U.S.) in the Tongass National Forest: Moira Sound, Canal and Hoya Creeks, Whale’s Tail (Etolin Island), Crittenden Creek, Woewodski Island, Saltery Cover, Taku Inlet/Harbor, Windham Head, St. James Bay, Pt. Couverden, Upper Lynn Canal, along with the above-named areas in the Tongass Land Management Plan protected in 1999. (Individual, Douglas, AK - #A13359.45624)	Tongass	AK
The Alexander Archipelago (Tongass N.F. plus native corp. lands). (Individual, Klawock, AK- #A12005.45623)	Tongass	AK
Roadless areas, including St. John the Baptist Bay, Schulze Cove. (Individual, Sitka, AK - #A15506.45326)	Tongass	AK
The Tongass National Forest, Sky Lakes Wilderness . (Individual, Klamath Falls, OR - #A11704.45620)	Tongass	AK
Roadless Areas of the Tongass National Forest. . . . Prince of Wales Island’s remaining wild lands. . . . Local Roadless Areas that would have been protected under the 1999 TLMP now at risk include: Salmon Bay Lake; Calder-Holbrook; Honker Divide; Moira Sound; Cholmondeley Sound; NW Dahl Sound; Sukkwan Island and; Kette Inlet, Hassia Inlet, Mabel Bay and Kassa Inlet. (Conservation/Preservation Organization, Craig, AK - #A23228.45621)	Tongass	AK
Dall Island . . . Kuiu Island. (Individual, Haines, AK - #A6161.45621)	Tongass	AK
Saook Bay in Peril Strait. (Individual, Cambridge, MA - #A19185.10155)	Tongass	AK
Three-Mile on Kuiu Island Moira Sound and Cholmondeley on Prince of Wales Island Finger Mountain on Chichagof Island Cape Fanshaw on the mainland coast. Douglas on Kupreanof Island. (Conservation/Preservation Organization, Sitka, AK - #A12003.45511)	Tongass	AK
Finger Mountain sale in Tenakee Inlet. . . . The area in Goos River. (Individual,	Tongass	AK

Tenakee Springs, AK - #A5143.53100)		
Southeast Alaska. . . . Elfin Cove on the north end of Chichagof Island. (Individual, Kenmore, WA - #A6023.45621)	Tongass	AK
Inventoried roadless areas, including: #311 Chichagof, #321 Tenakee Ridge, #323 Game Creek, and #312 Trap Bay. (Vicki Wisenbaugh, City Council President, City of Tenakee Springs, Tenakee Springs, AK - #A3358.45621)	Tongass	AK
The Gravina Island Timber Sale. . . . the pristine 37,000-acre Gravina Roadless area. (Individual, San Diego, CA - #A1740.45620)	Tongass	AK
The Cleveland Peninsula . . . forest areas around Ketchikan. . . . It was extremely disturbing in the late '70s when a road was punched through from Rowan Bay on west-side of the island. This road removed Kadake Creek and the bay at its mouth which is directly across from Kake from roadless and wilderness consideration. Most of the West Side of Kuiu. . . . the Castle River on Kupreanoff Island. . . . the Peril Strait area. (Individual, Juneau, AK - #A10588.45621)	Tongass	AK
We request that all roadless areas of national forest land on Admiralty Island, including but not limited to the Mansfield Peninsula on the north end of the island, remain roadless under the Roadless Conservation Rule (Conservation/Preservation Organization, Auke Bay, AK - #A23611.45611)	Tongass	AK
Remote areas of Chichigof, Buranof and Admiralty Islands should remain roadless. (Individual, Juneau, AK - #A23200.45621)	Tongass	AK

Table F-2. Site-Specific Requests that Areas be Exempted from National Roadless Area Protection

Region 1 Northern

Area	National Forest or Grassland	State
9 million Idaho acres. (Individual, Lewiston, ID - #A30037.45611)	Multiple	ID
Montana. (Individual, No Address - #A16310.90320)	Multiple	MT
Williston Basin is a natural gas transporter, operating storage fields and over 3000 mile of pipelines throughout its traditional service territory in Montana, Wyoming, North Dakota and South Dakota. Williston has operated a transmission pipeline crossing the Little Missouri National Grasslands in North Dakota since 1930. . . . reconsider implementing this rule or exempt pipeline transportation and oil and gas development from the Roadless Initiative. (Oil, Natural Gas, Coal, or Pipeline Industry, No Address - #A29748.45610)	Multiple	MT, ND, SD, WY
Lands in North Dakota. (Range/Grazing Organization, Denver, CO - #A21358.45618)	Multiple	ND
North Dakota . . . the National Grasslands . . . western and central North Dakota. (Range/Grazing Organization, Denver, CO - #A21358.10130)	Multiple	ND
The National Grasslands and North Dakota. (Dale Patten, Commissioner, McKenzie County Board of Commissioners, Watford City, ND - #A27737.45611)	Multiple	ND
Exempt Wyoming. (Timber or Wood Products Industry/Association, Cody, WY - #A19163.45611)	Multiple	WY
The areas I am referring to are in the Tobacco Root Range and Gravelly Range areas of the Beaverhead-Deerlodge forest. . . . the Tobacco Root mountains, the Wisconsin Creek, Indian Creek, and Mill Creek . . . the Gravelly Mountains. (Individual, Tustin, CA - #A20777.45512)	Beaverhead-Deerlodge	MT
The Flathead National Forest. (Individual, Kalispell, MT- #A29631.45612)	Flathead	MT
Forest Service lands within the Little Missouri National Grasslands. (Oil, Natural Gas, Coal, or Pipeline Industry, No Address - #A29748.45610)	Little Missouri National Grasslands	ND

We don't need or want any roadless areas on the Cheyenne Grasslands. (Individual, Sheldon, ID - #A22622.45611)	Cheyenne National Grasslands	ND
--	------------------------------	----

Region 2 Rocky Mountain

Area	National Forest or Grassland	State
The National Forest lands within the State of Wyoming. . . . I will further state that at least on the Bridger-Teton National Forest, there are several supposed roadless areas which have roads in them that have been in place for 40 years or more. (Individual, Jackson, WY - #A29348.45611)	Multiple	WY
Reasons why public access to Flat Top Mountain area should be maintained at the present level. 1. FR 829 is utilized by ranchers for extensive grazing on their private lands and I suspect on leased public lands above. 2. The land has a silent beauty with vistas of the West Elk area, Fossil Ridge and Elk Mountains. The sunsets are spectacular. 3. The roads are well used, well maintained, free from erosion, unlittered, and controlled by gates and fences. 4. The area has moderate use by hunters and exclusion of this area would decrease Colorado Game Management Unit's size by about 50%, increasing pressure on other areas. 5. The area is primarily sage with some stands of conifers at higher elevations. The land is clean, free of erosion, shows no signs of scarring by illegal off road travel. 6. The area is relatively close to residential areas of Gunnison and is convenient for short visits decreasing pressure on more heavily traveled recreational areas. 7. FR 829 and FR 863 have been in use for many years, are well established and maintained, and are well marked on USFS maps. This area would not appear to fit the definition of roadless in various USDA Forest Service communications. 8. Arbitrary denial of access to this area would be a great loss to this group and to me personally as it is one of the few areas close to our home where participation in high country activities (camping, bird watching, game viewing) is possible for someone with mobility problems. (Individual, Littleton, CO - #A13845.91110)	Arapaho-Roosevelt	CO
The Flat Top Mountain area . . . FR 829 and FR 863. (Individual, Littleton, CO - #A13845.91110)	Arapaho-Roosevelt	CO
I believe that presently the Western Unites States, Colorado, and Larimer County has more than enough federal lands set aside in roadless parks and wilderness areas. (Tom Bender, Commissioner, Larimer County Board of Commissioners, No Address - #A19772.45341)	Arapaho-Roosevelt	CO
I feel that the Black Hills should be exempt from the roadless rule. (Individual, Moorcroft, WY - #A40541.45612)	Black Hills	SD, WY
During the forest plan revision process on the Black Hills National Forest, forest resources were carefully evaluated and no new areas were deemed qualified for roadless status. However, according to the roadless rule, the Inyan Kara and Sand Creek areas were designated as having roadless characteristics. We strongly support the local forest decision, and urge the removal of those two areas from roadless designation. (Mark Semlek, Chairperson, Crook County Board of Commissioners, Sundance, WY - #A15545.45611)	Black Hills	SD, WY
The Castle Peak area. (Individual, No Address - #A889.90320)	Gunnison	CO
Medicine Bow National Forest. (Business, Cheyenne, WY - #A20917.90000)	Medicine Bow-Rouff	CO, WY
The WRNF (White River) in Colorado. (Individual, Snowmass Village, CO - #A8329.90320)	White River	CO
An approximately 6,000 acre roadless area along the western boundary of the Vail (Mountain) Resort special use permit area known as South Game Creek.	White River	CO

(Special Use Permit Holder, Avon, CO - #A28852.45614)		
Inventoried roadless area in the WRNF in Eagle County, Colorado adjacent to the western boundary of the Beaver Creek Resort special use permit area known as McCoy Park. (Special Use Permit Holder, Avon, CO - #A28852.45617)	White River	CO

Region 3 Southwestern

Area	National Forest or Grassland	State
Arizona State Trust lands located within and near the local forests. (Michael E. Anable, Commissioner, Arizona State Land Department, Phoenix, AZ - #A17678.91110)	Multiple	AZ
The Pecos area . . . areas of the high forest in New Mexico. (Individual, No Address - #A5360.90000)	Multiple	NM
Carson National Forest Plan concerning Sipapu Ski Area. . . . counties in northern New Mexico. (Special Use Permit Holder, Vadito, NM - #A28970.45624)	Carson	NM
Sipapu Ski Area. . . . Taos and Mora counties. (Special Use Permit Holder, Vadito, NM - #A28970.45624)	Carson	NM
The Roadless Area Initiative has been said to be insignificant on the Cibola and Gila national forests in terms of total acres to be withdrawn from multiple use. In fact the Forest Service proposed Roadless designations in Catron County are significant for several reasons. The national forest non-multiples use (Roadless, wilderness, protected threatened and endangered species) areas in Catron County already consume well over half of the national forests in the County. The net consequences could result in less than 20% of the National Forest remaining accessible to multiple use, the statutorily mandated land use for national forests. Catron County and southern New Mexico is a fast growing region of the southwest. People who live and move into this region utilize the multiple uses of the national forest-the very forests that are proposed to be withdrawn. The existing Cibola and Gila national forest roads provide a vital service to our citizens and visitors who travel through the national forest by vehicle. The number one recreation activity on these forests is vehicular driving through the forest on dirt roads. It provides the most important recreation activity, driving through the national forest. Families, sportsmen, and a growing retirement and elderly population can only fully enjoy the national forest through vehicle access. (see Forest Service report: <i>Gila National Forest Recreation Market Study</i> , by Dr. Alexander J. Thal, Western New Mexico University). Timber harvests (fuel wood gathering and timber operations) have been a vital part of Catron County’s customs, cultures, and economy. The impact of the Roadless Area Initiative has yet to be determined, but its impact on future fuel wood gathering and any timber production could be significant, because it could lock up more of the forests, resulting in less than 20% of the remaining non-wilderness areas left for multiple use and future timber production in Catron County. Many of the roads used by woodcutters in the national forest could be excluded from vehicle use. (Auggie Shellhorn, Chairperson, Catron County Board of Commissioners, Reserve, NM - #A15538.45611)	Cibola, Gila	NM
The Roadless Area Initiative has been said to be insignificant on the Gila National Forest in terms of total acres to be withdrawn from multiple use. In fact the Forest Service proposed Roadless designations in Sierra County are significant for several reasons. The national forest non-multiples use (Roadless, wilderness, protected threatened and endangered species) areas in Sierra County already consume well over half of the national forest in the County. The net consequences of this current roadless initiative could result in less than 20% of the national forest remaining accessible to multiple use, the statutorily mandated	Gila	NM

<p>land use for national forests. Sierra County and southern New Mexico is a fast growing region of the southwest. People who live and move into this region utilize the multiple uses of the national forest - the very forests that are proposed to be withdrawn. (Adam Polley, Manager, Sierra County, Truth or Consequences, NM - #A22059.45622)</p>

The Manti LaSal National Forest. (Individual, Manti, UT - #A20336.90320)	Manti-La Sal	UT
<p>I believe the entire area immediately East of Ogden, Utah has been inaccurately inventoried as Roadless. There are a number of current and future roads that are now, or soon will need to be, located in this area.</p> <p>Even if boundary adjustments could be made to exclude these existing and future roads from what is being called the Burch Creek Roadless Area, I believe the resulting area, (sandwiched by private mountain land on the North, developed ski resort land on the East, Ogden City on the West, and Interstate 84 on the South,) is too small to have the characteristics that are desirable in a roadless area. With roads, mountain bike trails, ski runs, ski race buildings and mountain restaurants at the upper fringes of the Burch, Beus, Strongs, Malans and Taylor drainages and with city streets and homes less than 3 miles away on the lower fringes, a roadless designation seems to invite unnecessary conflicts with the adjoining high-density recreation and urban uses. To effectively administer this land, I believe the Ogden Ranger District should have at its disposal the full range of National Forest uses without the strictures imposed by a roadless designation. Current roads in the inventoried Burch Creek roadless area, as mapped on the FS website:</p> <ol style="list-style-type: none"> 1) The road to the Mt. Ogden Telecommunications site in Section 6 of Township 5 North, Range 1 East, Salt Lake Base and Meridian 2) The road and ski run at the top of Burch Bowl between DeMoisy Peak and Strawberry Peak in Section 8 of Township 5 North, Range 1 East, Salt Lake Base and Meridian <p>New road needed in the inventoried roadless area:</p> <ol style="list-style-type: none"> 1) a skier trail from the top of Snowbasin Resort's Strawberry Gondola north into Middle bowl. This skier road will improve skier egress from Strawberry Bowl at the end of the day, and when this road is built, it will allow the current, above ground high voltage electric line (from the top of the Mid Bowl Gondola to the top of the Strawberry Gondola) to be buried. This path is now used extensively by skiers taking the shortcut from Strawberry to Middle Bowl, resulting in a hazard as metal ski and snowboard edges cut through the insulation on the high-voltage line. A bigger hazard of not having this road (and accompanying 	Wasatch-Cache	UT

<p>underground power line) is that avalanche control charges are exploded in close proximity to the surface-power line. An unlucky avalanche charge could cut off power to the Strawberry Gondola for weeks if not months. Given the two existing roads in this “roadless” area, and the need for a third, I respectfully request that the Burch Creek Roadless area near Ogden, Utah be deleted from the map of inventoried roadless areas. (Individual, Ogden, UT - #A30540.45510)</p>		
---	--	--

Region 5 Pacific Southwest

Area	National Forest or Grassland	State
<p>The Cascade-Siskiyou National monument in southern Oregon is of great concern to the citizens of Jackson County and affected adjacent areas. We support the Jackson County Commissioners and their recommendation to reduce the monument to include only federal land in solid block ownership of approximately 16,500 acres. Boundary description – East boundary of Wilderness Study Area; West boundary Hwy 99; South boundary Oregon/California state line; North boundary south of Soda Mountain (known as Alternative B Minus). There is broad base support to eliminate this monument to protect private property rights and maintain Multiple-Use and Management. (Individual, Watsonville, CA - #A20403.45621)</p>	<p>Cascade-Siskiyou National Monument</p>	<p>OR</p>
<p>Sage Road in Laguna Mountains, San Diego. (Individual, San Diego, CA - #A12279.91110)</p>	<p>Cleveland</p>	<p>CA</p>
<p>A further remedy would be to include in any action or decision an exemption excluding all lands in the National Forest system, and as to MMSA [Mammoth Mountain Ski Area], those areas within the INF, previously identified for resort or recreation site development or expansion from consideration in the Roadless Initiative. This would include all lands within the SUP boundaries of MMSA, those identified in master development plans, those lands designated in forest plans for potential ski area development, and Management Prescriptions 13 and 14 in the INF Forest Plan. (Special Use Permit Holder, Mammoth Lakes CA - #A21901.45620)</p>	<p>Inyo</p>	<p>CA</p>
<p>It appears that the following areas are proposed to be included and subjected to the Roadless Area rules: Section 8, Township 12 North, Range 19 East, Mt. Diablo Base & Meridian; The southern portion of Section 4, Township 12 North, Range 19 East; The northern portion of Section 9, Township 12 North, Range 19 East; and The eastern portion of Section 7, Township 12 North, Range 19 East. The lands proposed for inclusion lie immediately adjacent to the 4,500 acres of land presently under Term Special Use Permits to Heavenly (permits #4056/01 and #4056/02), or adjacent to private held lands which Heavenly owns or controls. In fact, the entire area of Section 7 is already within Heavenly’s Special Use Permit boundary and is used for downhill skiing. . . . Inclusion of these areas within Heavenly’s Special Use Permit boundary (i.e., not subject to the proposed Roadless Area rules) would allow a continuous connection to be developed between a potential base area at the bottom of the slopes near the Kingsbury Grade (Nevada State Route 207), on land which Heavenly controls, and the existing resort facilities located on the Nevada side. The ability for the public to access the resort in this manner ensures that the Forest Service and Heavenly will continue to provide a high-quality public outdoor recreational experience, and, that transportation impacts to the existing road network, particularly those on the Kingsbury Grade and in the Lake Tahoe Basin are minimized by providing public access at the bottom of the hill and then transporting visitors onto national forest lands using ropeway forms of transportation. (Special Use Permit Holder, Stateline, NV - #A21708.45617)</p>	<p>Humboldt-Toiyabe, Lake Tahoe Basin Management Unit</p>	<p>CA, NV</p>

<p>Changes to rules that affect forest plan directives should seek to maintain the environmental and economic balance.</p> <p>The local forest plans in Mono and Inyo counties include consideration of local general plans. These plans were not consulted last year in the development of the roadless rule. As an example, it appears that the roadless rule would preclude development of the Sherwin Bowl Ski Area, which is a major development component of the Town of Mammoth Lake General Plan. It also appears that the rule would preclude expansions of the June Mountain Ski Area, which is contrary to the June Lake Area Plan of Mono County. (Byng Hunt, Chairperson, Mono County Board of Supervisors, Bridgeport, CA - #A18107.13110)</p>	<p>Inyo</p>	<p>CA</p>
<p>I own several parcels of land located in the Raywood Flat Area shown on the San Bernardino National Forest Inventoried Roadless Map in the far east part of Area #62 known as Raywood Flat "B". I have several structures located on my land and lease Snow Peak, which is located on the southern highest point in Section 31 T1S R2E SBBM to a communication company known as Snow Peak Communication. They have installed substantial improvements and equipment on this site since the early 1960s and service over (30) government agencies, private companies and individuals. The access to my properties is through a road known as Forestry #2S01 or Banning Canyon Rd & Raywood Flat Rd. The road has existed in some form or another since the late 1800s when the area was settled. . . .</p> <p>Other problems stem from inaccurate site specific studies of the area, the description in the above mentioned book on page C-26 (Exhibit "A"), it does not describe the two diversion dams at South & East Fork of the Whitewater River providing water through a 7 1/4 mile flume and 2 1/2 mile penstock for the Banning Heights Water Company & the City of Banning Water Supply. Also missing is the Riverside Flood Control District's weather measuring equipment and a state seismic monitoring station located at Raywood Flat on Section 31 and additionally missing is two Radio Facilities one on Snow Peak in Section 31 the other in the southwestern area of Section 21 T1S R1E SBBM near Little San Gorgonio Peak.</p> <p>I am very concerned that creating this roadless area in an area with many improvements and so much private land is just wrong and bad planning. It is clear that the original Rare II studies missed a lot of improvement and it still concluded that it did not meet roadless area inventory criteria. I am requesting to have the entire Sections 36 T1S R1E SBBM & 30 T1S R2E SBBM & the southwestern portion of Section 19T1S R2E SBBM that is not in wilderness, removed from the proposed roadless area. Also to substantially buffer the roads, flumes and penstock in Sections 1, 2 & 3 T2S R1E SBBM by at least 1/8 mile on each side of the roads, flumes and penstock centerline from the proposed roadless area. (Individual, Encinitas, CA - #A20826.45614)</p>	<p>San Bernardino</p>	<p>CA</p>
<p>The economy on the Banning Bench has developed on the basis of the water provided by the water flume and depends on the continued availability of this water. The flume, in turn, depends on the Raywood Flat and Banning Canyon Roads for its continued existence. Designating Raywood Flat Area A & B (#61 and #62) of the San Bernardino National forest to be a Roadless Area would effectively lead to the termination of the Banning Bench water supply by blocking the vehicular necessary for the continued maintenance of the flume. . . . we urge the Secretary <u>not</u> to declare these areas to be Roadless. (Utility Group/Organization, Costa Mesa, CA - #A20854.45611)</p>	<p>San Bernardino</p>	<p>CA</p>
<p>The Raywood Flat Rd. & Banning Canyon Rd are shown on existing Forestry Maps to be partially cherry stemmed from the proposed Roadless Area, but this is not enough. All the roads along with the entire water conveyance system needs to be removed from the Roadless Area starting from Banning Heights Water Tank at Pine Powerhouse all the way up to the diversion Dam at East Fork of the whitewater River. (Individual, Banning, CA - #A17655.45611)</p>	<p>San Bernardino</p>	<p>CA</p>

<p>I am sending you this letter on behalf of the Company’s Board of Directors in order to address the proposed “Roadless” designation of the Raywood Flat Area A & B (#61 and #62) of the San Bernardino National Forest in Southern California. Such a designation would impact the Raywood Flat and Banning Canyon Roads, in the counties of Riverside and San Bernardino, roads that are essential for maintaining BHMWC’s [Banning Heights Mutual Water Company] water conveyance system that diverts water from the Whitewater River watershed to the Banning Bench area adjacent to the San Gorgonio River. The Raywood Flat and the Banning Canyon Roads are used to access and service the water conveyance system that provides water to Banning Bench, a community of some 600 residents served by BHMWC, and the City of Banning (the “City” [pop. 26,000]) and also provides the hydro power for the Southern California Edison (“SCE”) San Gorgonio #1 and #2 hydroelectric project. The system included two diversion dams, two power houses, water tanks, and an approximately 14 mile long water flume. . . .</p> <p>Designating Raywood Flat Area A and Area B as a Roadless Area would seriously impair these “key principles” by not allowing for road maintenance and repairs that are periodically needed in order to enable BHMWC, the City, and SCE to have access Project 344. (Utility Group/Organization, Orange, CA - #A20944.45614)</p>	<p>San Bernardino</p>	<p>CA</p>
<p>I am sending you this letter on behalf of the City of Banning in order to address the matter of the proposed ‘Roadless” designation for Raywood Flat Area A and Area B (#61 and #62).</p> <p>The Raywood Flat and the Banning Canyon roads in the counties of Riverside and San Bernardino, California, are used to access and service an approximately 14 mile long water conveyance system that provides water to residents of Banning Bench and the City and also provides the hydro power for the Southern California Edison (“SCE”) San Gorgonio #1 and #2 hydroelectric project. The system includes two diversion dams, two powerhouses, water tanks, and a long water flume conveyance system. Historical records indicate that the original flume was constructed of wood around 1877 to provide water to the early settlers in the region, and that the current concrete flume was constructed around 1910 to provide water and generate hydroelectric power. The system is referred to by the Federal Energy Regulatory Commission (FERC) as “Project 344,” and SCE holds a FERC license to operate it for power generation.</p> <p>Some 75 years ago, the State of California adjudicated the right of the Banning Heights Mutual Water Company (“BHMWC”) and the City to divert and use the water that generates power for Project 344. The adjudicated right to divert water that BHMWC and the City hold to is very significant indeed: approximately 9,500 acre/feet per year from the whitewater River. Banning Bench, a community of some 600 residents served by BHMWC, has been almost entirely dependent on this water supply for nearly a century. Use of this water by the residents of the City (pop. 26,000) goes back at least that far. Moreover, for more than a century, the City, SCE, and BHMWC have used the roads in this area to operate, maintain and repair the flume system.</p> <p>Designating Raywood Flat Area A and Area B as a Roadless Area, would seriously endanger BHMWC’s and the City’s water supply by not allowing for the road maintenance and repairs that are periodically needed in order to enable BHMWC, the City, and SCE to have access to Project 344. Including these areas in the Roadless Area designation would only lead to inevitable problems, as the Forest Service will most likely maintain that special permission is thereafter required to repair and maintain the existing roads, and the City will out of necessity, respond by asserting its various rights to this essential right-of-way as were granted by 19th Century Federal Law. The upshot will be costly and potentially cause long delays for essential repairs to the diversion dams and water conveyance system that our community depends on.</p>	<p>San Bernardino</p>	<p>CA</p>

As to Raywood Flat B, the “Appendices” to the <i>San Bernardino National Forest Land and Resource Management Plan</i> acknowledged that further restrictive designation is not warranted. (Don Foster, City Manager, City of Banning, Banning, CA - #A20958.51210)		
The Raywood Flat Road and Banning Canyon Road are shown on existing Forestry maps to be partially excluded from the proposed Roadless Area, but this is not enough. All of the roads along with the entire water conveyance system need to be excluded from the Roadless Area, starting from the Banning Heights Water Tank at Pine Powerhouse all the way up to the Diversion Dam at the East Fork of the Whitewater River. The best approach is simply not to include in the Roadless Area any of the Sections of land that contain any roads or improvements on them or provide access to portions of the water conveyance system. (Don Foster, City Manager, City of Banning, Banning, CA - #A20958.45610)	San Bernardino	CA

The Chattahoochee and Nantahala National Forests and Black Rock Mountain State Park (GA) . . . the Chattahoochee National Forest in northeast Georgia. (Individual, Crystal River, FL - #A6257.91110)	Chattahoochee-Oconee, Nantahala	GA, NC, TN
I find the current Roadless exercise in Wisconsin to be of little value since all 15 inventoried parcels were rejected for US Federal Wilderness in 1984. I also note that 9 of the 15 USFS parcels are zoned semi-primitive motorized since	Chequamegon-Nicolet	WI

important winter corridor snowmobile trails have been on these parcels from 20 to 30 years. (Individual, Thiensville, WI - #A28617.45611)		
Wisconsin’s Department of Natural Resources recommends that the rule not be implemented as drafted. The Department is in favor of protecting and managing roadless areas as a component of the National Forest system. There are sensitive and unique areas in Wisconsin that could benefit from more road exclusion or limited road access but they should be identified and managed based on current ecological, economic and social values specific to each site. (Wisconsin Department of Natural Resources, Madison, WI - #A28775.45611)	Chequamegon-Nicolet	WI
Hiawatha National Forest. (Individual, Christmas, MI - #A6694.45611)	Hiawatha	MI
The Shawnee National Forest . . . old roads and trails in the Hoosier National Forest and the James D Wilderness in Indiana. (Individual, 22318.45611)	Hoosier, Shawnee	IL, IN
Our major concern lies with the decisions that affect the White Mountain National Forest that occupies approximately thirteen percent of the State of New Hampshire. We see an annual a loss of about twenty thousand acres of forest and field to development across the State. As this trend continues there is an ever increasing demand for outdoor recreational activities, including hunting and fishing on our public lands. There is a simultaneous effort on the part of some individuals and groups to reduce the opportunity for quality hunting or related wildlife enjoyment be removing the opportunity to manage vegetation in a way that enhances habitat quality for a majority of the game and non-game species found in New Hampshire and in the White Mountains. Over fifty percent of the White Mountain National Forest, under its current management plan, has been withdrawn from vegetative management. The roadless areas designation process has the potential to significantly increase that percentage as part of the current revision process. It is imperative that the ability to manage habitat through the use of commercial timber sales and through non-commercial applications be retained on these lands if the future needs of the wildlife enthusiasts in New Hampshire are to be met. Table F-3. Site-Specific Requests that areas be Recommended/Designated as Wilderness

Area	National Forest or Grassland	State
All roadless areas including those encompassed in the Northern Rockies Ecosystem Protection Act to and including, one thousands acres in size should be protected to preserve their wilderness character and eligibility for congressional Wilderness designation, rather than being deferred later to the forest planning process. (Individual, Elmhurst, IL - #A15290.45320)	Multiple	ID, MT, WY
I'm looking to you to <u>save</u> wilderness areas in the Yellowstone region. (Individual, Corte Madera, CA - #A10851.45621)	Multiple	ID, MT, WY
By law, new wilderness area recommendations must be proposed by the Forest Service to Congress during the forest plan revision process for possible new wilderness legislation. The 1.9 million acres of inventoried roadless areas in Oregon, plus the remaining 2.9 million acres of unprotected roadless areas on Forest Service and BLM lands should be designated as wilderness through a comprehensive statewide forest wilderness bill. (Individual, Blue Lake, CA - #A3671.25000)	Multiple	OR
Those areas adjacent to the existing High Uintas Wilderness and other wilderness areas should definitely be proposed for wilderness designation. (Individual, Dutch John, UT - #A25600.45622)	Ashley, Wasatch-Cache	UT
For instance, on the Carson National Forest significant roadless lands border the Pecos, Wheeler Peak and Cruces Basin Wilderness areas. Protecting these lands and recommending them as additional wilderness makes common sense. On the Santa Fe National Forest, inventoried roadless areas border the Pecos and Dome Wilderness areas and significant portions of the Jemez Mountains contain roadless areas. Protecting these roadless lands would bolster the integrity of the sensitive mountain ecosystems of New Mexico and would do much to provide wildlife movement corridors to ensure the long-term survival of the state's unique fauna. (Individual, Santa Fe, NM - #A22971.45622)	Carson, Santa Fe	NM
We urge you to provide Wilderness protection for much of Alaska's Chugach National Forest. Currently, there is none. Wilderness is good business. Wilderness is sustainable. Please insist that the plan revision include Wilderness protection for the existing Wilderness Study Area, the Big Islands of Prince William Sound (Knight, Montague, and Hinchinbrook), the Copper River Delta and the Kenai Peninsula. (Conservation/Preservation Organization, Seward. AK - #A24021.25000)	Chugach	AK
The planning group of Cordova residents supports a 501(b) Recommended Wilderness-type designation for the eastern Copper River delta because of the	Chugach	AK

<p>long term protection it offers, and because it limits the type of development that degrades fish and wildlife habitat. (Conservation/Preservation Organization, Cordova, AK - #A23229.91110)</p>		
<p>These areas on the Clearwater National Forest and deserve fullest protection as a federally designated Wilderness area. They include: Weitas Creek, Mallard-Larkin Pioneer area, 5 Lakes Butte, Chamberlain. Mtn./Vanderbuilt Mtn. area, Pot Mtn., Kelly Creek and the Great Burn area, Cayuse Creek area, Fish and Hungry Creek area, North Lochsa Face area, and Freeze-out Mtn. area (on the Panhandle National Forest). (Individual, Manhattan, KS - #A4598.45624)</p>	<p>Clearwater</p>	<p>ID</p>
<p>Idaho Panhandle National Forests: (only portions in the Big Wild Ecosystem, mainly the upper St. Joe River drainage are listed—others outside the ecosystem should also be protected) <u>Mallard-Larkins</u> (see Clearwater National Forest) <u>Meadow Creek/Vanderbilt-Upper St. Joe</u> (see Clearwater National Forest) <u>Mosquito Fly—1150.</u> This area is separated from Mallard-Larkins by a dirt road. It is crucial wildlife habitat and an important fishery. Terrain is diverse and elevation changes are rapid. A recent land exchange blocked up the area in public ownership. <u>Midget Peak—1151.</u> This area borders the St. Joe River. It has steep canyons. Simmons Creek is a tributary to the fabled St. Joe River. <u>Sheep Mountain/State Line (also Lolo National Forest)—1779.</u> This area includes high alpine. terrain near the headwaters of the St. Joe river. Historic fires have made an interesting mosaic and the rugged terrain is very scenic. Several alpine lakes are found near the state line on both sides of the border. Many higher peaks dot the landscape, on and off the Bitterroot Crest. <u>Grandmother Mountain—1148.</u> This area is a popular high elevation recreation area. However, ORV use creates damage along the trails and meadows, especially around Widow Mountain. Much of the area is managed by the BLM and a corner of it drains into the St. Maries River. (Conservation/Preservation Organization, Moscow, ID - #A22654.25200)</p>	<p>Clearwater, Idaho Panhandle, Lolo</p>	<p>ID, MT, WA</p>
<p>I ask that you try to have these areas—including Baker-Snoqualmie and Gifford Pinchot—be designated wilderness areas to be regulated by Congress. (Individual, Bellingham, WA - #A21485.45622)</p>	<p>Gifford Pinchot, Mt. Baker-Snoqualmie</p>	<p>WA</p>
<p>ADDITIONS TO SELWAY-BITTERROOT WILDERNESS AREA <u>Meadow Creek/Vanderbilt and Rawhide—1302 and 1313.</u> (also Idaho Panhandle and Lolo National Forests) This is wild headwaters of both the North Fork proper and the St. Joe Rivers with isolated mountain lakes like Trail, Oregon, and St. Joe Lakes. Closure of unneeded and deteriorating road 5428 was suggested to unite this area with the Rawhide Roadless Area in the Clearwater Forest Plan appendices (page C-224). This has been done and the two areas should be considered as one roadless area. Recent land exchanges have removed the private checkerboard land formerly found in the southern part of this area. The map that shows development in this area is not as extensive as what has occurred. For example, there is a corridor along the North Fork River. These are all logical additions to the Selway Bitterroot Wilderness and many were previously included in the old Selway Primitive Area. (Conservation/Preservation Organization, Moscow, ID - #A22654.25200)</p>	<p>Idaho Panhandle and Lolo</p>	<p>ID, MT, WA</p>
<p><u>Upper Bear Creek.</u> This area, about 700 acres, has been in wilderness proposals though it was inadvertently neglected in the Nez Perce forest plan inventory. However, it appears to have been included in Bitterroot National Forest inventories as it is contiguous with the Selway Bitterroot additions on that forest (although it is in Idaho, on the Nez Perce National Forest). It is the headwaters of Bear Creek, contiguous to the Selway Bitterroot Wilderness and at the top of Lost Horse Canyon. It should be part of the Selway-Bitterroot Wilderness. (Conservation/Preservation Organization, Moscow, ID - #A22654.25200)</p>	<p>Nez Perce</p>	<p>ID</p>

<p>Hells Canyon is the deepest gorge in North America. These areas should be added to the Hells Canyon Wilderness: <u>Klopton Creek/Corral Creek and Big Canyon A—1854 and 1853 (Hells Canyon NRA)</u>. These areas were recommended for further planning in the RARE II final EIS but were not included in the inventory in the Nez Perce forest plan due to the fact they are within the Hells Canyon National Recreation Area (HCNRA) managed by the Wallowa-Whitman National Forest. <u>Salmon Face—1855</u>. This area contains spectacular scenery adjacent to the Hells Canyon Wilderness. It also contains a significant, natural cave which has created recent management controversy. The agency must do a better job protecting this area. <u>Rapid River—1922</u>. (also Payette National Forest). The Rapid River is a wild and scenic river and contains crucial anadromous fish habitat for Chinook salmon. The area is unique in that it escaped fires early in this century. it is a very popular backcountry area and should be added to the Hells Canyon Wilderness. (Conservation/Preservation Organization, Moscow, ID - #A22654.25200)</p>	<p>Nez Perce, Payette</p>	<p>ID</p>
<p><u>Secesh, Needles, and Caton Lake Roadless Areas</u> These three areas should be considered the South Fork Salmon Wilderness in three units. . . . They include the Secesh (South Fork north) west of Zena Creek and along the South Fork of the Salmon; the Needles (South Fork west) along six mile ridge and beside the South Fork of the Salmon to the north and South of Blackmare Creek; and Caton Lake (South Fork east) along the South Fork of the Salmon and the East Fork of the South Fork Salmon River. The South Fork north area is, fortunately, little threatened. This area includes the lakes portion of Twentymile Lakes, Loon, Enos, and Jungle Lakes, part of the Secesh River and the South Fork. The only area that is threatened is Loon Lake which is popular with trail bicycles. Quartz Creek on the southeast of the area is another spectacular drainage. South Fork west is another subject. Sixmile Ridge, above Krassel, has been controversial for may years because of its timber potential. Include it in the proposed wilderness and go get your timber in another place. It is sensitive because of its place adjacent to the South Fork and Fitsum and Buckhorn Creeks. In addition, the Ponderosa pine habitat is increasingly uncommon and most of this I would say is not in serious jeopardy from fire. The rest of the South Fork west region from Cly Lakes and the Lake Fork watershed and Idler drainage to Nick, Buckhorn and Backmare lakes and the creeks that drain them are shoe-ins for wilderness designation. The Buckhorn drainage is a special case and one that has recently gone from worse to better. A few years ago the main stem Buckhorn Creek “blew out” sediment in a rain on snowstorm, carrying much of the road with it. Then the Forest Service chose to close about 6 miles of the road along with pulling out culverts; the “road” is now a trail. Please include this trail in the recommended wilderness. It is roadless at least. South Fork east (including the Boise NF portion of the Caton Lake Roadless Area) is the lesser known of the South Fork roadless areas and deserves to be wholly designated as wilderness. . . . The Thunderbolt Mountain timber sale illegally cut into this area on the south. (Individual, Boise, ID - #A21369.25200)</p>	<p>Payette</p>	<p>ID</p>
<p>I strongly support protecting the following potential new wilderness areas and potential additions to existing wilderness areas, as well as potential new wild and scenic rivers. These six potential wilderness areas are within the South Fork Trinity River Watershed. The six potential wilderness areas are: Chinquapin Potential Wilderness Underwood potential wilderness Pattison potential wilderness</p>	<p>Shasta-Trinity, Six Rivers</p>	<p>CA, OR</p>

South Fork potential wilderness Yolla Bolly Middle Eel potential wilderness addition Chanchellula potential wilderness addition Eligible and potential new Wild And Scenic River sections: Upper South Fork Trinity River above Forest Glen Lower Hayfork Creek, major tributary to the South Fork Trinity River. (Individual, Orleans, CA - #A27263.25200)		
Please consider wilderness recommendations for Shoshone National Forest's roadless areas. (Individual, Dallas, TX - #A143.45620)	Shoshone	WY
The Cascade Siskiyou area has the additional resources to be a Monument due to its unique beauty. (Individual, Ashland, OR - #A14573.45620)	Siskiyou	OR
I urge you to include the King Range Nat'l Conservation area and the LOST COAST as California wilderness areas. (Individual, Santa Rosa, CA - #A21284.25200)	Six Rivers	CA
The FS should place the Mansfield peninsula under the management of AINM [Admiralty Island National Monument] and suggest to Congress it be placed in Kootznoowoo Wilderness. (Individual, Juneau, AK - #A2319.45500)	Tongass	AK
By the time the Alaska Lands bill (ANILCA) had passed in 1980, many of the most important watersheds with the largest old growth spruce and Western Hemlock had been logged. Logging and roads were extensive on Prince of Wales Island; Baranoff, Kuiu, Chicagoff and those roads were causing problems for fish spawning streams and they still are. . . . The best use of what is left of the Tongass National forest is wilderness. (Individual, Juneau, AK - #A10588.45623)	Tongass	AK
On the east slopes of the Cascades, a few Roadless Areas in particular such as Nason Ridge of Tiffany Mountain are so spectacular they should have been included in the original Wilderness Act but were taken out by pressure from timber interests. (Individual, Peshastin, WA - #A20875.45624)	Wenatchee	WA
The Roadless Rule should stand as it was written, with NO exemption for Pelican Butte, which should be added to the Sky Lakes Wilderness Area, of which it was originally intended to be a part. (Individual, Klamath Falls, OR - #A1035.45622)	Winema	OR

Table F-4. Site-Specific Requests that Areas not be Recommended/Designated as Wilderness

Area	National Forest or Grassland	State
My state of Montana has an average yearly salary of approx \$22,000 per person. We have lost logging, mining, and ranching as industries and are told we need to depend on tourists who want to "view wilderness and more wilderness." They can view what we've got. That's enough! (Individual, Kalispell, MT - #A1076.75200)	Multiple	MT
We note that in the Central Idaho Wilderness Act of 1980 (Public Law 93-312), Congress specifically stated its intent that the wilderness legislation was a comprehensive land allocation decision relative to the roadless areas. The roadless areas were allocated by Congress. Similar land allocations were made in the Oregon Wilderness Act of 1984 wherein Congress specifically reviewed the roadless areas and in turn designated the roadless lands that need to be protected for their watershed, wildlife habitat, scenic and historic, and primitive recreation values as wilderness (see "Oregon Wilderness Act of 1983, Hearings Before the Subcommittee on Public Lands, Reserved Water"). These are the same values that are now being re-evaluated. To	Multiple	OR

<p>avoid conflicts with these earlier congressional reviews and comprehensive lands allocations, we suggest that these Congressional designations be followed. (Joyce Morgan, Commissioner, Douglas County Board of Commissioners, Roseburg, OR - #A11811.25110)</p>		
<p>The advance notice of proposed rulemaking dated July 3, 2001 states “The Forest Service has been evaluating roadless areas for nearly 30 years”. While this may be true Service-wide, this effort was concluded in Wyoming with the passage of the Wyoming Wilderness Act of 1984 (Public Law 98-550). This public law states in Title II, the Congress has made its own review and examination of the National Forest Roadless Areas in Wyoming and the environmental impacts associated with alternative allocation of such areas. Section 401(b):”On the basis of such review, the Congress hereby determines and directs that - (2) the Forest and Rangeland Renewable Resources Act of 1976 (Public Law 94-588) to be an adequate consideration of the suitability of such lands for inclusion in the National Wilderness Preservation System and the Department of Agriculture shall not be required to review the wilderness option prior to the revisions of the plan, but shall review the wilderness option when the plans are revised.” Section B (3): “Areas in the State of Wyoming reviewed. . . shall be managed for multiple use in accordance with the land management plan.” Section B (5): “Unless expressly authorized by Congress, the Department of Agriculture shall not conduct any further statewide roadless area review and evaluation of National Forest System lands in the State of Wyoming for the purpose of determining their suitability for inclusion in the National Wilderness Preservation System.” (Timber or Wood Products Industry/Association, Cody, WY - #A19163.25100)</p>	<p>Multiple</p>	<p>WY</p>
<p>I am against any more Wilderness Designation in the Jackson area, we actually need more Multiple Use. (Individual, No Address - #A9003.50200)</p>	<p>Bridger-Teton</p>	<p>WY</p>
<p>The Chugach is also subject to the No-More clause of ANILCA and, as with the Tongass, must have areas set aside for intensive forestry. This is the only way to insure that resource development interest can become established and remain viable on the Chugach. (Timber or Wood Products Industry/Association, Ketchikan, AK - #A20443.25100)</p>	<p>Chugach</p>	<p>AK</p>
<p>Given Section 708(b) (4) and Section 1326(b) of ANILCA, none of the roadless areas in the national forests in Alaska should be proposed to Congress for wilderness designation. (Individual, Sitka, AK - #A12821.25240)</p>	<p>Chugach, Tongass</p>	<p>AK</p>
<p>In the Olympic area, the National Forest surrounds nearly 1,000,000 acres of the primarily roadless, Olympic National Park. In the Park, the designation of roadless areas for wilderness use has clearly been met. Further dialogue occurred in the 1984 wilderness Hearings in Washington State that designated another one million acres for these purposes, including over 100,000 additional acres in the Olympic area. Elsewhere this may not be true and the merits of designating roadless areas would need to be debated locally, on a case-by-case basis in those areas. (Larry Doyle, Mayor, City of Port Angeles, Port Angeles, WA - #A22068.45100)</p>	<p>Olympic</p>	<p>WA</p>
<p>Congress has already designated vast areas of the Tongass as wilderness or LUD II lands where development is restricted. No more areas of the Tongass should be proposed as wilderness. Balanced multiple use should be provided through the local forest planning process, and the needs of the communities dependent on the Tongass must be genuinely considered and provided for in that process. Under the provisions of ANILCA, none of the roadless areas on the Tongass should be recommended to Congress for wilderness designation. (Ketchikan Gateway</p>	<p>Tongass</p>	<p>AK</p>

Borough, Ketchikan, AK - #A17476.25240)
