Executive Summary

Introduction

The following is a summary of public comment received by the Forest Service regarding the Advance Notice of Proposed Rulemaking for roadless conservation. The comment period was July 10, 2001, to September 11, 2001. The Forest Service received approximately 726,440 responses—including letters, emails, and faxes—approximately 52,432 of which are original responses. The balance of the responses are form letters, which the Content Analysis Team defines as five or more letters consisting of identical text submitted by different people. One example of each form type is coded and entered into the data base to ensure that the concerns are considered. The balance of the forms are sorted by form type, tallied by state, and the total number of each recorded in the database. The analysis provided in this document is based on the approximately 52,432 original responses and the one example of each form letter.

These responses have been analyzed using a process called content analysis. Although this analysis attempts to capture the full range of public issues and concerns, it should be used with caution. The respondents are self-selected; therefore their comments do not necessarily represent the sentiments of the entire population. The analysis attempts to provide fair representation of the wide range of views submitted, but makes no attempt to treat input as if it were a vote. The goal of the content analysis process is to ensure that every comment is considered.

Content Analysis Process

The content analysis used on this project is a method developed and refined, over the years, by a specialized Forest Service unit, the Content Analysis Team (CAT). This method employs both quantitative and qualitative approaches. It is a systematic process designed to provide a mailing list of respondents, categorize the comments contained in each response,¹ and identify and summarize similar comments from different responses. The process produces a relational database in which categorized comments are linked to original letters and from which various types of information can be reported.

Through the content analysis process CAT strives to identify the concerns raised by all respondents. Breadth and depth of comment are important. CAT's intention is to represent the public's viewpoints and concerns as fairly as possible, and to present those concerns in such a way as to assist the Forest Service to effectively respond to them.

Project Background and Document Overview

The Advance Notice of Proposed Rulemaking (ANPR) proposes an evaluation of roadless area values and public concerns in anticipation of a new rulemaking which will specifically address roadless area management in National Forest System lands.² Management of inventoried roadless areas was previously addressed in the Roadless Area Conservation Rule (Rule), signed

¹ A response is a single, whole submission—e.g., a letter, e-mail, fax, presentation at a public meeting, etc. A comment is a specific, identifiable expression of concern within a response.

² National grassland roadless areas are also included in this statement, but for convenience this document refers to national forests unless a respondent's comment makes specific reference to national grasslands.

by the Secretary of Agriculture, Dan Glickman, on January 5, 2001. On May 10, 2001, the U.S. District Court for the District of Idaho enjoined the Forest Service from implementing the Rule, a decision that is under appeal. The ANPR identifies 10 questions to assist in the identification of values and concerns regarding the protection of roadless areas:

1. ***Informed Decisionmaking.*** What is the appropriate role of local forest planning as required by NFMA in evaluating protection and management of inventoried roadless areas?
2. ***Working Together.*** What is the best way for the Forest Service to work with the variety of states, tribes, local communities, other organizations, and individuals in a collaborative manner to ensure that concerns about roadless values are heard and addressed through a fair and open process?
3. ***Protecting Forests.*** How should inventoried roadless areas be managed to provide for healthy forests, including protection from severe wildfires and the buildup of hazardous fuels as well as to provide for the detection and prevention of insect and disease outbreaks?
4. ***Protecting Communities, Homes, and Property.*** How should communities and private property near inventoried roadless areas be protected from the risks associated with natural events, such as major wildfires that may occur on adjacent federal lands?
5. ***Protecting Access to Property.*** What is the best way to implement the laws that ensure states, tribes, organizations, and private citizens have reasonable access to property they own within inventoried roadless areas?
6. ***Describing Values.*** What are the characteristics, environmental values, social and economic considerations, and other factors the Forest Service should consider as it evaluates inventoried roadless areas?
7. ***Describing Activities.*** Are there specific activities that should be expressly prohibited or expressly allowed for inventoried roadless areas through forest plan revisions or amendments?
8. ***Designating Areas.*** Should inventoried roadless areas selected for future roadless protection through the local forest plan revision process be proposed to Congress for wilderness designation, or should they be maintained under a specific designation for roadless area management under the forest plan?
9. ***Competing Values and Limited Resources.*** How can the Forest Service work effectively with individuals and groups with strongly competing views, values, and beliefs in evaluating and managing public lands and resources, recognizing that the Agency cannot meet all of the desires of all of the parties?
10. ***Other Concerns.*** What other concerns, comments, or interests relating to the protection and management of inventoried roadless areas are important?

In the list of public concerns accompanying this executive summary, the topics addressed by these 10 questions are organized into logical groupings within six chapters. **Chapter 1, Introduction to National Roadless Protection Rulemaking**, covers general reasons for and against developing a national roadless rule in general and the Rule in particular, and the adequacy of the above 10 questions. **Chapter 2, Process, Planning, Policies, and Laws**, covers

concerns related to the National Forest Management Act, National Environmental Policy Act, interim direction, other policy concerns, appeals and litigation, and various other legal concerns. **Chapter 3, Public Involvement**, covers concerns related to Questions 1, 2, and 9. **Chapter 4, Roadless Area Values**, covers concerns related to Question 6. **Chapter 5, Forest Management**, covers concerns related to general forest management; concerns related to Questions 7 and 8; and concerns related to agency organization and funding. **Chapter 6, Protecting Forests, Communities, and Private Property Access**, covers concerns related to Questions 3, 4, and 5. These question numbers appear in parentheses next to the chapter or main section title covering that topic.

There is no chapter or section of the document devoted to Question 10, Other Concerns. Comments that specifically reference Question 10 range from simple requests to implement the Rule as it now stands to reiterations of concerns addressed in other questions. Thus it is impossible to categorize most responses to Question 10 into groupings which differ from responses to the other nine questions. The topics people address which do not logically fall under Questions 1 through 9 are accounted for in Chapters 1 and 2, as well as in the sections on general forest management and agency organization and funding in Chapter 5.

One further point needs to be made regarding the organization of the chapters around the questions posed in the ANPR. While some respondents do specifically reference the 10 questions in their remarks, many others do not. All responses are considered in the content analysis process, and every effort is made to identify all concerns and present them in a logical, readable format. Because the ANPR poses specific questions, this document is organized topically around those questions. But because the organization is topical, all concerns which address a given subject are included within the same section, whether the respondent raising that concern specifically references the question associated with that topic or not. In this way the document attempts to present the public concerns as a response to the questions posed in the ANPR, while at the same time presenting all related concerns raised by the public.

The issues relating to roadless area management, and likewise the concerns expressed by the public, are highly interrelated. The chapters into which the concerns are organized, therefore, must be seen as broad, overlapping areas. Every effort has been made to organize respondents' comments into natural, clear, and accessible categories. However, due to the common, overlapping themes which run through these issues, similar concerns often appear in multiple places.

Following the six chapters described above are six appendices. Appendix A describes the content analysis process; Appendix B is the coding structure used for this analysis; Appendix C is an index of public concerns; Appendix D is a demographics report; Appendix E is an organized response campaign report; Appendix F lists specific places respondents request be included in/excluded from roadless area protection or to be recommended/not recommended to Congress for wilderness designation; and Appendix G provides a list of preparers of this document.

Finally, regarding terminology, many respondents refer explicitly to the Roadless Area Conservation Rule signed January 5, 2001. Others are not so explicit, and in some contexts it is not clear whether the respondent is referring specifically to that Rule or to a national roadless rule in general. When it is clear that a comment refers to the actual Roadless Area Conservation Rule signed January 5, 2001, then reference in the analysis is made specifically to the Roadless

Area Conservation Rule, or the Rule. When it is not clear whether the respondent's reference is specific or generic, then reference in the analysis is made to a national roadless rule.

General Overview of Public Comment

Respondents differ in their views of whether there is a need for the ANPR and a new round of national roadless rulemaking. In general, those who doubt the need argue that the Rule was adequate in process as well as content, and they ask that the Rule be implemented. Those who believe there is a need for a new rulemaking say the process for the Rule was rushed, that a new round of comment is justified, and that the Rule should not be implemented. These two viewpoints are integrally tied to comments regarding forest management in general.

Some respondents emphasize protection and preservation; they ask that restrictions on active management be imposed at the national level and that natural systems be allowed to operate without human intervention. Others emphasize active management of resources; they ask that resource decisions be made at the local level, arguing that land managers and local citizens not only have a greater stake in decisions close to their community, but also have a historical perspective on past decisions which they believe shows that active management is better for the environment.

Some respondents assert that the values they most associate with forest lands are clean water and air, biodiversity among plant and animal life, unfragmented wildlife habitat, and opportunities for solitude and mental rejuvenation. Thus, they tend to stress the intrinsic value of untouched areas, and believe there is a need to allow natural processes—including, under certain circumstances, wildfire and insect/disease outbreaks—to operate without human interference. They state that human interference upsets nature's balance and that the Forest Service must have a national policy to protect these areas not only for the health of the environment but for future generations of people to experience.

These respondents submit that there is too much active management; that these activities are subsidized; that long-term economic costs are ignored; and that human intervention has and continues to have effects on the environment which mitigation cannot undo. These respondents also believe that these perceived effects on the environment primarily benefit local communities and natural resource industries, and they do not think the nation as a whole wants or benefits from active management of the National Forest System. They ask the Forest Service to establish a programmatic policy that restricts management of undeveloped areas.

Some respondents also assert that natural resource industries are in decline. They question claims that public land management policies and laws are responsible for job losses and economic hardship in rural areas. They believe it is the cyclical and competitive nature of these industries themselves and the societal preferences and priorities they see shifting towards other uses of the national forests. According to these respondents, the nation as a whole is coming to value forest lands more for the ecological health and recreational opportunities they provide than for the timber and minerals that can be taken from them. They maintain that people in declining industries have in the past had to adjust to new economic realities, so now people dependent on natural resource industries must adjust. Some suggest that government-sponsored retraining programs should be developed, but in general they say that rural communities must make an effort themselves to adapt.

In short, many of these respondents say undeveloped lands foster happy and healthy lifestyles and best provide the environment with clean air and water, genetic diversity of plant and animal life, and opportunities for recreational solitude and renewal.

Many of these individuals also question the reasoning behind this new round of review and comment. They say the Rule was the result of a three-year public review process that included over 600 public meetings and 1.6 million responses, most of which reflected satisfaction and expectation that the Rule would be implemented. They believe the Forest Service should have more vigorously defended the Rule in litigation and not started a new rulemaking process. They ask why the ANPR was released for comment and suspect this Administration is taking the interests of local communities and natural resource industries over what they see as national interests and environmental benefits. Respondents report feeling disenfranchised and wonder whether their comments will have any influence. These parties urge the Forest Service to implement the Rule in the form in which it was signed in January 2001.

Other respondents offer a different perspective. They believe National Forest Systems lands can be safely developed and products taken without long term effects, and they assert that active management is necessary for forest health. These respondents believe that forest thinning is essential to prevent fuel buildup and catastrophic wildfire, that access is necessary to carry out such thinning projects, to fight fires that do occur, and to carry out other management activities, such as eradicating invasive species and treating for insects and disease. All these activities, say these respondents, constitute good management of our natural resources—benefiting the natural environment, the plant and animal species that reside in these forest lands, and the people who use and enjoy the products such management affords.

These respondents often mention that they care about the environment and that they understand where needed natural resources come from and how to manage them while caring for the land. They suggest that those who do not rely on the land for a living are so far removed from the direct sources of energy and consumer goods that they do not understand the connection back to the land. They believe those who work in active natural resource management and see the connection are better qualified to offer comment on public land management than those for whom a visit to a national forest is a recreational pastime.

Some of these respondents relate that their livelihoods have been tied to forest lands for most of their lives, or for generations, and that they value those ways of life. They want to continue, and see their children continue, to enjoy the rural lifestyle and close ties to forest lands; they request that federal policies not be adopted which restrict their access to and use of these lands. These people sometimes add that, were it not for some national policies, natural resource industries would be thriving, forest lands would be healthier, and rural economies would not be struggling. They believe the federal government should not issue national policies regarding public land management. They say they have a right to use of these lands—a right, they believe, the government is increasingly failing to respect.

Some respondents state that the Rule is the product of biased federal rulemaking. They say it was unduly influenced by organizations having sufficient resources to wage letter-writing and postcard campaigns that they cannot compete with, and believe it was signed into law by a President intent on furthering closure of roadless areas to future active management. These respondents do not believe all the issues were looked at carefully. They ask that the Forest Service abide by the injunctions set in place by the District Judges and reevaluate local

community effects, local decisionmaking, forest health issues, and fire management. These members of the public urge the Forest Service to forego a national policy in favor of site-specific evaluation of roadless areas within the local forest planning process.

Prominent Themes in Public Comment

Trust and Integrity

Comments regarding trust and integrity are usually made in the context of other concerns; these comments can be found in numerous sections throughout the document. Because relatively few comments are directed solely to trust and integrity, the section in Chapter 3 which specifically addresses this topic is not large. Nevertheless, trust and integrity is one of the most prominent themes running through public comment on the ANPR.

Some respondents question the integrity of the former Administration in creating the Rule, alleging that it was created mainly to curry favor with those wishing to close roadless areas to active management, that it was ill-advised and pre-decisional, and that it was developed without adequate response or review of input from people living in close proximity to the national forests. These people state that the ANPR represents a chance to set things right (although some argue that any attempt to formulate a national rule should be abandoned). Other respondents question the integrity of the current Administration for reevaluating the Rule and possibly proposing a new one. They question why the current Administration, as they see it, has inadequately defended the Rule in court. They often state that the Administration is not fully considering the concerns of the many people who requested the Rule's implementation and is putting too much emphasis on local communities' and natural resource industries' needs and concerns.

In summary, trust and integrity issues have been and continue to be at the forefront of public comment on the proposal to establish national management protocols for roadless areas. Respondents of all viewpoints assert distrust in both the Agency and the Administration to the extent that they claim their own concerns are being disregarded or unfairly impacted.

Process, Planning, Policies, and Laws

National Forest Management Act

Some respondents urge compliance with the National Forest Management Act (NFMA). The Forest Service, they say, should comply with NFMA by providing a fair and open public involvement process; by including input from local, state, and federal elected officials; and by ensuring that forest plans are in compliance. Generally, those who stress the need to comply with NFMA say the Forest Service was not in compliance in its development of the Rule. Some, however, assert that the Agency is in compliance, inasmuch as the Rule is no different from other national-level direction that forest planning must incorporate.

In addition to general comments regarding compliance with NFMA, some comment specifically on the relationship between a possible roadless rule and the Planning Regulations. Comments include the suggestion that the Rule be implemented under the existing Planning Regulations; that roadless area regulations be coordinated with the Planning Regulations; and that decisions

regarding roadless area management be postponed until completion of the revised Planning Regulations. Respondents also comment on the revision of the Planning Regulations. Some suggest public involvement should be emphasized. Others suggest that ecological sustainability should not be given first priority in planning; rather equal consideration should continue to be given to social, economic, and ecological values. On the other hand, some respondents emphasize that revisions must not weaken existing environmental safeguards.

National Environmental Policy Act

Some respondents urge the Forest Service to comply with the National Environmental Policy Act (NEPA) by including input from local, state, and federal elected officials; by providing accurate, site-specific information about roadless areas, thereby eliciting meaningful, informed comment; and by providing an adequate range of management alternatives. Some respondents assert that the Rule violated NEPA by being predetermined, and that the process went forward without adequate information upon which to comment and without taking into account significant concerns raised by the public and elected officials.

Respondents also comment about environmental analysis documents. In this regard, a number of respondents express confusion over the status of the Advance Notice of Proposed Rulemaking relative to NEPA and, consequently, over the necessity to produce environmental analysis documents. Some imply that the ANPR is a NEPA process, and their comments suggest that they believe a new EIS has been prepared. Others believe they are still commenting on EIS for the Rule. Beyond that, a number of people remark on the adequacy of the Rule EIS. They suggest that it did not present a sufficient range of alternatives; that the Forest Service should correct deficiencies or substantiate statements made in it; and that a supplemental EIS should be prepared which provides adequate maps of roadless areas and quantifies the miles of existing roads in roadless areas.

Interim Direction

Some respondents comment on the interim direction outlined in the Forest Service Chief's June 7, 2001, memo to staff. Some state that this direction should be kept in place until forest plans are revised. Others state that interim direction should not be implemented. Some say it is not strong enough, suggesting that it returns the Forest Service to the situation that existed prior to the creation of the Rule, with roadless areas being managed solely through the forest planning process. Others say it is too strong—that although it does not technically rule out activities in inventoried roadless areas, in practice no Forest Service decisionmaker will enter Roadless Areas without fear of litigation or reprisals from their superiors. Therefore they consider this an illegal implementation of the Rule and say it violates injunctions placed on the Forest Service by District Judges.

Other Policy Concerns

A number of respondents comment on the relationship between a possible rule on roadless area management and other planning processes. In this context, some ask the Forest Service to evaluate the cumulative effects of multiple management proposals—such as the Rule, the Planning Regulations, and the Roads Policy. Another concern is that inadequate attention was given to the cumulative effects of a national roadless rule when combined with other National

Forest System land withdrawals such as wild and scenic river areas, wilderness areas, national recreation areas, etc.

One policy often mentioned is the proposed Roads Policy. Some stress that the Forest Service should decide roadless area management only after the Roads Policy has been completed and after roads analyses have been conducted by the Forests, thereby providing better road and trail inventories, and a better understanding of what constitutes a road, how roads are to be managed, and what needs to be closed or reconstructed.

Appeals and Litigation

Some respondents discuss the appeals process in general. They believe appeals are interfering with forest management and preventing the implementation of plans which were, themselves, years in the making. People suggest that time limitations be imposed on the appeals process and that litigants be required to submit to arbitration before their cases can proceed to court.

Comment varies over how the Forest Service should respond to litigation over the Rule. According to some, litigation usually arises during the site-specific decision process, so decisions made at the national level should help cut down on litigation. Others suggest that the reason the Rule is tied up in litigation now is because the Forest Service did not pay sufficient heed to public concerns expressed during that comment period. These people say the Agency should delay any decision on the Rule until judicial review, so that the impacts of proposed management can be appropriately analyzed.

Other Legal Concerns

Legal issues are frequent topics of comment. A number of respondents ask the Forest Service to review the legal validity of the Rule; others assert that it has no legal validity and that the Agency should develop a new rule that complies with the law. In addition to these general comments about the legality of a national roadless rule, some address the applicability of specific federal acts. Following are concerns regarding some of the more frequently cited acts.

Alaska National Interest Land Conservation Act (ANILCA) – Respondents urge the Forest Service to comply with ANILCA by providing reasonable and timely access to inholdings; by excluding the Tongass National Forest from the final rule; and by, in general, foregoing sweeping national level withdrawals such as the Rule. On the other hand, at least one respondent suggests that ANILCA needs to be revised to allow ownership of private inholdings within roadless areas without the accompanying obligation to allow roaded access to them.

Americans with Disabilities Act (ADA) – Comments on the ADA arise most frequently in connection to access. Some respondents comment that roadless protection will negatively affect the ability of elderly or physically impaired forest visitors to access roadless areas. They claim that the ADA legally obligates the Forest Service to maintain roaded access or allow it to be developed. Others, however, downplay the legitimacy of this concern, saying there is already sufficient access and that the preservation of access for the elderly and handicapped should not be used as an excuse to build roads.

Clean Water Act (CWA) – Respondents state that the Forest Service must comply with the CWA by including in management plans roads that cross streams or wetlands and by obtaining

the necessary permits and exemptions for closing forest system roads. Some suggest that the CWA and the Endangered Species Act should be integrated early in the forest planning process.

Endangered Species Act (ESA) – Some respondents urge the Forest Service to comply with the ESA. Others, however, comment on impacts of the ESA itself. Some assert that the ESA should be eliminated in its present form because of its impact on private property rights, because of its role in closing roads, and because of its use in litigation. Some state that there are groups who use the ESA as a weapon against traditional uses of forest lands, and that the Forest Service should support legislation which would prevent litigation over the ESA and reimbursement of legal fees.

Mining Laws – Respondents urge the Forest Service to comply with mining laws (Mining Law of 1872 and Mining and Mineral Policy Act) to ensure access to mineral deposits in National Forest System lands and to enable this country to remain free of foreign dependence on raw materials. Others suggest such laws should be repealed to ensure protection of roadless areas.

Multiple Use and Sustained Yield Act (MUSYA) – Some comment that a national roadless rule would effectively eliminate multiple use management of roadless areas. Many argue that a national roadless rule should not be implemented because, under MUSYA, public lands must remain open to uses such as natural resource management and motorized recreation. Others, however, claim that multiple use does not mean that every use must be accommodated in every part of the forest and that protection of roadless areas is in keeping with MUSYA. Further, some say, the Forest Service is in violation of the Act because they see little evidence of sustained yield and believe forests have been damaged without proper restoration.

Revised Statute 2477 (RS 2477) – Some assert that the Forest Service must comply with RS 2477 with respect to road closures. Many respondents argue that a national roadless rule should not be implemented because it would close many roads whose status as public rights-of-way is protected under RS 2477. One respondent reminds the Forest Service that State law reserves the right to public access to all section lines, while another believes the Agency has no clear direction or policy regarding RS 2477 roads and asks the Forest Service to clarify its position, especially as it relates to roadless areas.

Public Involvement

Informed Decisionmaking (Question 1)

Decisionmaking Authority – The question of what informed decisionmaking requires, and who should be involved in the decisionmaking process, elicited considerable response. Some suggest the Forest Service should decide the management direction for roadless areas, rather than politicians or the public. Others recommend that Congress should manage federal lands because congressional representatives would be more responsive to constituent concerns. These respondents also believe that members of Congress would be better able to address local conditions and that a congressional decision is needed to end the present stalemate surrounding roadless area management. Others suggest decisionmaking parties include individual states, American Indians, and variously composed committees of experts.

Local versus National Decisionmaking – Much of the comment on informed decisionmaking addresses the question of whether roadless area management decisions should be made at the local (forest planning) level or the national level. Respondents who believe decisions should take

place through the local forest planning process say it is not the place of the federal government to issue national mandates regarding management of individual forests; that the forest planning process has worked well in the past; that it affords adequate public involvement with all interested parties; and that it allows adequate consideration of local conditions and needs. Further, some respondents comment, since local residents have more knowledge about the resources and the most to lose if a bad decision is made, it is appropriate for them to have a strong voice in management decisions.

Others say it is appropriate for roadless area management to be decided at the national level. According to these people, the local forest planning process has proven it cannot adequately protect these areas because local people tend to weigh the profit potential from commercial activities above the damage such activities may cause. They also feel that because of the importance of preserving these areas for the benefit of all Americans, decisions should be in the best interest of the whole country. Further, these respondents emphasize, these forests are national forests, thus all Americans—not just local residents—have a legitimate interest in their management and are equally entitled to have their views considered.

The Forest Planning Process – Opinions concerning decisionmaking roles are reflected in comments regarding the forest planning process. Those who believe roadless area management decisions should be made at the local level state that the forest planning process can and should identify local concerns, attitudes, issues, and problems that might remain unknown at the national level; consider site-specific conditions and needs of roadless areas; work with local stakeholders; and implement sustainable forest management practices, etc. In contrast, those who prefer decisionmaking at the national level claim it is appropriate for the forest planning process to adhere to the Rule and maintain maximum amounts of roadless areas.

Working Together (Question 2)

The question of how the Agency can best work with all interested parties through a fair and open process involves two related issues: 1) the adequacy of the actual processes and methods used to engage the public; and 2) the adequacy of involvement and collaboration made possible by those methods.

Processes and Methods – In general, those who ask for implementation of a national roadless rule state that the methods used to engage the public for the Rule and the level of collaboration achieved were adequate—as contrasted, they say, with the level of involvement offered for the ANPR. On the other hand, those who ask that the Rule not be implemented generally assert that the public involvement process for that rulemaking was biased and unresponsive, and that there was insufficient collaboration.

With respect to methods used to engage the public, a number of respondents urge the Forest Service to make greater efforts to notify people of upcoming proposals. People complain that not everyone has access to the Federal Register nor the time to peruse it on a regular basis. They suggest using mass media, conducting nationwide polling, posting information on local and national web sites and providing opportunities to respond over the web site, or maintaining a current mailing list to inform people of pending management proposals.

Many people state that the public meetings held in association with the Rule were inadequate, that they were biased, scheduled at inconvenient times and places and with inadequate advance notice, conducted by officials who were ill-informed about the proposal, and lacked site-specific

information upon which to offer meaningful comment. They stress the need for an adequate comment period. Other respondents assert that the number of meetings held—over 600—testifies to the high level of public involvement encouraged in association with the Rule. These meetings were open to everyone, these people state, and everyone had opportunity to express their views. They also point to the volume of comments received for the Rule—1.6 million—as evidence that the comment period was adequate. These respondents say it is the ANPR that offers inadequate opportunity to comment.

Opinion varies over how public comment should be analyzed. Some urge the Forest Service to give equal consideration to all comments, while others urge that greater weight should be given to some parties, such as those representing local and resource-dependent interests. Some respondents argue that because some interest groups have the resources to organize form letter/postcard campaigns and others do not, the content of comment should be considered rather than the number of comments received. Others assert that everyone has an equal opportunity to submit comment and that the fact that so many respondents to the Rule request its implementation shows that most people want stricter roadless area protections. They contend that, as this is a democratic nation, the will of the people should conclude the issue.

Public Involvement/Collaboration – Many respondents urge the Forest Service to establish strong lines of communication to promote a better understanding in the agency and among the general public of how public land management affects natural resource dependent communities. These respondents stress the need for adequate local input and participation in the decisionmaking process, and they urge the Agency to work closely with states, counties, and local governments. They write that the Agency listens more to people who do not understand local concerns and that the Agency cares more for the environment than for the people whose lives are affected. Some believe the Rule was unduly influenced by groups of people not directly affected and that such groups should be excluded from the decisionmaking process.

Other respondents believe the Agency weighs the concerns of local residents and natural resource industries too heavily, and that their own views have not been adequately considered. Some say industrial groups should be excluded from the decisionmaking process because of their vested economic interests.

Not all comment regarding public involvement/collaboration is divided. Some respondents state that it is not wise to rely too much on collaboration to begin with, saying that it can lead to policies that are merely agreeable rather than high quality; that it is limited to solving only the easy problems; and that the time commitment it imposes makes it an unrealistic solution. A number of people point out that agreement between parties may not be possible. Others, however, urge greater collaboration with all groups, with agencies such as the U.S. Fish and Wildlife Service, and generally with all interested parties. These respondents agree that close collaboration with diverse groups will enhance the decisionmaking process by fostering cooperation and mutual trust and respect.

American Indian Rights and Interests – Because of the unique status of American Indian tribes and the government-to-government relation that exists between them and the U.S. Government, special care has been taken to review comments from tribes and tribal interests separately from comments of other respondents who discuss tribal interests. Accordingly, the section in Chapter 3 which addresses American Indian Rights and Interests is composed of two subsections: Comments of American Indian Tribes/Tribal Interests, and Comments from Other

Respondents Regarding American Indian Tribal Interests. (This distinction is based on how respondents identify themselves or their organization in their letters. It is possible that among comments attributed to other respondents are comments actually made by tribal members or tribal interests, but if so it cannot be determined from the letters.)

Most tribal representatives specifically ask that treaty rights be respected, often requesting consultation or special consideration, while supporting the Rule as a means of providing a measure of protection for resources such as anadromous fish populations and American Indian culture and sacred sites. Non-tribal respondents on this topic tend to be of the same mind, supporting the Rule to protect tribal interests and urging the Forest Service to give high priority to American Indian concerns. Another view is that the Rule should not be applied to reservation forests because it would negatively affect American Indians economically by restricting timber removal and recreation.

Competing Values/Limited Resources (Question 9)

The Federal Register notice for the ANPR asks, “How can the Forest Service work effectively with individuals and groups with strongly competing views, values, and beliefs in evaluating and managing public lands and resources, recognizing that the Agency cannot meet all of the desires of all of the parties?” Comments which address this question are closely related to comments on collaboration in general. Many respondents suggest that competing values be addressed through enhanced collaborative efforts by the Forest Service. Some suggest using professional negotiators, public relations consultants, and conflict resolution specialists. As noted earlier in this summary, some suggest bringing together advisory panels composed of different interest groups. Others suggest meeting with different groups both individually and collectively to develop agenda items important to all parties. According to these respondents, what is paramount is that a forum be provided in which all views are respected and compromises worked out. To that end, several respondents urge the Forest Service to make greater efforts to educate the public about public land management issues as a way of resolving conflicts. Further, respondents go on, efforts at collaboration and education will be more effective if the Forest Service first sets out to restore the public’s trust, clarifies its own purpose and mission, makes use of the best available science and information, trains its personnel to work with a diverse constituency and to facilitate cooperative meetings, and applies its policies to all interests consistently.

Some respondents remark that the best way to deal with competing values is to implement the Rule, stating that it represents the wishes of most Americans. Others state that the public involvement process used to develop the Rule did not comply with applicable laws, particularly NFMA and NEPA. These people say the best way to deal with competing values is through compliance with these laws which, they argue, dictate that competing values should be addressed at the local level through the forest planning process.

Roadless Area Values (Question 6)

Characteristics of Roadless Areas

Respondents suggest a number of characteristics of roadless areas that ought to be taken into account, including environmental, social, and economic values (to be discussed in the following sections). One point of disagreement involves natural resource management in roadless areas. A

number of respondents believe the potential economic value of natural resources is integral to the evaluation of roadless areas. Others state that the value of these lands should not be based on the value of the natural resources they can yield. A common remark is that the values associated with roadless areas were adequately identified and considered during the course of public involvement for the Rule.

In connection with a general evaluation of roadless areas, many respondents ask that maps and inventories be updated with current, accurate information; that mapping errors be corrected; and that inventories be completed for biological features, natural resources, and existing infrastructure. Respondents also ask that certain terms be defined, such as road, road building, unroaded, and roadless area. People say they are confused over how these terms are being used.

Environmental Values

Respondents offer considerable comment on the environmental values of roadless areas. Many comments reflect the need to manage roadless areas to protect and preserve environmental values. These respondents address the need for ecosystem/restoration management, the advisability of multiple use management, the effects of activities on the environment, and specific resources—water quality, air quality, soils, scenery, and wildlife.

A number of respondents state that roadless areas should be managed within an ecosystem-based framework. They believe healthy ecosystems cannot be managed at the site-specific level and are concerned that if there is not overarching direction, connectivity will be lost at the landscape level. They argue that local decisionmaking too often does not take into account other land management decisions, thus resulting in issues not being resolved in a manner they believe is sufficient. Some suggest ecosystem-based management could be furthered by allowing the public to sponsor or adopt an area of the forest or by encouraging non-profit organizations to support the preservation of pristine areas.

The topic of multiple use management arises frequently in comments addressing environmental values. As noted earlier in this summary, some respondents comment that, under multiple use management, resource use—including timber removal, mining, grazing, and motorized recreation—ought to be allowed. These respondents state that allowing any single use preference to dominate would be unfair and in violation of the multiple use mandate. They say that, per MUSYA, the Forest Service is legally obligated to manage for multiple uses. Conversely, other respondents argue that multiple use management does not mean that every use must be accommodated in every part of the forest.

Public comment regarding the effects of various activities on the environment differs as well. Some respondents claim that road building, use of natural resources, and motorized recreation damage the environment beyond the land's ability to recover. They state that mitigation efforts cannot undo much of the damage that has already occurred nor the future damage that will occur if activities such as road building and timber removal are allowed to continue. Other respondents disagree and argue that these activities do not harm the environment; in fact, some claim, they benefit it.

Some respondents ask the Forest Service to protect roadless areas in order to preserve watershed health. One point of difference in these views concerns the effects of timber removal on water quantity. According to some, removing timber increases water quantity because less dense tree

stands permit greater absorption of water. Others, however, state that timber removal does not increase water quantity and is generally destructive of natural resources.

Respondents also urge the Forest Service to protect roadless areas in order to preserve air quality; to address the effects of timber removal and road building, which they believe causes erosion and landslides; and to protect scenic resources.

Respondents offer considerable comment on the need to protect wildlife and wildlife habitat; and just as comments differ regarding the effects of activities on watershed health, so they differ regarding the effects of activities on wildlife and wildlife habitat. According to some, road building, timber removal, and motorized recreation are harmful to wildlife. These respondents comment that road building, active management of natural resources, and motorized recreation fragment wildlife habitat. Others declare that these activities do not pose the danger to wildlife and wildlife habitat that other members of the public claim. Roads, they state, do not impede wildlife movement; vehicles do not disturb the wildlife; and removing timber, particularly in the form of thinning, benefits wildlife by promoting plant growth and feed for wildlife and birds.

Social Environment and Values

Respondents make a number of points regarding the social values they associate with roadless areas and the management direction the Forest Service should take to protect these values.

People urge the Agency to protect these areas for their natural grandeur and beauty; for their intrinsic value; for what they represent to America, especially the western experience; and for their contribution to quality of life. People say roadless areas are needed as refuges from the stresses of urban life; and as places to find solitude, natural quiet, spiritual renewal, and to spend time with their families. They point out that with our increasing population and growing urban/suburban sprawl, roadless areas are needed more than ever to serve as respites from the press of humanity and all of the usual demands of life. Other respondents say that preserving these values requires that the Agency not give these areas special roadless protection. These people argue that roadless protection threatens western traditions and culture; that it unfairly restricts motorized users' ability to enjoy these areas; and that, by restricting motorized access, it restricts the ability of family groups—which include people of all ages and physical abilities—to use these areas, thereby reducing family stability and togetherness.

Respondents also ask that these areas be protected through a strong national rule for the sake of future generations (a particularly frequent assertion); for their educational value; and for their value in promoting human health and welfare through physical and emotional rejuvenation.

Economic Environment and Values

Comment on the economic values associated with roadless areas covers a wide array of topics. Respondents address the adequacy of analysis of economic factors; the effects of roadless protection on local communities/economies, including employment and tax receipts; effects on the global economy; effects on the mining, oil, and gas industries; and government subsidies.

Some respondents question the data, methods, and models used for the economic analysis in the Rule EIS. They urge the Forest Service to conduct adequate cost-benefit analyses before issuing a new rule; and some state, in particular, that the Agency should use the most up-to-date economic valuation tools for ecological valuations as well as other non-market values. People

also ask the Agency to assess and consider the resource damage from commodity uses, to consider commercial interests of local areas, and to quantify recreation-based data for all roadless areas.

Respondents addressing economic issues differ over the impacts of roadless protection on local communities and their economies. Some argue that the protection of roadless areas will greatly benefit local economies because roadless areas are coming to be more highly valued for their pristine condition than for their developable natural resources. They thus stress the importance of these areas to the tourism industry in general—particularly to recreational non-motorized users, the mountain biking community, recreational fishing and hunting, outfitter-guides, the outdoor gear industry, and commercial fisheries—and to companies seeking locations which provide a high quality of life. Others, however, assert that roadless protection will negatively impact local economies. These respondents state that restrictions on road building and timber removal will harm natural resource-dependent rural communities, mining-dependent communities, timber-dependent businesses, the motorized recreation-dependent tourism industry, and the homebuilding industry. They state further that low-wage recreation-based jobs are no substitute for commodity-based high-wage ones.

Some respondents who comment on the impacts on local communities/economies specifically mention the tax receipts made available to local communities from resource management activities. Some assert that resource management should be allowed to continue, to maintain tax receipts from timber removal and minerals royalty payments. This revenue, they say, is vital to local economies and an important source of funding to local schools. Others, however, suggest that the rural school financing system should be reconsidered and changed to reduce the need for high timber removal levels.

Comments on the impacts of roadless protection to the global economy typically take one of two forms. Some state that restricting natural resource development, as well as exporting our natural resources, leaves us too dependent on foreign resources. These respondents conclude that the Forest Service should encourage domestic development of natural resources. Other respondents suggest that if domestic timber removal is restricted, it will likely be carried out in other countries which have lower environmental standards than ours and thus contribute to environmental degradation on a global level.

Some respondents urge the Forest Service to consider the impacts of roadless protection on the mining industry, employees, and mining-dependent communities. In this context, they mention a number of specific areas and operations which would be negatively impacted by such protection. The main gist of these comments is that restrictions on roaded access would restrict mineral discovery and management, and that these restrictions would so disrupt the ability of mining companies to carry out their operations as to impose significant economic hardship.

Finally, a number of commentators address subsidization of private industry, particularly the timber industry. Respondents assert that subsidization by the federal government gives timber companies operating on public lands an unfair advantage over private forest owners. They say that below-cost timber sales are unfair to taxpayers—using as an example their understanding that the United States faces budget deficits and that tax dollars are needed for other programs—and that such sales require roads that the Forest Service lacks the funding to maintain. They say the Forest Service should consider all relevant factors in timber sale decisions and require timber

companies to cover the full cost of any road construction, removal, or restoration that is found appropriate.

Forest Management

Activities (Question 7)

Travel Management – A number of respondents comment on the road and trail systems in national forests. Some suggest that the entire road and trail systems be evaluated to determine long-term management needs; which existing roads are needed, where new roads should be built, and which roads should be obliterated; and the environmental effects of existing routes. People also say roads and trails should be adequately maintained, and some suggest that the Forest Service should seek the assistance of motorized recreation groups in maintaining these travelways. Responses vary, however, over the question of whether new road construction ought to be allowed and whether existing roads ought to be closed.

Some respondents assert that road construction ought to be allowed in roadless areas. Common reasons cited are the Agency's general obligation to provide adequate access to citizens, including the disabled; the need to allow resource-dependent communities to use forest lands without undue governmental obstruction; the need to disperse recreation, and thus offset the environmental impacts which would follow from concentrated use in other areas; and the need to maintain an adequate infrastructure for forest management activities, primarily forest health treatments. Other respondents who comment on this topic, however, state that road construction should be prohibited in roadless areas. They say that roads lead to increased activity in general and increased natural resource management in particular; that roads provide an avenue both for abusive human behavior and for invasive species; that they lead to increased mortality of endangered species; and that both environmental and human well being require the existence of untouched, pristine areas. These respondents believe access to forest lands is adequate, and more is not needed.

The question of road closures does not generate the same level of comment as the question of new road construction. In general, those who request that new road construction be prohibited also request that roads be obliterated under certain conditions. Primarily, they ask that all user-created routes be obliterated and natural conditions restored. Those who request that new road construction be allowed generally ask that no roads be closed, for the same reasons that new road construction should be allowed.

Natural Resources Management – The management of natural resources is a topic which generates a good deal of comment. As mentioned before, some believe the Forest Service should encourage natural resource management, and assert that such active management can occur in roadless areas without harm to the environment or to wildlife. Others urge the Agency to resist pressure to manage roadless areas, both because of the public support for the Rule and because they believe industrial activities and preservation of roadless values are mutually exclusive. While respondents comment on virtually all areas of natural resource management, recurring topics are timber removal and mining.

A number of individuals and organizations believe timber removal should be allowed in roadless areas. Many cite reasons why it should be allowed—to maintain forest health; to supply the wood products central to American culture; to avoid dependence on foreign countries for these

supplies; and to support resource-dependent communities. Other people, while asking that timber removal be allowed, suggest preferred harvest methods to reduce negative environmental effects. These suggestions revolve primarily around removing trees without the use of roads; harvesting in already roaded areas; selectively removing or thinning; and requiring replanting following removal.

Many of those who address timber removal that it be completely prohibited in roadless areas, or that it be prohibited or severely restricted in general. These respondents state that the environmental cost of timber removal is too high, in the form of erosion, siltation, and wildlife habitat disruption. Generally, these respondents say that timber removal should be allowed only when genuinely needed for forest health treatments or to protect communities and human life. With respect to forest health, however, some state that wildfire and insect and disease outbreaks are natural occurrences, and that forests left to experience these natural influences will be healthier in the long run.

Comments are mixed over mining, oil, and gas development. A number of respondents state that the Forest Service ought to provide substantially more analysis of the impacts of national roadless protection on mineral development than was provided in the Final EIS for the Rule. These respondents urge the Agency to address oil and gas resource potential in National Forest System lands in general and in roadless areas in particular; to address effects of the Rule; and to address the legal obligation to allow access—especially roaded access—for mineral exploration and development. These respondents argue, as do those who request that timber removal be allowed, that continued mining is needed to supply the mineral products and energy sources central to American society; to avoid foreign dependence; and to support natural resource-dependent communities. Likewise other commentors, while asking that mining be allowed, suggest preferred methods to reduce environmental effects. These suggestions include, for example, drilling by manual means only, slant drilling, or other techniques which do not disturb the surface.

Of those who comment on mining, however, many state that it should be prohibited in roadless areas. Generally respondents say they want mining prohibited for environmental reasons. Some allege that many impacts from mining are unnecessary because they are associated with mining claims that are either invalid or do not support the discovery of mineral deposits.

Recreation Management – The topic of recreation management generates a fair amount of comment. Some respondents urge the Forest Service to provide the maximum amount of recreational opportunities possible in concert with protecting the environment. Some ask that the Rule not be implemented on the grounds that the Agency failed to adequately address its effects on recreation, and say that it would overly restrict recreational uses. Others state that the Rule achieves an appropriate balance of uses and that restrictions in roadless areas are necessary and justifiable. Other points of difference are over what types of recreation should be allowed in roadless areas and how various recreational uses should be restricted. While respondents offer comment on virtually all forms of recreation, they comment most often on motorized recreation (including off-road vehicles and, to a lesser extent, snowmobiles), followed by hunting/fishing and ski area development/expansion, respectively.

Many respondents write that motorized recreation is a growing pastime in this country and that it has become a much loved tradition in their own families. They explain that it allows entire families—including members of all ages and physical abilities—to enjoy the outdoors together,

and to enjoy it within the short timeframes made necessary by busy working schedules. These respondents assert that motorized recreation, engaged in responsibly, is not a threat to the environment or to wildlife, and ask that no more restrictions be placed on their form of recreation. Many others who address this topic request that motorized recreation be banned entirely from roadless areas, and often ask that it be prohibited or severely restricted in the rest of the forest as well. These respondents feel that the impacts to the environment and to wildlife are too serious to allow unrestricted use of this form of recreation. Other respondents advocate a middle ground with respect to motorized recreation. Some who ask that it be restricted acknowledge that it is here to stay and must be accommodated in certain areas and subject to restrictions; others who say it should be allowed likewise acknowledge the need for some form of regulation.

Of those who address hunting and fishing, many say these activities should be allowed to continue—for their recreational value, as tools for wildlife management, and to meet subsistence needs. Some believe, however, that hunting and fishing should be prohibited in roadless areas because they think they are not effective management tools and that restrictions are poorly enforced.

Those who address the topic of ski area development/expansion state that development and expansion should be allowed to continue because there is a growing demand for winter recreation, and because ski area operations can be compatible with roadless protection. Others oppose expansion, saying a need has not been demonstrated.

Designating Areas (Question 8)

At issue is the question of whether inventoried roadless areas should be recommended to Congress for wilderness designation, or whether they should be maintained under a specific designation for roadless area management in forest plans. Many respondents who address this topic say Question 8 misrepresents current policy, which does not impose an either/or decision, and believe it inflames public debate over wilderness acreage, which, as they point out, is a separate issue from the Rule. A number of individuals write in a short ‘vote’—such as recommend all roadless areas for wilderness or no more wilderness. Others provide suggestions for evaluation criteria and various management designations for these areas. Given this wide range of comment, only broad trends can be summarized here.

Comment on this issue sometimes reflects an underlying confusion, both with respect to use of the term wilderness and to the process by which areas are officially designated as wilderness. With respect to use of the term, many respondents—whether commenting specifically on this issue or on others—speak of the need to protect wilderness areas. Often it is clear from the context of these comments that the respondent is not speaking of designated wilderness areas, but simply of wild, undeveloped areas; but sometimes the writer’s intent is not clear. With respect to designation, many respondents seem to be unaware that wilderness designation is made by Congress, and assume it is made by the Forest Service. Care has been taken to capture the writer’s concern as accurately as possible while avoiding reading into a comment a meaning that was not clearly intended. With that caveat in mind, some themes can be identified regarding public comment on wilderness and roadless designation.

A number of respondents urge that all roadless areas should be recommended to Congress for wilderness designation, stating that only a wilderness designation can adequately protect these

areas. Others suggest that all qualifying roadless areas be recommended; and some state that additional recommendations should be made strictly on a site-specific basis based on local condition, need, and input. Other respondents urge the Forest Service not to recommend roadless areas for wilderness designation, stating that a wilderness designation is too restrictive and that there are already enough wilderness areas. Both those who request more wilderness designation and those who request no more wilderness designation mention specific areas they say either should or should not be recommended. Finally, respondents suggest specific criteria for wilderness recommendation based on ecosystem considerations, location, and acreage; and suggest various management alternatives for areas which do not meet wilderness criteria, ranging from special roadless area management to withdrawal from roadless status altogether to allow more use of these areas.

This same range of beliefs is displayed in comment on roadless area designation as well. Many who address this topic urge the Forest Service to manage roadless areas under a specific roadless management designation which would protect these areas without imposing the same level of restrictions as that of wilderness management. Others suggest creating multiple roadless prescriptions that could be applied based on site-specific conditions, or allowing forest plans to modify roadless management prescriptions. On the other hand, some urge the Forest Service not to create a specific roadless area designation at all—because conditions and situations vary too much for such a designation to be needed or workable; because the mere presence or absence of roads is not sufficient justification; and because it will strain forest budgets. Others say simply that the Agency should not designate any additional roadless areas, primarily because they believe it will negatively impact recreational access. Respondents also suggest specific criteria for roadless designation based on ecosystem considerations, existing infrastructure, inventory status, and acreage. Finally, some respondents urge the Forest Service to use appropriate existing management categories to protect roadless qualities, or to develop other new management categories.

A number of people suggest that specific areas be included in, or excluded from, roadless area protection. One specific area of note is the Tongass National Forest. According to some, the Tongass should be excluded from a national roadless rule because its inclusion would be contrary to Alaska state and federal laws; because of the time and effort that has gone into development of its recently revised forest plan; because active management is necessary to preserve the environment and forest health; and because communities depend on timber from these areas. Many others who address this topic state that the Tongass should be included in a national roadless rule because of the area's social values; because local businesses, fishing, and tourism industries depend on the area's wild characteristics; and because protection is necessary to preserve the environment and environmental values such as biodiversity, old growth, fish and wildlife habitat, etc.

Protecting Forests, Communities, and Private Property Access

Protecting Forests (Question 3)

Many people offer general comments on this topic or stress the need for more in-depth analysis, particularly with respect to fire management and management of insects, disease, and noxious plants. People assert either “active” management or “ecosystem/restoration” management will

best maintain forest health. These different assertions stand out in comment on roads/roaded access and selective timber removal for forest health purposes; on strategies for managing fire; and on strategies for managing insects, disease, and noxious plant and invasive species spread.

Many respondents urge the Forest Service to allow road construction/roaded access for forest health management, including fire hazard reduction and pest management. Others state that forest health should not be used as an excuse to build roads in roadless areas. These parties say roads are not necessary—that roadless areas can be accessed by other means—and that roads actually spread disease and noxious weeds.

These same assertions are found in comments on timber removal. Many urge the Forest Service to allow timber removal to reduce the risk of wildfire, insects, and disease. Suggested methods include salvage timber removal and thinning. Conversely, others state that forest health should not be used as an excuse to harvest timber because removing timber actually increases fire risk and severity. These respondents specifically urge the Agency to stop timber removal.

Likewise, some suggest that fire management strategies should include multiple techniques, such as monitoring, grazing, prescribed burns, the construction of firebreaks, and maintenance of existing fire trails. Some suggest the Forest Service should actively suppress forest fires because letting forests burn is not environmentally responsible. Other respondents assert that wildfire is a component of a healthy forest. These respondents state that natural fire maintains diverse forests and wildlife habitat; that it rejuvenates ecosystems; that dead timber is a critical part of the forest ecosystem; and that firefighting is a waste of money, dangerous, and more harmful to the environment. They conclude that the Forest Service should not suppress forest fires.

A number of respondents request that the Forest Service actively work to control insects, disease, and the spread of noxious plants. Suggested methods include timber removal, prescribed fire, the use of chemicals and other solutions, etc. Others say the Forest Service should acknowledge that native insects and diseases are part of a healthy ecosystem—that they are vital to ecological sustainability and biodiversity, and play an important role in forest nutrient cycling and renewal. These respondents urge the Agency not to use pesticides and herbicides and rather to rely on natural remedies, to prohibit road construction in roadless areas, and to encourage a proliferation of songbirds and other species that feed on insects.

Protecting Communities (Question 4)

A number of respondents comment on the question of how to protect communities and private property near inventoried roadless areas from natural events. Topics include land use ordinances and building codes, management of the urban-forest interface, and the question of whether the Forest Service or private property owners should bear the major responsibility for private property protection.

Of those who address private property protection, some believe that people should not be allowed to build in areas adjacent to public land at risk of wildfire. They suggest the Forest Service promote land use ordinances which keep residential development away from public lands. Others advise that insurance companies could do much to either discourage development in high risk areas or to encourage safer development. Suggestions include either increasing rates or refusing coverage for homes built in locations at risk of wildfire; offering reduced rates to those that meet fire danger reduction standards; and making private developments in these areas

generally less qualifiable for recovery insurance. Some also suggest that building codes should be revised to set a standard for construction in fire-prone areas.

With respect to management of urban-forest interface areas, some people suggest the Forest Service establish buffer zones between private property and roadless areas, or that communities be allowed to construct such zones. Other respondents urge the Forest Service not to fragment roadless areas by constructing buffer zones; and according to one respondent, the Forest Service should recognize that extensive vegetation management in forest-urban interface areas does not reduce potential home fire losses.

Respondents suggest various actions the Forest Service can take to better protect private property from natural disasters—thinning dense stands or clearing hazardous materials near communities, conducting prescribed burns, establishing quick response procedures, providing local water access for fire hoses, etc. In particular, some suggest the Forest Service should educate private property owners regarding the dangers that exist in roadless areas and the steps they should take to protect their property.

Some comments on this topic express that it is, or should be, incumbent upon private property owners to build away from high-risk areas and to employ building standards and materials designed to lower the risk of fire damage. Some respondents argue that fire protection provided to communities and homeowners should be paid for by the private property owners, not by taxpayers. In summary, some respondents say the Forest Service should bear the cost of replacing private property damaged by wildfire, but others believe the property owner should be financially accountable for his/her choice to build in high risk areas.

Protecting Access to Property (Question 5)

While respondents offer a number of general comments on this issue, most specific comment centers around access to National Forest System lands through private property and access to private property through National Forest System lands.

Some people urge the Forest Service to prevent public lands from being landlocked by private lands. They say that when that happens, traditional access routes are sometimes closed by private property owners, which they believe effectively turns the enclosed public land into a private preserve from which the general public is barred. Thus respondents urge the Agency to maintain public rights-of-way through private property.

Many comments on access to property address access through public land to private land. A number of people believe this is a non-issue. They say that since access is protected by existing law, the Rule has no impact on access to inholdings; they question whether more is being addressed in Question 5 than just reasonable access. Much comment on this topic consists of suggestions by which access can or should be maintained, ranging from maintenance of existing roads to airstrips and helispots. People also point to the local planning process and collaboration with local officials as effective ways of addressing access issues.

Conclusion

Some respondents emphasize protection and preservation; they emphasize the need to allow natural systems to operate without human intervention and believe restrictions on active management of roadless areas will be most effective if imposed at the national level. They

request implementation of a national roadless area management policy that lays down strong restrictions from which no individual forests are exempt. Other respondents emphasize active management of natural resources; they emphasize the knowledge local citizens have of forest conditions and believe that management decisions can best be made at the local level. They request continuation of local decisionmaking, which allows for different management prescriptions for different roadless areas depending on condition and need. These different viewpoints are evident in nearly all the comments offered on the ANPR.

Most respondents express concern for and love of national forest lands. While some advocate taking a hard stance for their positions, others acknowledge that people who care deeply about the land can honestly disagree about how it should be managed and believe that a degree of compromise is necessary.

Chapter 1

Introduction to National Roadless Protection Rulemaking

This chapter includes two main sections: National Roadless Protection – General Remarks, and Issue Identification.

National Roadless Protection – General Remarks

This section includes two subsections: Need For a National Roadless Rule General and Need for the Roadless Area Conservation Rule.

Need for a National Roadless Rule General

Summary

A number of respondents question the need for a national roadless rule. They wonder why the Forest Service does not simply continue guidance under existing law, where they believe that the National Forest Management Act (NFMA) provides both guidance and opportunities for public input on a forest by forest basis, hence the Agency should not need a national policy. Some also point out that environmental laws are already in place, obliging the Forest Service to manage their jurisdictions in accordance with these laws. Others suggest the Forest Service delay development of a new rule until judicial resolution of the current Roadless Area Conservation Rule or until the forest plan revision process takes place.

Other respondents assert that a national roadless rule is needed. One of the most common reasons given for needing one is they believe the current forest planning process has failed to protect the environment in the past (see Chapter 3: Informed Decisionmaking (Question 1): Local vs. National Decisionmaking: *National Decisionmaking*

1. Public Concern: The Forest Service should clarify the need for a national roadless rule.

We are still mystified why the Department needs a new rule at all. The National Forest Management Act (NFMA), an existing law, clearly provides for public input to forest plans on a forest-by-forest basis. NFMA provides for a public involvement process (local, regional, and national) whereby anyone interested in the management of a particular [forest] can comment on, and be directly involved in, the management of those lands. (Elected Official, Fremont County, ID - #A4942.20201)

You should also seriously consider whether this entire process is really warranted. The Forest Service is perfectly able to manage the lands it controls under its existing management prescriptions. Another Washington based management directive is duplicative of existing powers, a waste of time and money and will never take the place of local management. (Organization, Steamboat Springs, CO - #A18447.10112)

BECAUSE EXISTING LAW ALREADY MANDATES ENVIRONMENTAL PROTECTION

An area of concern to many is the area of environmental protection afforded the Forest Service lands. Environmental protection is currently mandated and governed by many federal laws with jurisdiction on Forest Service lands—the Clean Water Act, Clean Air Act, and numerous other laws governing environmental activity on public and private property. Additional protection in the form of “roadless” areas is not warranted nor justified. (Business or Association, Novato, CA - #A17652.10112)

BECAUSE EXISTING LAW ALREADY PROVIDES FOR ADEQUATE PUBLIC INVOLVEMENT IN FOREST MANAGEMENT DECISIONS

As forest users and outdoor enthusiasts we are used to providing input on forest service plans and projects. We did so on the original roadless area proposal. Imagine our surprise when the Clinton administration released its top-down, government-knows-best roadless proposal. None of our comments were considered in that proposal. That Roadless Rule flew in the face of NEPA and NFMA direction for obtaining public input. In fact, we are still puzzled why the Department needs a new rule at all. The National Forest Management Act (NFMA), an existing law, clearly provides for public input to forest plans on a forest-by-forest basis. NFMA provides for a public involvement process (local, regional and national) whereby anyone interested in the management of a particular forest can comment on, and be directly involved in, the management of those lands. (Organization, Saint Anthony, ID - #A13225.20200)

Develop a National Roadless Rule

2. Public Concern: The Forest Service should develop a national roadless rule.

Why do we need roadless areas? You’ll get as many different reasons as there are people: spiritual, wildlife and wildlife habitat, fisheries, water quality, tranquility, soils, intact ecological processes, freedom, wildness. The list could go on. Separately, these are good reasons; however, taken together, the reason becomes overwhelming. The American public, whether they live next to a roadless area or in a large eastern city, wants roadless protection. Protecting roadless lands means no roads, no logging, no ORVs, no mining, period. Our roadless lands don’t need protection from fire or insect and disease, they need protection from human intervention, which has done more in the last fifty years to throw our forestlands out of whack than Nature could ever do. (Organization, Missoula, MT - #A21359.10111)

BECAUSE ONCE THESE AREAS ARE GONE THEY’RE GONE FOREVER

I hike in wilderness areas all over New Mexico as often as I can. I raft several times a year through wilderness areas in Colorado. The beauty and peace of these areas is unsurpassed. The bounty of the wildlife living in these areas is also a thing of wonder. Once these areas are gone they can never be reclaimed. Wilderness areas are what make our country so unique, and are part of our heritage. (Individual, No Address - #A4648.10111)

If these lands are protected now, future decisions under different conditions could change land designations as needed. If roads are allowed now, there is no turning back. The USFS and US taxpayer cannot continue in the business of subsidizing local resource based economies that refuse to move into the 21st century. The whole world is changing a lot. If small towns aren’t willing to change also, too bad. Keep in mind that this country will likely be around for a long time while our population continues to grow. If we do not stop this road building now, there will not be nearly enough roadless land around to meet our needs when our population reaches 400 or 500 million, as we are well on the way to doing. Once these lands are roaded, you can NEVER go back! (Individual, Boise, ID - #A8715.10111)

My family, and I regularly seek out these roadless areas. So much of the backcountry is currently taken over by off-road vehicles, extraction industries, and development. We need these last roadless areas to be protected before they are gone forever. (Individual, Helena, MT - #A5298.10111)

BECAUSE INDIVIDUAL STATES ARE UNABLE TO ADEQUATELY PROTECT ROADLESS AREAS

Most of this land is in the rural West and our western politicians, like our current president, are a little too accommodating to the oil, timber, and mining industries. This is the reason we need federal protection of these areas. Our western leaders in their quest for “states rights” seem to have forgotten that the balance of power between Federal state governments was “hardwired” into the constitution by America’s founders, who brilliantly recognized that the sharing of authority among state and federal governments would allow each to make its separate contribution to the building and sustaining of the country and its citizens. It is called federalism and it works.

Besides, many of the Federal programs currently in existence were created to achieve what the states have been unable or unwilling to do on behalf of their citizens. (Individual, Ketchum, ID - #A7766.12200)

BECAUSE MOST NATIONAL FOREST SYSTEM LANDS ARE ALREADY MANAGED FOR MULTIPLE USES

In Idaho, we have over 8 million acres of unprotected roadless lands in need of protection. By far, the majority of National Forest lands are already open to multiple use management, and the remaining National Forest roadless lands, which make up less than 3% of lands in the United States, deserve the greatest protection that can be afforded in order to ensure their preservation as intact, virgin ecosystems that will provide clean water, air, wildlife habitat, and undisturbed recreation opportunities for future generations. (Individual, Idaho Falls, ID - #A1330.10111)

BECAUSE ROADLESS AREAS ARE NEEDED TO PRESERVE ENVIRONMENTAL AND HUMAN VALUES

Roadless areas are the more remote sensitive areas of the United States. Activities from extraction industries often have greater impacts in these areas. Clearcutting and roadbuilding in these areas may produce flooding, erosion, landslides, and stream silting. I urge you to leave these areas wild in order to safeguard water recharge areas, species diversity, and air pollution filtering. (Individual, Westminster, MD - #A1604.10111)

We need the freedom, and resources, to get lost in the beauty of nature. We are quickly running out of such places. Forest areas need to be preserved. Logging should be banned in the roadless areas. These tracts of forest need to be protected, as they provide protection for wildlife. They also provide clean water and help to clean the air. (Individual, Rochester, NY - #A3718.10111)

I support roadless protection because roadless areas protect water quality for fishing, swimming, drinking, and life. As stated earlier, roadless areas function as biological strongholds for rare wildlife, provide large, relatively undisturbed landscapes important for protecting the greater ecosystem, present opportunities for healthy exercise, recreation, and solitude, and offer opportunities for scientific study and research. (Individual, Seattle, WA - #A4885.10111)

As a seasonal wilderness ranger, avid outdoorswoman, and an American citizen I use National Forest land to cross country ski, hike, mountain bike, camp, fish and most importantly to learn. I have learned that a healthy forest has a diverse biological make-up that I have fortunately witnessed as a brown bear dined on salmon. I have learned that National Forest land is the primary provider for Americans’ clean water. I have also learned the value of peace and solitude on extended hikes or travels that have revived my spirit. For these reasons and several more is why our remaining roadless National Forest Land should remain roadless. (Individual, Juneau, AK - #A13354.10110)

BECAUSE THE MAJORITY OF CITIZENS ENJOY USING ROADLESS AREAS

From a purely economic standpoint, roadless land provides far more short and long term returns than does extractive practices. This is evidenced by a couple of simple observations:

National Parks and Wilderness areas are under ever-increasing pressure due to crowding/over-use. Indeed many areas have had to go to a reservation system (see Alpine Lakes Wilderness Area in my area) to limit the number of people. Clearly the majority of citizens of this country enjoy using roadless land and are even willing to pay for it (the trail-head user fee now imposed by the USFS). (Individual, Seattle, WA - #A4885.10111)

TO SETTLE CONTROVERSIES REGARDING ROADLESS AREAS

On many national forests and grasslands, roadless area management has been a major point of conflict in land management planning. The controversy continues today, particularly on most proposals to harvest timber, build roads, or otherwise develop inventoried roadless areas. The large number of appeals and lawsuits, and the extensive amount of congressional debate over the last 20 years, illustrates the need for national direction and resolution and the importance many Americans attach to the remaining inventoried roadless areas on National Forest System lands (FEIS Vol. 1, 1-16). These disputes are costly in terms of both fiscal resources and agency relationships with communities of place and communities of interest. Based on these factors, the agency decided that the best means to reduce this conflict is through a national level rule.” (Organization, Plymouth, MN - #A7116.16000)

Do Not Develop a National Roadless Rule

3. Public Concern: The Forest Service should not develop a national roadless rule.

BECAUSE CURRENT LAW ADEQUATELY PROTECTS THE ENVIRONMENT

An area of concern to many is that of environmental protection regarding Forest Service lands. Environmental protection is currently mandated and governed by many federal laws with jurisdiction on Forest Service lands, including but not limited to the Clean Water Act, Clear Air Act, and numerous other laws governing environment-related activity on public and private property. Additional protection in the form of “roadless areas” is unjustified: it is duplicative and unnecessary. (Individual, Reno, NV - #A20857.20000)

BECAUSE THE NATIONAL FOREST MANAGEMENT ACT ALREADY ADEQUATELY PROVIDES FOR PUBLIC INPUT

The Clinton roadless rule was an abomination and an affront to our constituents and us. We are relieved to hear Secretary Venemon is going to reexamine the rule.

We are still mystified why the Department needs a new rule at all. The National Forest Management Act (NFMA), an existing law, clearly provides for public input to forest plans on a forest-by-forest basis. NFMA provides for a public involvement process (local, regional and national) whereby anyone interested in the management of a particular forest can comment on, and be directly involved in, the management of those lands.

Former President Clinton chose to override that public involvement process with a top-down, Washington-knows-best approach. In effect, he chose to impose his own values on the rest of us. As a result there are now 8 lawsuits, involving 7 states, in 6 federal districts, and 4 federal circuits. The federal judge hearing the case in Idaho stopped implementation of the rule, saying it was “fatally flawed”. It appears to us, therefore, that the Clinton rule need only be set aside and we can return to the public involvement process for forest planning. That is the long and short of our input. We will respond to your 10 questions, but they will be largely redundant because our answers tie directly back to this point: **GET RID OF THE CLINTON RULE; REINSTATE NFMA.** (Elected Official, Clark County, ID - #A23504.20201)

BECAUSE THE COURTS HAVE ESTABLISHED THAT NATIONAL FORESTS ARE NOT WHOLELY DEDICATED TO RECREATIONAL AND ENVIRONMENTAL VALUES

This national rulemaking attempt, in addition to completely sidestepping NFMA planning requirements, considers only land preservation alternatives (with the exception of the no-action alternative) and ignores the multiple-use mandate that the Forest Service must follow. The courts have separated the sustained-yield and multiple-use mandate of national forests from other Congressional mandates, such as national park management, and have clearly distinguished national forests as being not wholly dedicated to recreational and environmental values. (Tribal Corporation, Anchorage, AK - #A20340.20202)

BECAUSE FORESTS ARE IN BETTER SHAPE NOW THAN AT ANY OTHER TIME IN RECENT HISTORY

I believe this whole exercise is unnecessary. The forests are in better shape now than they have ever been within recent history, further restrictions are unnecessary. (Individual, Tustin, CA - #A20777.10112)

BECAUSE THE AGENCY ALREADY HAS ENOUGH REGULATORY CONTROL AND MANAGEMENT AUTHORITY TO PROTECT THESE AREAS

The proposed regulations were only an attempt to limit legitimate development and use by certain commodity producers such as those in mining, and timber and food production as well as to limit access and use by off-highway vehicle users. The Forest Service already has more than enough regulatory control and management authority to control and protect areas within National Forests. Travel management plans can achieve many of the same results. The only thing travel management cannot do is prohibit legitimate and legal development and use of natural resources such as timber and mining. Under the proposed regulations almost any area could be designated roadless regardless of its current use and available access. The approach taken in the Roadless Rule again undermined the Forest Service's credibility to effectively work with local communities and has further eroded the trust and confidence Lander County has in the agency to manage natural resources. (Elected Official, Lander County, NV - #A27730.12230)

4. Public Concern: The Forest Service should delay development of another national roadless rule**UNTIL JUDICIAL RESOLUTION OF THE ROADLESS AREA CONSERVATION RULE**

A finding that the 2001 roadless area rules are invalid could change the type of roadless area proposal that this Administration chooses to advocate and adopt. If the Administration's roadless area initiative is compared against the baseline of the roadless area uses allowed under the controlling forest plans (rather than the baseline level of protection under the invalid January 2001 roadless area rules), the Forest Service may have more room to adopt measures that include greater preservation of roadless areas than the forest plans provide for, but which allows for more forest health protection and developmental uses than under the January 2001 roadless area rules.

The Forest Service and this Administration would be exposed to greater public criticism: (1) if it starts with one roadless regulatory proposal, then shifts course after the roadless area rules have been invalidated in court; and (2) requests public comment several times on different rulemaking proposals, and NEPA, and RFA compliance documents.

Thus, the public interests in efficient government, in not wasting the public's time in commenting on likely-unlawful proposals, and in legal certainty all favor obtaining judicial resolution of the roadless cases before the Forest Service proceeds too far on another roadless rulemaking proposal. (Association, Kalispell, MT - #A20940.20000)

UNTIL FOREST PLAN REVISION PROCESSES TAKE PLACE

The Roadless Initiative is not following the regulations of the National Forest Management Act (NFMA) or the Wilderness Act. Many of the national forests are in the process of revising their forest plans. This latest initiative has thwarted the national forest planning process. The Forest Service should wait until the Gila National Forest planning process to consider such a substantial withdrawal of multiple use lands. (Manager, Sierra County, NM - #A22059.20201)

Need for the Roadless Area Conservation Rule**Summary**

General Comments – Some respondents state that the Forest Service should clarify the need for the Roadless Area Conservation Rule since, they say, it does not address the stated purpose and need and prove there should be a nationwide ban on road construction.

Implementation of the Roadless Area Conservation Rule – People comment on whether or not the Roadless Area Conservation Rule should be implemented as is, revised, or eliminated all together. The reasons given are numerous and varied. Some respondents state that the 2001 Rule meets the five principles of roadless conservation. Furthermore, they believe the current Rule adequately addresses the issues of fire management, forest health, access, and local input, so do not think there is a need to revise the current Rule. Others believe the Rule did not adequately address these principles at a local level, so consequently the Rule needed to be re-opened for public input. These principles included; informed decisionmaking, collaboration, forest protection, private property protection and ensuring legal access (see Chapter 3: Informed Decisionmaking (Question 1): Local vs. National Decisionmaking: *National Decisionmaking*).

Respondents also question the need to repeat the process due to allegations that there was not enough opportunity to comment last time around. According to these respondents, the time spent on public involvement for the draft Rule was more intensive than the current ANPR 60-day comment period. These respondents also felt that being asked to comment on 10 questions indicated that those answers would be given more weight than simple comments about roadless policy in general. They also question the objectivity of the 10 questions and assert that the majority should prevail, regardless of specificity. Respondents also disagree with what they believe the Forest Service is saying about not having any local and State support for the Rule.

Respondents also assert that revisiting this process will have several negative effects. First, they say, it will be a waste of taxpayer money. Others say that revisiting the Rule will weaken public trust in the federal government in general, and in the forest planning process in particular. They question why their concerns were not heard during the first two go rounds of comment.

Other respondents request that the Rule not be implemented. Just as those who ask that the Rule be implemented question the motives behind the current process, those who ask that it not be implemented question the integrity of the previous roadless process. Several say the Rule was developed using emotion, not logic, or based on subjective reasoning. Respondents question the validity of the Rule since, they assert, it lacks site-specific information. Some point out that they believe there is a lot of information available to the Agency that the previous process did not avail itself of.

Some respondents believe the government is intruding into their geographical part of the country and their way of life, while other individuals state that the existing Roadless Rule does not adequately consider effects of fire fighting, public safety, access to private property and still others write that policies and regulations, in place prior to the Roadless Rule, were adequate for forest health and conservation.

Finally, one respondent advocates that inadequate road maintenance funding should not be used as a reason for implementing the Rule. This respondent suggests that other alternatives, such as requests for additional funding for roads from Congress, or allowing road maintenance by the private sector, should be considered and published for public comment.”

Revision of the Roadless Area Conservation Rule – Individuals who suggest revising the Roadless Area Conservation Rule request fewer restrictions, while those who request more restrictions generally ask for the Rule to be strengthened. The reasons given for revising the Rule generally echo the reasons for not implementing the Rule mentioned in previous paragraphs. There are respondents who believe the Rule should be revised because the process leading to its development was inadequate. Other respondents who request the Rule be strengthened generally

ask that the exemptions be removed from the existing Rule, such as public health and safety and go on to request that the Rule should have more restrictions, such as prohibitions on motorized recreation and hard rock mining.”

Defense of the Roadless Area Conservation Rule – Respondents request that the Forest Service, the Department of Agriculture, and the executive branch defend the Roadless Area Conservation Rule. They assert that the new Administration the Rule’s legality and request and request that all three levels of government mount a defense against the lawsuits challenging the Rule.

Several individuals specifically request that the Rule not be defended in court. One respondent, r, asserts that the Administration should not spend taxpayer money defending against laws suits that they see as legitimate and view any defense as restricting and giving in to only one segment of the population.

Other General Comments – Some individuals state that the Roadless Area Conservation Rule is difficult to interpret and needs clarity. Others say the Forest Service should abide by decisions already made, and emphasize work on other priorities such as compliance with NEPA, the threat of unnatural wildfire, and the spread of noxious weeds. Some respondents comment that a rule should not be developed which will affect eastern and western states differently, while another individual suggests separating the Rule into two distinct policies, for administrative purposes, local prescriptions and cumulative effects.

Need for the Roadless Area Conservation Rule General

5. Public Concern: The Forest Service should clarify the need for the Roadless Area Conservation Rule.

BECAUSE THE RULE DOES NOT ADDRESS THE STATED PURPOSE AND NEED

We note that in the DEIS (3-6) there is a reference that the regions with the highest population densities have the least amount of inventoried roadless areas and that the highest demand for the unroaded benefits are in these areas. However, we also note that the areas with the most inventoried roadless areas (Alaska and Idaho) are in fact farthest from the population centers (DEIS 3-3). Given [where] the demands for roadless lands are located, it appears that the proposed action with its emphasis on unroaded areas in low population density areas does not address the stated purpose and need. (Elected Official, Douglas County, OR - #A11811.10000)

First, we feel the ANPR fails the test of Executive Order 12866 requiring agencies to identify a need for new regulations. The Forest Service has stated that the three reasons for the proposed rule are: (1) road construction can alter the fundamental characteristic of roadless areas; (2) budget constraints limit the number of roads that can be adequately maintained; and (3) the controversy over management of roadless areas causes costs and delays. However, the Forest Service did not identify a market failure or other compelling public need for the proposed rule. None of the three stated reasons indicate a need for a nationwide ban on road construction within Forest Service managed lands. In fact, a review of our company’s cooperation and partnership with the Forest Service demonstrates that all three of the above concerns can be successfully addressed and mitigated through a local control and planning process. (Business or Association, Pocatello, ID - #A20842.10000)

BECAUSE ONLY A SMALL PERCENTAGE OF ROADLESS AREAS IS PROJECTED TO BE DEVELOPED BETWEEN 2000 AND 2004

I agree with Secretary Veneman’s 5 principles.

Other Resource potentials really are not realistic for the Tongass if roads can't be built - logging, at least, would be nearly impossible. Current Forest plans assign about 41 percent of total I.R.A. to roadless management. This is enough. Only about 16 percent of the total I.R.A. is productive timberland that might have roads built for timber harvest, according to your figures. And if the Forest Service Roadless Area Conservation Final Environmental Impact Statement (USDA Forest Service, November 2000, pages 2-25) estimated that less than two-tenths of one percent of the total of inventoried roadless areas (94,600 acres of 58.5 million acres) might be developed between 2000 and 2004, then what is the need for the Roadless Rule? (Individual, No Address - #A1133.10110)

6. Public Concern: The Forest Service should explain how current management does not provide the protection which it is the purpose and need of the Roadless Area Conservation Rule to provide.

The roadless proposal implies that the current management does not "protect" these areas however none of the materials to date have examined the site specific management currently in place for these areas. We suggest that any analysis include a review of the management currently in place and describe how these strategies do not provide the perceived protection that is the purpose or need for the proposed action. (County Attorney, Grant County, OR - #A17667.30100)

Implement the Roadless Area Conservation Rule

7. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule as it now stands.

I am writing to support the Forest Service's Roadless Area Conservation Rule as it now stands. This policy was developed after extensive public hearings and legislative consideration over time.

We need to keep a BALANCED approach to forest conservation to save our remaining 30% of America's wild national forests from logging, mining, and drilling—activities already allowed on most national forest lands. The current rule adequately addresses the issues of fire management, forest health, access, and local input. (Individual, Fort Lauderdale, FL - #A20.10110)

I can attest that America is what it is today because of its beautiful woodlands that house creatures great and small and a variety of plants/trees. We must do everything we can to protect the woods. Clinton's wild forest protection act was not a hasty decision. Instead, it was born out of many years of research and discussions with average citizens and scientists in the field. It is what Americans want. So please let Clinton's roadless area plan stand as is with no modifications that would only destroy it. (Individual, Columbia, MO - #A24.10110)

On May 4, USDA Secretary Veneman announced that the Forest Service "will implement the Roadless Area Conservation Rule" and that the administration "is committed to providing roadless protection for our national forests." If the administration is sincere in its support of the protection provided by the Roadless Rule, it will respect the clearly expressed wishes of the public and decide not to tamper with the rule. (Organization, Washington, DC - #A20424.10150)

I am writing to you to urge you to preserve the Forest Service's Roadless Area Conservation Rule as it now stands (including in it the recently protected Tongass National Forest). This policy is the product of the most extensive federal rulemaking in history, with more than 600 public hearings and 1.6 million public comments, 95% of which support the strongest protection. (Individual, Brooklyn, NY - #A172.10111)

I still strongly support the protection of wilderness areas covered under the Roadless Area Conservation Rule since they provide, among other things, clean drinking water; protect water quality for drinking, fishing, and swimming; function as biological strongholds for rare wildlife; provide large, relatively

undisturbed landscapes important for protecting the web of life; serve as barriers against the spread of weeds and pests into pristine areas; offer opportunities for scientific study and research; provide open space and unspoiled vistas; and preserve areas needed for traditional Native American religious and cultural observances. (Individual, Roanoke, TX - #A4626.10150)

Not to flagellate a dead equine, but this process, in and of itself, is the most pressing concern to me. Like a recalcitrant child, the Forest Service continues to ask the same questions, hoping to get a different response. Well, it's not going to happen. The overwhelming majority of Americans want to protect roadless areas. The overwhelming majority of people who commented on the roadless rule (be they from NYC or Montana) supported the Rule as it is written. I will be one of literally tens of thousands of people who write this simple message to you. The Forest Service should support and implement the Roadless Rule just as it is. (Individual, Lewiston, ID - #A29569.10150)

BECAUSE ONLY A NATIONAL RULE CAN GUARANTEE PROTECTION OF NATIONAL FORESTS THROUGH CHANGING POLITICS AND PERSONNEL

We SUPPORT THE ROADLESS CONSERVATION POLICY—JUST AS IT IS . . . Only national protection will guarantee that Idaho's wild national forest lands remain intact regardless of changing politics and personnel. (Individual, Clayton, ID - #A5310.10150)

I support the roadless Area Conservation Rule as it is. National protection is best for these lands. During 18 seasons of work in Wilderness (Absaroka-Beartooth) and on Lookouts, I've seen how a change in personnel and politics can change land-use. If we're serious about keeping roadless areas intact (and I think we should be) national protection is the best way to do it. (Individual, Billings, MT - #A8697.10150)

Because the National Forests are a national resource, only national protection of the roadless areas will guarantee that wild national forest lands, in those states where they exist, (such as Wyoming, where I grew up, or Montana, where I have hiked and hunted in wilderness areas) will remain intact regardless of changing local and national politics and personnel. (Individual, Somerville, MA - #A9107.10111)

I am writing to you today to express my strong support of the roadless Area Conservation Policy, and to urge the U.S. Forest Service to implement the policy as it is currently written. Only national, coherent protection will guarantee that our wild, roadless national forest lands remain intact for generations to come—regardless of shifting politics and changing agency staff. Our partly owned roadless lands are part of an invaluable, irreplaceable national treasure; it is incumbent upon us to ensure this treasure can be cherished by our children and their children. (Individual, Portland, OR - #A19217.10111)

BECAUSE IT PROVIDES CONSISTENT STANDARDS

A national policy is needed to establish a set of standards to protect all National Forest roadless areas. Please implement the Roadless Conservation Rule that was set to go into effect in March. (Individual, No Address - #A3061.10150)

Question 1: Generically speaking, forest planning as mandated by NFMA is the appropriate arena for making determinations concerning Roadless Area management. However, there must be regulations that aid Forest Supervisors and the plan revision team that provide a consistent procedural approach to Roadless Area management. (Individual, Quarryville, PA - #A15217.13130)

SDSAF urges the Bush administration to develop a new rule that:

- establishes national standards to guide roadless area conservation
 - requires Forest Service line officers to apply those standards through the forest planning process.
- (Professional Society, Rapid City, SD - #A21751.13130)

BECAUSE THE FIVE PRINCIPLES OF ROADLESS CONSERVATION HAVE ALREADY BEEN FOLLOWED

Simply I believe that the five principles of roadless conservation that you ask the public to follow in this case, informed decisionmaking, collaboration, forest protection, private property protection and ensuring legal access, have already been closely followed. (Individual, Clayton, GA - #A15320.10111)

BECAUSE IT IS BASED ON THE BEST AVAILABLE SCIENCE

Other concerns. My main other concern, which I related in part in previous comments, is that your decision be based on the majority of public comments and on the best available science, not by politics, especially what I fear will be the influence of special interests on the environmental policies of the current administration. In the previous planning process, 95% of respondents were in favor of protecting the remaining roadless areas. While I appreciate the importance of forest products, I also appreciate the importance of the values that are unique to our remaining roadless habitats and that should be protected. Scientifically, it has been well established that roads are major causes of noxious weed invasions, degradation of fisheries and spawning beds, disruption of hydrologic cycles, spread of exotic diseases and pests that threaten forests (e.g. Chestnut blight, sudden oak death syndrome), erosion, and fire. Many important animal species avoid roads (wolves, grizzly bears, black bears, wolverines, fishers, martens, lynx, bobcats), while many native plant species are displaced by weeds that are only able to enter systems because roads acted as corridors for their invasion. The scientific basis of maintaining roadless habitats is well established and supported by overwhelming evidence that has been compiled by some of the world's best scientists. I know this very well because my Master's research explored the ecological effects of roads (including a current paper just submitted to Conservation Biology, authored by myself and a USGS scientist), and my current Ph.D. research concerns ecological effects of roads on exotic plant invasions, including a paper that I am about to submit to Ecological Applications. (Individual, Davis, CA - #A30523.10150)

BECAUSE ONCE THESE PLACES ARE GONE THEY'RE GONE FOREVER

The term roadless values is relative. To loggers and developers, it means money. To those of us who enjoy the outdoors for recreation, sometimes it can mean sanity. Let the rule stand as written. Again I say this—and cannot say it strongly enough—WHEN THESE FORESTS ARE GONE THEY ARE GONE FOREVER! Surely 95% of the people who took the time to give input can't ALL be wrong. Let's give the American public its due and listen. I hope these comments will not be met with the silence I love hearing in the forests. They are there for us—let's be there for them. (Individual, Rex, GA - #A576.10150)

Roadless areas may be the most important use of the National Forest, which is dedicated as a land of many uses. Roadless areas encourage biodiversity, offer unique recreational opportunities and protect wilderness for future generations. A shockingly small percentage of land in the United States is in designated roadless area. We must protect these remaining areas because once they are violated they cannot be replaced. Wilderness is not a renewable resource. (Individual, Afton, WY - #A10526.10150)

BECAUSE IT IS LONG OVERDUE

For many years, I have participated in the forest service planning process before government committees, the Bolle Commission, on primitive areas, on Wilderness areas, RARE I, RARE II, and the Tongass Land Use Management Plan 1975 through 2000. I can say after 47 years of documented involvement in the forest service planning process, that the Roadless Rule was long overdue. When Congress passed the Organic Act in 1897, and President Theodore Roosevelt added 140 million acres to the national forest system in 1907, it was to protect the remaining public forests from the timber barons and the railroads. There has been over 100 years of public testimony on the Roadless Rule, attempting to protect the watersheds of our nation.

The Forest Service, which after WWII should have changed its name to the Road Service for the timber Industry. That is clearly evident in the Tongass National Forest in Alaska on Prince of Wales Island. This 1.5 million acre island owned by the public and administered by the USFS in Alaska has almost as many miles of road as the entire State of Alaska (365 million acres+) and 190 miles of road on Prince of Wales Island (1.5 million acres).

If it had not been for President Theodore Roosevelt in 1909 adding more than 140 million acres to the national forest system, we would have nothing left for the Roadless Rule. This has not been a rushed process. The Roadless Rule is documented in public administration for having the largest public hearing in USFS history and coming up with a ruling in 18 months. If only the congress could do so well. (Individual, Juneau, AK - #A2317.10111)

TO AVOID REPEATING MISTAKES OF THE PAST

It is of paramount importance that we understand when our roadless areas and wilderness are gone, they WILL BE GONE.

If you doubt my words, look at countries [which] have done just that. Surely we can learn from their mistakes, before it is too late for us and our lands.

I ask that you honor my and the 1.5 million of American people's request to leave all the million acres of roadless areas BE. (Individual, Grass Range, MT - #A18058.10111)

I have heard of the Cedars of Lebanon, but today they exist only on the Lebanese flag. The Landes area of France is nothing but sand dunes now because of over cutting of a huge forest area in order to construct sailing ships. Please, let us not make similar mistakes. (Individual, APO, CA - #A12817.10111)

The Maine woods is just beginning to recover after being logged and burned in the mid 19th century, the pine forests of the Great Lakes states have still not recovered from similar treatment 100 years ago. The western fir and pine forests are riddled with logging roads and clear-cuts, except for a few islands of late successional forest and roadless areas. Last year, I, and a million people like me, supported the cessation of logging, roading, and mineral leasing in roadless areas of the national forests. We did so to preclude repeating the same mistakes that our culture did as it moved west. Now we are being asked to reconsider. (Individual, Corvallis, OR - #A7998.10111)

I have lived in Alaska since 1972. I have a Masters degree in resource economics. Economics is the study of scarce resources. Our forest resources belong to us all, subsistence hunters and urban dwellers alike, fishermen and tourists and residents. Except for one industry, the timber industry, which has already cut down 70% of the best Tongass habitat, the rest of us depend on intact habitat and plenty of it for fishing, hunting, berry and mushroom gathering, and just camping with the kids. Must we repeat all the mistakes of the lower 48? (Individual, Juneau, AK - #A23012.10111)

BECAUSE IT REPRESENTS A BALANCED APPROACH TO FOREST CONSERVATION

The January ruling, as published, provides for the remaining 31% of our forests to be protected as roadless lands. As the January roadless conservation rule sets forth, a grand compromise balances roadless conservation versus development. Setting aside only 31% of our forests is, in the face of all the forests that have been cut, drilled and mined to date, less than optimal. However, it is a worthy compromise and it needs your unwavering support. (Individual, Oswego, IL - #A12043.10111)

I recently receive a copy of the "Forest Service's Roadless Area Conservation Rule" to review. I have completed my review and I am writing this letter in support of the Rule.

The Rule represents a balanced approach to forest conservation and protecting important roadless areas from damage caused by activities already allowed on most National Forest Lands. The Rule in its present form adequately addresses the issues of fire management, forest health, access, and local input. Because I am an elected official, the opportunity for local input is always a plus for me. I am opposed to weakening National Forest protection in favor of logging and development in roadless areas on a forest-by-forest basis. This type of practice has led to a steady decline of these precious lands.

The comprehensive and inclusive public process outlined in the Rule should reassure decision makers of the public support for the Roadless Areas Rule. The forestlands provide numerous amenities, which are enjoyed by all Americans. The Rule will allow logging to continue on most Forest Lands while

protecting 31% of these lands for other values. This balance is very important to me and is the primary basis for my support of the Rule.

Therefore, I encourage the implementation of the "Roadless Area Conservation Rule as promulgated." (Individual, Little Rock, AR - #A19226.10111)

The last wild roadless areas of our National Forests are critical for priceless ecological services such as clean water sources, and habitat for diverse fish, wildlife and plant species. They also provide unique recreational opportunities for those who like to hike, hunt, camp and fish. Over half of our national forests are already open to logging, mining, roadbuilding, and other development. The 58.5 million acres protected by the Roadless Rule should remain protected from logging and other destructive activities not only for the benefit of all Americans today, but also for future generations. (Individual, Charlottesville, VA - #A5097.10111)

Presently, 51 percent of the national forests remain open for logging, mining, and other resource activities, while only 18 percent have been designated as wilderness areas. The rule, without modifications, will ensure that the last 31 percent remains unspoiled and protected from logging, mining and road-building. I support the Roadless Area Conservation Rule, without modification, because it achieves a true balance between the recreational and extractive uses for our national forest lands. I am concerned that changes to the rule will significantly weaken protections for these special places. I urge you to let the rule stand as it is written in the January Record of Decision. (Individual, Concord, NH - #A19701.10150)

Much to the dismay of the public, National Forest Service lands are already heavily roaded and frequently harvested for timber. **PRECISELY BECAUSE IT IS NECESSARY TO BALANCE THE ECONOMIC INTERESTS OF TIMBER COMPANIES WITH THE MORAL, AESTHETIC AND RECREATIONAL INTERESTS OF THE PUBLIC, THE FOREST SERVICE SHOULD MAINTAIN THE ROADLESS RULE AS IT PRESENTLY EXISTS.** (Individual, No Address - #A5948.10000)

BECAUSE IT STILL LEAVES AMPLE AREA FOR OTHER USES

Protecting less than one-third of the national forests from logging and road building for recreational use and resource conservation should leave more than enough areas remaining for special interest logging and other commercial uses. (Individual, Tucker, GA - #A4543.10111)

As a frequent recreational user in our National Forests, I would like you to know that I am very concerned about the current proposed changes to this rule that was previously commented on by 1.6 million Americans, myself included. I have been hiking and camping in nearly two dozen of our National Forests and found roadless areas to be in need of the protections that this rule will (in its current form) enable. Furthermore, there are ample areas of the USFS system open to commercial exploitation. Personally, I would prefer that my grandchildren be able to experience the wild Monogahela, Kaibab or Tongass as they have always been than to say someone made money by culling these forests in the past. (Individual, Rockville, MD - #A4974.10111)

BECAUSE IT ADEQUATELY PROTECTS OTHER INTERESTS

We do not need more timber roads in the forest just to log one quarter of one percent of the national timber supply. The rule as it stands exempts all acres currently under lease for logging. Furthermore, it preserves existing access for motorized recreation, mountain biking, hunting and fishing. It also permits construction of new roads for fire suppression and for stakeholders with existing statutory rights. It also allows for the cutting and removal of trees for fire prevention. (Individual, No Address - #A3605.10150)

I am writing to express the support of the California Department of Forestry and Fire Protection (CDF) for the Forest Service Roadless Area Rule (Rule) as adopted on January 12, 2001. The protection of wildlands and roadless areas provided by the Rule is important to many Californians. In its existing

form, the Rule poses no major impediments to CDF in its collaborative work with the US Forest Service to protect the citizens and natural resources of the state. CDF appreciates the degree to which the final Rule was responsive to the issues raised both by CDF in its scoping letter of December 21, 1999, and by The Resources Agency of California in its letter of July 28, 2000, resending to the Draft Environmental Impact Statement. (State Agency, Sacramento, CA - #A18110.10150)

BECAUSE SO MUCH FOREST LAND HAS ALREADY BEEN ACTIVELY MANAGED

Please enact the roadless rule! Too much of our forest land is logged, developed, and industrialized. The forests are shrinking every day, and this is one of the most important steps to take to ensure the future of woodlands. One day, even if not in our lifetime, someone will ask Why did they destroy the most important habitat on Earth? What was the reason? Was it money? Was it pressure from logging and mining companies? Was it pressure from PROGRESS?? (Individual, No Address - #A4590.10110)

Enough of America's forests and wild lands have already been ruined as a result of poor planning and misuse by unconcerned industry interests. There are no good reasons for altering the Conservation Rule, as it contains provisions for fire management, forest health, access, and local input. (Individual, Davis, CA - #A170.10111)

I care about conservation and am deeply concerned about the possibility of losing valuable wild land to roads and the uses that would engender. There are so few truly wilderness areas left. What about the people who want a true wilderness experience? Soon the world, and worse, the United States will have no areas left to provide that if we further encroach on what we have left. Please don't rescind the 'roadless' rule, but let it stand. (Individual, Hopkins, MN - #A217.10111)

Under current forest plans, about 60 percent of the remaining roadless areas are available for road construction and logging. The Roadless Area Conservation Rule is needed to prevent further incremental loss of roadless areas. The appropriate role for forest planning is to provide additional protection of roadless areas, such as preventing off-road vehicle damage, and identifying roadless areas omitted from Forest Service inventories. (Individual, No Address - #A4758.10110)

BECAUSE WILDERNESS AREAS ARE TOO HIGH IN ELEVATION AND TOO FAR SEPARATED FROM EACH OTHER TO ADEQUATELY PRESERVE BIODIVERSITY AND WILDERNESS RECREATION

Years before the process that led to the Roadless Area Rule began I had, through research and personal experience, come to the conclusion that protecting roadless areas was absolutely essential for the long-term health of the forest and its indigenous wildlife. While one third of the White River—750,000 acres—is designated Wilderness, these areas fail to protect biodiversity or provide adequate opportunities for wilderness recreation for two fundamental reasons: they are too high in elevation and too far separated from each other and from centers of human population. The Roadless Rule, as it stands, would correct these critical deficiencies in the management of the White River National Forest and provide more benefits than costs to our local communities and economy. (Organization, Carbondale, CO - #A17314.10111)

BECAUSE ROADLESS AREAS SERVE A DIFFERENT PURPOSE THAN WILDERNESS AREAS

The National Forests belong to all Americans and this decision should not be placed in the hands of local officials. Roadless areas and Wilderness areas are different, and both deserve protection. Roads are gateways to logging and ORV use, and the large body of literature on edge effects and habitat fragmentation should make this decision easy—Please keep the Roadless Rule intact. (Individual, Boulder, CO - #A20981.13110)

BECAUSE THE ORIGINAL PROCESS WAS SUFFICIENTLY LOCAL

In an increasingly "small" world, local is a term that has a changing meaning. In terms of national public lands, such as the National Forest System, all planning is inherently local. Since National Forests are "owned" equally by the citizens of the United States in a collective manner, it shouldn't matter whether a person lives in Florida or Nevada when it comes to management decisions on a National Forest in any given location. In that regard, I believe that **the original national process used in 1999 and 2000 to**

develop the Roadless Rule was appropriate and sufficiently “local”. (Individual, La Pine, OR - #A22107.10151)

BECAUSE IT REPRESENTS THE WILL OF THE PEOPLE

I read the newspapers and magazines. I use the Internet for research. I listen to the broadcast news. So please don't continue to insult my intelligence by maintaining that somehow the “public” has not had adequate input to the roadless area policy currently hanging fire in this administration. That's just nonsense. Feeding to the uninformed as a way of circumventing the expressed will of the people is almost criminal. Roadless policy has been studied and commented upon more thoroughly than any other forest policy in this nation's history. Good grief. (Individual, Spokane, WA - #A1057.12200)

The Sitka Conservation Society has consistently worked to protect America's last remaining Roadless Areas and inclusion of the Tongass National Forest in the Roadless Area Conservation Rule. We strongly oppose timber sales in any of the Inventoried Roadless Areas (IRAs) on the Tongas. Apparently, the American public agrees with us. In no fewer than eighteen separate opinion polls (conducted by both Republican and Democratic pollsters), the American public has shown strong support for national forest conservation. It is estimated that 76% of Americans (62% Republicans) support the Roadless Rule and inclusion of the Tongass N. F. (Organization, Sitka, AK - #A12003.10150)

In the case of the RACR, it is now mandatory that the Forest Service implement this rule to try to build a positive relationship with this national public. Subverting this national public desire will eventually lead to the demise of the Forest Service—the public wrath will not be denied. You are embarked on a course of consciously subverting a clear public mandate for the protection of roadless areas.

Many rural and local people support the roadless rule as part of the broad national mandate. The Forest Service must find ways to deal with the rhetoric of the few who would subvert not only the national will, but also what is best ecologically for the land. The vitriol of the minority against the RACR can be mitigated if the Forest Service simply worked with this constituency within the framework of the RACR—and you have lots of flexibility to do so. Environmental groups complained strongly during the development of the RACR that too much flexibility was embodied in the rule. This flexibility over time would allow the Forest Service to work with these local minorities in a positive way. Instead, your approach is to deny the clear and broad mandate and move to disenfranchise the people who own these forests and pay the bills. Hardly wise. (Individual, Corvallis, OR - #A13493.10150)

The forest service must serve the broad public interest by fully protecting the environmental, wildlife and aesthetic values overwhelmingly supported by the public and by firmly opposing economic exploration values which are completely incompatible with the maintenance of roadless area characteristics. The Forest Service should be respectful to those seeking to undermine roadless area values but must enforce the rules and the law, even if unpopular with a tiny minority of citizens and corporate interests who selfishly promote personal, temporary, economic gain overall other values. Those who promote commercial exploitation demands must be respectfully reminded that the vast majority of forest service lands are already managed for economic values and that a small percentage of the public lands in the Unites States of America must be managed for primarily ecological and aesthetic values. In a democratic society worthy of the name, the will of the majority must prevail, particularly when it is the result of an exhaustive, legally scrupulous process for seeking such public will. American citizens overwhelmingly want complete protection of our roadless areas as wilderness. (Individual, Port Angeles, WA - #A6179.15165)

The process for the ANPR has been less than honorable. The ANPR states in part that “there was inadequate opportunity for public review and comment on the roadless rule”. This is the opposite of the truth. Over a three-year period, over 1,600,000 Americans gave their opinion on the RACR. About 1,500,000 of them supported increased roadless protection. The scale of the public hearings was unprecedented. Yet, in response to these false allegations of inadequate opportunity for public comment, the ANPR allows only a poorly publicized 60-day comment period, in which comments on 10 questions

(8 of which are clearly biased towards the extractive industries that would benefit from alterations to the RACR) are given more weight than simple comments about roadless policy in general. The public has spoken, and the administration has an ethical and legal obligation to abide by the RACR. (Individual, Boulder, CO - #A14055.10152)

The Forest Service conducted an unusually extensive public participation process in California to solicit public input. The agency held 63 public meetings throughout the state. Support for the roadless area rule was and remains widespread and strong in California. Public opinion polling conducted in the state indicated that support was approximately 3 to 1 statewide. Approximately 140,000 public comments were submitted on the draft proposal from California; the overwhelming majority was in support. (State Agency, Sacramento, CA - #A18110.15110)

BECAUSE ROADLESS AREAS IN EASTERN FORESTS ARE SO SCARCE

A key finding of the recent interagency Southern Appalachian Assessment (SAA) was that only 4% of the 37 million acre multi-state region is in a roadless condition. Most of this acreage is on the National Forests. Roadless areas are the last vestiges of wilderness in the East. They are rare and precious, small and disparate. And destined to become smaller and even more degraded if present Forest Service policy and practices are not stopped. As an example of how bad the situation is, when the 600,000 acre Daniel Boone NF was recently “inventoried”, only a single tiny stand-alone roadless area (of around 1800 acres) was found on the entire Forest. Less than a half of 1% of the 1.1 million acres of NFs in Mississippi are inventoried as roadless by the FS. According to the May 2000 DEIS (pg. B-10), only 7% of the acreage in all the Southern Region NFs are designated as roadless areas. The entire Eastern United States (Forest Service Regions 8 and 9) contains less than 4% (1,543,000 acres) of the inventoried roadless lands outside of Alaska (see DEIS page 3-98). (Individual, Staunton, VA - #A29325.10111)

BECAUSE IT PRESERVES THE STATUS QUO

This rule preserves the status quo of actual uses in our National Forests by limiting development of areas that have never been developed, while not impeding already approved activities. The result of the public process is precedent-setting because it is typically the opposition to a proposed action that garners the greatest level of support and comment. In this case, it was supported for the status quo that received the overwhelming support of Americans. (Individual, Evergreen, CO - #A28071.10153)

8. Public Concern: The Forest Service should recognize that the Court’s concerns do not justify a departure from the Roadless Area Conservation Rule.

What are the Court’s and the plaintiff’s concerns that the Service has pledged to address? In its May 4 report to the Court, the Service has said that it shares the Court’s concerns about the process through which the Rule was promulgated, and that it wants to “ensure that Americans who live near these inventoried roadless areas have sufficient and meaningful opportunity to comment upon the Rule’s development and implementation.” As we understand them, these statements signal three things: 1. The Service intends to address the specific NEPA irregularities found by the Court. 2. The Service intends to provide for substantial public participation in the current review and in considering any subsequently proposed modifications to the Rule. 3. The Service intends to ensure that citizens who live near roadless areas have a voice in decision making under the Rule.

While we by no means wish to convey that the FRWG agrees with the Court’s analysis or the plaintiff’s concerns, it should be emphasized that none of these concerns even comes close to undermining, or justifying a departure from the Rule’s basic construct: management by considering site-specific exceptions from a national standard. On the contrary, these concerns clearly are capable of being addressed within that construct, through this rulemaking and perhaps through supplemental NEPA documentation . . . (Organization, Washington, DC - #A23283.15150)

9. Public Concern: The Forest Service should consider that revisiting the Roadless Area Conservation Rule will have negative effects.

IT IS A WASTE OF TAXPAYER MONEY

I understand that more comments were received on this regulation than ever in Forest Service history, and the great majority favored the Roadless Area Conservation Rule. It is reasonable to assume that many millions more agree with the million or so people who took the trouble to write. I cannot fathom therefore why this public comment period has been reopened except to fish for a different answer, one more to the liking of the narrow interests opposing this rule. I object to taxpayer money being wasted on revisiting a good rule that went through a lengthy and competently run public process. (Individual, Juneau, AK - #A23012.10152)

I would like to express outrage at the waste of taxpayer money being perpetrated in the name of properly determining public sentiment. Roadless-Area legislation proposed under the last administration resulted from one of the most all-encompassing public-outreach exercises ever undertaken. To claim that abundant opportunities were not available for public comment is to criminally misrepresent the efforts of those who came before you to this question. The American public spoke clearly and forcefully. Their present attempt to find some justification for ignoring those voices is undemocratic and unworthy of the American people or the resources for which they are quite obviously concerned. (Individual, Bloomington, IN - #A30275.10153)

It is baffling to people who are not career politicians as to how the government can spend the money on RARE I and RARE II, spend the money and the manpower over the years developing a policy and soliciting public comment, and then throw away the investment due to nothing more than a change of administration. This waste of taxpayer money is appalling. DON'T WASTE THE TIME AND MONEY OF THE PAST; DON'T THROW IT AWAY. (Individual, Lake Tomahawk, WI - #A29653.75600)

IT WILL WEAKEN PUBLIC TRUST IN THE FEDERAL GOVERNMENT

Any efforts to change this publicly mandated policy would significantly weaken the protections our wild forests deserve and would also weaken the public's trust in our federal government to do what is morally, ecologically and ethically right. (Individual, Morrisville, PA - #A4931.10111)

IT WILL WEAKEN PUBLIC TRUST IN THE FOREST SERVICE PLANNING PROCESS

The existing Rule provides a reasonable approach to protecting roadless areas on our national forests, including adequate exceptions to address concerns referenced in the ANPR. It was adopted after extensive study and public involvement, including 600 local hearings and over 1.6 million citizen comments, 95% in favor of the Rule. Through these public meetings and public comments on the roadless area conservation rule, there has been ample demonstration of public support for maintaining roadless areas in an unroaded condition. Reliance on this public involvement is crucial for continued respect and confidence in the Forest Service process. (Individual, Asheville, NC - #A22623.10153)

The ANPR implies that local decision-making is needed because protection is warranted for some roadless areas but not others. It states that most roadless areas previously were not recommended for wilderness designation due to low wilderness values, inadequate public support, or "other resource potentials." It observes that the resource values of roadless areas "vary in importance," specifically pointing out that roadless areas contain 9 million acres of "productive timberland." These statements exhibit the anti-wilderness, pro-timber mentality that has eroded public trust in Forest Service planning and created broad support for national regulatory protection of roadless areas. (Organization, Bellingham, WA - #A22958.10161)

IT WILL POLARIZE THE POLITICAL CLIMATE AND INCITE PEOPLE TO RADICAL ACTIONS

We all know why this roadless issue is being revisited and will ultimately be compromised to appease political interests. Let's at least have the decency to disclose the truth and the real consequences of building more roads, the uncertainty of the science behind this analysis should also be disclosed so that

decision makers realize they're going into this half blind, we don't have the ability to accurately predict the impacts and mitigation for anticipated impacts oftentimes fail. On the political end, you'll appease some greedy and/or misguided folks by building more roads but you'll anger untold masses of people and this will serve to further polarize the political climate and incite environmentalists toward radical avenues to achieve their goals. There is little choice when the proper channels have been followed that culminates in an executive order and then it's torn apart by special interests. (Individual, No Address - #A137.12210)

10. Public Concern: The Forest Service should recognize that many groups support the Roadless Area Conservation Rule.

SOME WESTERN GOVERNORS

The administration states that "western governors" are opposed to this ruling. That is a gross stretch of the truth. My governor, Gary Locke of Washington State, is a STRONG supporter of the ruling, as is Governor Kitzhaber of OR and Governor Davis of California. Our states collectively have more roadless areas than any of the "western governors" states that are now whining about public process. (Individual, Seattle, WA - #A84.15130)

LOCAL RESIDENTS

The Bush administration's claim of lack of local input is disingenuous at best. Local communities were heavily involved in the planning process for the Roadless Rule. Nearly three years in the making, the Roadless Area Conservation Rule was the most extensive Federal rule-making process in history. Over 600 public meetings were held nationwide, the majority of which were held on or in the vicinity of the national forests affected by the rule. In Alaska, roughly 7,500 people commented on the Roadless Rule and 6,200 of those comments favored the rule and inclusion of the Tongass and Chugach National Forests. In Sitka, 69 people spoke at the public hearing held by the Forest Service, and 63 spoke in favor of the policy, I'm not sure how much more local than that you can get—Sitka is surrounded by the Tongass N.F. (Organization, Sitka, AK - #A12003.10153)

The Conservation Rule was adopted after much public deliberation and the receipt of more comments (reports are an estimated 1.6 million) than have been received on any other issue. There could hardly have been more informed decisionmaking. You ask about what local participation should be involved, but there were 430 public meetings, including at least two meetings for every national forest. We understand that over 23,000 people participated in those meetings. This was a fair, open and very extensive process. Thus, input from local interests has already taken place. The Forest Service has already gone to a great deal of time and expense to solicit views from the public and from those near each national forest for input into the Conservation Rule. That rule is further supported by an environmental impact statement. (Organization, Birmingham, AL - #A21582.10153)

IT IS IMPORTANT TO NOTE THAT, CONTRARY TO CHIEF BOSWORTH'S ASSERTIONS, MANY RURAL RESIDENTS APPLAUD THE ROADLESS RULE. The majority of those who attended the meetings at the National Forest level during scoping and the development of the draft Environmental Impact Statement endorsed the RACR. In fact, many local residents called for even stronger protections than the final rule afforded roadless areas because they were concerned about quality of life issues and their local economies It is misleading for the Administration to portray the roadless rule as a federal land grab that local communities oppose. As evidenced by the testimony given at the 600 National Forest hearings, that is simply not the case. The record is clear: the majority of Americans, rural and urban, want their wild, public forests conserved. (Organization, Nevada City, CA - #A4941.10152)

The current Forest Service's Roadless Area Conservation Rule should stand as it is currently written. Last summer, I attended the public hearing in Bellingham, Washington regarding the proposed roadless policy. The public support for the roadless policy at that meeting in a western timber county was overwhelmingly in favor. Nearly all those who spoke . . . at the hearing were local Whatcom County

citizens. The few people I saw who spoke against the roadless policy were all from outside the area. (Elected Official, Whatcom County, WA - #A4955.10153)

AVERAGE CITIZENS

There are several areas where this [snowmobiles and ATVs] type of recreation can be done yet we have a militia-oriented radio host here telling people to break down the gates to trails that they illegally put in to begin with. These people threaten, spread anti-governmental conspiracy theories, give assassination lists on the air, threaten and commit property damage to those who speak out about their racism (I know this first hand as I have become a target of theirs along with my children after they called a Jewish Holocaust survivor a cheap whore on the air and then went into the Jewish banker world take over garbage) yet they are the only ones complaining about the Roadless issue. Normal, honest, non-militia citizens love it. (Individual, Kalispell, MT - #A26418.15123)

I just wanted you to know that some of the supporters of this popular government effort come from "middle-of-the-road" backgrounds. I live in southern California and own the brunt of my real estate in southern Oregon-Josephine County. I am neither hippy nor logger and was a republican activist until the advent of king George Bush . . . Currently, I am employed by Albertson's grocery chain. (Individual, No Address - #A899.15111)

TRIBES

Your quote includes states, tribes, and other stakeholders in addition to local communities. That's all well and fine, but didn't states, tribes and other stakeholders already comment? What tribes are you soliciting comments from? The ones who have joined a lawsuit against the Forest Service? I currently live on the Nez Perce Reservation. The Nez Perce and their ancestors have lived in central Idaho for thousands of years. You can't get more "local" than that. The Nez Perce Tribe fully supports the Roadless Rule. Didn't you get their first letter? The Tribe has written a second letter, once again supporting the Rule. If you are truly looking for "local" input, I would suggest you read their letter. (Individual, Lewiston, ID - #A29569.10152)

Do Not Implement the Roadless Area Conservation Rule

11. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule.

I, myself do not see any real purpose to the roadless areas except to keep the public away from public land. Is there something going on here that I don't know about? I can peacefully co-exist with livestock and many western ranchers can't survive without the grazing permits that roadless areas put an end to. The large companies own thousands of acres of timberland, so, all that you are really hurting in the timber industry are the small companies that need public lands in order to stay in business. I don't believe in so-called clear cutting and I think that any company cutting trees on public land should have to clear off old, dry brush that would cause disastrous forest fires. And, has anyone stopped to think that everything that we have come out of the ground in one way or another? It surely doesn't seem that way to me. (Individual, No Address - #A8252.10112)

The roadless rule should be abolished totally and completely, never to be resurrected. Anything short of this is pure insanity, and totally un-American. It smacks of the Communist approach to people and resource control, and certainly doesn't seem at all to represent the values of freedom that I grew up with. (Individual, Manti, UT - #A27830.10130)

BECAUSE IT IS THE PRODUCT OF A BIASED PROCESS

I am writing to oppose the Forest Service's Roadless Area Conservation Rule as it now stands. This policy is the product of the most biased federal rulemaking in history, with most emphasizing eastern states absentee landlords who have no direct livelihood interest. (Individual, Spokane, WA - #A1711.10120)

I am very opposed to the Roadless designations being pursued by your agency throughout the United States. While I do favor reasonable and effective management of our national resources, including forests, this process extends way beyond what is reasonable. It is clear that environmental extremism is alive and well in our national service staff, and this is hugely disappointing to people who pay their taxes in support of government, and expect to have access to public lands when they visit. The extent of closures in forests and other public lands is just not acceptable.

I have always held a favorable view of the Forest Service, until recently. The Roadless Initiative has changed my view. Please share my message with other staff within your unit who are involved in Forest Planning and Land Use decisions. (Individual, Yucaipa, CA - #A12.10130)

I am writing to support revisiting the Forest Service's Roadless Area Conservation Rule as it now stands.

The rule represents a one sided approach to forest conservation, and in essence locks up the forests. What happened to the multiple use concept that allows responsible logging, mining, and drilling. (Individual, Salina, UT - #A1119.10130)

I am writing to ask you to repeal the Forest Service's Roadless Area Rule as it now stands. This policy is the product of the most one-sided opinion of federal rulemaking in history.

The rule represents a one-sided approach to forest conservation. Each specific area needs to be examined and ALL parties concerned must be informed and given their fair chance to voice their opinions.

The best thing to do is to trash the roadless plan as it is written and draft a new plan for the National Forests that includes access for the public recreation and responsible extraction of our valuable resources that these forests provide. (Individual, Phoenix, AZ - #A1699.10150)

BECAUSE IT IS BASED ON EMOTION, NOT LOGIC

I believe the proposed Roadless plan was based on emotional and unprovable science, by people who think with their hearts instead of using common sense logic. (Individual, No Address - #A1729.10130)

BECAUSE BENEFITS OF THE RULE ARE INFLATED BASED ON SUBJECTIVE REASONING

Benefits of the proposed rule are inflated based on subjective reasoning. There is scant evidence in the FEIS that the Forest Service has truly done any analysis that objectively considers the long-term impacts of this proposal. (Professional Society, Anchorage, AK - #A21707.20203)

BECAUSE IT WAS DEVELOPED WITHOUT LOCAL INPUT AND DUE PROCESS

I am strongly opposed to the Clinton Roadless Initiative Program. The program was implemented without local input and due process and in my opinion is in violation of the U.S. Constitution. I believe the U.S. Forest Service needs to consider the needs of all user groups when implementing policies that affect these users. (Individual, No Address - #A47.10130)

We believe there are significant policy and legal concerns with the January 2001 roadless regulations. It is essential that these decisions are made only after taking into account local conditions, local values and local input. The failure by the previous Administration to do this is precisely why the regulations are criticized for failing to provide an adequate opportunity for public comment (the over one million form e-mails and postcards generated by the Heritage Forest Campaign notwithstanding) and contributed heavily to the injunction issued by the U.S. District Court for the District of Idaho in *Kootenai Tribe of Idaho v. Veneman*, No. CV01-10-N-EJL, and *State of Idaho v. United States Forest Service*, No. CV01-11-N-EJL (D. Id. opinions filed April 5 and May 10, 2001). We urge the current Administration not to repeat the same mistake. (Association, Rockville, MD - #A13306.10130)

I think the entire roadless area designation process should be rethought out. Numerous public hearing should be held in all affected forest areas. Input from local people who depend on the use of forest service lands for economic survival should be consulted. These would include farmers, ranchers, loggers, miners, oil men.

This policy should not be implemented until the people of the west have a chance for input. (Individual, No Address - #A527.10133)

When the initial Roadless Area Conservation was announced in January, 2001, ARRA believed along with millions of other Americans, that the policy developed was a result of a top down approach dictated from Washington without the benefit of input from Americans living in close proximity to the forests managed by the U.S. Forest Service. Re-opening this rule for additional comment is an important step in remedying this serious oversight by the previous Administration. (Organization, Washington, DC - #A5069.10131)

I attended two public hearings on the proposed roadless rule last year. It was evident from responses to questions at the hearings that local and regional Forest Service personnel responsible for implementing the roadless rule were not fully certain of the content of the rule, not sure of the rule's implications for forest health and not confident of their ability to interpret the rule and then enforce it locally. The whole tone was of local administrators who had been blindsided by an initiative which their constituency had no part in shaping, but which they were now expected to defend and implement. (Professional Society, Eagle River, WI - #A19071.10132)

Alaskans are never heard on these issues because a bunch of people who have never been here, and do not understand how we live drown out our voices from the lower 48. It is not fair, and it is not right that people in Boston have more say about how we in Alaska live our lives than we Alaskans do. Nobody here cares how people in Boston live—why should outsiders have so much control over our lives? Imagine what would happen if Alaskans were able to shut down the third largest industry in the lower 48, as people from the lower 48 have done to us. There would be a revolution down there. (Individual, Anchorage, AK - #A15680.10131)

BECAUSE IT IGNORES PROGRESS MADE AT THE LOCAL LEVEL

The State of North Dakota has worked diligently with Forest Service personnel, oil and gas interests, ranchers and the environmental community during the planning process to address concerns regarding the Grasslands Management Plan. The Roadless rule trumps those efforts and ignores the progress being made at the local level. Implementation of the roadless rule will impede future cooperation among those groups. (Governor, State of North Dakota, - #A22065.15162)

BECAUSE ROADLESS ISSUES WERE ADEQUATELY DEALT WITH IN RARE I AND RARE II

We would hope that the Forest Service would by now have reasoned that the reason for so many lawsuits relating to the roadless review is because the agency clearly stepped out of bounds when considering the roadless review. It would be in the best interest of the Federal Government to rethink its position on roadless areas. Those issues were dealt with in the first go round of wilderness known as RARE I and RARE II. (Elected Official, San Juan County, UT - #A4890.10137)

Last summer, New Mexico's forests burned out of control, destroying millions of dollars of homes, private property and timber, not to mention the livestock and wildlife habitat, and the danger to watersheds as the late summer rains begin to fall. These fires burned so hot and fast because of years of fire suppression combined with restrictions on logging and grazing, creating a fuel load that was simply a disaster waiting to happen. It will take literally generations for these forests and watersheds to heal. The FS now is considering implementing an initiative across the US to limit timber harvest and road construction, making fire control even more difficult. The NMWGI strongly opposes the creation of roadless areas. (Organization, Albuquerque, NM - #A8813.10112)

BECAUSE ROADLESS AREAS ARE ALREADY ADEQUATELY PROTECTED

We do not need any more protection for, so called roadless areas. We have enough laws, already in place to keep all the off the road travel stopped. All the proposed wilderness study areas, have been inspected by congress and deemed not suitable for wilderness designation. What is it environmentalists don't understand about congress' decision. (Individual, Bishop, CA - #A4796.10112)

Areas not suitable for road construction are presently being adequately protected under policies now in existence without a national roadless policy. (Individual, Kalispell, MT - #A1071.10112)

I am writing because I do not support the Forest Service's Roadless Area Conservation Rule as it now stands. This policy is the product of the most extensive federal rulemaking in history, with more than 600 public hearing and 1.6 million public comments, and I believe the Forest Service has adequate means at its disposal to take proper care of all of its valuable resources without a need for more rules. (Individual, Grand Junction, CO - #A1696.10150)

The policies in effect prior to the Roadless Conservation Rule were completely adequate. (Individual, Albuquerque, NM - #A10497.10112)

I would support the no-action alternative. The Forest Service already has adequate administrative authority to control road development and Manage Lands. Page S-7 of the DEIS states. "Road construction and reconstruction would continue to be prohibited only where land management plan prescriptions prohibit such action". In Lander County a majority of unroaded portions of inventoried roadless areas already have vehicle access restrictions. The proposed rule is very similar to the no action alternative. The proposed rule is overly restrictive and limits local decisionmaking authority, particularly in communities like Austin, Kingston and Hadley that rely upon the development and use of the natural resources on the National Forest Lands. (Individual, Austin, NV - #A15794.10130)

BECAUSE THERE SHOULD BE NO ROADLESS AREAS

There should be no roadless areas therefore there is no need to develop a process to designate roadless areas. (Individual, Ogden, UT - #A494.10130)

BECAUSE IT DOES NOT REPRESENT A BALANCED APPROACH TO FOREST CONSERVATION

The rule represents an unbalanced approach to forest conservation. In federal forests where 87% of the land is already off limits to timber harvest, this wacko policy will set aside the last remaining forest land as wilderness—not to be managed for multiple uses. (Individual, Salem, OR - #A188.10130)

The rule does not represent a balanced approach to forest conservation. As written, it does not adequately address issues of fire management, forest health, access, and local input. (Individual, Pasadena, CA - #A979.10130)

I am writing NOT TO support the Forest Service's Roadless Area Conservation Rule as it now stands. This policy should be done away with.

The rule REPRESSES a balanced approach to forest conservation. (Individual, Knoxville, TN - #A456.10112)

As responsible users of the nation's public lands, we strongly urge that the Roadless Initiative (proposed by the previous presidential administration) be eliminated. It does not properly balance the needs of American citizens/taxpayers and environmental issues. We represent a significant number of groups and individuals who will be adversely affected by this measure, and we hope that the Forest Service President Bush, and Vice-President Cheney will act in the manner we suggest and expect. (Business, Corona, CA - #A747.10130)

As a native Montanan, I love the area I live in and appreciate the beauty of the natural world around us. My family and I respect the land and the creatures who live there. All of the people I know feel the same way.

The idea of closing off another 60 million acres of land to roadless areas seems crazy to me. We have lost countless small businesses and mills as it is and after the fire season of 2000 it amazes me that this is even an issue. We enjoy clean air and water here in Montana but with all of the smoke from the fires last

summer many people suffered from respiratory problems, especially the elderly, which is a high percentage of our state's population. (Individual, Kalispell, MT - #A994.10130)

BECAUSE IT DOES NOT ADDRESS THE DIFFERENT NEEDS OF EASTERN AND WESTERN FORESTS

The proposed Roadless Rule is a continuation of the non-use policies presently saturating the management of our forests. Preservation by non-use may be reasonable in extreme cases like New Jersey but it is not necessary in the Rocky Mountain region.

The proposed Roadless Rule is way out of balance with the needs of the public. (Organization, Helena, MT - #A13226.10130)

I am not sure that you read these letters. I think that you just count for or against. I live in the west not the east and I want a say in what happens to the forests in my area. I don't know anything about the National Forests in the east and wouldn't presume to tell them how to manage them. I don't want a one-size-fits all policy for our forests. In my opinion this isn't a Congressional decision. (Individual, Centerfield, UT - #A12776.10130)

BECAUSE IT DISPROPORTIONATELY AFFECTS WESTERN STATES

We would like to add our support in opposition to any further designation of roadless or wilderness areas.

Our western states have more public lands than any other geographical area (with the possible exception of Alaska) and this land mass should not be treated as a National Park for the rest of the country. (Individual, Columbia Falls, MT - #A1070.10112)

I am opposed to the roadless plan to lock up the natural resources and our public lands, I am an avid snowmobiler, hunter, fisherman, and all around user of public lands. This plan will lock me and thousands like me out!!! STOP THE WAR ON THE WEST!!!! (Individual, Whitefish, MT - #A1030.10130)

There is an angry rebellion gathering momentum. The decision to 'rethink' the recent changes in Federal Roadless Policy may be just in time; an opportunity to hear what the people of Nevada, as well as all the western states, are beginning to stand up and shout. (Individual, Gerlach, NV - #A1066.10130)

BECAUSE IT WILL MAKE THE JOB OF MANAGING FORESTS MORE DIFFICULT

In the environmentalists' fight to obtain this roadless area they placed a full page ad in the Idaho Statesman indicting that nothing would change if the roadless initiative was enacted. If this is truly the case, then why do we have to enact such a ridiculous policy in the first place. Of course the answer to that is that it does change things, it makes your job of managing an already cumbersome and politically controlled national forest system even more difficult. (Individual, No Address - #A14.10112)

In closing, I will refer to the current society of American Foresters Position Statement, *Roads in Forests*, renewed June 13, 1999, which explains the purpose of roads in the national forest system. "Under the Multiple Use and Sustained Yield Act, . . . the National Forest Management Act, the Forest Service . . . manages for seven separate purposes—water, wildlife, recreation, timber production, grazing, minerals, and wilderness." "To implement management plans, the Forest Service, and all forest managers, must have access to their forests through a well-maintained road system. In the case of public forests, this requires a substantial, dependable road budget for maintenance as well as reconstruction. Roads should be seen as a capitol investment, "We are concerned that the roadless regulations deviate from the multiple use statutory intent, and is inconsistent with the society of American Forester's road position. (Association, Salem, OR - #A21754.10112)

BECAUSE IT IS BASED ON INADEQUATE INFORMATION

The lack of site-specific information available to the Forest Service during the promulgation of the January 12, 2001 rule is readily apparent when one considers that, as an example, the "roadless area"

within the Grand Mesa-Uncompaghre National Forest system (“GMUG”) here in Colorado included within its boundaries 1) an existing underground coal mine which had previously conducted surface activities using temporary roads, 2) areas which in fact (if not by regulatory definition) contain roads, and 3) federally-owned minerals being developed under existing lease and ripe for future lease. The GMUG “roadless area” is adjacent to other existing mines operating under recently granted BLM leases which eventually would move into that area as additional coal resources are pursued. The dearth of information available to the Forest Service and to the public resulted in a predetermined outcome as boundary lines were fixed under a “national” rule before more specific local information was made available which pointed to a different approach. (Business or Association, Denver CO - #A20676.10141)

BECAUSE ITS SUPPORT HAS NOT BEEN ADEQUATELY DEMONSTRATED

The Roadless Conservation Rule was NOT supported by a majority of Americans, so therefore, it needs to be either corrected or eliminated. (Individual, Orange, CA - #A6764.10131)

The roadless initiative was ill conceived and poorly executed—at the instigation of conservation organizations who never have (and probably never will) represented the will of the people of this country. One point five million out of 250 million, plus—what a joke . . . (Individual, Gorham, NH - #A8943.10132)

BECAUSE THERE IS OPPOSITION TO IT

On March 31st of this year, the Montana State gave final approval of a House Joint Resolution in support of multiple use of National Forests and urging Congress and the President to overturn the Federal Roadless Initiative. That resolution was patterned after the Roadless Resolution passed by the membership of the Montana State AFL-CIO at their 2000 annual convention.

The Montana Coalition of Forest Counties has taken a strong position against the proposal. Lincoln and Flathead County Commissioners each placed the issue on their respective ballots and approximately 80% of the voters voted in opposition to the Roadless Initiative. (Elected Official, State of Montana, MT - #A18045.10130)

It astounds me that in spite of the reported over 1/2 million comments that were submitted in opposition to the roadless rule that the agency proceeded with the plan like no one had objected to it. (Individual, Austin, NV - #A15794.10130)

BECAUSE IT WILL PROMPT CIVIL DISOBEDIENCE PROTESTS

I could go on and on concerning the financial impact the rules would have and expound on dozens of other arguments. Let me forego all that and close by saying this. In 1776 a band of patriotic Americans boarded a ship in Boston Harbor and threw tea overboard in the first act of rebellion against a tyrannical government which had overstepped its bounds. I would consider the imposition of the proposed forest service rules to be just such an overstepping of government’s bounds in the instant case. If that happens, I will be one of the first to step to the plank and walk up the gangway to act in defiance of my government. I say that as a proud citizen and a veteran who has served our country in time of war. A few weeks ago I pointed out our kitchen window toward the mountains we love so dearly and told my wife that if people like Al Gore and the Forest Service have their way, we were as close to those mountains as we would ever be able to get. I tell you now, I am not alone in my sentiment. My passion for my mountains is shared by thousands upon thousands of others. We are a vast army who are not going to simply stand by and watch the Forest Service take away our rights of access to the forests we have been raised in and are now raising our children and grand children in. I will not be alone if and when the time comes that I must raise my mighty pen, my wallet and my fist against my government trying to take away my access to the mountains and forests that have formed a heritage and a home for me and my family. (Individual, Mount Pleasant, UT - #A26116.10112)

BECAUSE IT WILL INCREASE SAFETY HAZARDS

Restricting options for fire-fighting and forest management does not serve the public interest or protect the National Forest System. In its current form, the Final Rule will impose negative economic effects that are not justified by any corresponding benefits. Rather, the Final Rule compounds existing safety

hazards, lacks an important phase of regulatory review, and arguably does not meet the Forest Service's mandate to manage and preserve NFS resources. HAI [Helicopter Association International] urges the Department of Agriculture to revise or repeal the Final Rule at its earliest opportunity. (Business, Alexandria, VA - #A30200.12120)

12. Public Concern: The Forest Service should not use inadequate road maintenance funding as a reason for developing the Roadless Area Conservation Rule.

One of the problems cited by the agency as a justification for this rule is the fact that the USFS does not have adequate resources to properly maintain existing roads. This problem also can be addressed by considering an alternative of requesting additional funding for roads from Congress, or allowing road maintenance by the private sector which uses them for resource development. None of these alternatives were considered by the agency.

The January 12 Rule could have been crafted so that temporary (non-paved) roads may be permitted on an as-needed basis. Such an alternative should have been considered and published for public comment. (Business or Association, Spokane, WA - #A17351.17240)

13. Public Concern: The Forest Service should recognize that support for the Roadless Area Conservation Rule is the result of misrepresentation of current forest management practices.

The "wide public agreement" cited in support of the former President's plan is, I would argue, the result of years of misrepresentation of both the nature and the impacts of current national forest management. Long-time opponents of road building in national forests, such as the Wilderness Society and the Sierra Club, have joined with lawmakers who are anxious to curb spending on "corporate welfare" to continue their opposition to "below cost timber sales". The implication of much of what has been said is that roads are built in national forests solely for the purpose of making it easy for private companies to log those forests. Ignoring the fact that contributing to the nation's timber supply is one of the reasons for the existence of the national forest system, it must come as a great surprise to the millions who drive into national forests to hunt, fish, picnic, camp, and sight-see that these roads are intended only for logging. In truth, logging income pays for most of the roads, but we seldom hear talk of "below-cost recreational services" being provided. It would be an interesting experiment for the Forest Service to shut down its road system to public access and see if loggers are the only ones who complain. (Professional Society, Orono, ME - #A17644.15120)

Revision of the Roadless Area Conservation Rule

14. Public Concern: The Forest Service should revise the Roadless Area Conservation Rule.

This current Roadless Area Rule as approved by President Clinton is grossly wrong - procedurally, politically, economically, socially, biologically, and particularly defies common sense. It needs to be reassessed and re-issued considering the biological and environmental needs of the forest, the social and economic needs of the public and to place the desires of some segments of the grossly underinformed public in a proper context. (Individual, Whitefish, MT - #A13335.10130)

TO ADEQUATELY ADDRESS FOREST HEALTH, ACCESS, AND LOCAL INPUT

The Rule must be significantly revised to promote forest health, access, and local input. Careful, active, and local forest management will ensure the long-term protection of our forests. Modifications to the Rule should be facilitated to properly implement Congress' mandate for multiple uses of our forest. Local forest decisions should be supported by accurate, site-specific information. (Elected Official, Shasta County, CA - #A4943.10130)

The rule must be significantly revised to adequately address forest health concerns, access to private and state inholdings, and local input. Roadless areas must be accurately mapped at the forest level, including an inventory of classified and unclassified roads, in order that informed decisions can be made. Modifications to the Roadless Area Conservation Rule must take into consideration the need to access the national forest to provide for Congressionally mandated multiple uses. (Elected Official, Afton, WY - #A6066.10141)

The Coeur d'Alene Chamber of Commerce supports environmentally sensitive and responsible natural resource management, which ensures that forests are healthy for all who depend on them. In the spirit of keeping our public forestlands healthy and open to families, recreationists, foresters and other land management professionals, the Chamber asks the Forest Service to revise the Roadless Rule so that it truly protects roadless area values. Without a comprehensive and locally based process, future decisions regarding how to manage roadless areas will not result in any real protection of the many forest values people care about. We encourage you to provide a meaningful process that will allow those who are most affected by management decisions on public lands to be included and heard. (Business, Coeur d'Alene, ID - #A18004.10130)

The roadless designations should be based on what is good for the locale on a local level, say the state level. It should be based on what is good for the forests, people and animals that inhabit it, not on some group's personal agenda for the west. (Individual, Centerfield, UT - #A12776.10130)

TO ADDRESS ACCESS FOR RECREATION AND RESOURCE USE

I am writing to support a decision to repeal the Forest Service's Roadless Area Conservation Rule as it now stands. This policy is the product of the most one-sided opinion of federal rulemaking in history.

The rule represents a one-sided approach to forest conservation. Each specific area needs to be examined and ALL parties concerned must be informed and given their fair chance to voice their opinions.

The best thing to do is to trash the 'roadless plan' as it is written and draft a new plan for the National forests that includes access for the public for recreation and responsible extraction of our valuable resources that these forests provide. (Individual, Phoenix, AZ - #A1179.10130)

The Roadless Area initiative must be tossed out and rewritten as it did not address issues of recreational access. (Individual, Thousand Oaks, CA - #A891.10130)

TO OMIT FROM CONSIDERATION LANDS SUITABLE FOR TIMBER REMOVAL

I would like to see you revise the plan, omitting land that is suitable for timber production unless it also has some good potential for recreation or other uses. (Individual, Bigfork, MT - #A1079.10130)

TO PROVIDE FOR REASONABLE MANAGEMENT

I'm taking the time to write to you today because I'm concerned about the unjust closure of public land to use by responsible U.S. citizens. The dishonest establishment of the Clinton/Gore Roadless Rule made me very uneasy about the way access to public land is being handled. Caring and fair-minded individuals like you and I can see that it is an extreme measure that greatly needs revision. I urge you to modify this rule so that public land is thoughtfully and responsibly cared for while still being available for reasonable, managed use. No one wants these lands abused, but over-reacting to extremist alarms helps only a few special interests, and shuts the rest of us out. Please take another look and the roadless rule, and make it into something that it is good for everyone. (Individual, Pleasant Plains, IL - #A5445.12220)

BECAUSE IT WAS THE PRODUCT OF AN INADEQUATE PROCESS

Please fix the flaws in the Roadless Area Conservation Rule. Their inadequate process was contrary to law. Local, State and Federal concerns were ignored. 421,000 acres of private land were affected.

Forest health, public access and local input were not addressed. Mapping and classifications of roads did not get done. Congressionally mandated multiple users were not considered. (Individual, Deer River, MN - #A2873.10120)

I would like to express my appreciation to you and the Forest Service for deciding to take a more informed look at the Roadless Area Conservation Rule. This original process was started in a flawed and illegal manner and seemed to have its conclusions before it began to analyze the information. (Association, Yreka, CA - #A8302.10120)

15. Public Concern: The Forest Service should recognize that the Advance Notice of Proposed Rulemaking does not substantiate the need to revise the Roadless Area Conservation Rule.

Despite a series of assertions about the existing Rule and roadless area management more broadly, the ANPR does not substantiate the need for revisiting this long-contentious issue. Some of its assertions directly call the existing Rule into question; others do so only indirectly. None, however, shows how the rationale for and substantiation of the Rule as faulty or inadequate. (Organization, Olympia, WA - #A20145.11100)

Strengthen the Roadless Area Conservation Rule

16. Public Concern: The Forest Service should strengthen the Roadless Area Conservation Rule.

I would like to see the roadless plan preserved and even expanded. The timber companies represent a very small percentage of the population of the country and the vast majority of us want those roadless areas preserved. In my state of Washington, on the previous public comment period the responses were 96% in favor of the roadless initiative. If you are a Government of the people and not of the corporations, which is of course a debatable issue, then please preserve these great and beautiful lands for my son and his children. (Individual, Olympia, WA - #A534.10150)

The rules of Roadless Area Conservation need to be strengthened, not weakened. The total National Forest System is only 8.5 percent of the total land base of the United States. That leaves 91.5 percent for economic exploitation. The 58.5 million acres of inventoried roadless areas should not be opened for economic use. The United States must protect and conserve this national resource for the treasure it will be in the future. (Individual, Zanesville, OH - #A758.10150)

The Roadless Area Rule currently under reconsideration will preserve these jewels. It does not need to be changed. You ask, how should communities and private property near inventoried roadless areas be protected from the risks associated with natural events, such as major wildfires that may occur on adjacent federal lands? The current Rule allows for emergency access to all Roadless Areas; if anything this should be strengthened to ensure a continuation of Roadless status after emergency roads have been constructed. (Individual, Brunswick, ME - #A5070.10150)

The Roadless Area Conservation Rule should be implemented without change and strengthened to stop damage to these areas by ORV use and hard rock mining. All timber sales in the Tongass National Forest that violate the Rule should be stopped immediately. This administration should defend the Rule against lawsuits and quit trying to weaken environmental safeguards and public participation processes in the development of forest plans. (Organization, Tulsa, OK - #A15362.10150)

BY ELIMINATING EXCEPTIONS

If the Clinton administration's Roadless Initiative needs any changes at all, they are to tighten up some of the loopholes that allow exceptions, such as for "public health" and "safety". (Individual, Leadore, ID - #A20898.10150)

BY IDENTIFYING AREAS WHICH SHOULD NOT BE EXEMPTED FROM THE RULE

The Service should begin by defining the types and locations of roadless areas for which exceptions to the prohibitions should not be considered. This would provide an important improvement to the Rule by

placing the most socially and ecologically important inventoried areas off limits to road building and timber harvesting. Through the rulemaking, the Service should establish categories of roadless areas for which exceptions should not be granted, and then document and map those areas in the course of subsequent forest plan revisions. These would include areas with important or scarce social and ecological values such as: source drinking water areas, reference areas for research, areas of high or unique biological diversity and old growth forests, areas where other roadless lands are scarce, areas that provide cultural or historic importance, and all areas that provide unique or important season habitat for wildlife, fish and plant species. (Organization, Washington, DC - #A23283.10150)

Defense of the Roadless Area Conservation Rule

17. Public Concern: The Administration should defend the Roadless Area Conservation Rule against lawsuits.

Failing to appeal the Idaho court's preliminary injunction blocking enforcement of the January 12th rule, constitutes an abdication of responsibility and dereliction of duty on the part of the new administration. (Individual, Chico, CA - #A17483.10159)

It is the Bush Administration's attempts to thwart The Rule that is of greatest concern by far. The Bush Administration should stop . . . undermining the legality of the rule (which they are doing by collaborating with the plaintiff) and should instead, immediately begin mounting a vigorous defense against the lawsuits challenging the Rule. (Individual, Hatboro, PA - #A8834.10159)

By allowing the deadline to pass, the federal government failed to appeal the court's decision. Fortunately, a coalition of Environmental Organizations has stepped in to fill the breach, despite the handicap of the federal bailout. Due to its failure to appeal, the new administration has now turned its back on, and shown a total lack of concern, for the 1.6 million interested parties who have submitted comments, 95% of whom supported the prohibition of new roads in the national forest roadless areas.

Dale Bosworth, in his letter of June 7, 2001, stated that "it is necessary for the agency to act decisively, proactively, and with common sense to ensure that our efforts to protect roadless values will not be confined to legal proceedings in courtrooms scattered throughout the country."

Rather than vigorously defending the public interest in open court, the Forest Service has acted in fear of litigation. Perhaps their actions are based on the fact that the court's decision is consistent with their existing bias demonstrated in the Federal Register and the several press releases of the USDA. The new administration appears to put its total faith in one lower court judge's decision, without review by a higher court. Instead of judicial review in open court, it appears that the decision will be made in Washington D.C. behind closed doors by politically motivated decision makers. If the conclusions already adopted by the new administration are carried out, the roadless issues will not be carried out by numerous courtrooms throughout the country, but will be based on local concerns confined to vastly more individual national forest proceedings throughout the entire nation. (Individual, Chico, CA - #A17483.10159)

I write to ask, as an official comment on any changes to the Roadless Rule, that the rule not be undermined through the creation of loopholes and exemptions to the protections in the original policy. Similarly, I ask that you do whatever is necessary to defend the current rule, that was to be implemented in June, from current legal challenges. Then the public could regain some faith in the Forest Service as an organization that was dedicated to environmental protection and restoration of public lands instead of one that was captive to corporate interests. The Roadless Area Conservation Rule should be implemented immediately, and without exemption, as it was signed on January 5, 2001. (Individual, Portland, OR - #A4816.10150)

You also claimed in the Federal Register, as further justification for the current rule making, that, "eight lawsuits, involving seven states, in six judicial districts of four federal circuits have been filed against

the January 12, 2001 rule.” Apparently you think that because so many suits were filed in so many districts in so many circuits, that you should just roll over and play dead. The filing of a lawsuit, of even many lawsuits, does not mean, however, that the federal government took an improper action. The federal government should have vigorously defended its rule on court, rather than caving in and starting the rule making all over again.

Also in Federal Register you cite the preliminary injunction issues by the Idaho District Court. I believe this court’s decision will be easily reversed on the appeal which has been filed by third parties. . . . The federal government should have appealed the District Court’s decision, and should have vigorously defended its Roadless Rule before the Circuit Court. Instead, no appeal was filed, and rather than waiting for a decision on the appeal filed by other parties, the government decided to launch another public process and change the rule. (Individual, Sitka, AK - #A24495.10159)

Do you remember Attorney General John Ashcroft saying during his Senate confirmation hearings that he would enforce the laws of the land? Why did Ashcroft’s office not vigorously fight the lawsuits brought by Boise-Cascade, the state of Idaho and others against the Roadless Area Conservation Rule? No matter how ill-advised it was for the Bush administration to put the current comment period, we are faced with the following questions: During this holding period, is the Roadless law of the land, or is it not the law of the land? If it is not the law of the land, how can the Boise-Cascade, the state of Idaho and others bring lawsuits against it? Should not any attempt to bring such suits against non-law have been forcefully fought by the Attorney General’s office? If the Roadless Rule is the law of the land during this holding period, why did the Attorney General’s office only put up a token defense in court against the lawsuits? Is it that by some TECHNICALITY that the state of Idaho, Boise-Cascade and others can bring lawsuits against a law of the land, which at the same time is not the law of the land from the standpoint of the Attorney General’s office? (Is this not comparable to “It depends on what your definition of ‘is’ is”?) Did John Ashcroft give FALSE TESTIMONY before the Senate confirmation committee when he said that he would enforce the law of the land? (Individual, Los Alamos, NM - #A13846.10159)

18. Public Concern: The Administration should not defend the Roadless Area Conservation Rule against lawsuits.

Most Americans oppose this rule. Don’t implement the original rule, and don’t waste taxpayer money defending it against industry and other lawsuits. These are PUBLIC lands and do NOT belong to the environmentalist crowd alone! (Individual, Marthasville, MO - #A6704.10130)

Other

19. Public Concern: The Forest Service should clarify the Roadless Area Conservation Rule.

I am writing to state my support of the Forest Service’s efforts to fix the fatal flaws in the Roadless Area Conservation Rule. This rule was passed with flawed if not misguided information and is subject to legality due to its substantive concerns by elected officials. It is also difficult to interpret. (Individual, Mayport, PA - #A8711.10141)

20. Public Concern: The Forest Service should consider that it has already issued a decision on the Roadless Area Conservation Rule and should now emphasize work on more pressing issues

The Forest Service has already issued a decision for the protection of inventoried roadless areas. It seems that the only reason you are revisiting this issue is because of the new administration. The Forest Service should build on its past accomplishments, not undo them. The Forest Service should emphasize work on more pressing issues, such as compliance with NEPA, the threat of unnatural wildfire, and the spread of noxious weeds. (Individual, Bemidji, MN - #A8784.10150)

21. Public Concern: The Forest Service should separate the Roadless Area Conservation Rule into two policies to administer lands in the eastern and western United States.

There appears to a much different view about public lands in the western US than here Back East of the Mississippi River, and there are a lot of differences in the areas being considered. The eastern US has a much larger population and unfortunately very little public land as compared to the West. We seem to treat our areas as more tourism/recreational areas versus the agricultural/resource banking of western counter parts.

The Forest Service, if it hasn't already, should seriously consider breaking the roadless area plan into two (2) separate plans for administrative purposes. This would allow the Forest Service to address issues such as fire hazards and inholdings, which are more serious in the West. The eastern US has very little roadless areas left and reserve/refuges for many plants and animal species that are overlooked or unknown to the general public. The forest system holds much more than robins, deer, bear, and a few raccoons. Many new animals are found in the Smokey Mountains National Park each year, though they may be butterflies, moths, or lichens, it still matters. It wouldn't be here if it didn't. (Individual, Granite Falls, NC - #A21281.45341)

22. Public Concern: The Forest Service should ensure that one state does not shoulder disproportionate effects of a national roadless rule.

The Forest Service must be willing to develop a procedure to ensure that its national policy is carried by the nation as a whole. In other words, the Forest Service must ensure that the citizens of Wyoming are not forced to shoulder a disproportionate share of what is in essence a national decision, demanded by people who have never stepped foot in the State and will suffer no economic or emotional hardship as a result of sending the Service a preprinted postcard allegedly "supporting" the Roadless Actions. If the Forest Service cannot ensure that Wyoming does not end up carrying a particular national policy, then it should not be adopted. Until the impact of the Forest Service's actions can be distributed equally across the entire country, then the interests of Wyoming must take precedence. (State Agency, Cheyenne, WY - #A22608.13120)

Issue Identification

This section includes one subsection: Adequacy of Questions in the Advance Notice of Proposed Rulemaking.

Adequacy of Questions in the Advance Notice of Proposed Rulemaking

Summary

In general, comments which question the adequacy of the 10 questions posed in the Advance Notice of Proposed Rulemaking come from those who ask that the Roadless Area Conservation Rule be implemented. Those who ask that the Rule not be implemented do not often comment specifically on the adequacy of the 10 questions. These respondents view the questions as adequate, not by saying it specifically, but in their general agreement for taking another look at issues associated with roadless areas.

Most commonly, respondents who question the adequacy of the 10 questions allege that the questions are unclear, biased, misleading, and have built-in assumptions designed to lead to certain responses. Some believe that these questions have already been addressed in the previous rule and it is disingenuous to ask them again. These respondents sometimes assert that they do not think the new Administration likes the previous policy, so they are looking for different answers that seem to have nothing to do with genuine concern for social, economic or ecological issues. Respondents state that the questions are framed to favor advocates of active management and allows resource users to define the terms of the debate.

As noted above, the view that the 10 questions are adequate is generally implicit in comments which stress the need to more fully consider roadless issues before making a decision. A few respondents, however, explicitly say the questions are a positive step toward adequate public involvement.

Adequacy of Questions; General

23. Public Concern: The Forest Service should recognize various problems with the 10 questions asked in the Advance Notice of Proposed Rulemaking.

THEY ARE UNCLEAR

Really, it is unclear what is meant by “local forest planning” in this question. For sure, this must not mean that local citizens should have any more influence over roadless decisions than non-local citizens.

Also, I continually see the terms “protect and manage” when reading what the USFS [United States Forest Service] will do within inventoried roadless areas. It’s unclear what the author of the questions meant by including these 2 words. Why do they automatically belong together? What’s the difference between these 2 words as they are used here? Is it possible to protect an area and not manage it? Yes, it sure is. It certainly is possible to manage an area, and not protect it. This has been happening (in places) on federally managed Forest Service lands for decades. (Individual, Grangeville, ID - #A830.11110)

[How should roadless areas be managed to provide for healthy forests and to protect forests from severe wildfire, insects and disease?]

The question is a paradox; a question with diametrically opposed statements. (Individual, Philomath, OR - #A943.11130)

These properties are in roaded areas, so if any fire harms them, it is in a roaded area. This question is pretty strange. (Individual, Wheaton, IL - #A52.11140)

This question is vague. What are you evaluating the IRAs for? Are you evaluating them for consideration as designated Wilderness Areas? Are you evaluating them for recreational potential? Clearly, the factors to consider when “evaluating IRAs” depend upon the purpose of the evaluation. The Forest Service has already identified positive values of roadless area conservation, such as wildlife habitat, clean water, recreational opportunities, scientific research values, and even economic values that come from recreational use and the improvement of nearby property values due to the improved quality of life that comes from nearby natural areas. (Individual, Palo Alto, CA - #A15827.45100)

The question is worded, what are the characteristics, environmental values, social and economic considerations and other factors the U.S.F.S. should it consider as it evaluates inventoried roadless areas. The question should have been worded thusly. What are the characteristics, environmental value, social and economic “values” and other factors the U.S.F.S. should consider as it evaluates inventoried roadless areas. (Elected Official, Iron County, MI - #A3612.11160)

[Question 3] This question implies that fire, insects, and diseases are undesired elements in a forest ecosystem, even in roadless areas. I would have expected a question to have been phrased in this way 40 years ago, but not today in light of a more thorough understanding of forest ecosystem processes. The use of the term “healthy forests” in this context is unscientific and inappropriate (see McClelland and McClelland. Wildlife Society Bulletin. 1999. 27[3]: 846-857). In the remaining roadless areas, commercial logging is not needed as part of any scientific management strategy. (Individual, West Glacier, MT - #A5946.30100)

THEY ARE BIASED

This is another unfair question in that it suggests States, tribes, organizations, and private citizens do not presently have access to their properties. There is nothing in the ban on new roads that closes any existing access to anyone’s properties. The only access that this ban on new roads would entail is that it will prevent timber and mining companies from destroying portions of our forests by grading roadways so they can access our natural resources, and therefore destroy even more timber and remove more hills and mountains for profit. (Individual, Port Angeles, WA - #A1044.11150)

The Roadless Area Conservation Plan already provides for access to state and private in-holdings. Roadless areas would be treated like any other national forest lands regarding in-holder access. This again is a biased question that can leave a reader with the false conclusion that there is no in-holder access under current rules. (Individual, No Address - #A4502.11150)

This [Question 3] is a biased and bold question! I will illustrate by rewording it. How should inventoried roadless areas be managed to provide for healthy watersheds, including playing an ever more-important role in protection of biodiversity, protection of water quality, and providing the correct balance of natural processes to give the ecosystem the resiliency to weather insect and disease outbreaks or wildfire over many disturbance cycles, spanning hundreds of years? (Individual, Lacey, WA - #A17998.11130)

How should communities and private property near inventoried roadless areas be protected from the risk associated with natural events, such as major wildfires that may occur on adjacent federal lands?

I would turn this around to read: How should inventoried roadless areas be protected from the risks associated with proximity to communities and private property, such as tree or wildlife poaching, human-caused wildfires, illegal roadbuilding etc? (Individual, Lacey, WA - #A17998.11140)

We believe the public has already spoken on this matter. This new round of comment is less open and responsive than the first round. There are no public hearings and the ten questions are inappropriately biased against roadless area protection, i.e. we all want to see lives and homes protected during wildfire, but roadless areas play little if any role in that protection. A new round of comments would likely yield the same results as the previous round and is therefore unnecessary and a waste of taxpayer dollars. We can only conclude that this latest call for input is an attempt to delay, weaken, or perhaps ultimately scrap the RACR. (Organization, Missoula, MT - #A21359.11100)

THEY HAVE BUILT-IN ASSUMPTIONS

Should Inventoried Roadless Areas selected for future roadless protection through the local forest plan revision process be proposed to Congress for wilderness designation, or should they be maintained under a specific designation for roadless area management under the forest plan?

The phrasing of this question assumes that the RACR will be shelved and that all roadless area considerations will revert to the individual forests. It is my understanding in responding to this questionnaire that this has not yet been decided. I hope this is the case. (Individual, Seattle, WA - #A11805.25000)

The “10 questions” format for scoping on this proposal is also inappropriate, as it presupposes an outcome that drastically revises the RACR. The questions also pose issues that have been asked since the first day of RACR rulemaking. I must therefore conclude that these questions simply provide a cover of rationality over a decision prompted by a change in Administration, not by any genuine policy matters grounded in ecology, sociology, or economics. (United States Representative, Georgia, - #A693.11100)

The assumptions underlying your questions are blatantly anthropocentric, and are skewed toward allowing continued exploitation of natural areas. They seemingly grow out of the conviction that humans are the only species that matters, and that they have the right to appropriate every square inch of the earth’s surface to their own material ends, regardless of the damage done to plant and animal communities. Property rights are evidently assumed to trump all other rights, just as monetary values are assumed to trump all other values. Monoculture is better than diversity, and 100 years of “custom and culture” are entitled to jeopardize the results of millions of years of evolution. (Individual, Dallas, OR - #A3697.11100)

[Question 9] The very premise of this question is false and therefore it should be either rephrased or eliminated from consideration. (Organization, Denver, CO - #A29624.11190)

THEY LEAD TO CERTAIN RESPONSES

We have made a few brief comments within the context of the 10 questions in the Federal Register notice. We do note that the text of the questions, many of which seem to overlap, seems predisposed to yield a certain answer. Additionally, the questions ask for opinions on natural resource management much broader than the rulemaking in a short (60-day) comment period. Although we do not disagree with the direction the 10 questions lead respondents in, we think this is a peculiar and possibly inappropriate way to elicit public comment. (Association, Washington, DC - #A17887.11100)

Should inventoried roadless areas selected for future roadless protection through the local forest plan revision process be proposed to Congress for wilderness designation or should they be maintained under a specific designation for roadless area management under the forest plan? . . . You have crafted this question in a leading fashion, with intent to obfuscate the matter and arrive at a predetermined outcome, which is to throw the Rule out by throwing it into the planning process for each national forest. This would be a disastrous outcome because it will result in certain elimination of inventoried roadless areas. (Individual, Ward, CO - #A18076.11180)

[Question 3] Well, what do we mean by healthy forests? That’s a loaded term. Allowing wildfire to play its natural role so that buildup of hazardous fuels does not occur seems to be wise; active management of

the urban interface seems to be wise, but wholesale “management” of large blocks of remote backcountry seems ridiculous. The Bitterroot and other fires have shown that what matters in saving buildings is treatment in the immediate vicinity, not the backcountry miles away. The way this question is worded appears to lead the respondent toward an answer that must already be in someone’s mind. (Individual, Jackson, WY - #A10527.30100)

THEY ARE TOO OPEN TO INTERPRETATION

That’s a broad question that can be interpreted to mean too many different things. (Individual, Eagle Creek, OR - #A29956.11130)

THEY ARE NOT RELEVANT

[Question 8] This does not seem to be relevant. Some of the current roadless areas may become special wilderness areas. So what? The important thing is that the roadless areas are protected from roads and logging. (Individual, Elmhurst, IL - #A8039.25000)

THEY DISTRACT PEOPLE FROM THE MAIN ISSUES

You really know how to word a question to get the goat of those who feel the “local forest plan revision process” is simply a way to thwart the will of the majority. This question is entirely independent of the original and rightful ruling and could be addressed without revising the rule and it appears to be an attempt to distract opinion from the main issues. Geez people, the rightful ruling states that, “areas currently inventoried as roadless remain roadless without resource extraction”. Is it that complicated? As long as that happens then, the ruling and the people’s will be upheld. (Individual, Seattle, WA - #A21682.11180)

THEY DISCOURAGE PUBLIC INVOLVEMENT

Our organization objects to the delayed implementation of the roadless policy by the Secretary of Agriculture. We object to the questions that you put forth—directing public comments to such issues as fire, access to inholdings, floods and forest health. This directed questioning tactic discourages public input to such issues as wildlife or fish species viability, quality wildlife habitat, clean water, backcountry hunting experiences and scenery. As you are well aware, the Science report for the Interior Columbia Basin Planning effort pointed out that roadless areas were the most intact parts of the Rocky Mountain ecosystem in the planning area. We are disappointed and discouraged that a professional land management agency would resort to such public involvement tactics to solicit a skewed public response on such valuable natural resources affecting far more resources issues than those for which you solicited comment. (Organization, Helena, MT - #A8255.11100)

First of all, I think your 10 questions are designed to intimidate citizens from commenting on the “roadless area” issue. And yes, I do realize these questions are optional. (Individual, Idaho Falls, ID - #A27740.11100)

THEY ONLY REFLECT THE VIEWS OF THE SMALL MINORITY WHO OPPOSE ROADLESS AREA PROTECTION

The ten questions for public comment mostly rehash the complaints and myths of the small minority that opposes roadless area protection. For example, the ANPR asks for input on the best way to provide access to private and state land inholdings in roadless areas, even though the Roadless Rule makes it abundantly clear that it has no effect on inholder access. These issues were fully addressed during the three-year public process leading up to January 2001. (Organization, Pikeville, TN - #A5167.10152)

THEY ATTEMPT TO JUSTIFY THE REVERSAL OF THE ROADLESS AREA CONSERVATION RULE

We feel the 10 questions, to help guide the decision process, are just a poor attempt to illicit opinions and comments that coincide with those of industry so that the reversal of these rules can be justified. We are insulted by the way the questions attempt to manipulate the public into responding unfavorably to the Current Rules. (Individual, Seattle, WA - #A19246.11100)

The above are all shamelessly leading questions, obviously fishing for an answer to justify the Forestry Circus', the current administration's and the various public lands commodity industries, and their bought-and-paid-for elected hacks' clamor for "local control". A pox on all of you.

This is an obvious situation where they didn't like the answers received, so they reworded the question, making them more leading and asked them again, hoping for answers more to their liking. (Individual, Dillion, MT - #A28767.11100)

THEIR INTENT IS TO DIVERT ATTENTION FROM THE ADMINISTRATION'S ATTEMPT TO DISQUALIFY THE RULE

The 10 questions are general in scope and non-scientific in nature, and one can only assume that their intent is to divert attention from the administration's attempt to completely disqualify the Rule. (Individual, Livingston, MT - #A17081.11100)

THEY ARE AN ATTEMPT TO GIVE GREATER WEIGHT TO LOCAL CITIZENS' COMMENTS

In earlier stages of the RAC process a truly historic level of public involvement occurred, both on a national level and on a local level throughout the National Forest system. The process was fair and open (in sharp contrast to this one's lack of any intention to hold public hearings). Comments from the whole spectrum of local advocacy groups was solicited and obtained. Local people turned out in droves to voice their opinions. The interest groups that are not objecting to the outcome are the same ones who have been benefiting at the expense of other users and the public treasury for decades. Dissatisfied with the result of open and public hearings, they now want a more closed process specially designed to give greater value to their comments than the ordinary citizen's. We believe question two is a sham that is intended to produce the rationale for granting that desire. (Organization, Juneau, AK - #A23263.11120)

THEY FOCUS EXCLUSIVELY ON THE ROLE OF LOCAL FOREST PLANNING AND FAIL TO MENTION THE ROADLESS AREA CONSERVATION RULE

The management of roadless areas is a matter of national importance. We are concerned that the questions to the public in the July 10 notice focus exclusively on the role of local forest planning in managing the country's national forests—and never mention the role of national policies like the roadless rule. We urge the agency not to undermine the rule's guaranteed protections for future generations by giving local agency officials broad discretion over the management of roadless areas. (United States Senator, New York - #A23325.13110)

THEY ENCOURAGE CONFLICT BETWEEN DIVERSE GROUPS

I recognize that this input was solicited in order to get comments on the rule-making process. As for the questions on the USFS roadless area response website, in my opinion they take the wrong approach. They seem directed at creating an area-by-area food fight at the local level, pitting environmentalists against the timber, mining and ranching interests (and perhaps some tribal elements), to determine the fate of each and every tract of land. (Individual, Whitethorn, CA - #A27998.11100)

THEY ARE FRAMED TO FAVOR RESOURCE USERS

I am outraged by this process and the questions included with the Advance Notice of Proposed Rulemaking. The framing of the questions show bias favoring advocates of exploitation and of "local control," which translates into weakened protection of roadless areas. I am one of many, many citizens who spent hours and hours participating in the Forest Service's three-year process that led to the Roadless Rule, and I am incensed that more of my time is required to respond to this issue after the conclusion of the process and the announcement of the Rule, and that efforts are made to relax environmental safeguards protecting our forests and to weaken public participation in forest management decisions. (Individual, Blue Ridge, GA - #A15666.11100)

THEY LET RESOURCE USERS DEFINE THE TERMS OF THE DEBATE

And now, they're asking for more comments to further delay protection for wild areas. It's like telling citizens to vote again because they didn't like the results. They've posed ten questions that let industry define the terms of the debate. The questions favor private over public rights, subdivision and industrial development over conservation, and they raise many issues already addressed by existing policies—such as fire, access to inholdings, floods, and forest health. (Individual, Twain Harte, CA - #A15652.11100)

THEY DO NOT CONTRIBUTE TO A HEALTHY AND REASONABLE DEBATE ABOUT THE VALUE OF ROADLESS AREAS

The recent attempt to revisit the roadless area policy is appalling, and shows a disturbing contempt for public participation. The 10 questions posed for consideration are absurdly slanted toward heavy handed management, and do not contribute to a healthy, reasoned debate about the value of roadless areas, I ask you to protect our roadless areas, and implement the roadless area policy that was to be the roadless area policy that was to be implemented at the start of this year. (Individual, Missoula, MT - #A17681.12111)

24. Public Concern: The Forest Service should explain why none of the 10 questions in the Advance Notice of Proposed Rulemaking address inventoried roadless areas as fully functioning ecosystems.

My first question is: who wrote these questions?

So much of the focus is on local decisionmaking. These roadless areas are in our National Forests. This is a national issue.

The true magic, at least in an ecological sense, is that these inventoried roadless areas represent fully functioning ecosystems. No question directly pertains to this issue. Why is this?

Two questions relate to fire management and private property. The focus on this issue is excessive. It is unfortunate that one of these ten valuable questions was wasted in this manner. (Individual, Walla Walla, WA - #A17698.11100)

25. Public Concern: The Forest Service should clarify whether the 10 questions in the Advance Notice of Proposed Rulemaking are an attempt to conduct scoping for a new or supplemental EIS.

AND WHETHER PREVIOUS PUBLIC COMMENTS WILL BE CONSIDERED

We take issue with the Bush Administration adding questions and issues, after the fact, that are outside the scope of the Environmental Impact Statements on the Roadless Policy without conducting a proper NEPA process. Is this scoping for a new or supplemental EIS? Why have our previous comments been ignored? (Organization, Bigfork, MT - #A17742.11100)

26. The Forest Service should recognize that all of the issues addressed in the 10 questions in the Advance Notice of Proposed Rulemaking were already addressed.

I support the Roadless Area Conservation Rule just as it is. The questions posed in this new review process have already been answered in the rule to my satisfaction. The vast majority of land in this country is roaded and open to development. The tiny amount that is not should be kept roadless and wild to provide the ecosystem services that only natural wild lands can provide. (Individual, Missoula, MT - #A5609.10150)

None of these issues were left unaddressed in the original rule. It is a waste of my time to have to reiterate my support for this Rule. But I will do so anyway, because I feel a strong commitment to America's future. (Individual, Lewiston, ID - #A29569.10152)

27. Public Concern: The Forest Service should consider that the 10 questions in the Advance Notice of Proposed Rulemaking are no substitute for the public involvement process.

It is clear that this current 10 Question Game is a attempt by the Cheney/Bush administration to overturn the Roadless Rule in order to favor their friends in the extractive industries and the ORV crowd for political purposes. It is also in violation of the NEPA regulations, since the major action of reversing the Roadless Rule (or of severely weakening it) requires a long process of public hearings with ample opportunity for all interested citizens to comment. This 10 Question Game is no substitute for the public

process. I am requesting the environmental and legal organization to which I belong to file suit against the USFS for a clear and egregious violation of NEPA. (Individual, Mancos, CO - #A15596.20203)

28. Public Concern: The Forest Service should eliminate the use of questions to solicit public comment.

Eliminate the future employment of difficult comment requirements such as these questions. They only serve to confuse and/or discourage potential responders. Majority must rule in the democratic system, and it strongly supports the Roadless Rule as proven by the overwhelming response of the last comment period. Comment periods should remain, but without the impediment of cryptic questions. (Individual, Lafayette, CO - #A26745.15152)

29. Public Concern: The Forest Service should recognize that the 10 questions in the Advance Notice of Proposed Rulemaking are a positive step toward adequate public involvement.

You are on the right track with your request for response on the roadless issue rather than the Clinton/Gore process, which everyone knew was a scam. Your questions are thoughtful and if responded to honestly, with real concern for the roadless areas by all the parties, should give you a good basis on which to make your decisions. The process can be considered democratic but it is not a popular vote. You will never get anything close to agreement from all the stakeholders on the roadless question because the views are so polarized and strong. (Individual, Sandy, OR - #A13471.15000)

This questionnaire is a positive step in ensuring that the voice of all Americans can be heard, rather than the shouting voices of a few. (Individual, Atlanta, GA - #A16459.14410)

Adequacy of Specific Questions

30. Public Concern: The Forest Service should recognize that Question 3 in the Advance Notice of Proposed Rulemaking is biased.

BECAUSE IT IMPLIES THAT THINNING AND ROAD CONSTRUCTION ARE ESSENTIAL TO FOREST HEALTH

[Question 3] This question is clearly phrased to suggest that heavy-handed thinning and road construction are essential to the desired forest health and wildfire hazard objectives. This is patently not true. (Individual, Missoula, MT - #A9106.30100)

BECAUSE IT REFLECTS A LACK OF KNOWLEDGE OF FOREST ECOLOGY

[Question 3] This question reflects a poor understanding of forest ecology. (Individual, South Royalton, VT - #A22114.11100)

31. Public Concern: The Forest Service should define “near” as used in Question 4 in the Advance Notice of Proposed Rulemaking.

How should communities and private property near inventoried roadless areas be protected from the risks associated with natural events, such as major wildfires that may occur on adjacent federal lands?

Define “near”: how “near” is “near”? (Individual, Leadore, ID - #A28841.35200)

32. Public Concern: The Forest Service should recognize that Question 4 in the Advance Notice of Proposed Rulemaking is misleading.

BECAUSE IT IMPLIES THAT ROADLESS AREAS POSE A FIRE THREAT TO HOMES AND COMMUNITIES

[Question 4] The wording of this question makes the roadless areas seem like a threat. In most forests, they are so small and remote that they are much less of a threat than the roaded parts of the forest. In most cases they are probably not at the borders of the national forests, so they are not next to homes or communities anyway. (Individual, Northfield, MN - #A22395.11140)

[Question 4] This is a very misleading and poorly worded question which seems to blame roadless areas for the fire threat to private property, when in almost every case it is the already roaded and mismanaged Forest Service lands that need the species and spacing control work to reduce fuel loading and create safer zones where it will be easier to stop fires near private property. (Individual, Olympia, WA - #A20849.11140)

[Q4] First, this question implies that National Forest inventoried roadless areas are prone or somehow at greater risk to natural events such as lightning, insects or disease than roaded National Forest lands or adjacent communities and private lands. Also, this question could easily be turned around: "How should National Forest lands be protected from risks associated with natural events (or individual carelessness) that may occur on adjacent community or private lands?" All property interests, public and private, share equal risk for the occurrence of natural events. Likewise, adjacent owners share a responsibility to prevent or control fire, insect or disease on their respective lands.

Some techniques, such as creating defensible space along property lines and in urban interface zones, can reduce the risk of fire, insect or disease spread. However, to posit this question in a manner that suggests roading somehow reduces the risk of natural events on those lands is ludicrous. (Individual, Lyons, OR - #A13491.35000)

33. Public Concern: The Forest Service should address various problems with Question 5 in the Advance Notice of Proposed Rulemaking.

IT IS OUT OF SCOPE FOR THIS ANALYSIS

What is the best way to implement the laws that ensure States, tribes, organizations, and private citizens have reasonable access to property they own within inventoried roadless areas?

This question is beyond the scope of this analysis. (Individual, Cave Junction, OR - #A17110.11150)

IT REFLECTS AN INADEQUATE REVIEW OF THE ROADLESS AREA CONSERVATION RULE

Roadless areas are the same as all other national forest lands with respect to inholder access. Posing this question does not reflect due attention having been paid to the Roadless Area Rule by the one asking it. (Individual, Bigfork, MT - #A17221.11150)

IT RAISES SUSPICIONS THAT MORE IS BEING ADDRESSED THAN REASONABLE ACCESS

It is not clear why this question is on the list since inholdings already have legal access. It raises suspicions that more is being asked for than reasonable access. (Organization, Anchorage, AK - #A17358.40100)

DEFINE "REASONABLE ACCESS"

What is the best way to implement the laws that ensure states, tribes, organizations, and private citizens have reasonable access to property they own in inventoried roadless areas?

This question is another straw dog. Define "reasonable access". (Individual, Leadore, ID - #A20898.11150)

34. Public Concern: The Forest Service should recognize that Question 6 in the Advance Notice of Proposed Rulemaking should be asked during the National Environmental Policy Act process.

[Question 6] You are asking a question that will be different then for every area of the country. (Not all communities are the same.) This question must be asked during the NEPA process, not now. (Conservation District, Meeteetse, WY - #A17665.11160)

35. Public Concern: The Forest Service should clarify whether Question 8 in the Advance Notice of Proposed Rulemaking refers to the designation of additional roadless areas.

BEYOND THOSE ALREADY IDENTIFIED IN THE ROADLESS AREA CONSERVATION RULE

[Question 8] We are not clear whether you refer to the designation of additional roadless areas beyond those already identified in the Roadless Area Rule. (Individual, Deridder, LA - #A28678.11180)

36. Public Concern: The Forest Service should recognize that Question 8 in the Advance Notice of Proposed Rulemaking is inappropriate for addressing roadless area protection.

BECAUSE WILDERNESS DESIGNATION IS OUTSIDE THE SCOPE

Who, by the way, designed the 10 questions for you? Look at Question 8. We are supposed to be commenting on future rule making for roadless designation, or so I assume. Yet, you throw in the question for us to answer which ties it to wilderness designation. That is like throwing red meat to the wolves. We are not in the wilderness debate. We are supposed to be restricted to "roadless." They are not the same. (Individual, Kalispell, MT - #A27715.11100)

BECAUSE THE FOREST SERVICE IS ALREADY REQUIRED TO INVENTORY FOR WILDERNESS AREA CANDIDATES DURING THE FOREST PLANNING PROCESS

[Question 8] This is a moot question. The Forest Service is already required to inventory for candidate wilderness areas in the planning process. (Organization, Moab, UT - #A30528.11180)

37. Public Concern: The Forest Service should recognize that Question 9 in the Advance Notice of Proposed Rulemaking goes beyond the issue of management of inventoried roadless areas.

[Question 9] goes well beyond the issue of management of inventoried roadless areas and is the essence of the debate over the purposes for which the National Forests are managed. (Organization, Chantilly, VA - #A3350.13200)

Chapter 2

Process, Planning, Policies, and Laws

This chapter includes six main sections: National Forest Management Act, National Environmental Policy Act, Interim Direction, Other Policy Concerns, Appeals and Litigation, and Other Legal Concerns.

National Forest Management Act

This section includes four subsections: National Rulemaking General, Compliance with the National Forest Management Act, Planning Regulations, and Relationship to Other Plans/Policies.

National Rulemaking General

Summary

A number of respondents question the Forest Service's legal authority to issue national regulations which change land allocations in national forests. They believe this is outside the parameters of the National Forest Management Act. Others, however, assert that national rulemaking is entirely consistent with NFMA. According to some respondents, they believe it was Congress's intent in passing NFMA to help the Forest Service make local forest planning decisions based on accurate local information. They also think that NFMA inherently recognizes interests at the local level frustrating the achievement of national needs. Consequently, these respondents ask that programmatic decisions be reserved at a national level with the Secretary of Agriculture bearing the responsibility for assuring that national forest management is consistent with the principles of multiple use and sustained yield.

38. Public Concern: The Forest Service should clarify its legal authority to issue national regulations.

WHICH CHANGE LAND ALLOCATIONS IN ANY NATIONAL FOREST

We believe the Forest Service lacks the legal authority to issue a national regulation that either changes land allocations in one or more national forest management plan or establishes a land allocation outside the forest planning process prescribed by the national Forest Management Act (NFMA). (Business or Association, Rockville, MD - #A13306.20201)

It would be unlawful for the Forest Service to adopt any similar national level rules which alter a forest plan by changing the allowed land use in roadless areas, but without also amending the governing forest plan.

The July 10 notice suggests that one regulatory option the Forest Service has under consideration is to leave in place temporary some form of rules generally prohibiting road construction and timber harvesting in all inventoried roadless areas, until long-term management decisions are made on a roadless area-by-area basis during revision of each forest plan. 66 Fed. Reg. 35919 the "best way to achieve this objective is to ensure that we protect and sustain roadless values until they can be

appropriately considered through forest planning”. The Forest Service lacks legal authority to adopt a regulatory option which purports to change the forest plan’s decisions on allowable multiple uses in a roadless area without first amending the governing forest plan. (Business or Association, Terra Bella, CA - #A15588.20201)

39. Public Concern: The Forest Service should recognize that the Secretary of Agriculture *does* have the legal authority to issue a national roadless rule.

The first question, which asks “What is the appropriate role of local forest planning as required by NFMA in evaluating protection and management of inventoried roadless areas,” deserves an additional response. While congress clearly intended the NFMA to help the Forest Service make local forest planning decisions based on accurate local information, it also recognized the danger of parochial interests at the local level frustrating the achievement of national needs. Consequently, it reserved to the Secretary of Agriculture the responsibility for assuring that national forest management was fully consistent with the principles of multiple use and sustained yield. This broad statutory authority provides the Secretary with all the authority, and indeed the duty, to adopt a national roadless area conservation rule. See 16 U.S.C. 1607. [Footnote 5: similarly, this statute provided ample authority for the Secretary of Agriculture to exercise discretionary review over the administrative appeals of the 1997 TLMP decision and modify that decision to protect high-value community use areas on the Tongass in the final 1999 TLMP decision.] (Organization, Juneau, AK - #A23091.20201)

The National Forest Management Act and other laws clearly provide authority for executive action through the Secretary of Agriculture. I absolutely oppose further fragmentation of decision-making as proposed by President Bush and others. (Individual, Olympia, WA - #A20844.12110)

NFMA provides that plans may “be amended *in any manner whatsoever* after final adoption after public notice. . . . “Thus, a national role setting forth standards for the protection of Roadless Areas that has the effect of amending local forest plans is fully consistent with NFMA’s procedures. Just as local forest planning must incorporate the effect of other national-level decisions, e.g., congressional wilderness designation, Forest Service Manual and Handbook directives, and national monument designation, so, too, local planning has to accommodate national level policy decisions regarding road building and protection of Roadless Areas. Unless national circumstances change, e.g., road maintenance backlog is eliminated and social preferences for protecting back-country, wildlands are reversed, local forest planning is not the appropriate venue to revisit national roadless policies. (Organization, Sitka, AK - #A12003.20201)

Compliance with the National Forest Management Act

Summary

Respondents encourage the Forest Service to comply with the National Forest Management Act (NFMA). Some assert that compliance is necessary to ensure a fair and open public involvement process. Compliance can be achieved, some suggest, by addressing specific environmental protections mandated by the Act; by providing enough staff and resources in the field to implement forest plans and achieve objectives; or by simply withdrawing the Roadless Area Conservation Rule. Several respondents suggest the Forest Service consider the Senate’s report on NFMA, which stipulates that there should be no national land management prescriptions. Many also stress the need, under NFMA, to hold adequate public meetings (see Chapter 3: Working Together (Question 2): Adequacy of Public Involvement Processes/Methods: *Adequacy of Public Meetings*). Additionally, one of the more common comments is that, per NFMA, decisionmaking must occur at the local (forest planning) level (see Chapter 3: Informed Decisionmaking (Question 1): Local vs. National Decisionmaking: *Local (Forest Level)*)

Decisionmaking and Chapter 3: Informed Decisionmaking (Question 1): The Forest Planning Process).

Others suggest that the Forest Service apply NFMA processes to national level decisionmaking. The assertion becomes one of separating site specific, local management and national protection and consistent decision making across all forests.

40. Public Concern: The Forest Service should comply with the National Forest Management Act.

The NFMA should be knowledgeable about protection of flora and fauna in the roadless areas and make decisions on that basis. (Individual, Metuchen, NJ - #A507.20201)

My comments on this latest iteration of the “roadless area” nonsense will be relatively brief, as my opinion of the whole situation has not changed since Clinton made his initial proclamation in October, 1999. The whole process was, and still is, blatantly illegal, in that it violates NFMA (16 USC 1604 (f)(1)) that calls for one integrated plan dealing with all the uses and resources present on a National Forest, not a separate plan for roadless areas or anything else. It still violates the planning regulations in even the new version of 36CFR219 that requires the management of roadless areas to be dealt with in Forest Plans, not separately (36CFR219.9(b)(8)). It also violates the release language in all the individual State Wilderness Acts that came out of the RARE II process, that state that these areas are available for multiple use management pending revision of Forest Plans. It’s time to comply with existing laws and regulations, and forget this nonsense of dealing with roadless areas outside the Forest Planning process. (Individual, East Kingston, NH - #A4893.20200)

TO ENSURE A FAIR AND OPEN PUBLIC INVOLVEMENT PROCESS

The most effective, proven tool for working with various groups to ensure that concerns about roadless values are heard and addressed through a fair and open process is the NFMA-mandated forest land and resource management planning process. The Forest Service must allow all interested parties, to offer their views and to help define the issues without being constrained by a pre-established planning format.

Establishing forest-level advisory committees as envisioned by NFMA can strengthen this process. Removing the bureaucratic, straitjacket requirements of the Federal Advisory Committee Act would facilitate this approach. Meaningful, productive relationships evolve from the contacts on the individual National Forests. This is where specifics can best be applied on the ground to work to the benefit of local individuals, the community, the state and the nation. (Individual, Lawrenceville, GA - #A6196.15161)

Legally, the protection and management of inventoried roadless areas can only be addressed through the planning process required by NFMA. In fact, the Clinton Administration’s Roadless Rule violates NFMA by amending the land management plans for the Tongass without following NFMA procedures and without the required local involvement. 16 U.S.C. subsection 1604 (f). Furthermore, the Roadless Rule violates NFMA principles of multiple use and sustained yield (16 U.S.C., subsections 1600, 1602, and 1604). (Ketchikan Gateway Borough, AK - #A17476.20201)

BY ENSURING THAT FOREST PLANS ARE IN COMPLIANCE

According to the NFMA, the Secretary of Agriculture shall involve the public in the development of management plans. Those plans must be developed, maintained, and revised as necessary for each unit (where “unit” means each National Forest) of the NF System. The plans must provide for multiple use as provided in The Multiple Use Sustained Yield Act of 1960, taking into account the “coordination of outdoor recreation, range, timber, watershed, wildlife and fish, and wilderness”. Protection of these resources is paramount and forest plans and revisions must include ways to protect the resources from fire, insect infestation and other types of harm. This would include the construction of roads, if necessary, to abide by this mandate. Maximizing the multiple use aspects of the forest is mentioned numerous times throughout the NFMA, and it is the sole purpose of 16USC532. (Individual, Los Alamos, NM - #A3720.20202)

BY ADDRESSING SPECIFIC ENVIRONMENTAL PROTECTIONS MANDATED BY THE ACT

There are numerous issues of scientific concern you refuse to discuss, despite the fact that the 1982 regulations originally mandated forest protections specifically to address watershed protection; protections for endangered species and their habitats; ways to seek removal of species from endangered species list, and that the plan must preserve healthy populations and habitats for larger animals for larger animals such as mammals, birds, and fish. You refuse to support these regulations of the 1982 NFMA. (Individual, Melvindale, MI - #A30286.20201)

BY PROVIDING ENOUGH STAFF AND RESOURCES IN THE FIELD TO IMPLEMENT FOREST PLANS AND ACHIEVE OBJECTIVES

Competing Values and Limited Resources: There will likely never be full agreement between all the parties interested in the national forests. With a lack of political consensus to change the statutory mission of the national forests, the Forest Service must adhere to the current body of legislation, most importantly to the National Forest Management Act. The Forest Service should re-emphasize local forest-level decisionmaking as the best possible means of achieving desired resource conditions. In addition, the agency should ensure that there are enough staff and resources in the field so that forest plans are implemented and objectives are achieved. (Organization, Rapid City, SD - #A17010.13110)

BY WITHDRAWING THE ROADLESS AREA CONSERVATION RULE

NFMA provides that plans may “be amended in any manner whatsoever after final adoption after public notice” Thus, a national rule setting forth standards for the protection of roadless areas that has the effect of amending local forest plans is fully consistent with NFMA’s procedures. I believe that it can be hard for those who live close to large roadless areas and take them for granted to see their significance in a national and global setting. Thus, I think it is appropriate that a national policy to protect them be created. (Individual, Sitka, AK - #A15506.10150)

I do not support the U.S. Forest Service’s Roadless Initiative in its present form for a variety of reasons. My main point of disagreement is that the roadless initiative appears to be designed to circumvent the National Forest Management Act process of review, and prevents local users of public land, representatives and U.S. Forest managers the opportunity to have reasoned and studied input. Creating 50 to 60 million acres of additional wilderness will mean that nearly 50% of all US National Forest lands are severely restricted and that millions of Americans will be prevented from accessing previously accessible lands. (Individual, Irvine, CA - #A937.10131)

The primary tool for evaluating and establishing management direction for all inventoried roadless areas should continue to be the planning process mandated by the National Forest Management Act (NFMA). This is a time-proven, science-based process that provides an opportunity for people to comment about individual forests and specific areas in those forests. (Individual, Juneau, AK - #A17238.10120)

UNTIL THE STATUTORY SYSTEM IS MODIFIED

Until such time that the statutory system is modified, the Forest Service must comply with the planning process as mandated by NFMA. (Individual, Edgewood, NM - #A5638.20201)

41. Public Concern: The Forest Service should consider the Senate’s report on the National Forest Management Act.**WHICH STIPULATED THAT THERE SHOULD BE NO NATIONAL LAND MANAGEMENT PRESCRIPTIONS**

Twenty-five years ago, the National Forest Management Act (NFMA) established forest planning at the local level as the tool by which local people (those most knowledgeable regarding the particular forest) including agency personnel, industry, the environmental community, local government representatives and other interested parties could work together to make decisions regarding the most appropriate use of these public lands. 16 U.S.C. [Sections] 1601-1614. All subsequent resource plans and provisions governing occupancy and use of the lands within a given forest must be consistent with the adopted forest plan, which then guides those activities for a period up to fifteen years. The wisdom of this

localized planning process has not changed, nor have events over the course of time pointed to the necessity for abandoning a local focus in favor of a national rule.

The importance of local knowledge and participation in decisionmaking was highlighted in the Senate Report to the NFMA, when Congress concluded that it was “unwise to legislate national prescriptions” for all national forests because of the “wide range of climatic conditions, topography, geologic and soil types” on individual national forests. Further reading of the Senate Report reveals a specific directive to the Forest Service that “there is not to be a national land management prescription.” S. Rep. No 94-893 at 26 (1976) reprinted in 1976 U.S.C.C.A.N.6684, 6685. (Business or Association, Denver, CO - #A20676.20201)

42. Public Concern: The Forest Service should consider that the National Forest Management Act has not prevented development of roadless areas.

The National Forest Management Act has not prevented relentless consumption of roadless areas by excessive road building and logging. (Individual, Carson City, NV - #A11788.20201)

43. Public Concern: The Forest Service should apply the National Forest Management Act to national-level decisionmaking.

TO ADDRESS THE DESIRES OF ALL AMERICANS

The National Forest Management Act (NFMA) needs to be dealt with on a national level. While the concerns of local citizens regarding issues close to home is important, national concerns are important, as well. Many of Wrangell, Alaska’s 2000 plus citizens grew up with and rely on the timber industry, however, their feelings should not out-weigh the sentiments of millions of other Americans. In addition, local Forest Service authorities may be strongly influenced by their friends, neighbors, and other community members. They may be more familiar with physical details and specifics of their managed areas than other United States citizens, but the protection and management of National Forests is a national issue. Furthermore, if local forest planning officials feel that the nation is not informed on their issues, then they should take the initiative to better inform the national public. (Individual, Akron, OH - #A17697.13100)

Planning Regulations

Summary

A number of respondents comment on the relationship between a possible roadless rule and the Planning Regulations. Comments include the suggestion that roadless area regulations be coordinated with the Planning Regulations; that the Roadless Area Conservation Rule be implemented under the former Planning Regulations; and that decisions regarding roadless area management be postponed until completion of the revised Planning Regulations.

Respondents also comment on revision of the Planning Regulations. Some say the Planning Regulations should address management direction of unroaded areas smaller than inventoried roadless areas. Some suggest that ecological sustainability should not be given first priority in planning; rather equal consideration should continue to be given to social, economic, and ecological values. On the other hand, some respondents assert that revisions must not weaken existing environmental safeguards. Additional suggestions include removing the phrase “at the discretion of the decision officer,” including oil and gas leasing decisions and procedures; and removing the objection procedures and retaining existing appeal regulations.

Additionally, there are comments suggesting that the Forest Service should prioritize completion of forest plan revisions once the new Planning Regulations are finalized . Another asserts that the Forest Service should comply with the new Planning Regulations before finalizing the Roadless

Rule because they will provide clear direction in how the agency must carry out local forest planning to ensure the ecological sustainability of roadless areas. Several respondents also request that the Forest Service should seek further public input before taking further actions regarding the Planning Regulations and Roads Policy. Finally, one individual states that the Forest Service should explain why the word “access” was removed from the Code of Federal Regulations (CFR) 212 rule without notifying the public in federal register notices, and should open the CFR 219 rule for full public discourse.

44. Public Concern: The Forest Service should coordinate the roadless area regulations with the Planning Regulations.

I cannot possibly offer meaningful comments on the validity of conducting roadless area management decision through planning until I clearly understand how “planning” will be conducted once the planning regulations are revised. Therefore, if Roadless Area management decisions are made through forest planning, this rulemaking must be postponed until the Planning Rule changes are finalized. (Individual, Moab, UT - #A15790.14422)

BY EVALUATING THE SOCIAL AND ECONOMIC IMPACTS OF EACH ALTERNATIVE

The roadless regulations and planning regulations must be coordinated. There must be a comprehensive evaluation of the social and economic impact of each alternative on surrounding communities. This should be based on real data, not models bearing little resemblance to the real communities. (Individual, Boise, ID - #A5165.16120)

THE SECRETARY OF AGRICULTURE SHOULD ELIMINATE THE NATIONAL APPLICATION OF THE CURRENT RULE AND ESTABLISH NATIONAL STANDARDS TO GUIDE THE FOREST PLANNING PROCESS

There appears to be a conflict between the current rule and the recently revised regulations as 36 CRF Part 219 Guiding the Development of Forest Plans (Nov.9, 2000; 65 FR 67571).

The current rule intent is to provide lasting protection for inventoried roadless areas within the National Forest System in the context of multiple use management.

However, the recently revised regulations guiding the development of Forest Plans provide that during the plan revision process or at other times as deemed appropriate, the responsible official must identify and evaluate inventoried roadless areas and unroaded areas and then determine which, if any, of those areas warrant additional protection and the level of protection to be afforded.

With the current rule in place, the responsible official in the plan revision would not be able to determine which, if any, of the inventoried roadless areas warrant additional protection and the level of protection because of the direction contained in the current rule.

To resolve this conflict, the Sect. Of Agriculture would have to eliminate the National application of the current rule and establish national standards to guide Forest Service officers in applying these standards through the Forest Service Planning Process. (Individual, McMinnville, OR - #A3361.12000)

45. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule under the former Planning Regulations.

If the Roadless Conservation rule is to be reconsidered and left to local planning, it should be done so under the planning rules that were in place during the development of the original plan, not what is presently in place. (Organization, Huntsville, AL - #A13542.16120)

The process under NFMA using the old (existing) Planning Regulations without the RACR seems to work well. The process should be open . . . and use sound science to guide final decisions. (Individual, Logan, UT - #A13482.20201)

46. Public Concern: The Forest Service should postpone decisions regarding roadless area management until completing the revision of the Planning Regulations.

In the same Federal register volume notice [Vol. 66, No. 132/Tue. July 10 2001] the Forest Service states: "The Forest Service is committed to protecting and managing roadless areas as an important component of the National Forest System. The best way to achieve this objective is to ensure that we protect and sustain roadless values, until they can be appropriately considered through forest planning." However we are uncertain as to which Forest Planning Regs we will be legally operating under or within, therefore we are unable to interpret much of the language proposed in the Proposed Forest Plan Revision still incomplete.

There are so many interrelated subjects all overlapping it makes commenting impossible.

We can give general comments, but they are meaningless until we have all the final outcomes after all lawsuits have been settled and we are certain which rules will be used and which regulations we will be operating under. (Fire Department, Uinta County, WY - #A15287.14422)

I cannot possibly offer meaningful comments on the validity of conducting Roadless area management decisions through planning until I clearly understand how planning will be conducted once the planning regulations are revised. Therefore, if Roadless Area management decisions are made through forest planning, this rulemaking must be postponed until the Planning Rule changes are finalized. (Individual, Quarryville, PA - #A15217.14422)

The "appropriate role" of the planning procedures required by NFMA is impossible to determine since the planning regulations have been recently revised and then subsequently temporarily withdrawn. It is impossible for the general public to answer this question until the Planning Rule changes are finalized.

Since the primary purpose of any NEPA process is full public disclosure of proposed changes and their impacts on the human environment we would advise the agency to withdraw the rule until the planning regulations are finalized. (Organization, Salt Lake City, UT - #A15263.14422)

PARTICULARLY THE 36 CODE OF FEDERAL REGULATIONS 219 RULE

Although your present directives (2400-2001-3, 7710-2001-1 and 7710-2001-2) and proposed new rules might alleviate those concerns brought forth by the above mentioned lawsuits, they by no means alleviate those still lurking that were not addressed and are not presently being addressed from future litigation.

Definitions at 219.36 are contradictory to new or reconstructed roads, yet we concern ourselves with 219.35 transition issues. Most publics applaud the move to establish procedure and management direction for "roadless" protection to the forest management and resource planning process without full knowledge of the November 2000, 36 CFR 219 rule as it stands today.

Until the various interests, including forest personnel, have a complete understanding of what 219 states, and inconsistencies in the management rule are remedied, the "Roadless" Area Conservation at 36 CFR [219] should immediately be suspended until the appeal procedure is complete. The forest management rule implementation date should be postponed at that time for the same reason. (Individual, Rock Springs, WY - #A15658.16100)

47. Public Concern: The Forest Service should review and amend the Planning Regulations.

We feel the best action would be to abandon this effort and put more effort into revising the Planning Regulations and updating the individual forest plan. (Business, Colville, WA - #A3362.16120)

TO ADDRESS THE APPROPRIATE MANAGEMENT DIRECTION FOR UNROADED AREAS

Scoping for the roadless conservation rule included provisions for identification and development of appropriate management direction of unroaded areas smaller than inventoried roadless areas. This component has dropped from the roadless conservation rule and placed in the planning process. Brief

note of unroaded areas was made in the 2000 revision of the planning regulations. However, these regulations are currently being revised further and it is unclear how the topic of unroaded areas will be integrated into these planning regulations and the implementing language in the Forest Service Manual and Handbook. We advocate attention to the delineation of and appropriate management direction for unroaded areas in the revised planning process. (Individual, Asheville, NC - #A22623.16120)

WITH RESPECT TO EMPHASIS GIVEN TO ECOLOGICAL SUSTAINABILITY AND TO TREATMENT OF UNROADED AREAS

The new planning regulations developed under the out-going Clinton administration are not an improvement. They need to be reviewed to fix some serious flaws:

A. The change from equal consideration of social, economic and ecological values TO ecological sustainability as the first priority in the management of National Forests is **not good** for quality land stewardship. Determining ecological sustainability is very complex with no hard and fast science on how to make the “call”. This will leave most decisions ripe for litigation where the courts will end up deciding how to best manage natural resources. Itasca County does not support court managed National Forests.

B. Moving the issue of unroaded areas from the Roadless Rule to the new Planning Regulations (late in the process) without any public review and comment is no way to treat constituents and was very likely an illegal move. Unroaded areas are vaguely defined and leave us with unknown impacts when their management is finally resolved.

**A positive aspect of the new planning regs is that there is more emphasis on local government cooperation and the local Forest supervisor is designated as the responsible official/decision maker.

Decision making at the local level is a good idea. (Elected Official, Itasca County, MN - #A2561.16120)

WITHOUT WEAKENING EXISTING ENVIRONMENTAL SAFEGUARDS

It should not revise the forest planning regulations so as to greatly weaken existing environmental safeguards and public participation opportunities in the planning process. (Organization, Oak Ridge, TN - #A12830.16120)

It is disingenuous for the Bush administration to suggest that local forest planning will adequately protect roadless areas. The administration is simultaneously revising the forest planning regulations to greatly weaken existing environmental safeguards of public participation opportunities. There is no reason to believe that roadless areas will be protected by future forest plans any better than they have been in the past. (Individual, Hatboro, PA - #A15489.16120)

BY REMOVING THE PHRASE “AT THE DISCRETION OF THE DECISION OFFICER”

The new planning regulations need to be revisited to return mandatory coordinated planning with local government to the regulations, removing the “at the discretion of the decision officer” portion. This will greatly aid the Service in meaningful collaborative planning. (Business or Association, Alturas, CA - #A17770.14422)

BY INCLUDING OIL AND GAS LEASING DECISIONS AND PROCEDURES

Include oil and gas leasing decisions and procedures in the body of the regulations. Make both the 36 CFR 228.102(d) and (e) decisions in the LRMP. (Business, Denver, CO - #A25688.10130)

The final rule published in the Federal Register on November 9, 2000 circumvented the decision making process with respect to where and what level of oil and gas leasing decisions will be made as a part of the planning process. **No reference to leasing is made** in Sections 219.10 Site-Specific Decisions or Authorized Use of Land or 219.26 Identifying and Designating Suitable Uses. Nevertheless, it is critically necessary to include specific direction on how oil and gas leasing is to be integrated into the planning process. To meet the legal requirements of the Mineral Leasing Act, the Energy Security Act and the Federal Onshore Oil and Gas Lease Reform Act, it is essential for direction to be included in the regulations establishing standards for making both the 36 CFR 228 Part 102 (d) and (e) leasing

decisions, availability and specific lands decisions, in the planning process. A key element of the process must be that the FS make both of these decisions during planning to avoid the unnecessary and costly supplemental NEPA (National Environmental Policy Act) documents currently required to make the “specific lands” leasing decision. Furthermore, a discussion of oil and gas resources and how they will be integrated into the forest planning revision and amendment regulations needs to be added to the regulatory preamble as well as the rule itself. (Business, Denver, CO - #A25688.65310)

BY REMOVING THE OBJECTION PROCEDURES AND RETAINING EXISTING APPEAL REGULATIONS

Abandon the “pre-decisional objection” procedures and retain existing appeal regulations. (Business, Denver, CO - #A25688.10130)

48. Public Concern: The Forest Service should prioritize completion of forest plan revisions once the new Planning Regulations are finalized.

The Forest Service needs to move forward with the development of a realistic revision of the NFMA and the implementation regulations. Upon the completion of the new Planning Regulations, there should be a priority placed on the completion of Forest plan amendments and/or revisions. These amendment/revisions should be done for each individual National Forest although some analysis may be necessary at a larger scale to properly analyze the effects to the ecosystem. I also strongly recommend that future Forest Plans be “ground proofed” as the final step in the planning process. “Ground proofing” is the only way to eliminate the questionable assumptions, gross generalizations, and the subjective values. Future plans must be explicit enough for reasonable people to properly evaluate and understand. (Individual, Colfax, WA - #A5421.13200)

49. Public Concern: The Forest Service should comply with the 2000 Planning Regulations.

Though not fully in force until November 2002, the Forest Service must comply with new planning regulations effective November 9, 2000. The regulations provide clear guidance in how the agency must carry out local forest planning to ensure the ecological sustainability of roadless areas. (Individual, Penn Valley, CA - #A12007.20200)

50. Public Concern: The Forest Service should seek further public input before taking further actions regarding the Planning Regulations and Roads Policy.

Of great concern to us is that you have allowed the Forest Service to suspend significant parts of both the planning and road management rules in the absence of any public involvement or consideration. We request that the Forest Service seek public input before taking further actions concerning these rules, which are of considerable importance to us all. (United States Senator, Georgia, - #A23325.16110)

Involvement of the public in the planning process is an issue that has been a component of the planning regulations. An aspect that has gotten increased attention in the 2000 planning regulations is the role of the public in developing Forest plans through a collaborative process. This emphasis should be retained as the planning regulations are revised further. (Civic Group, Roanoke, VA - #A1713.16120)

51. Public Concern: The Forest Service should explain why the word “access” was removed from the Code of Federal Regulations (CFR) 212 rule without notifying the public in federal register notices, and should open the CFR 219 rule for full public discourse.

Suspend the “roadless rule”, explain to the public why the word “access” was removed from the 212 rule without notifying the public in federal register notices, and open the 219 rule in its entirety for full public discourse. (Individual, Rock springs, WY - #A15658.25200)

Relationship to Other Plans/Policies

Summary

Several respondents urge the Forest Service to coordinate roadless area management with local forest plans. As one person points out, that the national forests are more often than not, disconnected areas, that make it difficult to coordinate all different types of direction, such as fire plans and ski resorts, hence close cooperation must be achieved. Other respondents remind the Forest Service that they are obligated to coordinate land management planning with other Federal, State, Tribal and County planning. While another respondent points out that the Agency should be also coordinating the Roadless Rule with the Interior Columbia Basin Ecosystem Management Project planning process.

52. Public Concern: The Forest Service should coordinate roadless area management with local forest plans.

The Forest Service cannot legally enact a rule that changes existing forest plans without going through the process of amending those forest plans. The issue of overriding existing forest plans strikes especially close to home for members of this Association, who spent the better part of 7 years involved in the revision of the Black Hills National Forest plan, only to see the decisions about how to manage Roadless Areas in the Forest changed by the Washington, D.C. Clinton Roadless Rule. (Organization, Rapid City, SD - #A17010.16000)

Fire has been a major issue during these last two summer seasons, and will probably grow in importance in the coming years. The Moose fire has burned to within 4.5 miles of our ski resort and has involved some of the proposed roadless parcels. How can our Flathead Forest management plan implement a comprehensive fire plan with this patchwork of lands? Do they take a "let it burn" approach to these 5,000+ acre parcels, and then try for control/containment on surrounding lands? What is the impact on wildlife, fish, water quality, and air quality both within the roadless parcel and the surrounding areas which may be both public and private? (Permit Holder, Whitefish, MT - #A20669.30410)

The regionalized method to planning allows for local concerns to be incorporated in to the planning effort. Instituting a blanket policy, such as the roadless policy, does not address the concerns Southeast Alaska might express in the Tongass Land Management Plan.

The Tongass Land Management Plan is a flexible and living document designed to change with the times. National mandates, such as the roadless policy, eliminate the public's opportunity to provide meaningful input. (Tribal Association, No Address - #A23324.16100)

53. Public Concern: The Forest Service should coordinate land use management with the planning and land use policies of local governments.

The Forest Planning regulations specify that the responsible officer for making planning decisions, such as the roadless policy, is to undertake a review of the planning and land use policies of local governments and display the results of this review within the environmental impact statement. This coordination with the local land use plans and communities must occur in the initial steps of developing forest land use management programs. (Elected Official, Douglas County, OR - #A11811.14430)

Roadless Proposal is in opposition to County Comprehensive Land Use Plans. We also wish to remind the USFS that by law and policy public land management agencies must recognize and consider County Comprehensive Land Use Plans as they manage public land. These county land use plans are developed through a formal public process including public hearings and legislatively adopted. The documents provide a legal foundation on which lands within the county should be used. All counties in Utah have recently updated their Comprehensive Land Use Plans. Through this process the citizens identified and

prioritized how land should be used. In all cases county citizens identified “access to public land” as their highest priority and number one objective regarding public land issues. We recognized the USFS is not bound by law to follow these county plans and that they only need to be “considered” when making management decisions. (Professional Society, No Address - #A27584.16000)

The debate over the purpose of the national forest extends far beyond management of roadless areas and has been greatly heightened in recent times. This proposal will not answer that question but makes the case for sticking with the existing planning framework as created by NFMA. Reworking the new planning regulations to retain the mandatory coordination with local government will help insure that local involvement remains high. The Service needs to remember that the goal is not planning and collaboration but implementation of management on the ground. (Business or Association, Alturas, CA - #A17770.15160)

It is important to recognize that, along with local forest plans, agencies such as Caltrans, who are responsible for transportation facilities in and through Forest Service lands, prepare and maintain long-range plans for their facilities. These plans must be considered by the Forest Service, so that decisions are not made unilaterally. (State Agency, Sacramento, CA - #A28870.12313)

54. Public Concern: The Forest Service should support the Giant Sequoia National Monument Management Plan.

The Giant Sequoia National Monument Management Plan should be an obvious necessity, overseen by the Department of Interior and the National Parks System. The U.S. Forest Service, which seemingly should shepherd the forests, has allowed itself to become timber-oriented. So putting thousand-year-old trees under the jurisdiction of that Service which sees no problem in chopping trees down would be as disastrous as dismissing the endangered species list because, say, it’s not important that our children actually see a bald eagle. (Individual, Frazier Park, CA - #A5010.16100)

55. Public Concern: The Forest Service should coordinate roadless area regulations with the Interior Columbia Basin Ecosystem Management Project planning process.

We are particularly concerned about the application of this roadless review of the lands within the Interior Columbia Basin project area. The counties were repeatedly told that planning for this region was to be ecosystem wide and in collaboration with the counties. While it was envisioned that a collaborative process was being established, the imposition of a new roadless policy without questions as to the integrity of the Interior Columbia Basin planning process. The ICBEMP cannot succeed if it is overridden by a piece-meal approach developed outside the region. The ICBEMP is [not] only an ecosystem strategy it is, and probably most important, a new collaborative approach to forest management that was designed to collaboratively resolve the very issues raised in this proposed rulemaking (i.e. proper treatment of roadless areas, transportation systems, and forest health and recovery). (Elected Official, Douglas County, OR - #A11811.16130)

National Environmental Policy Act

This section includes two subsections: Compliance with the National Environmental Policy Act and Environmental Analysis Documents.

Compliance with the National Environmental Policy Act

Summary

Respondents state that the Forest Service should comply with the National Environmental Policy Act (NEPA). To that end, individuals suggest the Agency include input from local, state, and federal elected officials; provide accurate, site-specific information about roadless areas to allow informed comment; ensure that the outcome is not predetermined; avoid committing resources such as to prejudice selection of an alternative; or simply withdraw the Roadless Area Conservation Rule. Some respondents, however, assert that NEPA is itself to blame for the Rule. They believe the Forest Service should work toward revising the National Environmental Policy Act (NEPA) process which, they consider to be an ill-conceived rule and is the cause of declining level of timber removal on federal lands.

56. Public Concern: The Forest Service should comply with the National Environmental Policy Act.

In response to your question, the appropriate role of local forest planning regarding the Roadless proposal is to ensure compliance with all laws and regulations. The National Environmental Policy Act (NEPA) and the Council on Environmental quality (CEQ) regulations are the key federal law and regulation. The pending Roadless proposal is under NEPA and its CEQ regulations. Catron County Commission requested last year to be a partner in the Environmental Impact statement process. Unfortunately, Catron County Commission did not receive any response regarding our request pursuant to 40 CFR 1506.2. Hence, the appropriate role of the Forest Service is to follow the rules and procedures of NEPA and CEQ, and request that the State and affected counties be involved, government-to-government, in the environmental analyses and documentation. (Elected Official, Catron County, NM - #A15538.20200)

The best way to work with different groups and different people who want different things is to continue to use the NEPA process, where all participants have a voice. Whatever the process though, it must be regulated by an umbrella of federal environmental laws which are designed to ensure the viability and sustainability of the forest ecosystem and all of its inhabitants. Opinion on roadless management would only be acknowledged if those opinions maintained or promoted the long-term survival of the forest ecosystem. We cannot meet all the desires of all groups, but we must be responsible enough to maintain and improve our natural resource base, and not let it fall victim to short term political favors or unreasonable economic considerations. (Individual, Bozeman, MT - #A5998.20203)

BY HOLDING FAIR AND OPEN PUBLIC MEETINGS AND CONSIDERING SUBSTANTIVE WRITTEN COMMENTS

The creation of the Roadless Initiative violated several laws. The ‘public meetings’ were a sham at which those supporting the Rule were given more time and more opportunity to comment. Substantive written comments were evidently disregarded. Inadequate time was allowed for comment. These are all NEPA violations. (Individual, Cedaredge, CO - #A10364.20203)

Many of our local citizens attended the community hearings in Plumas and other counties that were held by the Forest Service. The hearings were called “listening sessions” and we believe that they fell short of NEPA requirements. (Elected Official, Plumas County, CA - #A4846.20203)

BY INCLUDING INPUT FROM LOCAL, STATE, AND FEDERAL ELECTED OFFICIALS

I am encouraged by your efforts to solve the problems that the Roadless Area Conservation Rule will cause if implemented as is. This is an example of the NEPA process completed without accurate information or the input of local, State and Federal elected officials. (Business or Association, Alexandria, LA - #A5426.20200)

I am writing to support the Forest Service's efforts to fix the fatal flaws in the Roadless Area Conservation Rule as it now stands. This policy is the product of a deeply-flawed NEPA process, which was conducted without adequate, accurate information about the affected areas, and which ignored significant concerns raised by local, state, and Federal elected officials. (Individual, Buckley, WA - #A704.20203)

This rule is the product of a deeply flawed NEPA process, which was conducted without adequate or accurate information about the affected areas, and is contrary to the agency's legal authority. I agree with U.S. District Judge Edward Lodge's decision that the U.S. Forest Service violated public disclosure requirements before approving the Clinton administration's roadless plan and that the initiative violated the National Environmental Policy Act. (Business or Association, Concord, NH - #A1050.20203)

This rule is the product of a deeply flawed NEPA process, which was conducted without adequate or accurate information about the affected areas, and is contrary to the agency's authority. I agree with US. District Judge Edward Lodge's decision that the U. S. Forest Service violated public disclosure requirements before approving the Clinton administration's roadless plan and that the initiative violated the National Environmental Policy Act.

The rulemaking process ignored substantive concerns raised by local, state, and federal elected officials. For instance, in January 2000 the NH House of Representatives voted overwhelmingly to oppose President Clinton's plan, voting 269-62 to support a resolution opposing President Clinton's action to establish vast roadless areas in the White Mountain National Forest and called up President Clinton to rescind his "roadless" area proposal and allow decisions regarding land allocation to be made through the Forest Planning process. The Democratically-led NH Senate passed the same resolution and Governor Jeanne Shaheen expressed strong opposition to the plan as well. Many New England residents rely upon access to the sustainable timber base on the White Mountain National Forest and have long participated in and supported the collaborative forest planning process as the only legitimate way to make decisions about all aspects of national forest management. (Individual, Cornish, NH - #A1712.20203)

BY INCORPORATING ACCURATE INFORMATION ABOUT ROADLESS AREAS

We are pleased to read that the Forest Service is attempting to fix the fatal flaws in the Roadless Conservation Rule. This policy is the result of a poorly conducted NEPA process. It was made without accurate information about the roadless areas. It ignored significant concerns raised by elected officials and the public. (Individual, Boise, ID - #A13385.10120)

BY ADEQUATELY ANALYZING ALL ISSUES AND CONCERNS IN THE ROADLESS AREA CONSERVATION RULE FINAL EIS

[The Roadless Area Conservation Rule] violates NEPA by failing to adequately and accurately analyze all issues and concerns in the FEIS. (Professional Society, Anchorage, AK - #A21707.20200)

BY PROVIDING SITE-SPECIFIC INFORMATION

How could the public possibly provide comments when the areas to be impacted by the rule were not identified; no information was provided on the location and size of the roadless areas to be studied or on environmental issues or alternatives. The environmental, social, and economic implications of the roadless rulemaking could not be properly analyzed in any environmental impact documents without this information.

The Forest Service must remember that NEPA requires site-specific analysis. In *California v. Bergland*, 483 F. Supp. 465 (E.D. Cal. 1980), *aff'd sub nom.*, *California v. Block*, 690 F.2d 753 (9th Cir. 1982),

the U.S. Court of Appeals for the Ninth Circuit rejected under NEPA, a blanket approach to roadless reviews. In its review of the Forest Service's RARE II program, the court in *Block* held that, "having decided to allocate simultaneously millions of acres of land to nonwilderness use, the Forest Service may not rely upon forecasting difficulties or the task's magnitude to excuse the absence of a reasonably thorough site-specific analysis of the decision's environmental consequences." *Id.* at 765. Indeed, "broad, generic statements neither inform the public of the environmental consequences of action, nor require the agency to take a 'hard look' at environmental factors." 483 F. Supp. at 465 ("site-specific information is especially vital in considering wilderness issues."). The January 12, 2001, rule has the same fatal flaws as noted by the Federal District Court. The Forest Service, in pursuing this ANPR process, should dedicate time and resources to mapping the national forest system to determine exactly what areas are considered roadless, as well as the resources that are located in such areas. (Business or Association, Washington, DC - #A29622.10135)

BY PROVIDING THE PUBLIC WITH ADEQUATE INFORMATION TO ALLOW INFORMED COMMENT

Binding NEPA regulations require that there "shall be an early and open process for determining the scope of issues to be addressed and for identifying the significant issues related to a proposed action" that will be addressed in the EIS (40 C.F.R. 1501.7). In the rulemaking process resulting in the January 12 Rule, the Forest Service completely failed to provide the public with adequate information on details of the roadless area initiative to allow informed public comment on the scope of issues to be addressed or on the significance of issues related to the proposed action. How could the public possibly provide comments when the areas to be impacted by the proposed rule were not identified, and no information was provided on the location and size of the roadless areas to be studied or on environmental issues or alternatives? The environmental, social, and economic implications of the roadless rulemaking could not be properly analyzed in any environmental impact documents without this information. (Business or Association, Spokane, WA - #A17351.10135)

BY ADEQUATELY STUDYING THE ISSUES BEFORE INITIATING POLICIES

It appears that the intent of NEPA has been badly violated with the current roadless policy as there does not appear to have been a proper study taken before implementation of this policy was made. (Individual, South Royalton, VT - #A13393.20203)

BY ENSURING THAT THE OUTCOME IS NOT PREDETERMINED

NWMA is obligated to point out that the Forest Service would likely not be engaged in this ANPR process if adequate compliance with NEPA had occurred in developing the January 12 Rule. The Forest Service should learn from its past mistakes. The rulemaking process resulting in the January 12 rule was a rushed process with a predetermined outcome. Decisions were made based on inadequate or incomplete information, and pertinent data were ignored. (Business or Association, Spokane, WA - #A17351.10135)

This rule is inconsistent with the intent of the National Environmental Policy Act, the National Forest Management Act, the Multiple Use Sustained Yield Act, the Organic Administration Act and most other legislation under which the national forests are managed. . . . although some hearings were held, the decision was made to go forward with the roadless area plan long before the hearings were held. For the most part, those who opposed the plan were ignored. Only those who favored the plan were heard. This is contrary to the intent of the National Environmental Policy Act. (Business, No Address - #A17224.20200)

BY NOT COMMITTING RESOURCES SUCH AS TO PREJUDICE SELECTION OF AN ALTERNATIVE

Under the NEPA regulations an agency can not commit resources prejudicing selection of alternative or otherwise limiting the choice of alternatives before making a final decision. We note that the Forest Service has been closing and obliterating roads with the stated intent to create larger unroaded areas. To ensure that the agency allows for proper review and comment by the public, we suggest that all roadless areas created or enlarged by road closures be identified. (Elected Official, Douglas County, OR - #A11811.45100)

BY WITHDRAWING THE ROADLESS AREA CONSERVATION RULE

I was very pleased that the Federal Judge in Idaho recently ruled that there is strong evidence that the Forest Service policy was predetermined and that the agency violated the National Environmental Policy Act. It is my hope that your Administration will agree with the Judge's ruling and seek to withdraw the rule. (Individual, Provo, UT - #A2875.20203)

I am writing to support the Forest Service's efforts to fix the fatal flaws in the Roadless Area Conservation rule as it now stands. This policy is the product of a deeply-flawed NEPA process, which was conducted without adequate, accurate information about the affected areas, and which ignored significant concerns raised by local, State, and Federal elected officials. (Individual, Temple City, CA - #A753.10130)

This letter is in support of the Forest Service's worthwhile efforts to rehabilitate the Roadless Area Conservation Rule (Rule). Shasta County supports the reasoned and reasonable oversight of land uses, on federal land and elsewhere. Sound land use policies are developed through open, deliberative, and participatory processes, as required by the National Environmental Protection Act (NEPA). The Rule's shortcomings can be traced to its hasty enactment, without sufficient opportunities for review, analysis, public input, and refinement. Shasta County supports the Forest Service's efforts to go back and address these critical shortcomings. (Elected Official, Shasta County, CA - #A4943.10130)

57. Public Concern: The Forest Service should recognize that it is circumventing the National Environmental Policy Act by requiring additional comments after the record of decision was issued for the Roadless Area Conservation Rule.

I am appalled that the NEPA process is being circumvented and ignored by requiring additional comments after the ROD was completed. (Individual, Lacey, WA - #A27032.20203)

58. Public Concern: The National Environmental Policy Act should be revised.

I encourage the Forest Service to work toward revising the National Environmental Policy Act (NEPA) process which has led to this ill-conceived rule and to the continually declining level of timber harvest on federal lands. (Business or Association, Escanaba, MI - #A8364.20203)

Environmental Analysis Documents

Summary

General Comments – Some respondents state that, in general, management decisions on roadless areas should require environmental assessments rather than EISs, since many of the areas are already roaded. With respect specifically to the Advance Notice of Proposed Rulemaking, however, some suggest that if the Agency believes the prior review was so inadequate as to require additional action, the extent of which is not now known, that an additional environmental review under NEPA should be required. Some believe that if this is not done, it weakens the process and jeopardizes the final Rule. They are also concerned about the possibility of a revised Rule not requiring an EIS before entering Roadless Areas. Respondents wonder how the public would then be involved in these site specific decisions.

Roadless Area Conservation Rule EIS – A number of respondents assert that the Roadless Area Conservation Rule Draft EIS was inadequate in a number of ways: it was not sufficiently site-specific and did not consider a sufficient range of alternatives; it failed to adequately discuss environmental and economic impacts; it failed to address meaningful input by affected citizens and parties; and its underlying analysis was insufficient. Additionally, some respondents state that the Final EIS included vital aspects of the policy which were not included in the Draft EIS,

such as restrictions on lands outside of unroaded portions of inventoried roadless areas; thus they believe the public was denied adequate opportunity for comment. Some suggest that the Forest Service should prepare a supplemental Draft EIS; suggestions include quantifying miles of existing roads in inventoried roadless areas and providing maps of roadless areas. Another person states that the Finding of No Significant Impact document, which allowed the roadless initiative to proceed, violated legal requirements for land withdrawals over 5,000 acres.

One individual takes exception to the Agency's claim that "it is difficult, and perhaps infeasible to collect in a short timeframe, on a national scale, the local data needed to produce a sufficient EIS that analyzes all relevant information or that proposes an adequate range of alternatives." This respondent asserts that the Forest Service has 30 years of data regarding EIS implications all over the country and believes the Agency does have a great deal of experience that shows that diminishing roadless areas diminish our forests. Finally, some respondents refer to the alternatives presented in the Draft EIS and offer their preferences.

Environmental Analysis Documents General

59. Public Concern: The Forest Service should require an environmental assessment or EIS before undertaking any significant action.

RATHER THAN ARBITRARILY PROHIBITING ROAD CONSTRUCTION

Before any action can be taken that would result in a significant environmental impact, such as the construction of a new road, an environmental assessment (EA) and if necessary an EIS, has to be done. This is the best way to manage projects on our National Forests, taking each situation on its own, rather than arbitrarily prohibiting all road construction. (Organization, Albuquerque, NM - #A8813.15169)

Moreover, at the same time the Bush administration wants to hand the fate of roadless areas to this process, it has proposed weakening the process itself. It wants to make writing an environmental impact statement optional and not required, for example. Now how in the heck is the public supposed to participate in local forest planning if the Forest Service does not provide an EIS to explain the different management options? If the administration really wants local input, it should aggressively uphold and apply the National Environmental Policy Act, instead of trying to avoid and ignore it. (Individual, Boulder, CO - #A20728.20203)

60. Public Concern: The Forest Service should require environmental assessments for roadless areas rather than EISs.

BECAUSE MANY OF THE AREAS ARE ALREADY ROADED

Since many of the areas and conditions on the land are already roaded simple EAs not EISs should be all that is necessary. Forest Supervisors need to be able to flatly state that roadless conditions do not exist, or have not existed and the areas are needed for semi-primitive motorized recreation and forest management activities. (Individual, Alturas, CA #A28581.45500)

61. Public Concern: The Forest Service should conduct an additional environmental review under the National Environmental Policy Act.

IF THE PREVIOUS REVIEW WAS INADEQUATE AS TO REQUIRE ADDITIONAL ACTION

If the prior review was so inadequate as to require additional action, the extent of which is not now known, an additional environmental review under NEPA should be required. (Individual, Chico, CA - #A17483.20203)

62. Public Concern: The Forest Service should prepare another EIS for a revised Roadless Rule.

The National Environmental Policy Act (NEPA) provides an excellent tool for local citizens and governmental officials to provide input into a considered decision on determining the need for and extent of additional “roadless” areas. NEPA requires “site-specific” analysis of the specific major federal actions. It requires that “responsible officials” prepare an adequate Environmental Impact Statement on such actions as the “Roadless Area Conservation” plan that has been proposed. Meaningful input by affected citizens and parties is a “must” for an adequate EIS. Such an EIS was not properly prepared for the rule implemented in January 2001. (Business or Association, Novato, CA - #A17652.20203)

If your roadless proposal is implemented in Alaska, you will eliminate all major uses, except one, backpacking, in a significant portion of the National Forests in Alaska. Such an action by the federal government constitutes a significant environmental impact on the human environment and must be documented in an environmental impact statement in accordance with NEPA, in fact, you are required to document the impacts of this proposal on each individual forest by completing an environmental impact statement for each forest affected by the proposal. (Individual, Eagle River, AK - #A23920.20203)

The NEPA process with scoping meetings, preparation of an EIS, circulation of the document to the public and evaluation of comments followed by decision on the best plan seems like a reasonable approach. (Individual, Las Vegas, NV - #A28178.20203)

PRIOR TO RELEASING LANDS FOR OTHER MANAGEMENT PURPOSES, AS REQUIRED BY CALIFORNIA V. BLOCK

Since the designation of some lands for roadless protection will also result in other lands being released or designated for other development usage, the draft EIS should discuss the impact and management activities expected on the released lands. This analysis is necessary to comply with the requirements of CALIFORNIA V. BLOCK, 690 F. 2d 753 (9th Cir. 1982) that an EIS is required prior to releasing lands for other management purposes. (Elected Official, Douglas County, OR - #A11811.25000)

TO FACILITATE WORKING TOGETHER WITH ALL INTERESTED PARTIES

The best way to do this would be to go through a full EIS process, and hold public meetings nationwide and allow all individuals and organizations to comment. *This has already been done, and the results are in.* Any attempt to repeat the NEPA process until the citizenry becomes so jaded with it that people cease to participate makes a mockery of NEPA and our democratic form of government. There is no reason to give states or local communities any greater weight than any other citizen in this process. Since collaborative processes by their very nature exclude large and diverse segments of the public, they should not be used to form public policy. Instead, the full NEPA process, which allows participation by **all** Americans, is the model of choice. (Individual, Laramie, WY - #A10590.10152)

THAT MEETS PAGE LIMITATIONS

The environmental document should be held to less than 150 pages as specified under Section 1502.7 Page Limits of NEPA. Including volumes of data in the text is confusing to public and makes the document unapproachable to the public. The volumes of data should be taken out of the EIS and put into separate Appendices. The EIS document should be condensed to measurable and quantitative discussions with reference to Appendices as required. The decision-making should be based on the key issues and the key measurable and quantitative impacts associated with those issues. (Organization, Helena, MT - #A13226.20203)

63. Public Concern: The Forest Service should employ the programmatic approach to EISs consistently.

The Forest Service is a multiple use agency; to not allow multiple uses on National Forest System (NFS) land should be carefully analyzed and specifically identified. If a programmatic approach and EIS works in this case, why wasn't a programmatic EIS of oil and gas leasing and potential oil and gas

development wells on NFS land used? This inconsistency in NEPA [policy] must be fully explained in the roadless EIS if we continue down this path. (Individual, Missoula, MT - #A30049.20203)

64. Public Concern: The Forest Service should consider that the Finding of No Significant Impact document, which allowed the roadless initiative to proceed, violated legal requirements for land withdrawals over 5,000 acres.

NATIONAL ENVIRONMENTAL POLICY ACT AND FEDERAL LAND POLICY AND MANAGEMENT ACT REQUIREMENTS

The Roadless Initiative was flawed since its inception. The Finding of no Significant Impact (FONSI), which allowed the Initiative to proceed violated NEPA and FLPMA requirements for land withdrawals over 5,000 acres. (Individual, Cortez, CO - #A9094.45310)

Roadless Area Conservation Rule EIS

65. Public Concern: The Forest Service should address inadequacies in the Roadless Area Conservation Rule Draft EIS.

IT FAILED TO SUBSTANTIATE STATEMENTS

In several areas of the draft EIS, the desire to return the forests to a “pre-European settlement conditions” is described. What are pre-European settlement conditions? How will the conditions be verified?

In the draft EIS, you refer to the “strong public sentiment for protecting roadless areas and the clean water, biological diversity, wildlife habitat, forest health, dispersed recreational opportunities and other public benefits they provide.” How many people does this “strong public sentiment” actually represent? (Organization, Albuquerque, NM - #A8813.10135)

IT WAS NOT SUFFICIENTLY SITE-SPECIFIC AND DID NOT CONSIDER A SUFFICIENT RANGE OF ALTERNATIVES

The Ninth Circuit federal court of appeals has held that a prior attempt at “national evaluation of roadless areas categorization was insufficiently site-specific and did not consider a sufficient range of alternatives.” Id. at 35919, citing *California v. Block*, 690 F.2d 753 (9th Cir. 1982). The Federal Register notice of July 10, 2001, for the solicitation of comments for review of the Roadless Rule, further explains the folly of the national guidance approach:

Similarly, with respect to January 12, 2001, rule, it is difficult, and perhaps infeasible to collect in a short timeframe, on a national scale, the local data needed to produce a sufficient EIS that analyzes all relevant information or that proposes an adequate range of alternatives. Moreover, within an extended timeframe, collecting and analyzing the information may unnecessarily duplicate the forest planning process.

66 Fed. Reg. 35919. COHVCO suggests that the Department of Agriculture and Forest Service heed their own advice and abrogate, in its entirety, the Roadless Rule, as a misbegotten and illegal attempt to usurp the legislative function from the Congress and a fruitless endeavor to overlay a broad national policy on a functional and working local forest planning process. (Organization, Denver, CO - #A29624.10139)

The DEIS does not abide by the National Environmental Policy Act (NEPA). The DEIS did not explore and objectively evaluate all reasonable alternatives to the proposed action. The DEIS needs to be rewritten to fully evaluate other middle ground alternatives and their economic impacts and compare them to the single alternative being proposed by the USFS. The current DEIS also predetermines the outcome of the final rule. (Business or Association, Juneau, AK - #A23080.10136)

IT FAILED TO ADEQUATELY DISCUSS ENVIRONMENTAL AND ECONOMIC IMPACTS

The DEIS was very verbose in talking anti-road philosophy and in taking a negative viewpoint about roads. But the DEIS is very lacking in not talking about any specific negative or positive environmental or economic impacts that will result in Alternative 2, 3, or 4. The DEIS fails to acknowledge those improvements in road building technology that have been developed. There are no specific economic or environmental impacts on the individual Forests or IRAs.

According to NEPA and 40 CFR 1500-08), an EIS is supposed to lay out the best estimates of specific and cumulative impact of both the detrimental and beneficial impacts of alternatives to allow the public to balance the impacts and make a scientifically based decision. But this DEIS has few specific instances of the impacts listed; many impacts are ignored, and the cause and effect analysis of the linkage of the impacts on the way the Forest Service currently builds roads is very weak.

The DEIS will not allow the public to make an informed decision. There is a saying that applies here: If we can't get the facts right, we will get the decisions wrong. The DEIS has failed to elucidate those facts. (Union, No Address - #A28881.10135)

IT FAILED TO ADDRESS MEANINGFUL INPUT BY AFFECTED CITIZENS AND PARTIES

We strongly encourage the Forest service to solicit and take serious comments made by local citizens, local, county and state government officials and others to all actions taken by the agency affecting the various forest management plans and areas of jurisdiction under their supervision. Local citizens and officials often "know best" how individual actions on Forest Service lands will affect both the local communities as well as the various resources on the land involved. (Business or Association, Novato, CA - #A17652.15111)

The National Environmental Policy Act (NEPA) provides an excellent tool for local citizens and government officials to provide input into a considered decision on determining the need for an extent of additional "roadless" areas. NEPA requires "site-specific" analysis of the specific major federal actions. It requires that "responsible officials prepare an adequate Environmental Impact Statement on such actions on the "Roadless Area Conservation" plan that has been proposed. Meaningful input by affected citizens and parties is a "must" for an adequate EIS was not properly prepared for the rule implemented in January 2001. (Business or Association, Novato, CA - #A17652.20203)

ITS UNDERLYING ANALYSIS WAS INSUFFICIENT

Our review of the Preceding EIS led us to conclude that the underlying analysis upon which these proposed rules were based was insufficient. The minerals and hazards analyses were too superficial for specific commentary. (State Agency, Cheyenne, WY - #A22609.14100)

66. Public Concern: The Forest Service should consider that the final Roadless Area Conservation Rule includes restrictions on lands outside of unroaded portions of inventoried roadless areas.**RESTRICTIONS WERE NOT INCLUDED IN THE ALTERNATIVES**

We appreciate the opportunity to provide our perspective on RAC through the advanced notice of rulemaking. We were especially disappointed that the final RAC rule included restrictions on lands outside of unroaded portions of inventoried roadless areas (IRAs) since those restrictions were not included in the alternatives offered for public comment and offer the greatest concern for continued access to intermingled state lands. This does little to build trust and the "working together" partnerships the USDA Forest Service says it is seeking. (State Agency, Saint Paul, MN - #A30025.45000)

67. Public Concern: The Forest Service should consider that the public was not given the opportunity to comment on vital aspects of the Roadless Area Conservation Rule which were added to the Final EIS, but which were not part of the Draft EIS.

The Forest Service did not give the public opportunity to comment on vital aspects of the Roadless policy that were added into the Final EIS, but not part of the initial analysis done in the Draft EIS. (Business or Association, Washington, DC - #A28689.20203)

When the initial Roadless Area Conservation Rule was announced in January 2001, I couldn't help but feel that the policy developed was a result of a top down approach dictated from Washington without the benefit of input from Americans living in close proximity to the forests managed by the U.S. Forest Service. I base this upon the fact that the FEIS was so radically different from any alternative in the DEIS that it appeared that the DEIS and review was a "smokescreen" to divert attention while the real rule was written. Reopening this rule for additional comment is an important step in remedying this serious oversight by the previous Administration. (Organization, Huntsville, AL - #A13542.10131)

68. Public Concern: The Forest Service should prepare a supplemental Draft EIS.

USDA should prepare and circulate a new or supplemental DEIS. The intent behind the new or supplemental DEIS would be to see that the public is fully informed and that all relevant data and information is contained in the DEIS. Maps and diagrams should be specific, detailed, and clear with respect to applicable boundary lines, including IRAs, proposed new roadless areas, areas affected by the Roadless Initiative, management prescriptions within national forests, permit boundaries within national forests. (Permit Holder, Mammoth Lakes, CA - #A21901.14000)

THAT QUANTIFIES MILES OF EXISTING ROADS IN INVENTORIED ROADLESS AREAS

If the agency relies upon the environmental analysis done in connection with the final rule issued January 12, 2001, [Footnote 17: 66 Fed. Reg. 3243] it must:

1) Prepare a supplement to the Final Environmental Impact Statement (EIS) which quantifies the miles of roads existing in Inventoried Roadless Areas in order to know the potential for road loss in the event that any or all of these roads require, but are denied, road reconstruction. (Organization, Chesapeake, VA - #A11804.10130)

THAT PROVIDES MAPS OF ROADLESS AREAS

Prepare a supplement to the Final EIS, which provides maps of roadless areas that indicate locations of all classified and unclassified roads lying within these roadless areas. (Organization, Chesapeake, VA - #A11804.10135)

69. Public Concern: The Forest Service should consider that data from the past 30 years of Environmental impact statements is sufficient to analyze the effects of the Roadless Area Conservation Rule.

It states that "it is difficult, and perhaps infeasible to collect in a short timeframe, on a national scale, the local data needed to produce a sufficient EIS that analyzes all relevant information or that proposes an adequate range of alternatives." The administration has 30 yrs. of data regarding EIS implications all over the country and a great deal of experience that shows that diminishing roadless areas diminishes our forests. It overtly attempts to nullify the EIS by making this statement and again opens the door to special interests. (Individual, Brookport, IL - #A17229.10152)

70. Public Concern: The Forest Service should adopt Alternative 3D.

BECAUSE IT REPRESENTS THE BEST CHARACTERIZATION OF ROADLESS AREA VALUES AND MANAGEMENT PLANNING

I supported the roadless area conservation proposal and feel that the Prohibition Alternative 3, including stewardship logging and fuel removal and Procedural Alternative D most closely fit my idea of what

roadless areas should be and what the procedure should be for planning at the forest level. Although not as high a concern from the horse use point of view, but because of hunting, fishing and wilderness values, I supported Alternative T3 for the Tongass National Forest. (Individual, Wauconda, WA - #A5442.10150)

71. Public Concern: The Forest Service should adopt Alternative 4D.

I support strengthened versions of alternatives 4 (including the Tongass National Forest) and D to prohibit all destructive activities in all roadless areas larger than 1,000 acres. (Individual, Portland, OR - #A17383.45320)

72. Public Concern: The Forest Service should adopt Alternative T4.

I believe if you would review a summary of the combined effects not addressed in the EIS for alternative T4 you would conclude it is the least impacting and again could still be reversible in the long term. (Individual, North Little Rock, AR - #A814.10161)

WHICH EMPHASIZES FRAGILE ECOSYSTEM PROTECTION OVER LOCALLY CONTROLLED DEVELOPMENT

I take exception, however, to your preferred alternative regarding the Tongass National Forest alternative. I would request that you adopt alternative T4 which emphasizes fragile ecosystem protection over local control development. This would provide a form of population control in an environmentally sensitive area. I also feel that local control will promote oil development regardless of the other elements of the equation. (Individual, North Little Rock, AR - #A814.45623)

Interim Direction

This section includes two subsections: Interim Direction General and The Interim Directive.

Interim Direction General

Summary

Some respondents suggest that the Forest Service establish interim direction for roadless area management for various reasons. One reason given is the length of time between Forest Plan Revision, 4-6 years and the uncertainty of the Roadless Rule status. These respondents believe there should be guidance during this time period or no work will be done on the ground. There are other individuals who ask that direction goes further than the ten questions in the ANPR and list items such as; all lands originally identified as roadless should be given full interim protection plus progress should be made on identifying new areas.

Some say interim direction should be established for national forests which are revising or have recently revised their forest plans; and some that it should be established to protect areas that cannot be actively managed during the current planning cycle or for smaller areas in forests through project-by-project analysis. Others assert that it should be established in collaboration with other agencies and affected users. Some specifically suggest that it should be established for mining.

On a similar note, respondents also suggest establishing a temporary moratorium on activities in roadless areas—for at least 50 years; for development projects that are inconsistent with the Rule; until litigation has been resolved; until the entire maintenance and reconstruction backlog is eliminated; until a new management policy is developed; or until the Agency determines what type of forestry should be practiced.

Finally, some respondents urge the Forest Service to clarify that the Rule is not now in effect and that roadless areas will continue to be managed according to already existing procedures and classifications.

73. Public Concern: The Forest Service should establish interim direction for roadless area management.

Unfortunately, forest management planning can often take 4-6 years to complete. While this time frame can be managed in some circumstances, the specter of the Roadless Area Rule (as of January 12, 2001) makes this completely unworkable. The Forest Service must decide and clearly articulate what is expected during the interim period between the flawed Roadless Area Proposal and the amended rule. The most logical outcome is that the status quo is preserved until the new rulemaking can be completed. Areas that were previously designated as inventoried roadless areas that allow road construction and reconstruction, should continue to be managed in that fashion. The Forest Service has no basis on which to pretend that the enjoined rule has been implemented. There areas should continue to be managed in the same fashion as they were prior to the January 12, 2001 rule—local decisions made on a case-by-case basis. (Business, Wright, KY - #A23085.12460)

Should the Forest Service still deem it necessary to reopen discussion of the Roadless Rule, the following issues and concerns should be addressed along with the 10 questions in the ANPR.

All the lands originally identified should be given full interim protection and the process for identifying additional areas should be implemented, until the process is complete. (Business, Spokane, WA - #A22047.12400)

TO ADDRESS ROADLESS AREA MANAGEMENT FOR NATIONAL FORESTS WHICH ARE REVISING OR HAVE RECENTLY REVISED THEIR FOREST PLANS UNDER THE 1982 PLANNING REGULATIONS

Some Forests such as the five Southern Appalachian Forests are continuing the revision of their plans under the 1982 planning regulations. These currently have no direction regarding delineation of unroaded areas or the development of appropriate management direction for them in the planning process now underway. We urge you to provide interim direction to address this situation. (Civic Group, Roanoke, VA - #A1713.45000)

The Forest Service is currently moving forward with timber sales and oil and gas leases in roadless areas. There is a long list of pending timber sales and oil and gas leases for roadless areas in Colorado and Wyoming that will likely proceed if the Roadless Rule is not implemented—a stark illustration of the need for a national rule and the inadequacy of depending on forest-by-forest planning to protect roadless areas. Furthermore, we note that, in the interim while the fate of the Roadless Rule is being decided, the three Colorado forests with recently revised plans (i.e., Routt, Rio Grande and Arapaho-Roosevelt NFs) are not even covered by Forest Service Chief Dale Bosworth's August 22nd directive to regional forest managers that would, at the very least, afford protection for roadless areas during this 60-day comment period. (Organization, Denver, CO - #A21367.12440)

TO PROTECT AREAS THAT CANNOT BE ACTIVELY MANAGED DURING THE CURRENT PLANNING CYCLE

Recognize that there are areas for fiscal or other reasons, cannot be actively managed during the current planning cycle, protect them and leave their management to future planning. (Individual, Fairfield Glade, TN - #A325.25230)

FOR SMALLER AREAS IN FORESTS THROUGH PROJECT-BY-PROJECT ANALYSIS

We should . . . give interim protection to the smaller acreages in forests through project by project analysis as a transition to the forest planning process. (Individual, Bozeman, MT - #A31208.12450)

IN COLLABORATION WITH OTHER AGENCIES AND AFFECTED USERS

Interim protections for roadless areas could be put in place while local forestland and resource management plans are updated or amended. Such amendments should be the product of comprehensive collaborative planning with local and state agencies and other affected resource users. Assessments of roadless areas could be part of collaborative wilderness reviews that are conducted in association with the plan amendments. In some cases, better management and maintenance of existing roads, off-highway vehicle management and other measures could protect important values without a wilderness designation. (State Agency, Carson City, NV - #A17669.12400)

74. Public Concern: The Forest Service should establish interim direction for mining.

IN GUNNISON COUNTY

Discussion of these areas in the Forest Management Planning process is certainly appropriate. Unfortunately, this planning process can take four to six years. In many instances this time frame may be satisfactory, but in the case of the coal mines in Gunnison County the enjoined rule is already impacting the daily operations of the coal mines. There also needs to be a more immediate solution to this problem between now and the time the revised forest management plan is completed. (Elected Official, Gunnison County, CO - #A22061.12400)

75. Public Concern: The Forest Service should establish a temporary moratorium on activities in roadless areas.

I also urge the agency to immediately halt all development projects in roadless areas that are inconsistent with the rule. Despite President Bush's pledge to uphold the roadless policy, the Administration

mustered no defense of the plan when it was recently challenged in court. To make matters worse, the Forest Service is moving forward with destructive logging projects in some of the nation's most pristine forests, including Alaska, Oregon, California, and Idaho. For example, logging projects on the Six Rivers National Forest in northern California and on the Tongass National Forest in Alaska threaten roadless areas, imperiled fish and wildlife, and scenic and recreational values. It is fair to ask then, why as the Service asks for more input and as the President expresses his commitment to conserving wild forests—the agency is preparing and implementing logging projects in roadless areas? (Individual, Napa, CA - #A1037.12440)

FOR AT LEAST 50 YEARS

It is my professional opinion based upon my career as a logging engineer/forester with the USFS in Alaska, Montana and Idaho that the remaining biologically productive unaltered areas throughout the National Forest System, especially the Tongass should have a development moratorium of at least fifty years, the Roadless Rule of January 2001 best accomplishes this. (Individual, Sitka, AK - #A1056.12440)

FOR DEVELOPMENT PROJECTS THAT ARE INCONSISTENT WITH THE ROADLESS AREA CONSERVATION RULE

I write to support the Forest Service Roadless Area Conservation Rule and to respond to your intentions to amend this balanced approach to forest conservation. I urge the agency to immediately halt all development projects in roadless areas that are inconsistent with the rule. (Individual, Buckley, WA - #A5962.10150)

WHILE THE MATTER IS BEING LITIGATED

We believe this ANPR is a waste of time and taxpayers' precious resources. The health of our national forests and the will of the American populace would be better served if the FS recommends the following with respect to the IRAS:

Declare a complete and strict moratorium on further road building and material extraction like logging, grazing and mining, while this matter is being fought in our judicial system. While these very words are being written, new roads are being laid on the IRAS, and mature old growth trees are being felled in Alaska, California, Oregon and Utah. The protection and management of "Roadless values" cannot happen in this scenario. (Organization, Seattle, WA - #A11782.12440)

UNTIL THE ENTIRE MAINTENANCE AND RECONSTRUCTION BACKLOG IS ELIMINATED

Other Concerns. On December 17, 1999, I commented by e-mail on National Forest System Roadless Areas. I suggested that the Forest Service establish a temporary moratorium (rather than complete prohibition) on activities within the current roadless areas until such time that the Forest Service completely eliminates its entire maintenance and reconstruction backlog. In essence, this would result in a total rehabilitation of all degraded lands including erosion control, weed control and reforestation. It would put pressure on the Forest Service and Congress to provide funds to accomplish this enormous job. Then, and only then, would the Forest Service be permitted to make carefully planned entries through the Forest Planning process into the present roadless areas.

I still think this is a reasonable approach and will again offer it as a suggestion to improve environmental conditions on all National Forest lands. (Individual, Salmon, ID - #A8830.12400)

UNTIL A NEW MANAGEMENT POLICY IS DEVELOPED

I would like the Forest Service to immediately call for a moratorium on all commercial exploitation and development of roadless areas in our National Forests. This moratorium should be in place until we can develop a new policy on what constitutes responsible forestry. If I could have my wish, I would have that moratorium applied to all National Forest lands! (Individual, Washington, DC - #A27348.12440)

UNTIL THE AGENCY DETERMINES WHAT TYPE OF FORESTRY SHOULD BE PRACTICED

The Roadless Initiative presents us with a unique opportunity to address the central question at the heart of all the disputes that have mired the Forest Service in the past: What type of forestry should we practice? This question can initially be posed in the context of the roadless areas, but can and should be expanded to the entire National Forest system. Until we do that, we should act according to the

precautionary principle and institute an immediate moratorium. (Individual, Washington, DC - #A27348.12440)

76. Public Concern: The Forest Service should clarify that the Roadless Area Conservation Rule is not in effect and that the lands will be managed according to already existing procedures and classifications.

Clarify that during this new rulemaking period that the enjoined Roadless Area Rule (January 12, 2001) is not in effect and that the lands will be managed according to procedures and classifications in effect prior to that time. (Business, Wright, WY - #A23085.45500)

The Interim Directive

Summary

According to some respondents, the Forest Service should make the Interim Directive effective until forest plans are revised; some say it should be strengthened to prevent any further loss of the roadless area base. One group asserts that it would essentially return land management to its prior state by leaving the fate of roadless areas to the forest planning process. On the other hand, one business states that it is essentially an implementation of the Roadless Area Conservation Rule, and thus violates the district court ruling.

77. Public Concern: The Forest Service should make the Interim Directive permanent.

UNTIL FOREST PLANS ARE REVISED

We urge you to make permanent the interim directive dated June 6, 2001. This directive clarifies the scope of local authority to make decisions in inventoried roadless areas until Forest plans are revised. (Civic Group, Roanoke, VA - #A1713.12400)

78. Public Concern: The Forest Service should strengthen existing interim protection of roadless areas.

TO PREVENT ANY FURTHER LOSS OF THE ROADLESS AREA BASE

Our National Forest Roadless Resource is a precious one that continues to grow smaller as development activities disqualify areas from the roadless inventory. Only under the most exceptional circumstances should development activities be allowed in our roadless areas and only under the authority of the Chief. The interim protections now in place are insufficient and full of exceptions. They should be strengthened. As the U.S.F.S. takes more time to come to grips with the roadless issue, it is imperative that the finite roadless base be undiminished. This should include all National Forests including the Tongass and regardless of the status of management plans, revisions or supplements. (Organization, Cave Junction, OR - #A17235.12450)

BY ADOPTING THE ROADLESS AREA CONSERVATION RULE UNTIL FEDERAL OFFICERS ARE CONVINCED OF ITS NEED

Please push for the adoption of the Roadless Rule! At least for some interim period until federal officers are convinced of absolute need! (Individual, Meeker, CO - #A6184.12400)

79. Public Concern: The Forest Service should consider that the Interim Directive would return land management to its prior state.

BY LEAVING THE FATE OF ROADLESS AREAS TO THE FOREST PLANNING PROCESS

We are troubled by the Interim Directive on the Roadless Rule, which essentially returns us to the situation that existed prior to the creation of the Roadless Rule, that is, with the fate of roadless areas being left to the forest planning process. (Organization, Washington, DC - #A18031.12400)

80. Public Concern: The Forest Service should recognize that the interim direction outlined in the June 7, 2001, memo to staff is an implementation of the Roadless Area Conservation Rule.

WHICH IS A VIOLATION OF THE DISTRICT COURT RULING

I have recently reviewed a copy of your letter of June 7, 2001 to the Regional Foresters, Station directors, Area Directors, and WO Staff. This letter, in effect stops all planned actions within existing Inventoried Roadless Areas by reserving to yourself the decision authority for timber harvest and road construction.

I, and my clients, are interested in your response to the following comments . . . :

Although you could argue that your action does not, in effect, stop activities within inventoried areas, it is clear to us that in the real world of Forest Service operations this action has the same effect as the Roadless Area Conservation Rule of May 12, 2001. Why shouldn't we consider this an implementation action of the above Rule which is a violation of the District Court Ruling? (Business, Colville, WA - #A2593.12400)

Other Policy Concerns

This section includes two subsections: Other Policy Concerns General and Other Policy Concerns – Specific Policies.

Other Policy Concerns General

Summary

Foremost among general policy comments is the comment that the Forest Service should evaluate the cumulative effects of multiple management proposals and policies. Suggested proposals and policies to evaluate include the Roadless Area Conservation Rule, the Planning Regulations, and the Roads Policy; and other withdrawals of National Forest System lands; multiple use mandates, and the fire plan, etc. Likewise, respondents ask the Forest Service to address related policies and regulations concurrently, in order to understand the cumulative impacts of these proposals. They believe a piecemeal approach will create additional confusion and will never get to the heart of the issues associated with the Roadless Actions. One individual requests that the Forest Service withdraw the Roadless Initiative, the revised Transportation Plan and the revised Forest Planning Rules and work towards a “fair use plan”. In particular, people wonder how the roadless rule and the topic of unroaded areas will be integrated into the Planning Regulations and the Forest Service Manual and Handbook.

81. Public Concern: The Forest Service should evaluate the cumulative effects of multiple management proposals.

THE ROADLESS AREA CONSERVATION RULE, THE PLANNING REGULATIONS, AND THE ROADS POLICY

The Forest Service must address the cumulative impact of three related, yet uncoordinated rulemakings, regarding Planning, Inventoried Roadless Area Management, and the Forest Transportation System. (Individual, Des Moines, IA - #A12587.16100)

THE ROADLESS AREA CONSERVATION RULE AND OTHER WITHDRAWALS OF NATIONAL FOREST SYSTEM LANDS

The DEIS fails to adequately consider cumulative impacts. The CEQ regulations specify that direct, indirect and cumulative impacts, both adverse and beneficial, must be considered in a NEPA analysis. The USFS has not considered the cumulative impacts of the various USFS pending environmental initiatives. There is no recognition at all of the cumulative impact of the proposed Roadless Areas program with other withdrawals of National Forest Lands including those for wilderness areas, wild and scenic river areas, Forest Service natural areas, and others. (Business or Association, Juneau, AK - #A23080.10141)

THE ROADLESS AREA CONSERVATION RULE, MULTIPLE USE MANDATES, AND THE FIRE PLAN, ETC.

Over-arching policies such as multiple use, the fire plan, etc. must be clearly described and their interrelationships and mandates impacting the roadless proposal must be clearly stated. This will permit an evaluation by interested parties as to the strength of the justifications used to rationalize local and regional decisions with national policies. (Business or Association, Sacramento, CA - #A15787.16000)

82. Public Concern: The Forest Service should concurrently address related policies and regulations.

THE ROADLESS AREA CONSERVATION RULE, PLANNING REGULATIONS, AND ROAD MANAGEMENT POLICIES

The United States Forest Service (USFS) has issued three Interim Directives related to National Forest management and the transportation system. The USFS has now requested comments regarding those interim directives (*see* Volume 66, Number 163, pp. 44111-44114; and Volume 66, Number 165, pp. 44590-44591). The first two interim directives related to “approval of activities in roadless areas—one to Forest Service Manual (FSM) 2400 Chapter Zero Code, which covers timber harvest decisions, and another to FSM Chapter 7710, which governs decisions on road construction and reconstruction in roadless areas [the Transportation Policy].” 66 F.R. 163, 44112. The third interim directive relates to the Road Management Rule and portions of the Forest Service Manual associated with forest-scale roads analyses. *See* 66 F.R. 165, 44590. The interim directives and the ten questions . . . are interrelated and interdependent. For those reasons, the State of Wyoming believes that all of these matters and issues should be addressed concurrently using one comprehensive process that will allow the States and the impacted parties to fully assess the cumulative impact of the Roadless initiative, Planning Regulations, Transportation Policy, and Road Management Rule. A piecemeal approach will only create additional confusion and will never get to the heart of the issues associated with the Roadless Actions. (State Agency, Cheyenne, WY - #A22608.10120)

83. Public Concern: The Forest Service should withdraw the Roadless Area Conservation Rule, the revised Roads Policy, and the revised Planning Regulations.

Please withdraw the Roadless Initiative, the revised Transportation Plan and the revised Forest Planning Rules and work with all involved for a fair use plan. (Individual, Buckley, WA - #A6702.10130)

84. Public Concern: The Forest Service should clarify how the topic of unroaded areas will be integrated into the Planning Regulations and the Forest Service Manual and Handbook.

In initial scoping for the roadless conservation rule, a key component of the proposed rule was identification and development of appropriate management direction of unroaded areas smaller than inventoried roadless areas. This component has been dropped from the roadless conservation rule and placed in the planning process. Brief note of unroaded areas was made in the 2000 revision of the planning regulations. However, these regulations are currently being revised further and it is unclear how the topic of unroaded areas will be integrated into these planning regulations and the implementing language in the Forest Service Manual and Handbook. We advocate attention to the delineation of and appropriate management direction for unroaded areas in the revised planning process. (Civic Group, Roanoke, VA - #A1713.45000)

Other Policy and Project Concerns – Specific Policies

Summary

Some respondents suggest that the Forest Service should review its own manual. According to one, roadless area management is already laid out in the Forest Service Manual, section 7703.1. Another respondent suggests the Forest Service coordinate review of the Roadless Area Conservation Rule with review of the Forest Service Manual 7710 revision because they have complementary direction.

The other specific policy most often mentioned is the Roads Policy. Some simply ask that the Forest Service support the Roads Policy. Several respondents, however, suggest the Forest

Service address the cumulative effects of the Roads Policy in combination with the Roadless Rule. Likewise, one individual suggests the Agency inform the public regarding the impact of the Roads Policy on management of inventoried roadless areas. Others assert that the Forest Service should coordinate the Roads Policy with the Rule, and that roadless area management should be decided only after completion of the Roads analysis. These respondent is would be helpful to have a clear definition of roads and road policies before revisiting the Roadless Inventory issue.

Forest Service Manual

85. Public Concern: The Forest Service should consult the 7703.1 Forest Service Manual for roadless area management direction.

Roadless area management direction is specifically laid out for the FS in Forest Service Manual 7703.1, "Make road construction and reconstruction decisions locally, with public involvement and based on thorough analysis considering the latest scientific information on the adverse effects of roads on ecosystems." (State Agency, Las Cruces, NM - #A18061.20500)

86. Public Concern: The Forest Service should coordinate review of the Roadless Area Conservation Rule with review of the Forest Service Manual 7710 revision.

BECAUSE THEY HAVE COMPLEMENTARY DIRECTION

Your review of the roadless rule should coincide with reexamination of the manual policy governing road management (FSM 7710), which was recently put in place. This policy reversed or seriously constrained the management decisions in many forest plans and their extensive public involvement. The roadless rule and the FSM 7710 revision have complementary direction.

Changing only one of them will result in ambiguous direction. The road policy, which precludes all road construction and most road maintenance in uninventoried roadless areas, irrespective of size or shape, preempts any land management decision in forest plans that would require constructing and maintaining a road system in these areas. The road policy effectively would drive the land management decisions—a perversion not only of NFMA but also of fundamental management principles. (Individual, Lawrenceville, GA - #A6196.16000)

Quincy Library Group

87. Public Concern: The Forest Service should support the Quincy Library Group legislation.

Though the QLG land base classification will sunset with the term of the pilot project, considerable acreage of productive forest lands are not being rehabilitated or reforested. The ultimate resolution to the classification of the various unroaded areas will hopefully be resolved through local participation in the land management revision process. The QLG legislation directs the three forests to commence the appropriate forest revisions within two years of the signing of the Act and I urge your support of that effort. If the national environmental crisis industry desires to dictate the management policies for a particular parcel of land in one of the affected eight counties, then let them come to the community meetings and express their opinions like the rest of us. (Professional Society, Chico, CA - #A29719.16100)

Recreation Agenda

88. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule conforms to the Recreation Agenda.

The roadless rule also conforms to the tenets outlined in the Forest Service's Recreation Agenda, released less than one year ago. The Agenda highlights the need to maintain the integrity of the landscape setting and protect natural character for ecological sustainability and the recreation experience. (Organization, Silver Spring, MD - #A13495.16000)

Roads Policy

89. Public Concern: The Forest Service should support the Roads Policy.

I am writing to express my full support for the three primary actions identified in the proposed road management strategy. This type of management approach will allow the Forest Service to retire the most environmentally damaging roads and at the same time allow the public better access to our national forests with better constructed and maintained roads. (Individual, Mount Shasta, CA - #A8360.10157)

90. Public Concern: The Forest Service should consider the cumulative effects of the Roads Policy in combination with the Roadless Area Conservation Rule.

When combined with the Forest Service transportation policy that limits the amount of roads in the national forests, this rule creates a minimalist road system that cannot adequately respond to changing transportation needs. (Individual, Eagle, ID - #A17754.16110)

When this initiative is combined with the new transportation policy, it creates a permanently shrunken road system at a time when Forest Service data indicates the most popular use on service land is recreational driving (and it's increasing rapidly). (Business or Association, Alturas, CA - #A17770.30200)

91. Public Concern: The Forest Service should inform the public regarding the impact of the Roads Policy on management of inventoried roadless areas.

It is important for the public to be given information by the agency on the impact that conformance with the Roads Policy will have on management decisions made for Inventoried Roadless Areas. (Individual, Moab, UT - #A15790.14120)

92. Public Concern: The Forest Service should coordinate the Roads Policy with the Roadless Area Conservation Rule.

Clearwater National Forest:

North Fork Country

Closure of a few, unnecessary dirt roads could unite the large roadless areas in the North Fork into one whole of over 1,000,000 acres. These areas should be prioritized for obliteration as the roadless policy and the roads policy work together at restoring the destruction that has taken place on our national forests. (Organization, Moscow, ID - #A22654.16110)

It is believed that the proposed Roads Policy will have an impact on the availability of recreation opportunities, but is unclear how the roads and roadless policies will interact. In reevaluating the Roadless Area Conservation Rule the Forest Service must consider the context of other recent initiatives such as the Roads Policy. The Forest Service should present an overview that explains the interaction of the separate regulatory acts. (Individual, Victoria, KS - #A2874.16110)

93. Public Concern: The Forest Service should decide roadless area management only after completion of the Roads Policy.

The primary characteristic that should be evaluated is whether or not roads exist in the so-called roadless areas. It is inconceivable that the roadless area initiative would go forward when the definition and standards for roads, road construction and maintenance are being reviewed. The Road Rules will not even be out for public review until 2002. How can one determine what constitutes a roadless area and propose management of roadless areas when the definition and rules for roads has not been finalized. The first step should be to complete the Road Rules and then revisit the roadless areas to determine whether the definition still fits. (Organization, Murphy, ID - #A18024.45200)

The entire inventoried roadless area should be shelved and reviewed only when the Road Rules have been completed and a determination can be made as to whether the inventoried area even conforms to the definitions to be developed in the Road Rule. . . . The roadless inventory is now more than 20 years old. The USFS is currently in the process of developing new rules for roads including definitions, construction standards and reconstruction standards etc. The process is operating backwards by trying to establish designated roadless areas and determine the management of those areas without first completing the Road Rules. The USFS should complete the Road Rules, consider public input as to road definitions and then re-visit the roadless areas to determine their status with regard to the new definitions. If the roadless areas are finalized with specific dictated management schemes, it will be meaningless for the public to participate in the Road Rules. Alternatively, the Road Rules may change to the point that current roadless areas would no longer qualify but would already be anchored to a roadless management scheme. (Organization, Murphy, ID - #A18024.14421)

Sierra Nevada Framework

94. Public Concern: The Forest Service should support the Sierra Nevada Framework decision.

As elected officials concerned about the Sierra Nevada region from various counties throughout California, we are writing to urge your continued support of the Sierra Nevada Framework Decision. The national forests are an important part of our public lands legacy that should be managed wisely for the benefit of this and future generations.

We believe that the recent Sierra Nevada Framework provides a comprehensive, scientifically sound and balanced approach to addressing the region's priorities. Our constituents, both urban and rural, rely on national forests for a number of benefits including clean water and air, wildlife, plants, recreation, community safety, sustainable timber production, and the region's high quality of life.

Due to past forest management practices, there are thousands of acres in the Sierra Nevada that now have forest conditions that heighten the risk of catastrophic wild fires. We support the Framework's strategic focus on reducing the small trees, brush, and ground fuels that contribute to wild fire risk.

We also support the Framework's protection of tourism and recreation which are the main economic engines of the Sierra Nevada. Over a ten-year frame, the Framework Decision will support more than 137,000 jobs based upon recreation spending. The amount of wages paid in recreation-related employment is estimated at \$2.66 billion (in 1997 dollars).

For the first time, the Framework establishes a comprehensive aquatic and riparian habitat conservation strategy which includes riparian buffer zones and special protection for critical areas near streams, meadows and lakes. We are very interested in maintaining a healthy ecosystem to support wildlife and to help ensure a continuing supply of clean water for the many beneficial uses for the people of California.

We strongly urge you to support the Sierra Nevada Framework as it stands. Revision of this decision could diminish the forests, watersheds and Sierra communities that rely on them. It is time to move away from past conflict and embrace the Forest Service decision as a positive step forward for all Californians. (Elected Official, Placer County, CA - #A12069.16000)

Other

95. Public Concern: The Forest Service should incorporate rulemaking 65 FR 11680m 11682 into future planning efforts.

WITH RESPECT TO THE REQUIREMENT TO CONSULT WITH AFFECTED STATE, TRIBAL, AND LOCAL GOVERNMENTS IN IDENTIFYING TRANSPORTATION NEEDS

The Proposed Rules failed to incorporate the requirement for “consultation with affected State, tribal, and local governments in identifying transportation needs” as set forth in the companion rulemaking (65 FR 11680m 11682). We suggest that in any future planning efforts that this consulting provision be closely followed. (Elected Official, Douglas County, OR - #A11811.15000)

96. Public Concern: The Forest Service should manage the forests with the pre-1994 direction.

The only acceptable choice for your multiple-choice initiative is Alternative A. Do Nothing. Please with draw your environmental takeover rule and get back to managing the Federal Forests and Forestland with the pre 1994 policy. (Individual, Salmon, ID - #A22536.10130)

Appeals and Litigation

This section includes two subsections: Appeals and Litigation General and Appeals and Litigation – Specific Cases.

Appeals and Litigation General

Summary

Respondents assert that endless appeals are interfering with forest management and preventing the implementation of plans which were themselves years in the making. People suggest that time limitations be imposed on the appeals process and that litigants be required to submit to arbitration before their cases can proceed to court. Some suggest that the Forest Service should not make settlement agreements with groups who bring ‘citizen lawsuits’ to curtail activities. One individual suggests employing a land-use clearing house, an ombudsman to sort out the issues before it goes to court.

97. Public Concern: The appeals process should be limited.

District Rangers and Forest Service Supervisors must be empowered to make decisions affecting National Forests. There should be one level of administrative appeal to decisions and no appeal should go higher than the Regional Forester level. Administrative appeals should be addressed promptly to avoid unnecessary delays. Appeals taken to the judicial level should be bonded and the appellant should be required to pay financial damages that result from frivolous appeals. Financial damages should include administrative costs by the federal government and costs incurred by third parties affected by the appeal. (Governor, State of South Dakota, - #A23354.12125)

REGARDING IMPLEMENTATION OF NEW POLICIES AT THE LOCAL LEVEL

The current processes of redress of Forest Service decisions (appeals and litigation) needs a major overhaul or special provisions made for policy related to roadless areas (Q10). I suspect that any policy changes that this process results in that are different from the protections provided by the last administration’s proposal will be vigorously challenged through the legal system. This is acceptable and necessary on a national scale. Endless appeals and litigation of every decision to implement new policy on the local level by extremists on either side of the issue needs to have limits. The gridlock over activities we are experiencing today and the repeated hardships imposed on rural western communities (near to where most of the “roadless areas” are located) by current administrative/legal review processes is not beneficial to the people of this nation. (Individual, Challis, ID - #A28346.10139)

REQUIRE LITIGANTS TO SUBMIT TO ARBITRATION BEFORE THEIR CASES CAN PROCEED TO COURT

I get really frustrated by law suits that are meant to tie up money, land and personal over picky little things.

I think that such suits should go to arbitration first before they end up in court. Let a judge determine if the case merits a trial, leave room for an appeal, then let it go to court if it makes it that far.

Too many special interest groups are abusing the system to get what they want at great cost to public interests. (Individual, Centerfield, UT - #A27645.10139)

RESTRICT LITIGATION TO ENTIRE MANAGEMENT PLANS, NOT INDIVIDUAL SALES OR ASPECTS THEREOF

Lawsuits by environmental groups need to be curtailed or contained somehow. When every sale or 80% of all sales are taken to court, it is an abuse of the power to litigate. I suggest that the management plan for the whole be challengeable, but not each individual sale or aspect. Perhaps have the forest service present a year’s plan as a whole. If they wanted to challenge the proposed sales they would have to show the whole plan to be flawed, not the pieces, and not just flawed possibly, but hard science to show that

the plan would cause significant irreparable harm to the forest. The possibility of harm should not be cause to prevent public use of the resource. (Individual, Boseman, MT - #A59.20000)

98. Public Concern: Time limitations should be imposed on litigation.

Limitation should be placed on the time required to settle a lawsuit, this may require an act of Congress to establish or pay local judges to adjudicate matters on a rapid timetable. Taxpayers should be freed from payment for any lawsuit and the cost associated therefrom should be borne by the parties involved, i.e., if the forest Service is being sued, and they lose the lawsuit, the cost thereof awarded by the judge should come from the Forest Service already approved budget and lawsuits should not be part of an approved budget. (Individual, Kalispell, MT - #A3380.12000)

99. Public Concern: The Forest Service should not allow litigation to sidetrack the legitimate forest planning process as defined by the National Forest Management Act.

The appropriate role of forest planning in resolving the roadless issue was well defined in settlements of RARE II lawsuits. Unfortunately, attempts to resolve the issue through forest planning as defined by the National Forest Management Act of 1976 have failed due to the appeal process and lawsuits. The forest planning process should be allowed to work as intended by the 1976 act. IWIT has invested considerable effort in the forest planning process only to see forest plans not implemented because of the effort of outside groups. (Business or Association, Moscow, ID - #A5428.20201)

100. Public Concern: The Forest Service should not make settlement agreements with groups who bring 'citizen lawsuits' to curtail activities.

On the Shawnee NF in Southern Illinois, the residents were dependent on recreation and tourism using trails into the Shawnee. Alleging "trail erosion" conservation groups were successful in closing trails into half of the areas used by customers and clients of the local residents. Grapefruit-sized stones were placed on the horse-trails to make sure horses could [not] use them. Even hiking was prohibited. This sort of closure is totally inappropriate. They nearly destroyed the tourist-dependent businesses. In "citizens lawsuits" to close national forests, the FS should not make "settlement agreements" with those groups. They should force the issue into higher courts on the basis of Acts of Congress. Congress never intended for these abuses to take place by closing the national forests to public use. (Organization, Three Rivers, CA - #A28739.90410)

101. Public Concern: The Forest Service should develop a land-use clearinghouse to sort out issues before litigation.

The Departments of Agriculture and Interior should not have to go to court to defend every decision they make. You guys are overworked and the courts are overworked. What this country needs is a land-use clearing house, an ombudsman, someone or something, to sort out the issues before it goes to court. And those decisions should be based on a realistic, non-political point of view that prioritizes, and re-prioritizes, the current needs of the country. (Individual, No Address - #A8879.15160)

102. Public Concern: The Forest Service should not allow Environmental Protection Agency data in court.

AS IT POINTS TO A LACK OF DUE PROCESS

In no way should EPA studies be allowed as data in court, this points to a lack of due process. We need to allow the people of the United States of America the chance to life, liberty and happiness. Please allow the citizens to make these joint decisions by working with the Forest Service and BLM. (Individual, Sandy, UT - #A6747.15110)

Appeals and Litigation – Specific Cases

Summary

A number of respondents discuss appeals and litigation with specific reference to the Roadless Area Conservation Rule. According to some, litigation frequently arises because of polarization of the public regarding cumulative effects and access issues. These respondents conclude that implementation of a national policy would cut down on both litigation and appeals during local decisionmaking.

One individual asserts that any attempt to modify the Rule through settlement of litigation would be illegal. Others suggest that the only reason the Rule is tied up in litigation now is because the Forest Service did not pay sufficient heed to public concerns expressed during the previous comment periods. These people say the Agency should delay any decision on the Rule until judicial review so that the impacts of proposed management can be appropriately analyzed.

Some respondents assert that the Forest Service should meet the stated objectives presented in its review of the Roadless Area Conservation Rule to the U.S. District Court. Additionally, others call on the Forest Service to address specific issues related to the legal challenge to the Rule brought by North Dakota interests.

Roadless Area Conservation Rule

103. Public Concern: The Forest Service should implement the existing Roadless Area Conservation Rule.

TO ELIMINATE PROLONGED AND COSTLY LEGAL BATTLES

The implementation of the existing rule will eliminate prolonged and costly legal battles that have been the history of the “local decision process.” The local decision making process usually results in battles between extractive industries and environmentalists on issues of roads and cumulative impacts. (Individual, Juneau, AK - #A11676.10159)

The Roadless Rule deals with specific issues that the Forest Service determined were inadequately considered and handled in forest-specific planning processes for many years. As written, it takes a targeted, balanced, and fiscally responsible approach to these issues. It addresses only two management categories, logging and roads (and only in areas long since identified and mapped by individual national forests, as corrected during the Rule’s public comment period). These are activities that the Forest Service found had costs—both ecological and economic—and cumulative national-level significance that were not reflected in local planning processes. The essence of the Rule, and its promise to lead your agency into a more responsible and less contentious future, lies in barring most logging and road-building in previously inventoried roadless areas, and in foreclosing reconsideration of that decision at the local level. (Organization, Olympia, WA - #A20145.10111)

104. Public Concern: The Forest Service should recognize that any attempt to modify the Roadless Area Conservation Rule through settlement of litigation would be illegal.

Merely being in litigation on the rule in a Federal Courtroom (far removed from public scrutiny) does not relieve the administration of its duties to the Congress and the public they represent. It is my firm belief that any attempt to modify the rule through settlement of litigation would be illegal under current law and certainly a breach of public trust in their elected officials. (Individual, Broomfield, CO - #A211.10159)

105. Public Concern: The Forest Service should pay greater heed to public comment.

TO AVOID LITIGATION

The material enclosed with this letter is on account of Forest Service Roadless Area Conservation Plan Final EIS volume 3 response, p. 2, #5 - *“The public submitted a large number of suggestions about national forest and grassland management in general, rather than roadless area conservation in specific In most cases, Volume 3 explained that these were outside the scope of the analysis.”* [emphasis mine] This attitude forced states and organizations into litigation. The USFS basically told those Americans, “So what? Sue us!”—and they did. Such attitude gives rise to question the reasons for over 40 firefighters killed over the last two fire seasons.

Nonetheless, as you state on page four of your advance notice of proposed rulemaking, request for comment (36 CFR Parts 219 and 294), “Eight lawsuits, involving seven states in six judicial districts of four federal circuits have been filed against the January 12, 2001, rule.” Had the former Chief and down-line Washington D.C. officials in CEQ and USFS environmental who collaborated together in ignoring comments pertaining to the resultant lawsuits reviewed the comments and questions of the day equally, you would not now be wasting taxpayer dollars pleasing the courts. (Individual, Rock Springs, WY - #A15658.10139)

106. Public Concern: The Forest Service should delay any decision on the Roadless Area Conservation Rule until judicial review.

It would be inefficient, and may not be in the public interest, for the Forest Service to proceed with any rulemaking proposal that tinkers at the margins with the January 2001 roadless area rules, (e.g., by transforming them from permanent rules into rules which govern only until a revised forest plan has been issued) before the legal constraints on nationwide roadless area rules are resolved in the roadless area cases. If the Forest Service initiates rulemaking now, the agency’s NEPA, NFMA, and Regulatory Flexibility Act (RFA) compliance documents would likely assume that the 2001 roadless area rules are in effect under the “no action” alternative, and would compare the incremental impacts of the new proposal to that baseline. If a final court order in the roadless cases later sets aside the roadless area rules, then (at the very least) the NEPA, NFMA, and RFA documents on the proposed revised rules will have used the wrong baseline for calculating the incremental impacts of the proposal. New documents would have to be prepared that analyze impacts from a “no action” baseline that consists of the protection of, and uses allowed in, individual unroaded areas under the governing forest plans. The agency’s time and money in preparing the draft documents will have been wasted. The public comments on draft NEPA and RFA documents will have been for naught, and the public would be asked to comment on revised documents. (Business or Association, Terra Bella, CA - #A15588.10139)

SO THAT THE IMPACTS OF PROPOSED MANAGEMENT CAN BE ANALYZED AGAINST THE APPROPRIATE BASELINE

The Forest Service should defer further Roadless Rulemaking until the Roadless Area Cases resolve the legal constraints on national roadless rules. . . . If the Forest Service initiates rulemaking now, the agency’s NEPA, NFMA, and Regulatory Flexibility Act (“RFA”) compliance documents would likely assume that the 2001 roadless area rules are in effect under the “no action” alternative, and would compare the incremental impacts of the new proposal to that baseline. If a final court order in the roadless cases later sets aside the roadless area rules, then (at the very least) the NEPA, NFMA and RFA documents on the proposed revised rules will have used the wrong baseline for calculating the incremental impacts of the proposal. New documents would have to be prepared that analyze impacts from a “no action” baseline that consists of the protection of, and uses allowed in, individual unroaded areas under the governing forest plans. The agency’s time and money in preparing the draft documents will have been wasted. The public comments on draft NEPA and RFA documents will have been for naught, and the public would be asked to comment on revised documents.

Further, a finding that the 2001 roadless area rules are invalid could change the type of roadless area proposal that this Administration chooses to advocate and adopt. If the Administration’s roadless area initiative is compared against the baseline of the roadless area uses allowed under the controlling forest

plans (rather than the baseline level of protection under the invalid January 2001 roadless area rules), the Forest Service may have more room to adopt measures that include greater preservation of roadless areas than the forest plans provide for: but which allow for more forest health protection and developmental uses than under the January 2001 roadless area rules. The Forest Service and this Administration would be exposed to greater public criticism: (1) if it starts with one roadless regulatory proposal, then shifts course after the roadless area rules have been invalidated in court; and (2) requests public comment several times on different rulemaking proposals, and NEPA, NFMA, and RFA compliance documents. Thus, the public interests in efficient government, in not wasting the public's time in commenting on likely-unlawful proposals, and in legal certainty all favor obtaining judicial resolution of the roadless cases before the Forest Service proceeds too far on another roadless rulemaking proposal. (Business or Association, Rockville, MD - #A13306.20200)

107. Public Concern: The Forest Service should meet stated objectives presented in its review of the Roadless Area Conservation Rule to the U.S. District Court.

Forest Service Position in *Kootenai Tribe of Idaho v. Veneman*] (Consolidated)

The Forest Service identified the following objectives in its review of the roadless regulation to the Idaho U.S. District Court and in the ANPR: (1) protect roadless area values and characteristics; (2) remedy procedural concerns, including but not limited to (a) lack of site-specific identification of the areas; (b) exclusion of actual roaded areas; (c) assure that any amendment responds to local information and conforms to NEPA and NFMA; and (3) protect communities, homes, and property under a good neighbor policy. Declaration of Dale N. Bosworth, May 3, 2001. The Forest Service also represented to the federal court that it has adopted a more formal policy to implement the above objectives, including protecting access to property. 66 Fed. Reg. at 35919. To date that has not occurred in North Dakota. (Organization, Denver, CO - #A21358.10131)

108. Public Concern: The Forest Service should address issues related to the legal challenge brought by North Dakota interests.

The National Grasslands were acquired for specific purposes, which are established in the complaints in condemnation. The United States chose to specify the public purposes and they were incorporated and adopted in the judgment of condemnation. Thus, the United States is still subject to the terms and conditions. These have been fully described and discussed in the HAND [Heritage Alliance of North Dakota] comments and the chapter on roads.

Furthermore, the county royalty rights and state lands further limit the Forest Service ability to restrict land uses. The lands should remain in agriculture use, available for mineral development and recreation. Even the artificial constraints like prohibiting hunters from cross-country access to retrieve their big game are unwarranted and should be repealed. (Elected Official, McKenzie County, ND - #A27737.90100)

STATE-GRANTED PUBLIC RIGHTS-OF-WAY ALONG SECTION LINES

The roadless rule does not take into account North Dakota laws that allow for public right-of-way along section lines throughout the National Grasslands. North Dakota's previous Attorney General issued an opinion which supported this local right-of-way access, and our current Attorney General has just announced that the state of North Dakota will join the legal challenge to this roadless rule submitted by North Dakota interests earlier this year. (United States Representative, North Dakota, - #A23212.20400)

The access and private property rights issue has been controversial in North Dakota for some time. Several counties have filed lawsuits, as has the State of North Dakota. The North Dakota suit claims the roadless areas and road-building ban are contrary to a law created by the Dakota Territorial Legislature in 1871. The law designated all section lines in the state as public highways, regardless of whether a road actually existed. The state suit claims any Forest Service proposal that would deprive the state of its right to develop section lines would be illegal. (Business or Association, Bismarck, ND - #A30187.20400)

DESCRIPTION OF THE ROADLESS ISSUE AS IT APPLIES TO THE NORTH DAKOTA LITIGATION IS INACCURATE

The Forest Service's description of the roadless issue as it applies to the North Dakota litigation is . . . inaccurate. The Forest Service notes that there are 8 lawsuits in six different jurisdictions and all express a common theme of inadequate public comment and review. *Id.* The North Dakota case takes the position that countless comments on the Dakota Prairie Grasslands Draft Plan Revision, the roadless rule and forest road transportation regulations that North Dakota lands managed by the Forest Service are not subject to the same laws and roadless management is both without legal authority and not feasible given the extensive network of roads and rights-of-way which run through each and everyone of the "roadless conservation areas" in North Dakota. The North Dakota situation is also different because the final plan revision converts the proposed wilderness areas to roadless conservation areas, while purporting to make site-specific determinations that these areas have "roadless values" which were actually "wilderness values." The decisions in the forest plan are no more accurate or valid than the roadless regulation now so heavily criticized throughout the country. (Elected Official, McKenzie County, ND - #A27737.10139)

ROADLESS AREAS RECOMMENDED AS WILDERNESS IN THE NORTH DAKOTA DRAFT PLAN REVISION WERE ALSO RECOMMENDED AS ROADLESS AREAS IN THE ROADLESS AREA CONSERVATION RULE

The Idaho litigation specifically took the national roadless regulation process to task for the failure to do a site specific inventory, to provide accurate maps, or to provide sufficient information and time for the affected interests and state and local governmental entities to comment. *See Kootenai Tribe of Idaho v. Glickman*, No. 01-10, Complaint [sections] 71-72; *Kempthorne v. U.S. Forest Service*, Complaint [sections] 163-66. However, additional notice and comment will not address the legal deficiencies of the FEIS in North Dakota where the underlying legal and factual assumptions are wrong.

The roadless conservation areas in North Dakota were first proposed as recommended wilderness areas in the draft plan revision released in July 1999. Northern Great Plains Plan Revision, DEIS, App. C. The comment period for the draft plan revision overlapped with the initiation of the roadless conservation rule and the areas designated in the regulation are identical to those proposed for wilderness in the draft plan revision. (Organization, Denver, CO - #A21358.10130)

THE ROADLESS AREA CONSERVATION RULE FAILED TO RECOGNIZE THE EXTENSIVE ROAD SYSTEM IN AREAS IN NORTH DAKOTA IDENTIFIED AS ROADLESS

One of the major issues regarding proposed wilderness and now roadless conservation areas in North Dakota is the fact that these areas have extensive road systems. This fact is admitted in the 1987 Custer Forest Plan. *See* Appendix C, FEIS. The 1999 draft plan revision, which preceded the roadless rulemaking by a few months, omits any enumeration of roads, although these roads still exist. The 2001 final plan revision and FEIS do not address the specific comments made about each unit, especially the roads found throughout these units. Thus, the record shows a specific failure of the agency to deal with the material information, that these units are not roadless, but in fact are "roaded areas".

The ANPR does not correct this failure because it incorrectly assumes that all of these roadless conservation areas are in fact roadless. Unless and until the Forest Service addresses this issue, no amount of process will undo the harm to North Dakota communities and governmental interests. (Elected Official, McKenzie County, Watford City, ND - #A27737.45514)

Other Cases

109. Public Concern: The Forest Service should disclose its role in the Luppi case.

As an inholder myself I have been trying to get some response to the following article in the New American. Could you, please comment on the Luppi case and the Forest Service's part in it. (Individual, No Address - #A26701.14140)

Other Legal Concerns

This section includes three subsections: Other Legal Concerns General; The U.S. Constitution; and Federal Laws, Acts, and Policies.

Other Legal Concerns General

Summary

Most general comments regarding legal issues revolve around the Forest Service's legal authority to enact regulations such as the Roadless Area Conservation Rule and the legal adequacy of the Rule in general. One organization responds that the USFS has only as much authority to make law as may be delegated to it by Congress under Congress's constitutional authority to make law. This respondent believe that agencies cannot create legitimate regulations in, what they consider, defiance of Congress by calling inherent regulatory components such as definitions 'policy'. Some respondents assert that the Forest Service should not implement the Roadless Area Conservation Rule because it fails to adhere to existing laws, regulations, and policies.

Other respondents urge the Agency to develop a new national roadless rule that is fully compliant with the law and suggest that the fair way to address the concerns raised by interested parties is to urge the Administration to develop a new rule that is fully compliant with the law, including the National Environmental Policy Act and the National Forest Management Act.”

Another individual comments more broadly that legal criteria must be developed which strictly defines what government agencies and private corporations can and cannot do on public land because, this respondent goes on, both the Forest Service and the Bureau of Land Management have shown themselves incapable of protecting the environment. A state agency urges the Forest Service to support the consolidation of existing federal legislation and rules because they believe there are too many statutes and regulations pulling the USDA Forest Service in too many directions. At the same time, one individual says the Forest Service should stop trying to enact legislation through changing rules and regulations in the Federal Register. Finally, one respondent suggests that foresters be required to review their assigned territory annually and make management recommendations to their supervisors for the purpose of reviewing and updating relevant laws, regulations, and policies.

110. Public Concern: The Forest Service should recognize that it has only as much authority to make law as may be delegated to it by Congress.

TO MAINTAIN ITS LEGITIMACY WITH THE PUBLIC

The USFS has only as much authority to make law as may be delegated to it by Congress under Congress's constitutional authority to make law. The agencies cannot create legitimate regulations in defiance of Congress by calling inherent regulatory components such as definitions “policy.”

The matter of legitimacy arises when a government is perceived by those it governs to act outside the bounds of its authority. The reason the Soviet Union lost its hold over its constitutive nations and fell apart was not because the Soviet Union ran out of machine guns, jack booted thugs, barbed wire, dogs, hydrogen bombs, or KGB agents. It was because the Soviet government lost legitimacy in the eyes of its citizens.

The USFS may believe that, no matter how unlawful its rules and no matter how much these rules are hated by those upon whom they are imposed, all USFS needs is a large enough army of armed enforcers to get its way. But the perception of a certain degree of legitimacy is necessary, even in a totalitarian state such as the Soviet Union. To many westerners, USFS must obey the law or suffer the consequences that will inevitably occur as you erode your own legitimacy. (Organization, Tonopah, NV - #A20337.12230)

111. Public Concern: The Forest Service should not implement the Roadless Area Conservation Rule.

BECAUSE IT FAILS TO ADHERE TO EXISTING LAWS, REGULATIONS, AND POLICIES

Our opposition to the Rule is based on our belief that the Rule violates numerous existing national laws, including the National Forest Management Act (NFMA), the National Environmental Policy Act (NEPA), the Alaska National Interest Lands Conservation Act (ANILCA), the Tongass Timber Reform Act (TTRA), the Organic Administration Act (OAA), and the Multiple-use Sustained Yield Act (MUSYA). Alaska would be irreparably harmed by the failure to follow these existing laws and by the arbitrary amendments to the revised Tongass Land Management Plan (TLUMP) that implementation of the Roadless Rule would create. (Elected Official, Petersburg, AK - #A23084.20200)

In my judgment the entire Roadless area Conservation Rule effort should be dropped. The Roadless Area Conservation Rule is illegal because it was conducted without adequate information about the affected areas; it was pre-decisional; it was based on new Planning Regulations (36 CFR 219) that have been withdrawn; it is illegal under the Washington State Wilderness Acts; it amends or revises individual Forest Plans without compliance with the National Forest Management Act; the EIS did not have an adequate array of alternatives; and the analysis ignored substantial concerns raised by the public. (Business or Association, Colville, WA - #A3091.20000)

The January rules violated the National Forest Management Act (NFMA), the Multiple Use Sustained Yield Act (MUSYA), the Acts of Congress designation Wilderness areas in a State and releasing remaining roadless areas for the multiple uses prescribed in forest plans, (Statewide Wilderness Acts), and other laws, as we allege in the lawsuit brought by AF and PA and 16 other plaintiffs, American Forest and Paper Association v. Veneman, No. 01-CV-00871 (D.D.C.) and in our comments on the proposed roadless area regulations. We have attached copies of our July 14, 2000 comments and our Second Amendment Complaint. We incorporate those documents by reference.

In brief, the January 2001 roadless area rules unlawfully attempt to override and ignore the forest plans and the multiple use allocation process mandated by the NFMA and Statewide Wilderness Acts.

In AF and PA v. Veneman, AF and PA's position is that national level rulemaking on roadless areas is unlawful unless the Forest Service conducts the rulemaking in a manner that also complies with the constraints in the NFMA, MUSYA, the Statewide Wilderness Acts, and other laws. We believe that the January 2001 roadless area rules are unlawful and must be set aside. (Business or Association, Terra Bella, CA - #A15588.20200)

112. Public Concern: The Forest Service should develop a new national roadless rule that is fully compliant with the law.

I believe that the only fair way to address the concerns raised by interested parties is to urge the Bush administration to develop a new rule that is fully compliant with the law, including the National Environmental Policy Act and the National Forest Management Act. This may include a determination that some roadless areas be recommended for permanent wilderness designation; some roadless areas be identified for protection of their outstanding roadless characteristics in the National Forest Plan; and some existing roadless areas be allocated to allow roads to be built for management of the resources and to allow public vehicle access. (Individual, McMinnville, OR - #A3714.10130)

113. Public Concern: The Forest Service should comply with existing federal laws, acts, and regulations.**SO STATES, COMMUNITIES, ORGANIZATIONS, AND INDIVIDUALS MAY BENEFIT FROM THE ENTIRE RANGE OF USES**

The Roadless Area Conservation Rule, published January 12, 2001 was challenged by the State of Alaska's Complaint filed in District Court January 31, 2001. At least five other states, tribes and various interested parties have also challenged this rule. The Facts and Claims of the Alaska Complaint enumerates specific violations of the National Forest Management Act (NFMA), National Environmental Policy Act (NEPA), Alaska National Interest Lands Conservation Act (ANILCA), Tongass Timber Reform Act (TTRA), The Organic Administration Act (OAA) and the Multiple-Use Sustained-Yield Act (MUSYA). Alaska has been irreparably harmed by the failure to follow these laws and by the arbitrary and capricious amendments to the revised Tongass and Chugach National Forest Land Management Plans.

The Ketchikan Chamber of Commerce supports Alaska's Complaint and endorses the Forest Service's decision to re-examine the Roadless Area Conservation Rule.

It is imperative that National Forests be managed in accord with the above statutes, so states, communities, organizations and individuals may benefit from the entire range of uses including intensive commodity and recreation use: dispersed and remote backcountry experiences as well as Wilderness Areas designated by Congress. Management plans and action programs must be science-based. (Business, Ketchikan, AK - #A8066.20200)

114. Public Concern: Legal criteria must be developed which strictly defines what government agencies and private corporations can and cannot do on public land.**BECAUSE BOTH THE FOREST SERVICE AND THE BUREAU OF LAND MANAGEMENT HAVE SHOWN THEMSELVES INCAPABLE OF PROTECTING THE ENVIRONMENT**

I live surrounded by heavily-roaded National Forest Service Land, and have seen USFS land that is roadless. The latter surpasses the former in terms of habitat, watershed, and ecosystem quality. Historically the USFS and its companion agencies (BLM, etc.) have shown absolutely no capability to manage for ecosystem health, watershed quality or habitat protection, nor should any reasonable citizen expect those agencies to protect limited resources in the near future. The full letter of the law must be brought to bear in order to define what government agencies and private corporations can and cannot do on public land. (Individual, Missoula, MT - #A21345.13100)

115. Public Concern: The Forest Service should support the consolidation of existing federal legislation and rules.

National Forest planning processes and land management decisions would benefit from a consolidation of existing federal legislation and rules (i.e., there are too many statutes and regulations pulling the USDA Forest Service in too many directions). (State Agency, Saint Paul, MN - #A30025.20000)

116. Public Concern: The Forest Service should stop trying to enact legislation through changing rules and regulations in the Federal Register.

I believe that the Forest Service and other Federal agencies need to stop trying to enact legislation through changing rules and regulations in the Federal Register. The Federal Register was never meant to be a vehicle to bypass Congress and due process of law. If scientific studies show that an area has wilderness value or is too sensitive to have roads then propose it as wilderness and work through Congress for the proper designation. There should not be a separate designation as "Roadless" which amounts to de facto Wilderness. (Individual, Elko, NV - #A30690.20000)

117. Public Concern: The Forest Service should require foresters to review their assigned territory annually and make management recommendations to their supervisors.

FOR THE PURPOSE OF REVIEWING AND UPDATING RELEVANT LAWS, REGULATIONS, AND POLICIES

The forest service has undertaken a project that is long over due. To dig deep into the regulations, laws, policies. They sure need a thorough re-reading for the purpose of updating each set of rules, polices, regulations, and even updated laws that need re-writing. From year to year each forester should be required to review the territory that he or she is assigned to. After this review each should write a thorough report of his findings in his territory. Also make recommendations to his supervisor. Remember this should have in mind that these changes mentioned above will have to be programs through your congressman, so that funds are appropriated for the job. (Individual, Celina, TN - #A11902.13212)

118. Public Concern: The Forest Service should avoid extreme interpretations of environmental laws.

Stop giving Environmentalists the benefit of the doubt.

Work to the short sides of the environmental laws instead of pushing their extreme limits. (Individual, Greeley, CO - #A28995.20000)

The U.S. Constitution

Summary

The constitutional issue most frequently mentioned by respondents is the doctrine of states' sovereignty. Some respondents assert that the Roadless Area Conservation Rule is a violation of states' sovereignty inasmuch as it seeks to control land within state borders. According to one individual, the only land the government should manage for is forts, post offices, and other conceived legitimate needs. According to others, the claim that federally owned lands within a state are illegally occupied, and a violation of that state's sovereignty, is false and believe that these lands are owned in common by all Americans, and should not be managed for the benefit of local residents and landowners.

One association asserts that the Rule seeks to protect spiritual values of the land which are associated with, they believe, religious connotations which they conclude, if the Roadless Rule is implemented would constitute a violation of the establishment clause of the First Amendment. Another respondent urges the Forest Service to comply with the commerce clause of the Constitution by avoiding any policy that would make it easier to remove timber in one state than in another. Others advise compliance with the Second and Tenth Amendments; and according to one respondent, the Forest Service should consider the constitutional impacts of one administration summarily dismissing the previous administration's rulings.

119. Public Concern: The Forest Service should ensure that the Roadless Area Conservation Rule is in line with the U.S. Constitution.

I challenge the authority of the [Executive] Branch of government to make rules and regulations of this nature. I challenge any act of Congress that violates our Constitution. The Roadless Initiative and ESA do indeed violate our Constitution. Marbury vs: Madison says any act, rule, regulation, or law that is repugnant to the Constitution does not have to be obeyed and no court is bound to enforce it. The roadless initiative is repugnant to the Constitution and I will not obey it. The roadless initiative and the ESA has led to the death of four fighters this year. Our acts and initiatives are now killing citizens. Do away with them. (Individual, Seiad Valley, CA - #A5092.20100)

120. Public Concern: The Forest Service should recognize the U.S. Constitution's doctrine of states' sovereignty.

I oppose former President Clinton's 58 million acre Roadless plan. President Clinton exceeded delegated powers defined in Article 2, Section 2 of the U.S. Constitution. There is no power granted which allows the President power to control sovereign State lands beyond those designated by Article 1, Section 8, which limits lands controlled by the United States "not to exceed ten mile square", within the District of Columbia and lands purchased and delegated by State governments voting approval of such land occupation by the federal government.

As such, President Clinton violated the Constitution and his oath of office as sworn to in Article 2, section 2. All such Presidential declarations, by whatever means, are null, void and of no effect.

Given the above violations, Presidential designation of road closure or controls in sovereign State territory contrary to the Constitution and laws of the sovereign States, are unenforceable and must be vacated immediately. (Individual, No Address - #A27381.20100)

The sovereignty of the states in which these areas lie is another casualty of Clinton's orders. Local input and local decisions are completely eliminated by a de facto closing of large tracks of forestland. It is outrageous that in the United States of America we still have to remind elected officials about constitutional principles. Among them (in this instance) the strict limits the Constitution places on the federal government. Even though this land is ostensibly federal lands, it resides within the borders of sovereign states and must give, at a minimum, respect to the local authorities and citizens and allow them a much greater role in the process. (Organization, Brattleboro, VT - #A27756.20100)

Lands within the States, which were not purchased by the Federal Government, belong to the States (Article 1, Sec.8, Clause 17, US Constitution). We believe this and therefore any claim by the Federal Government and Forest Service as its agent, is void, as pertains to the roadless issue. It is reserved to the States themselves. (Individual, Hawthorne, NV - #A736.20100)

121. Public Concern: The Forest Service should review the U.S. Constitution's doctrine of states' rights before considering any actions affecting Revised Statute 2477 roads.

Please note these facts before any further rule making and before any further actions are taken by any federal agency regarding: 'Public Lands', the forest and RS2477 Roads.

The 10th Amendment to the Constitution (Bill of Rights) plainly states: "Those powers not granted to the federal government within the Constitution are reserved to the States and their people respectively." (Individual, No Address - #A783.20100)

122. Public Concern: The Forest Service should recognize that, under the U.S. Constitution, the government may only own land for forts, post offices, and other legitimate needs.

Follow the basic constitution that states the only land the government should have is for forts, post offices, and other legitimate needs. (Individual, Fallon, NV - #A21953.20100)

123. Public Concern: The Forest Service should acknowledge that federal ownership of land is not a violation of the U.S. Constitution's doctrine of states' sovereignty.

There is a belief that the federally owned lands within a state are somehow illegally occupied, and a violation of that state's sovereignty. That is completely false—those lands are owned in common by all Americans, and should not be managed for the financial benefit of a few loggers or ranchers, any more than I should be compelled to allow a logging company to clear cut my backyard, and then pay them for their costs. (Individual, No Address - #A470.12300)

124. Public Concern: The Forest Service should comply with the establishment clause of the First Amendment.

BY AVOIDING MANAGEMENT BASED ON RELIGIOUS VALUES

To our knowledge, the Clinton Administration did not properly review one aspect of the [Roadless] Initiative, its compliance with the Establishment Clause of the First Amendment of the Federal Constitution. We ask that you suspend the Rule providing for the Roadless Initiative until compliance has been sustained as a matter of law. We believe the Roadless Initiative violates the Constitution because it favors a narrow set of religious beliefs. The purpose as stated within the Final Environmental Impact Statement (FEIS) of the Roadless Initiative does not rest on scientific necessity, but rather on value-based concepts regarding humans' relationship to nature, an ideology. Page ES-1 states that the purpose and need for the Roadless Initiative is to "stop activities that pose the greatest risk to the social and ecological values of inventoried Roadless areas." Those activities are human activities. To stop them implies a value judgment being made about human activities. On what justification does such a value judgment rest?

Pages ES-5 and 3-17 of the FEIS clarifies what value the United States Forest Service feels are put at risk and would be protected by a prohibition on road building and timber cutting. Page ES-5 states that road building and timber cutting could "lead to a loss of non-commodity values such as ecological values, solitude, and personal renewal in wild areas."

Page 3-17 Spiritual and aesthetic values towards forests include the belief that NFS lands have intrinsic value, and a right to exist; that current generations have an obligation to pass on healthy wild lands to future generations; that forests are sacred; that forests have spiritual values. This is the language of religion, not science. The FEIS clearly states protecting values as a management objective. Whose spiritual values? The religious beliefs and values of all the citizens protected by the Constitution?

This spiritual value, which is a management objective of the proposed Roadless Initiative, parallels the religious ideology known as Deep Ecology and other religions who worship nature. (Business or Association, Tower, MN - #A17499.20100)

125. Public Concern: The Forest Service should comply with the commerce clause in the U.S. Constitution.

BY AVOIDING ANY POLICY THAT WOULD MAKE IT EASIER TO HARVEST TIMBER IN ONE STATE THAN IN ANOTHER

Lumber is obviously an article of interstate commerce. Consequently, it would seem violative of the commerce clause to permit logging more easily in one state than in another. It does not seem that this issue has been adequately addressed, but it should be violative to allow a lumber company to cut national forest trees more easily in one state than another. In any event, it would certainly not appear the exercise of responsible stewardship to permit that to happen. (Organization, Birmingham, AL - #A21582.20200)

126. Public Concern: The Forest Service should honor the Second Amendment.

Let's keep the second amendment and manage our wildlife and waters for the future. (Individual, Edmore, MI - #A7313.50000)

Please don't let down in the 2nd Amend. Keep the areas for the hunters and fishermen. This country needs to get back to the founding fathers plans for the statement by the people and for the people. Don't become a dictator nation. (Individual, McCook, NE - #A11142.20100)

127. Public Concern: The Forest Service should abide by the Tenth Amendment.

We must adhere to the 10th amendment to the US Constitution. There is no place for the man in the biosphere now should any entity of the United Nations have any say so whatsoever! (Individual, Mount Ida, AR - #A13372.20100)

128. Public Concern: The Forest Service should consider the constitutional impacts of one administration summarily dismissing the previous administration's rulings.

I am writing you concerning the call for 'written comments before September 10th' about the Clinton Administration's ban on logging and road construction, and the Bush Admin's taking issue with this ban. I am very much afraid of what the indiscriminate shredding of one administration's rulings by the next does constitutionally for this country. (Individual, Seattle, WA - #A11712.12111)

Federal Laws, Acts, and Policies

Respondents comment about the legality of the Roadless Area Conservation Rule specifically as it relates to certain federal laws, acts and policies. Following are major topics associated with some of the more frequently cited acts.

Alaska National Interest Land Conservation Act (ANILCA) – Respondents urge the Forest Service to comply with ANILCA by providing reasonable and timely access to inholdings (see also Chapter 6: Protecting Access to Property (Question 5): Legal Considerations); by excluding the Tongass National Forest from the final rule (see also Chapter 5: Designating Areas (Question 8): Inclusion/Exclusion of Specific Areas from a National Roadless Rule: *Exclusion*); and by, in general, foregoing sweeping national level withdrawals such as the Roadless Area Conservation Rule. On the other hand, at least one respondent suggests that ANILCA needs to be revised to allow ownership of private inholdings within roadless areas without the accompanying obligation to allow roaded access to them.

Americans with Disabilities Act (ADA) – ADA comments arise most frequently in connection to access. Some respondents comment that roadless protection will seriously impact the ability of elderly or physically impaired forest visitors to access roadless areas, and claim that, per the ADA, the Forest Service has a legal obligation to maintain roaded access or allow such access to be developed. Others, however, say there is already sufficient access and that the preservation of access for the elderly and handicapped should not be used as an excuse to build roads. (See also Chapter 4: Social Environment and Values: Social Values of Roadless Areas; *Access for Special Populations*.)

Clean Water Act (CWA) – Respondents urge the Forest Service to comply with the CWA by including in management plans roads that cross streams or wetlands, and by obtaining the necessary permits and exemptions for closing forest system roads. One respondent reminds the Forest Service of their legal obligations to follow the law. Some suggest that the CWA and the Endangered species Act should be integrated early in the forest planning process.

Endangered Species Act (ESA) – Comments regarding the ESA are mixed. Some respondents urge the Forest Service to comply with the Act. Others advocate eliminating the ESA in its present form because of its impact on private property rights, because of its perceived role in closing roads, and because of its use in litigation. Some assert that groups are unfairly using the ESA as a weapon against traditional uses of forest lands, and that the Forest Service should support legislation which would prevent litigation over the ESA and reimbursement of legal fees. (See also Chapter 4: Environmental Values: Threatened and Endangered Species.)

Mining Laws – One association lays out the history of multiple laws and regulatory acts which, this association concludes, obligates the Forest Service to maintain roaded access for mineral exploration and development. Generally, respondents urge the Forest Service to comply with the

Mining Law of 1872 and the Mining and Mineral Policy Act to ensure access to mineral deposits in National Forest System lands that they believe would enable this country to remain free of foreign dependence on raw materials. Others suggest such laws should be repealed. (See also Chapter 4: Economic Environment and Values: Economic Effects: *Effects on the Mining, Oil, and Gas Industries*; and Chapter 5: Activities (Question 7): Mining, Oil, and Gas Development.)

Multiple Use and Sustained Yield Act (MUSYA) – Respondents frequently comment that a national roadless rule would effectively eliminate multiple use management of roadless areas. A number of respondents suggest that, under MUSYA, public lands must remain open to such uses as extraction activities and motorized recreation. Others, however, assert that multiple use does not mean that every use must be accommodated in every part of the forest and that protection of roadless areas is fully in keeping with MUSYA. Further, some say, the congressional mandate to provide sustained yield of renewable resources ought to be reevaluated inasmuch that they conclude that forest management has not successfully provided sustained yield. (See also Chapter 4: Environmental Values: Management: *Multiple Use Management, Allow Multiple Use Management, and Do Not Allow/Reconsider Multiple Use Management.*)

Regulatory Flexibility Act (RFA) – Some respondents assert that the Forest Service should comply with the RFA by completing a regulatory flexibility analysis for the Roadless rule that would show no direct or indirect financial impact on small businesses. They believe that only then, after certifying no significant economic impact on a substantial number of small entities, should the Agency go forward with a national policy. Likewise, one respondent points out that each IRFA [Initial Regulatory Flexibility Analysis] contain a description of any significant alternatives to the January 12 Rule which accomplish the stated objectives of applicable statutes and which minimize any significant economic impact of the January 12 Rule on small entities. This respondent believes that the IRFA prepared by the USFS was devoid of any attempt to satisfy this requirement. (See also Chapter 4: Economic Environment and Values: Adequacy of Analysis.)

Revised Statute 2477 (RS 2477) – Some assert that the Forest Service should comply with RS 2477 with respect to road closures. A number of people say that a national roadless rule would result in the closure of many roads whose status as public rights-of-way, they claim, is protected under RS 2477. A typical belief, regarding this issue, is that it is illegal to close many of these roads under RS 2477 and the Roadless Rule seeks to decrease public access to the back country. At the same time, one respondent states that the Forest Service currently has no policy in place to recognize or deal with RS2477 roads, and asks the Agency to clarify its position on this issue, especially as it relates to roadless areas. (See also Chapter 5: Activities (Question 7): Travel Management General: *Roads.*)

Tongass Timber Reform Act (TTRA) – Some respondents urge the Forest Service to comply with the TTRA by excluding the Tongass National Forest from a national roadless rule. According to respondents, by including the Tongass in the final Rule prohibits the Forest Service from complying with the Tongass Timber Reform Act (TTRA) and the Alaska National Interest Lands Conservation Act (ANILCA). These respondents do not see how the Forest Service will be able to supply an adequate volume of timber to meet the needs of Alaska resource dependant businesses and residents.

Other respondents assert that, per multiple legal rulings, the TTRA does not require unconditional timber sale offerings; thus the TTRA cannot be used as a rationale for excluding the Tongass from national roadless protection. (See also Chapter 5: Designating Areas (Question 8): Inclusion/Exclusion of Specific Areas from a National Roadless Rule.)

Wilderness Act – A number of respondents state that the Roadless Area Conservation Rule violates the Wilderness Act. They assert that by imposing special restrictions on roadless areas, the Forest Service is in effect creating de facto wilderness areas without benefit of congressional approval. Others, however, assert that the Rule does not constitute a violation of the Act. Beyond that, many comments regarding the Wilderness Act are made in reference to procedures for wilderness recommendation. (See also Chapter 5: Designating Areas (Question 8): Wilderness Recommendations.)

Administrative Procedures Act

129. Public Concern: The Administration should comply with the Administrative Procedures Act.

This is a ‘desk drawer’ rule in violation of the Administrative Procedures Act. (Individual, Gold Bar, WA - #A28501.20209)

BY PROVIDING ADEQUATE INFORMATION AND TIME TO COMMENT

The Administrative Procedures Act (APA) requires that a Federal agency shall give notice of a proposed rulemaking in the Federal Register, and thereafter provide interested persons an opportunity to participate in that rulemaking by submitting comments. 5 U.S.C.A., Chapter 5 [section] 553. Furthermore, the agency must consider all of the comments received before finalizing the rule, *Id.* The time provided by the Forest Service for public comments was insufficient due to the breadth and complexity of both the proposed rule and the Draft EIS prepared by the agency. Additionally, there were vital aspects of the Roadless policy that were added into the final rule, but not available for public comment in the proposed rule. Both of these deficiencies are a violation of the APA by the Forest Service. (Business or Association, Washington, DC - #A28689.20209)

The time period provided by the Forest Service was inadequate and the agency did not fulfill its requirements under the APA to provide the public with sufficient opportunity to comment. (Business or Association, Washington, DC - #A28689.20209)

BY PROVIDING EFFECTIVE PUBLIC PROCESS IN PROMULGATING RULES

It is also the responsibility of any administration to follow the dictates of Congress in exercising their authorities. In this case, that particularly implicates the Administrative Procedures Act’s requirements for an effective public process in promulgating these rules. (Individual, Broomfield, CO - #A211.20209)

Alaska National Interest Land Conservation Act

130. Public Concern: The Forest Service should comply with the Alaska National Interest Lands Conservation Act.

BY ADEQUATELY ANALYZING IMPACTS OF A NATIONAL ROADLESS RULE ON ALASKA’S NATIONAL FORESTS

The USFS lands in Alaska, representing over 25 % of lands affected by the roadless rule (14.8 million acres), are subject to federal laws unique to Alaska. The Alaska National Interest Lands Conservation Act (ANILCA) of 1980 established regulatory framework for all federal lands in Alaska and laws specific to the conservation system units established by ANILCA. Preservation of access rights are central to ANILCA and must be preserved in administrative or forest plan level decisions. The Roadless

FEIS claims to have addressed the unique characteristics of federal lands and socioeconomic needs in Alaska in the section devoted specifically to the Tongass National Forest, but in fact failed to identify many provisions of ANILCA.

The FEIS, in its analysis of unique characteristics in Alaska, essentially ignored the 5.6 million acre CNF [Chugach National Forest]. The CNF, with an astonishing 98.9% of its land base classified as roadless, is by far the most affected national forest in the nation. The immense impact that the roadless rule, as presently written, will have on the CNF was not analyzed in the FEIS in even the most rudimentary fashion. For instance, national forests in Alaska were not analyzed for fire risk because “of the low fire hazard and fire occurrence associated with their temperate rain forests” (p. 3-409 Roadless Area Conservation FEIS). (Professional Society, Anchorage, AK - #A21707.20207)

BY EXCLUDING THE TONGASS NATIONAL FOREST FROM THE FINAL RULE

Including the Tongass in the final rule prohibits the Forest Service from complying with the Tongass Timber Reform Act (TTRA) and the Alaska National Interest Lands Conservation Act (ANILCA). (Elected Official, Haines, AK - #A18063.20400)

BY FOREGOING SWEEPING NATIONAL LEVEL WITHDRAWALS SUCH AS THE ROADLESS AREA CONSERVATION RULE

With respect to national forests in Alaska, sweeping national level withdrawals such as the Roadless Rule promulgated by the previous administration are contrary to the provisions of subsections 101 (d), 708 and 1326 of the Alaska National Interest Land Conservation Act (ANILCA). (Ketchikan Gateway Borough, AK - #A17476.20201)

All areas of a national forest should be managed in accordance with local land management plans rather than through nationally directed land set-asides. With respect to national forests in Alaska, Section 708 and 1326 of ANILCA prohibit nationally directed agency land set-asides because as found in Section 101(d) of ANILCA, Congress had already set aside enough land in Alaska:

“(d) This act provides sufficient protection of the national interest in the scenic, natural, cultural and environmental values on the public lands in Alaska and at the same time provides adequate opportunity for satisfaction of the economic and social needs of the State of Alaska and its people; accordingly, the designation and disposition of the public lands in Alaska pursuant in this Act are found to present a proper balance between the preservation of national conservation system units and those public lands necessary and appropriate for more intensive use and disposition and thus Congress believes that the need for future legislation designating new conservation units, new national conservation areas or new national recreation areas has been obviated thereby.” (Tribal Corporation, Seattle, WA - #A20468.20207)

BY FOREGOING ANY ATTEMPT TO SET ASIDE LANDS IN ALASKA OUTSIDE THE NATIONAL FOREST MANAGEMENT ACT PLANNING REGULATIONS

With respect to National Forests in Alaska, Section 708 and 1326 of ANILCA prohibit nationally directed agency land set-asides because, as Congress found in Section 101(d) of ANILCA, Congress had already set aside enough lands in Alaska:

“(d) This act provides sufficient protection of the national interest in the scenic, natural, cultural and environmental values of the public lands in Alaska and at the same time provides adequate opportunity for satisfaction of the economic and social needs of the State of Alaska and its people; accordingly, the designation and disposition of the public lands in Alaska pursuant in this Act are found to present a proper balance between the preservation of national conservation system units and those public lands necessary and appropriate for more intensive use and disposition and thus Congress believes that the need for future legislation designating new conservation units, new national conservation areas or new national recreation areas has been obviated thereby.”

The National Forest Management Act (NFMA) was in existence at the time that ANILCA passed and was not explicitly changed thereby. This means that land planning through National Forest System Planning regulations remain in place as the method by which land management should be formulated on the National Forests in Alaska. Efforts by the bureaucracy to set aside lands in Alaska outside these

planning regulations are illegal under Section 708 and Section 1326 of ANILCA. (Business or Association, Ketchikan, AK - #A20443.20200)

ANILCA Section 101(d) specifically prohibits designation of new conservation system units, new national conservation areas, or new national recreation areas on federal lands in Alaska.

ANILCA Section 708(b)(4) specifically prohibits the Department of Agriculture from conducting any statewide roadless area review or study for the purpose of determining their suitability for inclusion in the National Wilderness Preservation system in Alaska.

ANILCA Section 1326(a) specifically prohibits administrative closures of more than 5,000 acres in Alaska unless approved by Congress, which approval has not been granted.

ANILCA Section 1326(b) specifically prohibits study of federal lands in Alaska for the single purpose of consideration for CSU's or other similar designations unless specifically authorized to do so by Congress, which authorization has not been given. (Professional Society, Anchorage, AK - #A20340.20207)

BY NOT RECOMMENDING ANYMORE AREAS FOR WILDERNESS DESIGNATION IN ALASKA

In Alaska, new wilderness designations would be in violation of the "no more" clause of ANILCA. (Organization, Anchorage, AK - #A15542.20207)

BY FOREGOING ANY FURTHER ROADLESS AREA REVIEW AND EVALUATION IN ALASKA

Section 708 of ANILCA, when combined with Section 1326 of ANILCA, can only be read to direct the Forest Service to conduct no further roadless area reviews and evaluations on the Tongass. In Section 708(a)(2) of ANILCA, Congress stated that it had made its own review and examination of the National Forest Roadless Areas in Alaska and "of the environmental impacts associated with alternative allocations of such areas". Congress further found in Section 708(b)(2), that the 1979 roadless area review and evaluation "was an adequate consideration of suitability of such lands for inclusion in the National wilderness Preservation system". In Section 708(b)(4), ANILCA specifically directs that there will be no "further statewide roadless areas review and evaluation of the National Forest System Lands in the State of Alaska for the purpose of determining their suitability for inclusion in the National Wilderness Preservation System". Clearly the "no timber harvest" uses and "no road building" uses to which the roadless rule would subject these lands is de facto wilderness and thus the roadless rule should not apply to National Forests in Alaska. Finally, Section 1326(b) of ANILCA states as follows:

"(b) no further studies of federal lands in the State of Alaska for the single purpose of considering the establishment of a conservation system unit, national recreation area, national conservation area or for related or similar purposes shall be conducted unless authorized by this Act or further act of Congress."

Clearly the proposed Roadless Rule is a review and study of roadless areas on the Tongass and Chugach. To set these areas aside as "roadless areas" is similar to the establishment of a conservation unit, national recreation area or national conservation area. Thus is prohibited by 1326(b) of ANILCA. The State of Alaska's lawsuit against the roadless rule is based in part on this point. (Business or Association, Ketchikan, AK - #A20443.20207)

BY FOREGOING ANY FURTHER ROADLESS REVIEWS ON THE TONGASS NATIONAL FOREST

With respect to the Tongass, Congress had determined in ANILCA that the proper balance between preservation and development has been struck. It is also clear under Sections 708 and 1326 of ANILCA that the Forest Service is not to conduct further roadless reviews on the Tongass for the purpose of managing such areas as wilderness or for similar purposes. (Manager, City of Wrangell, AK - #A17670.20200)

BY NOT CLOSING AREAS OF MORE THAN 5,000 ACRES WITHOUT CONGRESSIONAL APPROVAL

ANILCA Section 1326(a) specifically prohibits administrative closures of more than 5,000 acres in Alaska unless approved by Congress, which approval has not been granted. (Tribal Corporation, Anchorage, AK - #A20340.20207)

BY PROVIDING REASONABLE AND TIMELY ACCESS TO INHOLDINGS

The Forest Service must provide reasonable and timely access to inholdings as required by the Alaska National Interest Lands Conservation Act. If access is limited or if the effects of federal policies preclude owners from effectively managing their lands, land exchange may be necessary. (State Agency, Saint Paul, MN - #A6063.20207)

In Minnesota, we have over forty parcels of state owned land contained within these new roadless areas. The rights of private citizens, states and counties to access their land-as required by the Alaska National Interest Lands Conservation Act-must be provided in a reasonable and timely manner. (Elected Official, State of Minnesota - #A15541.40100)

131. Public Concern: The Alaska National Interest Land Conservation Act should be amended.**TO ALLOW OWNERSHIP IN INVENTORIED ROADLESS AREAS WITHOUT ROADED ACCESS**

Some states, tribes, organizations, and private citizens do own property within inventoried roadless areas. The Alaska National Interest Land Conservation Act should be changed to allow ownership in such areas without roaded access. (Individual, Grangeville, ID - #A830.20207)

132. Public Concern: The Forest Service should not use the Alaska National Interest Land Conservation Act as an excuse to grant access.

USFS needs to stop hiding inappropriately and illegally behind ANILCA in granting access. (Organization, Columbia Falls, MT - #A17951.20207)

*Alaska Native Claims Settlement Act***133. Public Concern: The Forest Service should comply with the Alaska Native Claims Settlement Act.****BY ALLOWING ACCESS TO AMERICAN INDIAN LAND INHOLDINGS**

The proposed policy violates the provisions of the Alaska Native Claims Settlement Act, ANCSA, which guarantees access to native land inholdings. This access problem is readily evident in the Chugach National Forest and the difficulties which Chugach Alaska Natives have had in securing access to their Carbon Mountain land holdings. (Individual, Anchorage, AK - #A11831.20200)

134. Public Concern: The Forest Service should clarify the rights specified to Alaska Native Claims Settlement Act corporations.

The national forests in Alaska are different than other national forests in the U.S. in a number of ways, including the passage of the Alaska Native Claims Settlement Act (ANCSA) of 1971. With the passage of ANCSA, 44 million acres of federal lands were made available in 12 regions of the state. Large tracts within both the Tongass and the Chugach National Forests were made available to satisfy the ANCSA mandate, causing ANCSA corporations to be effectively joined at the hip with the USFS in these regions. Despite the spirit and intent of ANCSA, access to their lands continues to be one of the largest obstacles Alaska Native Corporations face in Alaska. The roadless rule, while providing for "valid and existing rights", does little to clarify those rights specified to ANCSA corporations as provided for in ANILCA. (Professional Society, Anchorage, AK - #A21707.20207)

Americans with Disabilities Act

135. Public Concern: The Forest Service should comply with the Americans with Disabilities Act.

I am a disabled American citizens. I fall under the Americans With Disabilities Act. Legislators have made access for me in my business and public places but you have failed in the area that I need access to the most, the Federally Controlled lands of this nation. When you close access to the roads in our National Forests, you lock me out. I cannot hike or back pack and I want the same access as the more healthy and younger people of this county have. I want to be able to drive to good fishing spots, good camping areas away from the crowds, I want to see nature at its best just as do the hikers and back packers. I want the old roads, trails and 4x4 access road left open for me, the elderly, handicapped, infirm, and the young. Do not close them. (Individual, Seiad Valley, CA - #A5092.20210)

BY PROVIDING ADEQUATE ACCESS

All forms of recreation must be allowed. I believe the roadless policy violates the Americans With Disability's Act. How can old and feeble people enjoy the forests if they don't have motorized access? How can crippled people enjoy their favorite park or stream if they can't drive to it? (Individual, Miami, AZ - #A880.20210)

Making our forests only accessible to hikers is against the disabilities act! The old, frail, young and disabled enjoy access to forests via 4-wheel drive vehicles. Close off these roads and they are being denied access! (Individual, No Address - #A296.20210)

Remember the American's with disability act requires accommodations, and just what is a handicap? My hip limits how far I can walk to 3-4 miles and an ATV would give me access to a greater amount of land. (Individual, No Address - #A917.20210)

I agree that roads should not be built for the sole satisfaction of transportation, but I do not agree that any roads that have already been built should be closed. These roads provide a way for people who enjoy the outdoors to reach those sites and sounds. Why not park and walk in? Well what about our commitment to our disabled persons of this land who can't walk, or can't walk very far. As I recall there is an act in place that provides for these citizens, the Americans with Disabilities Act (ADA). These people need some sort of transportation to get there so they are not discriminated against. (Individual, No Address - #A10448.20210)

I am almost 80 years old and in my later years I have resorted to traveling the mountain jeep trails in my 4 wheel Jimmy. The roads have been there for centuries and seem none the worse for wear. Many are logging and mining roads and without travel will take hundreds of years to cover over (remains of the Santa Fe and Oregon Trails are obvious). Many people like me have dedicated much of their spare time to the mountains and have been good stewards of the land and now we are being eliminated because of our age (which seems to me is a violation of the Disabilities Act). (Individual, Longmont, CO - #A17891.20210)

The Americans With Disabilities Act passed in 1990 has provisions requiring equal access for all Americans. If there are no roads into the National Forests, there is no access. If the existing roads are destroyed, as they have been under the previous administration, existing access into National Forests is reduced. If restrictions on motorized transport into federal lands are levied by bureaucratic fiat, access is reduced. If logging has been systematically shut down in the National Forests, no new roads will be cut, and no new access into those forests for the disabled will be created. The actions that limit the access of all Americans into federal lands also limit disabled access, and are therefore illegal under federal law. (Individual, No Address - #A26180.20210)

TO AVOID THE THREAT OF LITIGATION

I realize that law suits and threat of law suit have forced you to manage the forest by court rather than by what is learned in training. But, if the money is spent for the few that use the wilderness with the exclusion of the old and infirm, maybe a new set of law suits are in order. (Individual, No Address - #A4560.10159)

Clean Air Act

136. Public Concern: The Forest Service should comply with the Clean Air Act.

In some cases, the Forest Service has legal obligations in management decisions (e.g., in those touching the Endangered Species Act, and the Clean Air Act and Water Acts, in addition to relevant local laws and ordinances). (Individual, Bozeman, MT - #A20412.20200)

Clean Water Act

137. Public Concern: The Forest Service should comply with the Clean Water Act.

BY INCLUDING IN MANAGEMENT PLANS ROADS THAT CROSS STREAMS OR WETLANDS

The Clean Water Act (copy of their acknowledgement included) was completely ignored. No permits were even applied for. Roads that cross streams or wetlands have to be included in the management plan. It would be very difficult to consider closing or opening any of the roads remaining without considering that water is involved. If permits are to be issued for new road construction, including the wilderness, or any reason then the laws that apply should be enforced on an even playing field. (Individual, Rock Springs, WY - #A5695.20221)

BY OBTAINING THE NECESSARY PERMITS AND EXEMPTIONS FOR CLOSING FOREST SYSTEM ROADS

Of the road systems closed wholesale in the Bridger Teton, Medicine Bow-Routt, and Wasatch-Cache National Forests over an extended number of years, no record can be found of a national permit, exemption, or state permit filed for or extended from the Corps of Engineers for stream channel work. Hundreds of access ways (thousands nationally) were closed using ground disturbance methods in or near navigable waters simultaneously—especially between June 1996 and October 1999.

According to Jim Furnish (May 14, 2001), the USFS “did not obtain, nor is required to obtain a permit” mainly because the long-term effect is an increase in water quality (never stating exactly by what authority). Region 8 EPA (July 11, 2001) states that “we are not aware of laws that authorize non-compliance with the Clean Water Act”.

This was followed (July 19, 2001) from EPA with, “Section 404(f) of the Clean Water Act addresses exemptions for forest roads and the regulations at 40 CFR 232.3 may be relevant as well. 40 CFR 232.3 (c)(6) in particular, deals with construction and maintenance of forest roads and might be useful. I would also like to point out that Section 404 (r) of the Clean Water Act provides that certain Congressionally authorized projects do not need a permit if certain conditions are met.” The USFS has never expressly stated what authorities they operated under as it concerns Jim Furnish’s statement of May 14, 2001.

Then (August 3, 2001) the Corps of Engineers, Omaha District stated, “Omaha District has searched its records and does not have any record indicating that Bridger Teton National Forest applied for and/or was issued exemptions or national permits...” And finally on August 30, 2001, in response to “copies of all documents for and issues showing **exemptions** or national permits issued to the Bridger Teton National Forest beginning from Jan. 1, 1984 to Jan 1, 2001 showing authorization for non-compliance of the Clean Water Act”, the Forest Service, Region 4, responded with “...we are providing you with a no records determination.” The August 30, 2001 letter was stated as the final word, subject to a “right of appeal”.

It is true that records regarded are primarily from the Medicine Bow-Routt, Bridger-Teton, and Wasatch-Cache national forests, however, this probably runs true throughout all 58.5 million acres of inventoried “roadless” areas and other areas of approximately 192 million acres comprising the National Forest

System. The point being, the Clean Water Act is a law for everyone to abide by, not just the private sector of business or landowner. Competing values aside, the USFS is not above the law. (Individual, Rock Springs, WY - #A15658.20221)

138. Public Concern: The Forest Service should comply with the Clean Water Act and the Endangered Species Act.

BY NOT REMOVING TIMBER OR BUILDING ROADS

The 10 questions listed as part of the Public Comment for Roadless Area Conservation avoided mentioning Federal Laws such as the CWA and the ESA. In order to meet the CWA requirement to maintain the physical and biological integrity of the Nation's waters that are in the roadless area watersheds, and to meet all ESA requirements, logging and road building should not be allowed in the roadless areas. (Organization, Coeur d'Alene, ID - #A17112.20200)

139. Public Concern: The Forest Service should integrate the Clean Water Act and the Endangered Species Act early in the forest planning process.

In addition to the traditional multiple use values that have guided national forest planning since before NFMA was enacted, I believe we would be well served by a constructive integration of ESA and CWA into the early forest planning process. (Individual, Spokane, WA - #A17819.20200)

140. Public Concern: The Forest Service should not use the Clean Water Action Plan as a guideline for roadless area management.

UNTIL CURRENT LITIGATION OVER ITS IMPLEMENTATION HAS BEEN SETTLED AND ITS IMPACTS HAVE BEEN ANALYZED UNDER THE NATIONAL ENVIRONMENTAL POLICY ACT

The Clean Water Action Plan (CWAP) has been cited as a reason for initiating this roadless policy. The use of the CWAP as a guideline is inappropriate and in violation of the National Environmental Policy Act (NEPA). The CWAP represents a significant Federal action that requires an EA or full EIS under NEPA, and they have not been completed. Use of the CWAP as a guideline should be held up until a judgment has been rendered in the lawsuit filed against its implementation and its impacts have been analyzed under NEPA. (Organization, Albuquerque, NM - #A8813.20203)

Conservation and Reinvestment Act

141. Public Concern: The Forest Service should encourage the Senate to pass the Conservation and Reinvestment Act.

IF STAKEHOLDERS ARE NOT ALLOWED TO REMOVE TIMBER

If private or Tribal forest surrounding or inside U.S. State and Federal Forest remain dead locked to the extent the owner/tribe will more than likely never be allowed to harvest their timber, which presently continues to be reality, even though the loss of 7-million-acres in the west is looming in the eyes of us who still have some common sense left, and in the future other private forest will more than likely burn, because USDA CLAIMS no one wants roads, helicopters, cable systems, etc. in the "ROADLESS AREAS;" then by all means, encourage the Senate to PASS CARA, encourage Americans who own private forest to sell to the government, compensate the Indian Tribes for the loss of timber harvest or farmers due to the lack of water as is the case of Klamath basin, allow counties to exchange funding they're entitled to, without the consideration of the county or states local economy, adjustment for inflation, federal spending, governmental control and monopolization of all privately owned forest or "SO CALLED SENSITIVE AREAS" in the 11 Western States, which by the way, CARA affects more than eastern states. (Individual, Jefferson, OR - #A775.30200)

142. Public Concern: The Forest Service should delay any decisions regarding the Roadless Area Conservation Rule until the Senate votes on its version of the Conservation and Reinvestment Act.

Endangered Species Act was never intended as the United States Department of Agriculture Forest Service, DEO [Department of Energy], BLM [Bureau of Land Management], DOI [Department of Interior] Fish and Wildlife Service, IUCN [International Union for Conservation of Nature and Natural Resources], Groups, Associations, Societies or individuals private tool in order to control the forest, farms or grasslands in the U.S. Therefore, ESA [Endangered Species Act] has direct relationship to past and present policies regarding roadless wilderness. CARA [Conservation And Reinvestment Act] as the funding mechanism for "new" property acquisition is passed into law will directly affect present roadless wilderness areas and future designations of "new" lands because private lands within the national forest could be purchased, thereby eliminating existing roads and shelving the construction of new roads in order to gain access to those forest previously privately owned. Yet without access to all national forest "wilderness areas," in order to thin the forest, wildfires will continue to deplete wildlife sustainable habitat, and natural resources, i.e., lumber. CARA has passed the house of Representatives with a comfortable margin of victory, and appears headed for passage in the Senate. Until the Senate passes its version of CARA and once and for all either ratifies or reinforces the present ESA, roadless wilderness decisions, including former President Clinton's roadless wilderness decisions announced in January 2001, any or all decisions should be postponed. (Individual, Jefferson, OR - #A775.20000)

Enabling Act

143. Public Concern: The Forest Service should comply with the Enabling Act.

BY PROVIDING A CONTINUOUS SUPPLY OF TIMBER AND PRESERVING THE WATERSHED

The primary purposes of the USFS as stated in the Enabling Act are: (1) to provide a continuous supply of timber to the American people and (2) to preserve the watershed. These two purposes were confirmed by the US Supreme Court as the primary purposes of the USFS and that all other purposes are secondary and of less importance. (Individual, Ruidoso, NM - #A17775.20200)

Endangered Species Act

144. Public Concern: The Forest Service should comply with the Endangered Species Act.

Local forest planning is important for specific management decisions but it should be strictly subject to national policy, especially compliance with NEPA [National Environmental Policy Act] and the ESA [Endangered Species Act]. (Individual, Black Mountain, NC - #A707.20000)

145. Public Concern: The Forest Service should consider that the Roadless Area Conservation Rule will jeopardize compliance with the Endangered Species Act.

BECAUSE IT WILL REDUCE ACCESS FOR REGULAR INSPECTION FOR DISEASES AND PESTS

It is clear that the ESA is seriously jeopardized by the current roadless policy because access to the interior of the roadless areas compromises regular inspection for diseases and pests that may destroy endangered or threatened species. (Individual, South Royalton, VT - #A13393.20222)

146. Public Concern: The Forest Service should clarify the relationship of the Endangered Species Act to international environmental legislation.

Endangered Species Act is a concrete example of the authoritarian power of international treaties over Americans' rights and property.

Read U.S. Code 16, Sec. 1531 (a)(4) Congressional Findings and Declaration of Purposes and Policy. You will find that the Endangered Species Act is conformable to and in accordance with: (A) migratory bird treaties with Canada and Mexico; (B) the Migratory and Endangered Bird Treaty with Japan; (C) the Convention on Nature Protection and Wildlife Preservation in the Western Hemisphere; (D) the International Convention for the Northwest Atlantic Fisheries; (E) the International Convention for the High Seas Fisheries of the North Pacific Ocean; (F) the Convention on International Trade in Endangered Species of Wild Fauna and Flora; and (G) other international agreements in a mockery of the “advice and consent” responsibility placed upon the Senate by our constitution, the U.S. Senate ratified 34 international treaties without debate, without a vote, and almost without notice during the 106th Congress. (Individual, Jefferson, OR - #A775.20222)

147. Public Concern: The Endangered Species Act should be revised.

BECAUSE IT DOES NOT STOP EVOLUTION

Obviously, this would require a complex answer and I would hope that the Forest Service knows this in greater detail than I do, but common sense tells me that this entails balancing the needs of humans with those of other animals on U.S. Forest lands. The gauges for making this balance are difficult to come by, but I suspect that the Endangered Species Act is one gauge that has been used to protect the interests of the other animals. The problem with using such narrow gauges, as has been applied extensively in Klamath County, is that there likely have been more extinct species in the “history” of this planet only in the last 200,000 years than the total number of species that exist now, not to mention the previous 3.8 billion years of this planet’s “history”. What is fallaciously presumed in the Endangered Species Act and by radical environmentalists that interpret this Act is that evolution of all animal species stopped on the date of the inception of this Act. What we are witnessing before our eyes is survival of the fittest and evolution itself. I see this everyday as bacteria develop resistance to antibiotics that they are presented when humans are being invaded by them and I treat these humans. This is not to say that the U.S. Forest should be cut and plowed down because there is a basic human need to seek solace in the wilderness, and there needs to be a basic respect for other animals and organisms. Nevertheless, there is only so much that human interaction can do to stop evolution. (Individual, Klamath Falls, OR - #A6931.53200)

BECAUSE IT HARMS RESOURCE INDUSTRIES, RECREATION, AND AGRICULTURE

CARA [Conservation And Reinvestment Act], if it passes, will be the mechanism providing USDA Forest Service funding for forest/land acquisition, Endangered Species Act gives USDA Forest Service the license to designate any area sensitive if an endangered species is found on any particular lands. With 1,243 species on the endangered list and an additional 2,000 under consideration, the future of private forests, farms and grasslands are uncertain. I would not encourage USDA to visit my rural community or my local privately owned forest, many that allow hunting, off road, etc., a benefit to the National and State Forest of the 11 western states. Yet more forests managed by USDA Forest Service are sought after. USDA Forest Service presently has not the funding to adequately manage the national forest at present. There has to be a balance. The government cannot own everything. Corporate America and international entities already have a big piece of America. Is it the intention of the USDA Forest Service in association with U.S. DOE [Department of Energy] (EIS No. 010222, Fish and Wildlife Mitigation and Recovery Draft, DOE [Department of Energy], Fish and Wildlife Implementation Plan) BLM [Bureau of Land Management], International Union for Conservation of Nature and Natural Resources (IUCN) . . . , Switzerland and Department of Interior Fish and Wildlife Service to continue using the Endangered Species Act to systematically deplete resources privately owned forests, farms and grasslands represent for the economy by declaring areas in the west sensitive for habitat or the home of one of the 1,243 species? While endangered species are being protected, is the death of other species now acceptable or destruction of entire farming communities as is the present situation in Klamath Basin? (Individual, Jefferson, OR - #A775.20222)

ESA has not been authorized since 1992 but Congress has been making appropriations for ESA every year. Forests have been closed, farms have been threatened by wildlife refuges. All of this without being officially reauthorized.

The Klamath Basin is the result of an ESA citizen’s lawsuit.

Somebody needs to be held accountable for economic, social, and cultural damages and human suffering caused by ESA actions.

Rural America is out of work, and thousands of farmers, loggers, miners, ranchers and people working in related businesses have been put out of work due to ESA Actions and ESA protections.

Our economic way of life is being destroyed. Natural Resources need to be used not just for oil energy, but mining, logging, grazing, etc. We need to work the land to produce raw materials for American industries and to produce food for our tables. (Individual, Eckert, CO - #A28671.20222)

BECAUSE IT IS BEING USED BY GROUPS AS A TOOL AGAINST TRADITIONAL USES OF FOREST LANDS

Congress passed the Endangered Species Act of 1973 into law in an effort to ensure the long-term solution, which satisfied the needs of both man and his surroundings. The Endangered Species Act was a noble endeavor in both concept and theory. Provide protection to the plant and animal species threatened with extinction, or endangered by the spread of the human population throughout the country. On its face the Endangered Species Act appeared to be a “common sense” piece of legislation. The idea was that there was more than enough room to go around and that man could easily coexist with his natural surroundings. America is a big place after all. Yet things are rarely what they seem. Over the years the Endangered Species Act, like the species it purports to “protect,” continued to “evolve.” At the behest of the Green Advocacy Groups, amendments to the original legislation along with creative interpretation by an activist judiciary have turned the law into little more than a weapon to be used against business, development interest, property owners and recreational groups...to name but a few. Today, once the Endangered Species Act is invoked in a land use battle, the battle is almost always over. How many among us can afford to go up against the near-limitless resources of the federal government, the GAGs [Green Advocacy Groups], and often complicit media effort combined? (Individual, Jefferson, OR - #A775.20222)

Property rights advocates have long contended environmentalists use the Endangered Species Act (ESA) to further such unrelated interests as limiting population sprawl, restricting natural resources recovery, and restricting the construction of new roads, airports, and dams. The National Wilderness Institute (NWI) notes no species have ever been removed from the endangered species list due to actions taken under the Endangered Species Act. Although NWI has filed many court actions and has fought diligently for the protection of endangered species, it recognizes that many species that are not threatened have been improperly added to the list. (Individual, Jefferson, OR - #A775.20222)

The most insidious weapon in the environmentalists’ hands is the Endangered Species Act. It is destroying farmers, ranchers, commercial fisherman, loggers, the petroleum industry, motorized recreation industry, and other recreational pursuits. Thousands upon thousands of people are losing their farms, ranches and jobs. This again is an underlying attempt by the Globalists to destroy our ability to produce in order to make us dependent on the U.N. (Individual, Sedona, AZ - #A1566.20222)

BECAUSE IT HAS NOT BEEN ESTABLISHED LONG ENOUGH TO OBTAIN THE NECESSARY DATA TO DECLARE SOME SPECIES ENDANGERED

The Endangered Species Act may be correct and needed but the management of the intent is wrong. Every species has its cycle from maximum population to minimum population. The ESA has not been established long enough to obtain the necessary data to declare some of these species endangered. Some of these declarations may affect forest health. (Individual, Klamath Falls, OR - #A8809.20222)

TO ELIMINATE THE PRINCIPLE THAT HABITAT IS MORE IMPORTANT THAN USE

Join the people in demanding hearty revision of the ESA.

Eliminate the goal, concept, or operational principle that habitat is more important than use. They are both important. (Individual, Greeley, CO - #A28995.53100)

TO ALLOW AN AUTOMATIC EXEMPTION TO PROTECT LIFE AND PROPERTY

ESA should be reformed or repealed the worst ESA travesty yet is the death of the four young firefighters in Washington. Due to endangered fish in the Chewick River the Forest Service) delayed for

several hours to take water from the river to drop on the fire. If Congress cannot reform the ESA to protect human life they should repeal it. This should never have happened, and who is to be held accountable? There should be an automatic exemption to protect human life and property. (Individual, Eckert, CO - #A28671.20222)

The ESA should be reformed or repealed. The worst ESA travesty yet is the death of the four young fire fighters in Washington due to endangered fish and Chewuk River. The Forest Service delayed several hours to deliver water on the fire, thus causing the death of these four fire fighters. (Individual, Cedaredge, CO - #A21879.20222)

148. Public Concern: The Endangered Species Act should be eliminated in its current form.

BECAUSE OF ITS IMPACT ON PRIVATE PROPERTY RIGHTS

ESA [Endangered Species Act] and International ESA policies combine together in a manner that allows others to decide the fate of your private property if someone trespassing discovers an endangered species, which by the way, may increase to 3,243 species from the present 1,243 critters and varmints since ESA's inception and only nine species have been taken off due to their recovery. The reality of the ESA today is not about protection. It is about control of a population through the use of its land and natural resources.

In short, proposals by both Democratic and Republican officials are all over the boards everywhere but where they need to be-De-finding and eliminating the ESA in its current form from the law books of the American judicial system. When people are forced by our government to eradicate what could very well be truly endangered species from their own property in order to protect both their rights and its value, you have a problem that runs far deeper than a piece of legislation. You have a government and related NGOs (non-governmental organizations) that are acting against the will of the people they serve, to the detriment of the species they purport to protect. (Individual, Jefferson, OR - #A777.20222)

BECAUSE OF ITS ROLE IN CLOSING ROADS

We already have millions of acres locked up in wilderness Areas, National Parks, Refuges, study areas etc. and far too many roads locked up because of the Endangered Species Act. (Individual, Kalispell, MT - #A1071.20222)

BECAUSE THE SCIENCE IS FLAWED

Also, the Endangered Species Act is flawed, and many land closures are based on "junk" science, with no scientific proof that certain areas should be closed to human access. (Individual, San Diego, CA - #A6766.20222)

149. Public Concern: The Forest Service should support legislation that prevents litigation over the Endangered Species Act and reimbursement of legal fees.

Remove the weapon used by our "Environmental Extortionist". Have legislation to prevent any lawsuits in regard to the Endangered Species Act or from these groups collecting reimbursement of legal fees or damages from the USFS. (Individual, Lawrenceville, GA - #A6196.15000)

Seek reform of the endangered species act so we can save our forests instead of litigate. (Individual, Canby, OR - #A15507.20222)

Reductions in the use of even-age and other habitat management practices on National Forests are due primarily to obstructionist legal challenges. These legal challenges are commonly based on existing Forest Service Land and Resource Management Planning Regulations. The wording of some of these regulations and judicial interpretation thereof can place sometimes-unreasonable requirements on the agency, thereby exacerbating efforts to implement needed habitat management projects.

Specifically, many suits allege that the Forest Service hasn't adequately monitored populations of certain species to ascertain whether or not these populations are viable, a requirement under the current interpretation of existing planning regulations. Given that these lists of species, which vary by National Forest, can include several dozen to almost 1,000 species, the population monitoring necessary to meet this viability requirement can be both technically and fiscally impractical, if not impossible. I would even go as far as to suggest that legislation be introduced to prevent such groups from collecting damages of legal fees in association with any endangered species. If our concerned environmentalists had to pay their own fees I wonder how often we would see a suit brought against USFS? Maybe Chief Bosworth you should lobby for legislation to save the taxpayers and the budget of USFS some money. (Individual, Lawrenceville, GA - #A6256.16120)

ENCOURAGE THE REPEAL OF THE CITIZEN SUIT PROVISION OF THE ENDANGERED SPECIES ACT

Repeal the "citizen suit" provision of the Endangered Species Act, and then **repeal the Endangered Species Act**. When regulations are issued and enforced as a result of bureaucratic interpretation which is inconsistent with law, or which result from a lawsuit filed against a government agency by an environmental extremist organization or any of its members, the persons and organization involved need to receive a large fine and considerable time in prison. Personal and organizational responsibility in following the law will go a long way toward protecting access to, and unfettered use of, private property. (Individual, Fredericktown, MO - #A11981.20222)

150. Public Concern: The Forest Service should consider that protection of unroaded areas on federal lands has provided state and private lands more latitude for management under the Endangered Species Act.

I would also point out that protection of unroaded areas on federal lands has provided state and private lands more latitude for management under the Endangered Species Act. Protection of federal lands has consistently been cited by the U.S. Fish and Wildlife Service and the Department of Interior as a reason to have less stringent protections of habitats of Threatened and Endangered species on nonfederal ownerships in Washington State. Thus private individuals and state trustees (beneficiaries of Washington DNR-managed lands) benefit directly from habitat conserved on federal lands. (Individual, Olympia, WA - #A30305.20222)

Federal Advisory Committee Act

151. Public Concern: The Forest Service should comply with the Federal Advisory Committee Act.

BY AVOIDING CLOSED-DOOR SESSIONS WITH TARGETED GROUPS

This Initiative was constructed, we believe, in closed-door sessions with radical environmentalists—a FACA violation. It violates the mandate of the USFS—to provide the greatest use for the greatest number—and probably the ADA. It shuts a huge percentage of our 'public' lands off to the public. (Individual, Cedaredge, CO - #A10364.20000)

152. Public Concern: The Forest Service should seek removal of the bureaucratic requirements of the Federal Advisory Committee Act.

TO FACILITATE FORMATION OF FOREST-LEVEL ADVISORY COMMITTEES

The most effective, proven tool for working with various groups to ensure that concerns about roadless values are heard and addressed through a fair and open process is the NFMA-mandated forest land and resource management planning process. The Forest Service must allow all interested parties to offer their views and to help define the issues without being constrained by this input.

Establishing forest-level advisory committees as envisioned by NFMA can strengthen this process. Removing the bureaucratic, straitjacket requirements of the Federal Advisory Committee Act would facilitate this approach. Meaningful, productive relationships evolve from the contacts on the individual National Forests. This is where specifics can best be applied on the ground to work to the benefits of

local individuals, the community, the state and the nation. (Business or Association, Portland, OR - #A19004.20201)

Forest and Rangeland Renewable Resource Planning Act

153. Public Concern: The Forest Service should comply with the Forest and Rangeland Renewable Resource Planning Act.

BY ADDRESSING ROADLESS AREA MANAGEMENT IN THE FOREST PLANNING PROCESS

To be consistent with the Forest and Rangeland Renewable Resource Planning Act of 1974 as amended (hereafter "RPA"); the National Forest Management Act (hereafter "NFMA"); and, the Multiple Use Sustained Yield Act (hereafter "MUSY"), the Forest Service should address the roadless management issues through the comprehensive planning process of the Land and Resource Management Plans (hereafter "LRMPS") process. By examining one issue (roadless management) in isolation, the resulting management policies will not provide for multiple use and sustained yield in a coordinated and consistent manner.

The LRMP process was designed to guide all natural resources management activities and in turn determine resource management activities in turn determining resource management practices, levels of resource production and management, and suitability of lands, all in a comprehensive approach that was responsible to changing social and economic demands.

The nationwide approach to roadless management runs counter to the goal of a coordinated, integrated, and consistent planning process. It is our recommendation that the roadless issue be addressed in the LRMP process wherein all resources outputs are balanced to determine the maximum long term net public benefits. (Elected Official, Douglas County, OR - #A11811.13110)

BY NOT MANAGING ROADLESS AREAS AS DE FACTO WILDERNESS

We note that the adoption of the proposed rule to temporarily suspend road construction and reconstruction within National Forest System roadless areas is viewed as critical to preserve land and resource management options. (63 F.R. 9980-02). However, this preservation of management option for the roadless areas is in direct contradiction to the Congressional intent relative to roadless areas as expressed during the 1981 designation of wilderness in California. We note the following statement in the Committee Report:

The fact that the wilderness option for the roadless areas will be considered in future planning raises the hypothetical argument that the areas therefore must be managed so as to preserve their wilderness attributes so that these may be considered in the future. Such an interpretation, however, would result in all roadless areas being kept in de facto wilderness for a succession of future planning processes. SUCH AN INTERPRETATION IS OBVIOUSLY INCORRECT, AND IF APPLIED, WOULD COMPLETELY FRUSTRATE THE ORDERLY MANAGEMENT OF NONWILDERNESS LANDS AND THE GOALS OF THE FOREST AND RANGELAND RENEWABLE RESOURCE PLANNING ACT. (Committee on Interior and Insular Affairs, 97th Cong. 1st Sess. Report No. 97-181, p.45) (emphasis added). SEE ALSO Committee on Energy and Natural Resource, 96th Cong. 2d Sess., Report No. 96-914, p. 26.

As noted above, the preservation of roadless areas to maintain options for future plans is inconsistent with the Forest and Rangeland Renewable Resources Planning Act as well as the various wilderness acts. (Elected Official, Douglas County, OR - #A11811.12460)

Knutson-Vandenberg Act

154. Public Concern: The Knutson-Vandenberg Act should be repealed.

BECAUSE IT AGGRAVATES CONFLICTING INTERESTS

The conflicting interests that are mentioned in several of the questions are, in part, due to the way the Knutson-Vandenberg Act has intermeshed local incentives with profits from national lands. This

outdated law creates many of these conflicts. It allows the best interest of the forest to be weighed against local county needs for bridges and schools, local businesses who are partly supported by the harvest of forests, and the numerous support functions that go along with logging and milling.

Consider for a moment if the Knutson-Vandenberg Act were repealed, that ALL revenue generated off of national lands was sent to the general treasury to benefit everyone (not just the local county), and that any harvest or extraction from national lands was strictly a forest service function, using forest service equipment, then I think you would get a picture of how differently this issue would become. . . . The repeal of the Knutson-Vandenberg Act is likely ‘wishful’ thinking, but I fail to see the logic that allows one county to benefit over another, simply because national land happens to be in its borders. Perhaps some compromise of locking in a fee that the federal government would pay to offset local county revenue that would be a flat fee per acre could be worked out. I am pessimistic however as I believe as long as there remains a financial incentive to cut trees, that no forest will ever be truly safe. (Individual, No Address - #A3649.20200)

Mining Laws General

155. Public Concern: The Forest Service should recognize its legal obligation to maintain roaded access for mineral exploration and development.

AS REQUIRED BY MULTIPLE LAWS AND REGULATORY ACTS

Apart from the general inadequacies of the rulemakings related to roadless areas, e.g., Land and Resource Management Planning Rule, 65 Fed. Reg. 67514, (November 9, 2000); Road Management and Transportation System Rule, 66 Fed. Reg. 3206 (January 12, 2001); Forest Transportation System Administrative Policy, 66 Fed. Reg. 3218 (January 12, 2001); and Roadless Area Conservation Rule, 66 Fed. Reg. 3244 (January 12, 2001), as applied to both federal and private minerals located within or nearby the National Forest System, these rules fail to properly consider and account for the public laws that specifically control access and development of minerals on public lands. Whatever mandate, or authority, the Forest Service believes it can derive from the laws it administers generally for activities that affect surface resources within the National Forest Service System, they do not supercede, or override, the more specific mandates and requirements of the mineral laws. For example, the Mining Law of 1872, 30 U.S.C. 22 et seq., establishes the right to access public lands to explore and develop locatable minerals on public lands, and the Forest Service cannot materially interfere with prospecting, mining, and other incidental uses on those lands in the course of its management of surface resources. Likewise, the disposition of solid minerals subject to the leasing laws cannot be impaired by unilateral action by the Forest Service under the guise of its general authority to manage surface resources within the National Forest System.

Again, by way of example, the disposition and development of federal coal under National Forest Lands is subject to the Mineral Leasing Act of 1920, as amended, 30 U.S.C. 181 et seq., and the Surface Mining Control and Reclamation Act of 1977 (SMCRA), 30 U.S.C. 1201 et seq. These laws establish specific land use planning considerations for the availability of federal coal resources. These specific provisions control and cannot be superceded by Forest Service edicts or rules purportedly taken pursuant to the National Forest Management Act (NFMA), 16 U.S.C. “1601-1614, Multiple Use and Sustained-Yield Act of 1960 (MUSYA), 16 U.S.C. “ 528-531, or the Organic Administration Act of 1897, 30 Stat. 11 (June 4, 1897). Rather, the Forest Service’s obligation, and the Secretary of Interior’s as well for that matter, is to assure that the Forest Service’s actions conform to the specific laws providing for access and development of the mineral resources within the National Forest System.

Our review of the records developed to support the Forest Service’s rules for roadless areas are shockingly devoid of any indication that these considerations were part of its decision making. Similarly, there is no indication that the Bureau of Land Management performed its obligations in assuring that these rules comport, and not interfere, with the Secretary of the Interior’s obligations under our Nation’s mineral laws. The National Mining Association was prepared to bring legal action to obtain appropriate relief to bar the application of the rules to mineral activities in light of these specific, as well as other general, infirmities with the rules. However, NMA decided to refrain from such action in light of the agency’s announcement to review the rules.

We see this as an opportunity for the Forest Service to cure the unlawfulness of these rules as applied to mineral development within the National Forest System. In the meantime, we request that the Forest Service refrain from applying the rules in a manner that interferes with the exploration and development activities that are the subject of the mineral laws.

Mining is unique, because federally owned minerals are primarily managed by the Department of Interior not the Forest Service. As such, the Forest Service has a limited role in the regulation of mineral resources. For mineral activity on Forest Service lands, the appropriate role of the local forest planning in evaluating protection and management of inventoried roadless areas is defined not only by NFMA but also other statutes particular to mineral development. Among those statutes upon which the agency must rely in the course of its planning process are: SMCRA; Federal Coal Leasing Amendments Act of 1975 (FCLAA) Pub.L.No. 94377, 90 Stat. 1083 (1976); Mining and Minerals Act of 1970 (30 U.S.C. 21a); Mining Law of 1872.

The Forest Service Only Has Limited Authority Over Minerals Governed by the 1872 Mining Law

The Forest Service only has limited regulatory authority over mineral resources governed by the 1872 Mining Law, as amended. This limited authority simply does not permit designation of roadless areas in a manner that unreasonably interferes with exploration for and development of minerals.

The Mining Law allows for “A free and open exploration and purchase” of “all valuable mineral deposits in lands belonging to the United States.” 30 U.S.C. [section] 22. Congress established the National Forests through the Organic Administration Act of 1897, 30 Stat. 11 (Jun. 4, 1897), with administrative authority originally vested in the Department of the Interior. In 1905, Congress transferred from the Interior Department to the Department of Agriculture the power to execute or cause to be executed all laws affecting public lands in the National Forests, but the 1905 Act limited that authority by excepting such laws as affect the surveying, prospecting, locating, appropriating, entering, relinquishing, reconveying, certifying, or patenting of any such lands.” 16 U.S.C. [section] 472; 30 Stat. 628 (Feb. 1, 1905). For decades, this qualification has been construed consistently as withholding administrative power over locatable mineral exploration and mining activity on National Forest lands from the Department of Agriculture. See, e.g., H.H. Yard, 38 Pub. Lands Dec. 59, 61-65, 1909 WL 936 (D.O.I. July 3, 1909) (stating that the Transfer Act of 1905 recognized the right, authority, power, and jurisdiction [over surveying, entering, patenting, prospecting, and appropriating] as already existent and vested and declares that such power and authority shall remain where now seated, viz: with the Interior Department.”); Apex and Extralateral Rights Issues Raised By The Stillwater Mineral Patent, 93 Interior Dec. 369, 384 n. 2, 1986 WL 222959 (D.O.I. Apr. 18, 1986) (The Interior Department has the statutory responsibility to administer the Mining Law of 1872 . . . on National Forest lands.”).

Even without consideration of the 1905 Act transfer provisions, the Organic Administration Act of 1897, which remains a central statutory authority for the Forest Service today, does not provide the authority to limit locatable mineral exploration and mining on National Forest Lands. To the contrary, the Act explicitly warns: “nor shall anything herein prohibit any person from entering . . . national forests for all proper and lawful purposes, including that of prospecting, locating and developing mineral resources . . . “ 16 U.S.C. [section] 478. Interpreting the Forest Service’s Organic Act, the U.S. Court of Appeals for the Ninth Circuit recently stated:

The Forest Service may regulate use of National Forest lands by holders of unpatented mining claims . . . but only to the extent that the regulations are “reasonable” and do not impermissibly encroach on legitimate uses incident to mining and mill site claims.

United States v. Shumway, 199 F.3d 1093, 1107 (9th Cir. 1999) (citing United States v. Weiss, 642 F.2d 296, 299 (9th Cir. 1981)). In addition, the court emphasized that the right of the Forest Service to manage surface resources shall be such as not to endanger or materially interfere with prospecting, mining or processing operations or uses reasonably incident thereto.” Id. Roads are most certainly legitimate uses incident to mining and mill site claims and the prohibition of roads in inventoried roadless areas would be a material interference with mining that is certainly an unreasonable and impermissible encroachment on legitimate uses.

Not only have courts and administrative adjudicatory bodies consistently interpreted the Organic Act of 1897 regarding locatable minerals, but also the Congress, in subsequent grants of authority to the Forest Service, has uniformly done so too. Thus, in 1960, Congress passed MUSYA, which directed the Forest Service to manage the National Forests according to the principles of “multiple use” and “sustained

yield.” Significantly, in the MUSYA, as in the Forest Service’s Organic Act, Congress warned that “nothing” in the Act “shall be construed so as to affect the use or administration of the mineral resources of national forest lands” 16 U.S.C. [section] 531(a) Similarly, Congress defined the term “sustained yield” to exclusively refer to the output of the various renewable resources of the national forests” 16 U.S.C. [section] 531(b) The Act’s legislative history demonstrates a deliberate effort by Congress to limit Forest Service authority over mineral resources. The House of Representatives Interior Committee Report on the Act states:

It is made clear that nothing in the bill would affect the authority which the Secretary of the Interior has with respect to the mineral resources in the national forest lands. Thus, the bill would not impair mining operations and activities under the authorities which the Secretary of the Interior has with respect to such mineral resources. House Report No. 1551, 1960 U.S.C.C.A.N. 2377 (Apr. 25, 1960).

In 1974, Congress spoke to this principle again when it enacted the Forest and Rangeland Renewable Resources Planning Act, (1974 Renewable Resources Act) 16 U.S.C. [section] 1600-1614.

While authorizing the Forest Service’s land use planning functions, Congress once again made clear, beginning with the 1974 Act’s title (“Renewable Resources”), that minerals were beyond the scope of Forest Service jurisdiction. Significantly, the term “renewable resources” is defined by the 1974 Act “to involve those matters within the scope of responsibilities and authorities of the Forest Service on the date of this Act” 16 U.S.C. [section] 1610 (emphasis added). Thus, the Act relates back to the MUSYA, which in turn specifically and deliberately exempted minerals from the Forest Service’s discretionary planning and management authority.

In 1976, the NFMA made significant amendments to the 1974 Renewable Resources Act. As in the original 1974 Act, however, the NFMA relates back to the principals of multiple use and sustained yield—applicable only to renewable resources—used by Congress in the MUSYA. See 16 U.S.C. [section] 472a(c). In the 1976 Act’s statement of policy, Congress stated:

To serve the national interest, the renewable resource program must be based on a comprehensive assessment of present and anticipated uses, demand for, and supply of renewable resources from the Nation’s public and private forests and rangelands, through analysis of environmental and economic impacts, coordination of multiple use and sustained yield opportunities as provided in the Multiple-Use Sustained-Yield Act of 1960 16 U.S.C. [section] 1600(3)

Thus, Congress repeatedly has acknowledged through legislation and legislative history that the Forest Service does not have discretionary planning authority over mineral resources on National Forest lands.

The Forest Service’s own regulations recognize this limitation on the Agency’s authority over locatable minerals. Thus, the regulations found at 36 C.F.R. Part 228, promulgated by the Forest Service in 1974 immediately after enactment of the 1974 Renewable Resources Act correctly set the boundaries of the Forest Service’s limited authority over locatable mineral resources and mining activities. In the statement of purpose for the Part 228 regulations, the Forest Service recognized that there is a statutory right to enter public lands in search of minerals. Thus, the purpose of the regulations was to:

Set forth rules and procedures through which use of the surface of National Forest System lands in connection with operations authorized by the United States mining laws (30 U.S.C. 21-54), which confer a statutory right to enter upon the public lands to search for minerals, shall be conducted so as to minimize adverse environmental impacts on National Forest System surface resources. It is not the purpose of these regulations to provide for the management of mineral resources; the responsibility for managing such resources is in the Secretary of the Interior. 36 C.F.R. [section] 228.1 Surely, restrictions on the construction of roads for mineral exploration and mine development interferes with that statutory right. The Part 228 regulations, which remain in full force today, require mining claimants to obtain Forest Service approval of a plan of operations, and post necessary bonding to secure compliance with the plan of operation’s reclamation requirements, but make no attempt to limit access to roadless areas. See, e.g., 36 C.F.R. [section] 228.4, 228.5. It is important to note that mining roads constructed pursuant to the Part 228 regulations do not become part of the National Forest Road System. Instead, as discussed below, the Part 228 regulations requires that such roads be reclaimed by the operator when they are no longer needed.

In the preamble to the Part 228 regulations, the Forest Service specifically and correctly recognized that it may not adopt surface regulations that impede upon the statutory mining rights:

The Forest Service recognizes that prospectors and miners have a statutory right, not mere privilege, under the 1872 mining law and the Act of June 4, 1897, to go upon and use the open public domain lands of the National Forest System for the purposes of mineral exploration, development and production. Exercise of that right may not be unreasonably restricted. Specific provision has been made in the operating plan approval section of the regulations charging Forest Service administrators with the responsibility to consider the economics of operations, along with the other factors, in determining the reasonableness of the requirements for surface resource protection. 39 Fed. Reg. 31317 (Aug. 28, 1974) (emphasis added).

The Forest Service lacks the authority to designate roadless areas in a manner that impedes longstanding statutory rights to explore the public lands for minerals and develop minerals discovered. The limitations on Forest Service authority with regard to minerals have been recognized and applied consistently.

Land Use Planning and The Federal Coal Management Program

In 1979, the Department of Interior (DOI) formally implemented by regulation the Federal Coal Management Program (Coal Program), after the completion of a Programmatic Environmental Impact Statement in which the Forest Service participated. The new Coal Program implemented three newly enacted statutes, the Federal Lands Policy Management Act (FLPMA), FCLAA and SMCRA. See Final Environmental Impact Statement for Federal Coal Management Program at pp.1-15-1-17. The Bureau of Land Management (BLM) has the primary responsibility for administering the Coal Program.

A major component of the Coal Program is comprehensive land use planning, which must be prepared and continually updated. It is only through such planning that federal coal suitable for further leasing consideration is identified. While general land use planning is conducted by BLM under FLPMA or by the Forest Service under NFMA (if National Forest lands are involved), as to coal leasing, both agencies must comply with FCLAA's more specific land use planning requirements. Specifically, section (3)(A)(i) of FCLAA mandates that "no lease sale shall be held unless the lands containing the coal deposits have been included in a comprehensive land use plan and such sale is compatible with such plan." Additional review of federal lands is required by section 522(b) of SMCRA which states the Secretary of the Interior must "review federal lands to determine whether they contain areas unsuitable for all or certain types of certain coal mining."

The FCLAA and SMCRA planning and review requirements are implemented through the Coal Program. See e.g., 43 C.F.R. 3420.1-4(a) (implementing Section (3)(A)(i) of FCLAA, "The Secretary [of Interior] may not hold a lease sale under this part unless the lands containing the coal deposits are included in a comprehensive land use plan or land use analysis.") and 43 C.F.R. 3420.1-4(b)(2) (also implementing Section (3)(A)(i) by specifying that in the case where the surface overlying the subject coal is managed by an agency other than the DOI, that department or agency has responsibility to prepare the land use plan. "The Department of Agriculture or any other agency with surface management authority shall prepare comprehensive land use plans or land use analysis for lands it administers.").

As to SMCRA's unsuitability review, the Coal Program developed specific unsuitability criteria that must be used by BLM or any other surface managing agency conducting the land use planning process. See 43 CFR 3420.1-4(e)(2) ("the Bureau of Land Management or the surface management agency conducting the land use planning **shall, using the unsuitability criteria and procedures** set out in part 3461 of this title, review Federal lands to assess where there are areas unsuitable for all or certain stipulated methods of mining."). The Coal Program regulations, based on SMCRA's unsuitability provisions, establish 20 specific unsuitability screening criteria for making such a determination.

The Forest Service agreed with the Department of the Interior—as a condition of the Memorandum of Understanding (MOU) by which the Secretary delegated the SMCRA federal lands unsuitability review for national forest lands to the Forest Service—to employ the unsuitability criteria and procedures adopted by Interior, by regulation, as parts of the Coal Program. Specifically, the MOU states:

The Secretary of the Interior and the Secretary of Agriculture will review Federal lands under their respective jurisdictions to determine which are unsuitable for all or certain types of surface coal mining operations. Such reviews shall be conducted and such assessments shall be made by the FS and BLM using [the 20 unsuitability] **criteria which have been promulgated as regulations by the Secretary of the Interior as part of the Federal coal management program** (43 CFR part 3400). May 20, 1980 Memorandum of Understanding between the Department of Agriculture and the Department of the

Interior Providing for Coordination of Activities Pursuant to the Federal Coal Management Program. No. 80-SIE-001 (Emphasis added.) More broadly, the MOU is intended to “establish a system for coordination between the BLM and FS on the Federal coal management program.” Id. As far as NMA can establish, the Forest Service has not coordinated with BLM on the interaction of the roadless rule with the Coal Program. NMA submitted Freedom of Information Act requests to both agencies to determine if there was any communication amongst the agencies as to such interaction or more broadly if there were any communications about the impacts of the roadless rule on any mining activities. The response received by NMA indicates no such communications took place. This lack of active consultation conflicts directly with the requirements of the Coal Program. See generally, 43 CFR 3420; 3461.

Thus, the Coal Program implements the planning and review requirements of FCLAA and SMCRA, by establishing a comprehensive federal system for identifying federal coal suitable for further leasing consideration. The Forest Service has no authority to ignore, as it did in the January 12, 2001 final rule, the Coal Program regulations, or their statutory basis, by declaring vast amounts of public land off-limits to future coal leasing activities. To do so, would be to violate the legal requirement to use the unsuitability requirements to determine areas available for leasing.

In addition, the Coal Program establishes that the local forest planning plays an essential role in determining areas unsuitable for mining, including the construction, reconstruction and maintenance of roads constructed in support of mining operations. In fact, it is the only procedure for determining whether Forest Service lands are suitable for mining. The local forest planning process is the common thread that holds together the three statutes that authorize and regulate coal mining on Forest System lands. These forest plans include reports on the application of the unsuitability criteria. See 43 CFR 3461. If the local forest planning process were bypassed in whole or in part, the Coal Program collapses. Without a predictable mechanism to lease and recover coal underlying Forest Service lands, the Nation’s energy supply could be significantly and seriously affected.

Leasable Solid Minerals other than Coal

The role of local forest planning is equally important in the leasing of solid minerals other than coal. 43 C.F.R. 3501.17(a) provides that ABLM will not issue you a permit or lease unless it conforms with the decisions, terms and conditions of an applicable land use plan@ 43 C.F.R. 3501.17(c) states that ABLM will issue permits and leases consistent with any unsuitability designations under part 1600 of this title.@ 43 C.F.R. 1610.7-1(b)(1) declares, The resource management planning process is the chief process by which public land is reviewed for designation as areas unsuitable [for] entry or leasing for mining operations for minerals and materials other than coal under section 601 of the Surface Mining Control and Reclamation Act of 1977.@ 30 U.S.C. 1281. Together these three planning provisions in conjunction with section 601 of SMCRA affirm that the local forest planning process plays an essential role in the evaluation protection and management of inventoried roadless areas on Forest Service lands.

January 12, 2001 Rule Not Explicit Enough in Exempting Mineral Activities from its Purview

Section 294.12 of the January 12, 2001 rule prohibits road construction and reconstruction in inventoried roadless areas. One of the exceptions to the general prohibition on roads is contained at section 2914.12 (b)(3) which allows roads “needed pursuant to reserved or outstanding rights or as provided for by statute or treaty.” This vague exception may be intended to address access for mineral exploration and development pursuant to the Mining Law of 1872, the Mineral Leasing Act and other laws, but the rule’s preamble provides little explanation of the exception’s scope. Indeed, statements in the preamble undermine the mining industry’s confidence that this exception will ensure access **via roads**. Specifically, the preamble states:

Access for the exploration of locatable minerals pursuant to the General Mining Law of 1872 is not prohibited by this rule. Nor is reasonable access for the development of valid claims pursuant to the General Mining Law of 1872 prohibited. **In some cases, access other than roads may be adequate for mineral activities. This access may include, but is not limited to, helicopter, road construction or reconstruction, or non-motorized transport.** 66 Fed. Reg. 3253. (Emphasis added.) While aerial access may not be prohibitive in connection with some exploration, we submit that aerial access will be prohibitive, i.e., unreasonable, with respect to essentially all mining activities. While the Forest Service may have more discretion over leasable mineral activities, the exception to the road prohibition would still apply to provide access for such activities to fulfill existing contracts. Permitting only aerial access

or non-motorized access is a constructive denial of access. To reiterate previous comments, the Forest Service has no authority to prevent access for mineral activities under the Mining Law. As the United States Court of Appeals for the Ninth Circuit has recently noted: “Congress has refused to repeal the Mining Law of 1872. Administrative agencies lack authority effectively to repeal the statute by regulations.” United States v. Shumway, 199 F.3d.1093, 1107, (9th Cir. 1999). In addition, denial or restriction of access may effect a taking under the Fifth Amendment of the U.S. Constitution, and any denial or restriction on access for a leasable mineral activity may also constitute a violation of the Contracts Clause of the U.S. Constitution.

The Forest Service must allow road construction for mineral exploration and development as guaranteed by statutory right in the various federal mining and mineral leasing laws. (Business or Association, Washington, D.C. - #A29622.20223)

Mining Law of 1872

156. Public Concern: The Forest Service should comply with the Mining Law of 1872.

The Forest Service should rely on local control and input to determine the best use of forest resources, while conforming to the Mining Law of 1872. (Individual, Aptos, CA - #A16303.20223)

TO REMAIN FREE OF FOREIGN DEPENDENCE ON RAW MATERIALS

The Mining Law of 1872 should be of prime concern, as our ability to remain free of foreign dependence on raw materials is of utmost importance. (Individual, Aptos, CA - #A16303.20223)

The Forest Service should rely on local control and input to determine the best use of forest resources, while conforming to the Mining Law of 1872. . . . The Forest Service must consider economic factors by law. The Mining Law of 1872 should be of prime concern, as our ability to remain free of foreign dependence on raw materials is of utmost importance. The Forest Service should allow local jurisdictions to make their own decisions on how best to use forest lands because local citizens are affected the most by these decisions. (Individual, Albuquerque, NM - #A10497.15111)

BY MAINTAINING ACCESS FOR MINERAL EXPLORATION AND DEVELOPMENT

Rights provided under the 1872 Mining Law to explore for and develop minerals cannot be abridged by the adoption of an administrative regulation in the absence of other Congressionally enacted statute granting such specific authority. No such Congressionally-granted authority can be found among the plethora of laws governing the management of federal lands. To the contrary, Congress granted specific protection for the exercise of valid mining rights, as set forth in:

Surface Resources and Multiple Use Act of 1955 30 U.S.C. 612

Multiple-Use Sustained Yield Act of 1960 16 U.S.C. 528

Wilderness Act of 1964 16 U.S.C. 1134

National Forest Management Act 16 U.S.C. 1601-1614

Access to Forest Service lands containing minerals under federal lease is also protected, since the contractually granted right given by the federal government to develop those minerals is dependent upon access necessary to conduct the operation in a safe and prudent manner in accordance with applicable laws, including requirements of OSM [Office of Surface Mining], MSHA [Mine Safety and Health Administration], and other agencies. Subsequent administrative inclusion within a defined roadless area cannot, and should not, infringe on existing rights. (Business or Association, Denver, CO - #A20676.20200)

First and foremost, the Forest Service must review its statutory authority as to whether it can prohibit any specific activities. For example . . . the Forest Service has no statutory authority to prevent access to federal lands pursuant to the Mining Law of 1872. Therefore, arguably, roaded access for mineral development should be expressly allowed. (Business or Association, Spokane, WA - #A17351.20000)

BY ALLOWING UNRESTRICTED MODES OF TRANSPORTATION

Mineral entry to public lands, as guaranteed by the 1872 Mining Act, is an act of Congress. The Act is a complete bundle of rights that includes, among other things the construction of access roads for exploration and development, the removal of bulk samples for test milling, and unrestricted modes of transportation to gain access to lands subject to the Act.

This bundle of rights to explore and develop federal minerals cannot be partially extinguished by administratively limiting modes of access, or any other valid rights granted by Congress when it enacted the 1872 Mining Act. (Business or Association, Reno, NV - #A15364.20223)

BY NOT MATERIALLY INTERFERING WITH PROSPECTING, MINING, OR MINERAL PROCESSING

Certain other federally owned minerals, e.g., gold and silver, are governed by the laws of location as set forth in the 1872 Mining Law, which predates the establishment of the National Forests (1897). The Mining Law allows for “free and open exploration and purchase” of all valuable mineral deposits in lands belonging to the United States.” 30 U.S.C. [Section] 22. Thus, while the Forest Service may have statutory authority to regulate surface use of the National Forests by holders of unpatented mining claims, that regulation must be reasonable and may not materially interfere with prospecting, mining or mineral processing as guaranteed under the Mining Law on lands open to the public. For a more comprehensive treatment of this issue, we refer you to and hereby incorporate by reference the comments of the National Mining Association. (Business or Association, Denver, CO - #A20676.20223)

157. Public Concern: The Mining Act of 1872 should be revised.

TO GRANT ROYALTIES AND LEASING FEES TO GOVERNMENT MANAGERS COMMENSURATE WITH THOSE RECEIVED FROM PRIVATELY OWNED LAND

Mining and the exploitation of non-renewable resources can impose major permanent impacts upon the land. Often these impacts can be localized; but none-the-less should be restrained. The 1872 Mining Act as well as grazing privileges need to be revised to result in the government managers receiving royalties and leasing fees commensurate to if the land was privately owned. National Forests are not intended for being tree farms, mines or cattle pastures. (Individual, Geneva, NE - #A15512.90110)

158. Public Concern: The Mining Act of 1872 should be repealed.

The 1872 Mining Act needs to be thrown out as well. (Individual, Boise, ID - #A8715.90720)

Mining and Mineral Policy Act

159. Public Concern: The Forest Service should comply with the Mining and Mineral Policy Act.

BY MAINTAINING ACCESS TO MINERAL DEPOSITS IN NATIONAL FOREST SYSTEM LANDS

Creation of vast “roadless” areas is in direct conflict with the Congressional mandate established in the Mining and mineral Policy Act of 1970 (MMPA). MMPA states the following: “The Congress declares that it is the continuing policy of the Federal government in the national interest to foster and encourage private enterprise in: (1) the development of economically sound and stable domestic mining, minerals, metal and mineral reclamation industries; (2) the orderly and economic development of domestic mineral resources, reserves, and reclamation of metals and minerals to help assure satisfaction of industrial, security and environmental needs.” Clearly, maintaining access to mineral deposits in the national forest system is essential to complying with the MMPA’s directive. (Individual, Reno, NV - #A21755.20223)

Compliance with the Mining and Mineral Policy Act of 1970—Creation of vast roadless areas is in direct conflict with the Congressional mandate established in the Mining and Mineral Policy Act of 1970 (MMPA). MMPA states the following: “The Congress declares that it is the continuing policy of the Federal Government in the national interest to foster and encourage private enterprise in: (1) the development of economically sound and stable domestic mining, minerals, metal and mineral

reclamation industries; (2) the orderly and economic development of domestic mineral resources, reserves, and reclamation of metals and minerals to help assure satisfaction of industries, security and environmental needs.” Clearly, maintaining access to mineral deposits in the National Forest System is essential to complying with the MMPA’s directive. (Individual, Reno, NV - #A21377.20200)

Multiple Use and Sustained Yield Act

160. Public Concern: The Forest Service should comply with the Multiple Use and Sustained Yield Act.

BY ENSURING THAT FOREST PLANS ARE IN COMPLIANCE

The plans must provide for multiple use as provided in The Multiple Use Sustained Yield Act of 1960, taking into account the “coordination of outdoor recreation, range, timber, watershed, wildlife and fish, and wilderness”. (Individual, El Dorado, KS - #A5117.20202)

BY MAINTAINING ACCESS

I am writing to support the Forest Service’s Multiple Use Act. The public lands belong to the public, that’s you and me, not to the federal government. We want access to what is legally ours. (Individual, Seiad Valley, CA - #A1150.20202)

BY PROVIDING FOR A COMBINATION OF USES IN WHATEVER MATRIX WILL BEST MEET THE NEEDS OF THE AMERICAN PEOPLE

The Multiple Use and Sustained Yield Act of 1960 (16 U.S.C. sec. 528 to 531) provides that our public lands shall be “utilized in the combination that will best meet the needs of the American people; making the most judicious use of the land for some or all of these resources and related services over areas large enough to provide sufficient latitude for periodic adjustments in use to conform to changing needs and conditions, that some land will be for less than all of the resources...”

Your public pronouncements suggest that the new leadership at the Forest Service has lost sight of this legal principle. It is not legally necessary to provide for every use on every acre of our national forests. Rather, it is your legal obligation to meet the needs of the American people, applying whatever combination of uses in whatever matrix is necessary. (Organization, Titusville, NJ - #A6288.20202)

The BLM Strategic Plan FY 2000 to 2005 states that: “To achieve this mission, the Bureau of Land Management follows these principles: Manage natural resources for multiple use and long-term value, recognizing that the mix of permitted and allowable uses will vary from area to area and over time.”

Multiple-use management goals are the only goals that will “best meet the needs” of the public and provide for equal program delivery to all citizens including motorized visitors. All of us have a responsibility to accept and promote diversity of recreation on our public lands. Diversity of recreation opportunities can only be accomplished through management for multiple-uses and reasonable coexistence among visitors.

The significant closing of roads and motorized trails in the project area is not consistent with meeting the needs of the public and the goals of Multiple-Use Management as directed under Federal Land Policy and Management Act of 1976 (FLPMA), Multiple Use Sustained Yield Act of 1960 and P.L. 88-657. The proposed rulemaking combined with the cumulative effects of other proposed and enacted federal land management policies have resulted in a significant reduction of multiple-use and OHV recreation opportunities. We request further evaluation of compliance with multiple-use policies and laws and that the decision support these policies and laws. (Organization, Helena, MT - #A13226.20200)

BY USING MULTIPLE-USE SUSTAINABILITY AS THE STANDARD RATHER THAN ECOSYSTEM SUSTAINABILITY

The Forest Service asks what characteristic, environment values, social and economic considerations they should consider as it evaluates inventoried roadless areas. ABATE of Illinois asks that the Forest Service return to the 1960 Multiple-Use Sustained Yield Act. This act outlines multi-use sustainability as opposed to the current standard of “ecosystem sustainability”.

The “ecosystem sustainability” standard currently being used could eliminate access of the forest to almost all recreationists, including motorcycles. (Organization, Naperville, IL - #A20342.20202)

BY GIVING EQUAL CONSIDERATION TO ALL RESOURCES

While the Forest Service is permitted under the MUSYA to prefer some uses over others based on relative resource values in particular areas, the Forest Service cannot, in a proposal that would impact the entire National Forest System, elevate one resource (i.e., environmental resources) over all others. In explaining the Act’s multiple-use directive, the House Report discusses the “relative values” analysis as follows:

One of the basic concepts of multiple use is that all of these resources in general are entitled to equal consideration, but in particular . . . localized areas’ relative values of the various resources will be recognized . . . In practice, the priority of resource use will vary locality by locality and case by case. In one locality timber use might dominate; in another locality use of the range by domestic livestock; in another outdoor recreation or wildlife might dominate. Thus, in particular localities the various resource uses might be given priorities because of particular circumstances. This is the meaning of the last sentence of section 2 of the bill. But no resource would be given a statutory priority over the others. The bill would neither upgrade nor downgrade any resource.

H.R. Rep. No. 1551, 86th Cong., 2d Sess.—(1960), reprinted in 1960 U.S.C.C.A.N. 2377, 2379. Thus, the Forest Service may [not]”upgrade” one resource use, i.e. roadless areas, over all others. (Business or Association, Washington, DC - #A29622.20202)

161. Public Concern: The Forest Service should clarify how the Roadless Area Conservation Rule complies with the Multiple Use and Sustained Yield Act.

Modifications to the revised Rule must clearly reflect how the new Rule will provide needed access for congressionally mandated multiple uses. (Business, Colville, WA - #A3362.20202)

162. Public Concern: The Forest Service should analyze how many wild fires in 2000 occurred in study areas and whether the Multiple Use and Sustained Yield Act has been suspended.

Check how many of the wild fires of 2000 started in study areas and whether the Multiple Use Act of 1960 has been suspended. (Individual, Corvallis MT - #A8081.20202)

163. Public Concern: The Forest Service should reevaluate the legal mandate to provide sustained yield of renewable resources.

I believe it is time to reevaluate the congressional mandate for the Forest Service to provide sustained yield of renewable resources. Past forest management has NOT provided sustained yield as required by the 1960 MUSYA Act, and public forests have been decimated over the past 40 years. (Individual, Olympia, WA - #A4929.20202)

I believe it is time to reevaluate the congressional mandate for the Forest Service to provide sustained yield of renewable resources. Past forest management has not provided sustained yield as required by the 1960 MUSYA Act, and public forests have been decimated over the past 40 years. (Individual, Olympia, WA - #A6262.20202)

National Forest Protection and Restoration Act

164. Public Concern: The Forest Service should comply with the proposed National Forest Protection and Restoration Act.

BY ELIMINATING COMMERCIAL LOGGING AND DIVERTING SUBSIDIES TO TRUE RESTORATION

The ultimate solution lies in the National Forest Protection and Restoration Act, which eliminates commercial logging and diverts subsidies towards true restoration. Only by fully protecting roadless

areas from commercial logging will we manage for “healthy” forests, in the true ecological sense. (Individual, Pullman, WA - #A6234.20200)

TO ELIMINATE FUTURE MANAGEMENT ERRORS

To eliminate the possibility of future management errors such as this proposal, I have introduced the National Forest Protection and Restoration Act. This Act would eliminate the commercial timber program, and neutralize the commercial incentives that are clearly at work in this reverse-rulemaking proposal. While the Forest Service may feel the need to hand our National Forests over to special interests, I do not share this vision, and will resist your efforts until you move in a new direction. (United States Representative, Georgia, - #A693.20000)

Northern Rockies Ecosystem Protection Act

165. Public Concern: The Forest Service should support the Northern Rockies Ecosystem Protection Act, HR 488.

TO PROTECT REMAINING PRISTINE LANDS

I am writing to please urge you to support the Northern Rockies Ecosystem Protection Act, HR 488. With all of the opposition you must be receiving against the act, I’m sure this puts you in a difficult position. But the very few pristine lands we have left in our country deserve to be left alone. (Individual, Alberton, MT - #A11755.20200)

Organic Act

166. Public Concern: The Forest Service should comply with the Organic Act.

I am more concerned about the trend of the Forest Service in management of the rest of the national forests. I think it is time for the Forest Service to re-examine its origin and purpose. The Organic Act of 1897 affirmed that the forests’ reservations are “for the purpose of securing favorable conditions of water flows, and to furnish a continuous supply of timber for the use and necessities of the citizens of the United States.”

A plethora of policy and management legislation has confused and complicated administration of the national forests, but none has repealed the basic premise so well stated in 1897. (Individual, Missoula, MT - #A4987.20204)

Before replying specifically to the 10 questions you pose, I believe it is essential first to refer back to the Organic Administration Act.

While the Multiple Use-Sustained Yield Act, Wilderness Act, Forest and Rangeland Renewable Resources Planning Act and National Forest Management Act, among others, modify the Organic act, and while the Clean Water Act, National Environmental Policy Act and Endangered Species Act, among others, affect its implementation, the core provisions of the Organic Act remain controlling law.

In 1978 the U.S. Supreme Court, after reciting the familiar language in the Organic Administration Act setting out the reasons why the national forests were created, added: “They are not parks set aside for nonuse” (United States v. New Mexico), the Wilderness Act did not change this. Quite the opposite, it recognized that to convert national forest land to “nonuse” required a specific act of Congress.

While the Forest Service’s ANPR does a good job summarizing the legal history of the roadless dispute since 1972, I raise the issue of the Organic Administration Act because it remains an essential legal context for any policy decisions about the national forests. (Individual, Spokane, WA - #A17819.20204)

BY MANAGING FOR MULTIPLE USES

The proposed policy is contrary to the Forest Service’s Organic Act which requires multiple use management of the National Forests. The policy would create de-facto wilderness covering 50-60 million acres. (Individual, Anchorage, AK - #A11831.20204)

Regulatory Flexibility Act

167. Public Concern: The Forest Service should comply with the Regulatory Flexibility Act.

As part of the revised rulemaking process on the Roadless Area Conservation Plan, the Forest Service must comply with regulations under the Regulatory Flexibility Act, Small Business Regulatory Enforcement Fairness Act, and the Benefit Cost Analysis/Unfunded Mandated Reform Act in promulgating the rules under this process. (Business or Association, Salt Lake City, UT - #A28991.20000)

BY PROVIDING A REGULATORY FLEXIBILITY ANALYSIS

The Final Rule was issued without benefit of a regulatory flexibility analysis. *66 Fed. Reg. at 3270*. The Department of Agriculture asserted that “Because the roadless rule does not directly regulate small entities, the Department does not believe the Regulatory Flexibility Act applies to this rule.” *Id.* HAI believes that this conclusion is grossly in error. The civil helicopter operators that provide aerial fire suppression and other services to federal land management agencies are all small business organizations, based on Small Business Administration criteria. Because helicopter operations in remote areas are dependent upon ground support teams and vehicles, the Final Rule will have a substantial negative impact on the ability of these small businesses to conduct operations in fulfillment of their contracts with federal land management agencies and others. This rulemaking is incomplete without a regulatory flexibility analysis of its potential economic impact on civil helicopter operators and related small businesses. (Business, Alexandria, VA - #A30200.20217)

The rules should be considered in light of the Regulatory Flexibility Act (5 USC 601 et seq). Under this law which guides broad planning principles and management of the Forest Service road system, this proposed rule must be shown to have no direct or indirect financial or other impact on small businesses. The Forest Service is required to certify that this action will not have a significant economic impact on a substantial number of small entities as defined by the Act. (State Agency, Cheyenne, WY - #A22609.20217)

The Forest Service previously claimed in its proposed rule, “*This proposed rule has been considered in light of the Regulatory Flexibility Act.*” It was further stated that “*the proposed rule primarily involves agency terminology and board principles to guide the planning and management of the Forest Service road system and has no direct or indirect financial or other impact on small businesses. Therefore, it is hereby certified that this action will not have a significant economic impact on a substantial number of small entities as defined by the Act.*” However, the FS also stated that a road constructed into a roadless or unroaded area automatically constitutes a significant impact, requiring an EIS. In other words, any road required for mineral exploration or development will also require an EIS, which could cost millions of dollars. In view of the agency’s purported budgetary woes, we are extremely concerned that the FS will force project proponents to pay for these NEPA analyses. It is unquestionable that the cost of a small exploration program would increase exponentially in conjunction with the required analyses. When one considers the number of mining claims, leases, or prospecting permits within the roadless areas, it is clear that the rule would definitely pose a significant economic impact on a sizable number of small companies. Consequently, we dispute the FS’s finding that its proposed rule would have no significant impact on small business and formally request the agency to conduct a specific analysis to clearly illustrate the genuine impacts of the proposed rule on small business. (Business, Denver, CO - #A29112.20217)

I request that the Forest Service conduct a detailed Regulatory Impact Analysis, including cost-benefit analysis, of any changes to the RACR as required by the Administration Procedures Act and the several Executive Orders and acts of Congress concerning cost-benefit analysis. These analyses must evaluate the net impact of any changes to the rule, and a draft analysis must be made available concurrent with the publication of the Notice of Proposed Rulemaking. I request that these analyses include the value of

ecosystem services provided by intact roadless areas. (Individual, Huntington Woods, MI - #A7706.20209)

Neither the Cost-Benefit analysis nor the Initial Regulatory Flexibility Analysis (IRFA) met the letter or intent of the Regulatory Flexibility Act (RFA), the Small Business Regulatory Enforcement Fairness Act (SBREFA), and the Benefit-Cost Analysis/Unfunded Mandates Reform Act. While much of the IRFA is couched in the proper terms and tone expected of an objective analysis, a knowledgeable reviewer quickly perceives that the document is seriously flawed in many respects. The overall credibility of IRFA is seriously diminished by the notable absence of hard data or facts substantiating the many assumptions used throughout the Final EIS and the January 12 Rule. The full range of management alternatives cannot be determined without a proper IRFA or Cost-Benefit Analysis.

As a result, the USFS has failed to analyze adequately the impact of the January 12 Rule on small entities and did not fairly consider regulatory alternatives that would minimize significant economic impacts to small entities. As the U.S. District court in Florida has keenly observed, **agencies must be mindful that even commendable goals like preservation do not excuse violations of the RFA.** “Although the preservation of Atlantic shark species is a **benevolent, laudatory goal**, conservation *does not justify government lawlessness.*” (emphasis added) *Southern Offshore Fishing Association v Daley*, 55F. Supp> 2d 1336 (D. FL 1999). (Business or Association, Spokane, WA - #A17351.75900)

BY STATING THE LEGAL BASIS FOR THE PROPOSED ACTION AND DESCRIBING ALTERNATIVES WHICH MINIMIZE THE ECONOMIC IMPACT ON SMALL BUSINESSES

The IRFA [Initial Regulatory Flexibility Analysis] is deficient in a number of respects. The RFA requires “a succinct statement of the objectives of, and legal basis for, the proposed action; a description of and, where feasible, an estimate of the number of small entities to which the proposed action will apply.” The IRFA was devoid of any attempt to satisfy either of these statutory requirements. The IRFA did not contain a statement of the legal basis for the proposed action. *The reason is simple: the agency lacked statutory authority for this rulemaking and was fully aware of this fact.*

The RFA further requires that each IRFA contain a description of any significant alternatives to the January 12 Rule which accomplish the stated objectives of applicable statutes and which minimize any significant economic impact of the January 12 Rule on small entities. Again, the IRFA prepared by the USFS was devoid of any attempt to satisfy this requirement.

The alternatives discussed in the preamble to the January 12 Rule are not “alternatives that minimize any significant economic impact of the rule on small entities.” Compliance with the RFA is not achieved by consideration of alternatives that do not meet the requirements of the Act. Accordingly, when the USFS considers alternatives that are more burdensome to small business, they are not valid for RFA purposes. In addition, the USFS did not consider several other obvious alternatives that would accomplish the objectives of the statute but would have protected small entities. These are temporary roads; well-maintained roads; privately maintained roads; and recognized RS 2477 roads. (Business or Association, Spokane, WA - #A17351.20217)

Our members have asked, “Did the USFS avoid the RFA mandated economic impact analysis because it knew that the impact to small businesses and rural communities would be large and devastating?” The USFS use of an all-or-nothing approach in developing the January 12 Rule, when experience, the laws written by Congress, and just plain common sense, dictated a middle ground, make their question pertinent. We believe the courts would agree.

One purpose of the RFA is to make sure reasonable alternatives are considered that avoid economic dislocation to small entities, while still accomplishing the stated regulatory goal. The technical and management capabilities exist to provide for continued judicious use of both new and existing roads on those tracts of land that remain largely unroaded. Middle-ground alternatives should have been considered, and their economic impacts evaluated and compared to the January 12 Rule. This nation has the means to avoid adverse environmental impacts to the land without essentially having to stop all resource-based economic activities. Not only was the absence of other reasonable alternatives inconsistent with RFA, but NEPA requirements as well. (Business or Association, Spokane, WA - #A17351.20217)

Revised Statute 2477

168. Public Concern: The Forest Service should comply with Revised Statute 2477.

WITH RESPECT TO ROAD CLOSURES

I am disgusted by the very prospect of the roadless initiative. For starters, it is illegal to close many of these roads under RS 2477. It seeks to decrease public access to the back country, eventually corralling the citizens of the US into small urban areas. (Individual, Anoka, MN - #A359.20208)

If you so much as touch an RS-2477 you will be trying to defend yourself before a judge. (Individual, No Address - #A6724.20208)

Most of the motorized trails have served as important public access routes since the turn of the century. This significance is clearly demonstrated by the number of historic mines and structures that are located along these routes. We have observed that these travelways are currently significant recreation resources for motorized visitors in the area including ATV, motorcycle, and four-wheel drive enthusiasts. Many of these travelways have right-of-ways as provided for under the provisions of Revised Statute 2477. These roads are shown on many older mapping sources including: aerial photographs, 15-minute USGS quadrangle sheets, and older county maps. The cut and fill sections and obvious roadbed indicate that these roads were constructed and used by the public for access to the forest. RS 2477 was created to provide adequate public access to our public lands. Now this public access is being eliminated. These travelways must remain open based on; (1) their history of public access, (2) the access that they provide to interesting historical sites, and (3) their significance to public access. The document must evaluate all of the issues surrounding RS 2477 including the cumulative impact of all past closures of RS 2477 routes. (Organization, Helena, MT - #A13226.20208)

All of the routes proposed for closure by the Forest Service were in existence before 1976 and, therefore, have RS 2477 rights-of-way to provide the public with access to public lands. (Organization, Helena, MT - #A13226.20208)

The rule ignores state law that reserves to the public, access to all section lines. In 1866 Congress provided rights of way for the public to federal lands, commonly known as R.S. 2477 grants. The State accepted the R.S. 2477 grant upon statehood, by declaring all section lines open to the public. (Governor, State of North Dakota - #A22065.20208)

A major concern of Catron County Commission is the RS 2477 Roads that lace the Gila and Cibola national forests in Catron County, including the proposed Roadless areas. The Catron County RS 2477 Roads are property of the County and its citizens. Yet the County Commission is concerned that the Roadless Initiative would usurp County jurisdiction with the federal government illegally "taking property" that belongs to the County. Catron County Commission has notified the national forest of its RS 2477 Roads has been done in the current Roadless EIS. The County has also requested to be a partner in joint environmental analyses of any Forest Service initiatives that could impact Catron County and its citizens' private properties. The County was not properly notified for early consultation, given the number of RS 2477 Roads on the national forests in Catron County. (Elected Official, Catron County, NM - #A15538.20208)

BY ACKNOWLEDGING ALL IDENTIFIED REVISED STATUTE 2477 RIGHTS-OF WAY AS ROADS

The proposed roadless policy must acknowledge the existence of Revised Statute 2477 rights-of-way (R.S. 2477) which allow access to lands owned by the State of Alaska and other private property. All identified RS 2477 rights-of-way in Alaska's and in the Lower 48 states, must be acknowledged as

“roads” for purposes of this regulation, regardless of the width of the roadway and its current condition. Otherwise, the proposed policy would violate RS 2477 and the Alaska Statehood Act. (Individual, Anchorage, AK - #A11831.20208)

169. Public Concern: The federal government should issue easement deeds that title insurance companies will insure.

INCLUDING REVISED STATUTE 2477 ROUTES

The Federal Government should issue easement deeds that Title Insurance Companies will insure including RS2477 routes. Enforcement jurisdiction lies within the counties. The Federal government may be obstructing justice by interfering with access guaranteed by Congress under RS2477, exempted by FLPMA and the National Preservation Act.

California Civil code 15:66 provides that the owner of an easement has the right to maintain and repair the easement, and the duty extends to the city or other public agency on a public easement so as to prevent injury. (Individual, Santa Ysabel, CA - #A26392.20000)

170. Public Concern: The Forest Service should defer action on roadless area management until local communities complete studies of Revised Statute 2477 claims.

The Forest Service is forcing local communities to begin costly and time consuming RS 2477 claims and studies since this appears to be the only avenue local communities have in maintaining local access to their public lands. These studies must be completed prior to any Forest Service roadless area designations or restrictions. (Individual, Alturas, CA - #A28581.20208)

171. Public Concern: The Forest Service should clarify its position on Revised Statute 2477 roads.

WITH RESPECT TO ROADLESS AREAS

We have one other concern that we did not see expressed here. That concern is: How is the Forest Service going to deal with RS 2477 roads, and how do those roads fit into the roadless area discussion?

Currently the Forest Service has no position on RS 2477 roads. There is no policy in place to recognize or deal with such roads. If a county asserts RS 2477 routes they are met with silence by the agency. If the county then pushes the issue the routes are grudgingly recognized (maybe), subject to unilateral action on the part of the agency to cancel that recognition if it (the agency) so decides.

This question can have an impact on a roadless area. If a county asserts an RS 2477 right-of-way for a road through a roadless area, and the agency refuses to accept that assertion, what happens to the roadless area until that disagreement is settled, and what process is used to settle the disagreement?

We would like to see this issue addressed at some point. It may have to be addressed in a separate regulation or policy statement, but we believe it ties in with the roadless issue. (Elected Official, Fremont County, ID - #A4942.20208)

172. Public Concern: The Forest Service should consult with counties regarding Revised Statute 2477 roads.

SIERRA COUNTY

The Gila National Forest in Sierra County already has substantial non-multiple use (Roadless, restricted and wilderness) areas. In addition, Sierra County RS 2477 Roads could be in jeopardy unless there is proper Forest Service consultation with the County Commission. (Manager, Sierra County, NM - #A22059.20208)

A major concern of Sierra County Commission is the RS 2477 Roads that lace the Gila National Forest in Sierra County, including the proposed Roadless areas. The Sierra County RS 2477 Roads are property

of the County and its citizens. Yet the County Commission is concerned that the Roadless Initiative would usurp County jurisdiction with the federal government illegally “taking property” that belongs to the County. Sierra County Commission has notified the national forest of its RS 2477 properties on the forest. Yet no proper consideration of the RS 2477 Roads has been done in the current Roadless EIS. The County has also requested to be a partner in joint environmental analyses of any Forest Service initiatives that could impact Sierra County and its citizens’ private properties. The County was not properly notified for early consultation, given the number of RS 2477 Roads on the national forest in Sierra County.

It should also be noted that federal agencies couldn’t extinguish or adversely impact RS 2477 Roads. Only the affected county of US Congress can extinguish, change or abandon RS 2477 Roads. The 1997 omnibus act, section 108, states that no final rule or regulation of any agency of the federal government pertaining to the recognition, management or validity of a right-of-way pursuant to RS 2477 shall take effect unless expressly authorized by an act of Congress. (Manager, Sierra County, NM - #A22059.20208)

173. Public Concern: The Forest Service should comply with the Revised Statute 2477 (RS 2477) savings provisions and the Section 108 prohibition against redefining what an RS 2477 road is.

First and foremost, the Forest Service must obey the law, most particularly the RS 2477 savings provisions of FLPMA and the Section 108 prohibition against redefining what an RS 2477 is. The 30,000 or so comments that you have received from eco-fanatics do not trump these laws. We doubt that Congress will change these statutes, because to do so would result in multi-billion dollar claims under the Taking clause of the US Constitution’s Fifth Amendment. This is why Congress wrote the savings provisions of FLPMA in the first place. (Organization, Tonopah, NV - #A20337.20000)

The USFS is attempting to define the terms “roadless areas” and “unroaded areas” in a way which adversely affects the recognition and validity of RS-2477 rights-of-way in a manner that has been expressly prohibited by a Congressional moratorium (Section 108). **These definitions are an inherent component of both the proposed “roadless area” moratorium rule and the ANPR.** Moreover, these definitions have been published in the Federal Register for public comment, as is required under the Administrative Procedures Act. This attempt to establish regulations through the use of a unilateral proclamation of the USFS is an illegal action, in defiance of Congress and in violation of the Administrative Procedures Act, the savings provisions of FLPMA, and Section 108.

The U.S. Constitution states that “ALL legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.” (emphasis added) The executive agencies, including the USFS, have **no** constitutional authority of their own to make law. Only the Congress can do that. Hence, a unilateral act of the USFS (or any agency) to establish rules (or inherent components thereof such as definitions) by cloaking them as “policy” in defiance of the express will of Congress is unconstitutional and unlawful. (Organization, Tonopah, NV - #A20337.20000)

BY RESPECTING ALL VALID EXISTING RIGHTS

The Forest Service should respect ALL “valid existing rights,” as stated in the Federal Land Policy and Management Act of 1976. (Individual, Eckert, CO - #A28671.20205)

Tongass Timber Reform Act

174. Public Concern: The Forest Service should comply with the Tongass Timber Reform Act.

BY EXCLUDING THE TONGASS NATIONAL FOREST FROM THE FINAL RULE

Including the Tongass in the final rule prohibits the Forest Service from complying with the Tongass Timber Reform Act (TTRA) and the Alaska National Interest Lands Conservation Act (ANILCA). (Elected Official, Haines, AK - #A18063.20400)

BY PROVIDING AN ADEQUATE VOLUME OF TIMBER

It . . . fails to consider the Tongass Timber Reform Act's directive that the Forest Service should supply an adequate volume of timber to meet the needs of Southeast Alaska's timber industry and timber-dependent communities such as the Borough. (Ketchikan Gateway Borough, AK - #A17476.20200)

The Tongass Land and Resource Management Plan (TLMP) just completed an 11-year, \$13 million revision funded by American taxpayers, which is currently under appeal by several entities. In addition to other legal impediments to the application of the roadless proposal on the Tongass, no changes in land allocations on the Tongass can be made by the Forest Service except to correct legal errors in the TLMP revision procedures or pursuant to a forest plan amendment following NFMA procedures. Adoption of the proposed rule will lead to violation of the Tongass Timber Reform Act (TTRA) because the Forest Service will be unable to meet market demand for timber sales as called for in this statute. (Tribal Corporation, Anchorage, AK - #A20340.20400)

175. Public Concern: The Forest Service should acknowledge legal rulings that the Tongass Timber Reform Act does not require unconditional timber sale offerings.**BY INCLUDING THE TONGASS NATIONAL FOREST FROM A NATIONAL RULE**

The Forest Service claims that the agency cannot include roadless areas of the Tongass in the policy because "use of the Tongass National Forest's inventoried roadless areas for timber production contributes to the Forest Service's effort to seek to meet (within the meaning of Section 101 of the Tongass Timber Reform Act) market demand for timber in the Tongass National Forest consistent with providing for the multiple use and sustained yield for all renewable forest resources. . . . First of all, the "seek to meet market demand" provision is subject to all other laws, consistent with providing for the multiple use and sustained yield for all renewable forest resources. Those forest resources include outdoor recreation, watersheds, wildlife and fish purposes (see Multiple Use Sustained Yield Act, 16 USC Sec. 528.)

The Ninth Circuit Court of Appeals, in *Alaska Wilderness Recreation and Tourism Association vs. Morrison* (1995), held that "TTRA envisions not an inflexible harvest level, but a balancing of the market, the law, and other uses, including preservation."

The Forest Service itself has advocated this more flexible and more accurate interpretation of the TTRA. In *AFA v. U.S.*, the Forest Service argued "The use of the word 'seek' necessarily implies a congressional recognition that the Forest Service may be in full compliance with Section 101's mandates, even though less than 'market demand' is offered. (*Defendants' Memorandum in Opposition to Plaintiff's Motion for Summary Judgment and in Support of Defendants' Cross-Motion for Summary Judgment*, 4/14/95, p. 10.)

In a case from this year, the Forest Service argued: "Reliance on the TTRA is misplaced because the TTRA directive is subject to numerous qualifications and because the Ninth Circuit has rejected the interpretation that the TTRA directive to seek to meet market demand is 'mandatory.'" (*Southeast Alaska Conservation Council v. Lyons, Defendants' Opposition to Plaintiffs' Brief on the Merits*, 2/18/00.)

Finally, the Department of Agriculture formally adopted these interpretations in the decisions on the appeals of the Tongass Land Management Plan Revision:

Section 101 clearly states that this provision is "subject to appropriations, other applicable law, and the requirements of the National Forest Management Act of 1976." In addition, it also clearly states that meeting demand is subject to being "consistent with providing for multiple use and sustained yield of all renewable forest resources." (Organization, Sitka, AK - #A30486.75510)

Weeks Act

176. Public Concern: The Forest Service should comply with the Weeks Act.

BY MANAGING FOR MULTIPLE USES

Please insist that **your** Agency manage **my** forests for multiple-use including timber production. The 1911 Weeks Act requires it. (Individual, Princeton, WV - #A18086.50200)

Wild Horse Act

177. Public Concern: The Wild Horse Act should be revised.

DUE TO ITS ROLE IN INCREASING THE HORSE POPULATION

The Wild Horse Act must be revised. The cost is too high. The overall horse population in the United States is forced to increase when it should be decreasing. (Individual, Klamath Falls, OR - #A8809.20200)

Wilderness Acts

178. Public Concern: The Forest Service should comply with the Wilderness Act.

I believe that the Roadless initiative violates the Wilderness Act. Congress should have oversight of any policy of such magnitude. (Individual, Sumter, SC - #A6210.20206)

Protection for “roadless” areas is unnecessary given the existence of the Wilderness Act. Inventoried “roadless” areas selected for future protection should be proposed to Congress for wilderness designation; there is no need for two separate processes to achieve the same goal. In addition, by proposing inventoried “roadless” areas to Congress, the Forest Service will avoid allegations that it is attempting to create de facto wilderness areas in violation of the Wilderness Act. (Business or Association, Reno, NV - #A21755.20206)

REGARDING LAND INVENTORY AND WILDERNESS RECOMMENDATIONS

In 1964 the Wilderness Act was passed and signed into law. The law required that the Forest Service and the Bureau of Land Management inventory the lands under their responsibility and recommend to Congress the areas that should be considered “wilderness.” (Elected Official, Gila County, AZ - #A3013.20206)

BY NOT CREATING DE FACTO WILDERNESS AREAS

Not only is this outcome poor public policy, but also designation of this roadless area directly flouted Congress’ intent in carefully drawing the boundaries of the Jarbidge Wilderness. The original designation of that wilderness area occurred as part of the Wilderness Act of 1964, 16 U.S.C. [section] 1132(a) (“1964 Wilderness Act”), and it was expanded in 1989, 103 Stat. 1784. The Wilderness Act and its legislative history make clear that Congress drew the boundaries carefully, and no protective perimeters outside of those boundaries were to be presumed. Instead, the remaining lands were intended to remain open to multiple use. Moreover, no further roadless area review and evaluation of National Forest lands in Nevada was to be conducted without congressional authorization. See 135 Cong.Rec. S11510-11515 (Sept. 20, 1989). Through the Roadless Rule, however, the Forest Service has acted directly contrary to congressional will by making a *de facto* extension of the Jarbidge Wilderness to include the area between AGNA’s operations at Jerritt Canyon and Big Springs as well as other “roadless” designations throughout Nevada. (Business or Association, Washington, DC - #A19636.20206)

The West Elk Mine is located a few miles from the West Elk Wilderness Area designated by Congress under the 1964 Wilderness Act. 16 U.S.C. [section] 1132. Despite its proximity to the Wilderness Area, the Mine has been able to operate successfully, largely because in 1964 Congress carefully considered the boundaries of that Wilderness and explicitly noted that “no future administrator” of the Forest Service could “make wholesale designations of additional areas in which use would be limited.” House Report No. 1538, 88th Cong. (July 2, 1964), reprinted in 1964 U.S.C.C.A.N. at 3616-17. (Business or Association, Washington, DC - #A19636.20206)

179. Public Concern: The Forest Service should comply with the Wyoming Wilderness Act.

BY NOT CREATING DE FACTO WILDERNESS AREAS

Be very careful road selection by the BTNF some of the roads closed violated “The Wilderness Act”. Authority to extend or reduce the wilderness boundaries is invested solely in Congress. By closing these selected roads they extended the wilderness boundary from the point of closure to the original wilderness boundary. At the very least they created many more square miles of de facto forest. This was also a violation of “The Wyoming Wilderness Act of 1984.”

This needs to be set right before any reasonable form of road management can be formulated. Many times I have asked from the Attorney General down to the local management for just one law or rule or what ever that allowed the enactors of the road plan to extend the wilderness boundary. If that information was forthcoming then we could let that old dog lie in peace. (Individual, Rock Springs, WY - #A5695.20206)

BY NOT ESTABLISHING BUFFER ZONES

In the Wyoming Wilderness Act of 1984 it specifically prohibits establishment of Buffer Zones and it appears that so-called roadless areas could be constructed as Buffer Zones. (Conservation District, Sublette County, WY - #A28888.20200)

BY NOT CONDUCTING ANY FURTHER ROADLESS AREA REVIEW AND EVALUATION

The advance notice of proposed rulemaking dated July 3, 2001 states “The Forest Service has been evaluating roadless areas for nearly 30 years”. While this may be true Service-wide, this effort was concluded in Wyoming with the passage of the Wyoming Wilderness Act of 1984 (Public Law 98-550).

This public law states in Title II, the Congress has made its own review and examination of the National Forest Roadless Areas in Wyoming and the environmental impacts associated with alternative allocation of such areas.

Section 401(b) On the basis of such review, the Congress hereby determines and directs that—(2) the Forest and Rangeland Renewable Resources Act of 1976 (Public Law 94-588) to be an adequate consideration of the suitability of such lands for inclusion in the National Wilderness Preservation System and the Department of Agriculture shall not be required to review the wilderness option prior to the revisions of the plan, but shall review the wilderness option when the plans are revised.

Section B(3) areas in the State of Wyoming reviewed . . . shall be managed for multiple use in accordance with the land management plan.

Section B(5) unless expressly authorized by Congress, the Department of Agriculture shall not conduct any further statewide roadless area review and evaluation of National Forest System lands in the State of Wyoming for the purpose of determining their suitability for inclusion in the National Wilderness Preservation System. (Business or Association, Cody, WY - #A41559.45400)

180. Public Concern: The Forest Service should comply with the Oregon-Washington Wilderness Act.

BY HONORING ITS PROMISED EXCHANGE OF 86,000 ACRES OF TIMBER GROUND FOR DESIGNATED WILDERNESS AREA

The 1984 Oregon-Washington Wilderness Act promised our community 86,000 acres of timber ground in the unroaded area in exchange for the designated wilderness we got. We're still waiting for the first mile of road to be built. (Individual, Clarkston, WA - #A6015.20206)

The roadless regulation dictated unilateral prohibitions, which illegally usurped the authority of national forest plans, violated the National Environmental Policy Act, as well as violated the 1984 Oregon Wilderness Act (OWA). National forests comprise a majority (58%) of the productive forest acreage in Oregon. The roadless regulation instituted a unilateral prohibition on 1.620 million acres of Oregon national forests—or 10 percent of the state's national forest acreage. National forest plans directed that some 931,000 acres of this acreage be managed for multiple uses, including road access. Another 2.923 million acres of national forest area [were] already in designated Wilderness and other legally withdrawals. We find the roadless regulation illegally ignored the authority of the NFMA, NEPA, and OWA. (Business or Association, Salem, OR - #A21754.20200)

Executive Orders

181. Public Concern: The Forest Service should comply with Executive Order 12866.

In a great many areas our schools, roads, family and community incomes have been adversely effected by this proposal. This proposal contradicts the September 1993 executive order 12866 handed down by Clinton himself. (Organization, Orofino, ID - #A8393.20300)

BY IDENTIFYING A NEED FOR A NEW REGULATION

In the proposed rule that led up to the January 12, 2001, rule, the Forest Service advanced three principal reasons why the proposed rule is necessary: (1) road construction can alter the fundamental characteristics of roadless areas; (2) budget constraints limit the number of roads that can be adequately maintained; and (3) the controversy over management of roadless areas causes costs and delays. But the Forest Service did not identify a market failure or other compelling public need for the proposed rule. None of the above reasons indicate a need for a nationwide prohibition on road construction.

Executive Order 12866 requires regulatory agencies to identify a need for new regulations, stating: "Each agency shall identify the problem that it intends to address (including, where applicable, the failures of private markets or public institutions that warrant new agency action) as well as assess the significance of that problem [emphasis added]." [see Clinton 1993, Executive Order 12866, Section 1(b)(1)] The Executive Order also states: Federal agencies should promulgate only such regulations as are required by law, are necessary to interpret the law, or are made necessary by compelling public need, such as material failures of private markets to protect or improve the health and safety of the public, the environment, or the well-being of the American people. [Ibid., Section 1]

To implement the Executive Order and to comply with Section 638 of the Fiscal Year 1999 Omnibus Appropriations Act and Section 628 of the Fiscal Year 2000 Treasury and General Government Appropriations Act, the Office of Management and Budget (OMB) in March 2000 released guidelines standardizing the measurement of costs and benefits. In the Guidelines, the Director of the OMB explained to heads of departments that you should explain whether the problem arises because of a significant market failure or some other compelling public need." [See Lew, Jacob. 2000. Guidelines to Standardize Measures of Costs and benefits and the Format of Accounting Statements. Washington, D.C.: Office of Management and Budget, March 22. URL:] The Director added: If the problem is not a significant market failure, you should provide an alternative demonstration of compelling public need [emphasis added]." [Ibid]

The description of the need for the regulation provided by the Forest Service in the proposed rule that resulted in the January 12, 2001, rule fails to satisfy the Administration's requirements for economic analysis of regulations. None of the three reasons provided satisfy the requirements of Executive Order 12866 or OMB's Guidelines to Standardize Measures of Costs and Benefits. To comply with the Administration's regulatory policies, and with the well-accepted principles of good governance that they represent, the Forest Service should identify a need for the regulation before proceeding further with the development of specific regulatory proposals. (Business or Association, Washington, DC-#A29622.20300)

182. Public Concern: The Forest Service should comply with Executive Order 13211.

BY PREPARING A STATEMENT OF ENERGY EFFECTS

Because of the aforementioned flaws in the Forest Service's analysis of the impacts of the Roadless Rule on coal production and reserves, the Companies believe that the Agency must now undertake the preparation of a "Statement of Energy Effects," as required by President Bush's Executive Order 13211. See 66 Fed.Reg 28355 (May 22, 2001). That Executive Order recognizes (as a matter of federal policy) the need to address the sort of problem the companies have identified in the Forest Service's flawed analysis.

Section 4(b) of E.O. 13211 defines the term "significant energy action" to include agency action that "is likely to have a significant adverse effect on the supply, distribution, or use of energy..." Id. at 28356. The effects of the Roadless Rule on the Nation's coal production and reserves fall squarely within this definition. (Business or Association, Washington, DC - #A19636.20300)

The Forest Service should review the ANPR in light of Executive Order 13211, to determine if this process may constitute a "significant energy action" that may have any adverse effects on energy. The Forest Service should determine: any adverse effects on energy supply, distribution, or use (including a shortfall, price increases, and increased use of foreign supplies) should the proposal be implemented, and reasonable alternatives to the action with adverse energy effects and expected effects of such alternatives on energy supply, distribution, and use.

Among the mineral commodities that will be affected by a national roadless rule is the increasingly important reserve base of federal coal located on National Forest System lands. The Nation must use this vast supply of domestic energy to meet the growing energy requirements of an expanding economy. During the 1990s, about 350 million tons of coal was produced annually from federal coal leases. Demand for coal for affordable reliable electricity is expected to increase over 25% during the next 20 years.

Nearly 90% of this additional coal production will come from lands in the West and most of this coal will come from federal leases. The U.S. Energy Information Agency forecasts that by 2020 over 785 million tons of coal will be produced from the West. The coal underlying the National Forest System is of critical importance to our Nation's energy needs. Some 21 million acres within the System contain about 30 billion tons of recoverable reserves. Watson W.D. et al., 1995, Coal Resources in Environmentally-Sensitive Lands Under Federal Management: Reston, VA, U.S. Geological Survey, Open File Report 95-631. If this affordable coal is not available, high costs for alternative fuels will result in higher electricity costs and lower reliability. Coal resources from federal leases are vital to supplying electricity at a reasonable price and in an environmentally sound manner to American consumers both east and west of the Mississippi River.

The federal treasury, as well as state and local governments, share in the economic benefits derived from the production of America's most abundant energy resource from federal lands. The already small margin on which miners that produce federal coal operate will be shrunk further by this additional prescription on federal coal leasing. The cumulative impact of this process must be evaluated as required by EO 13211. (Business or Association, Washington, DC - #A29622.20300)

BY ENSURING AN ADEQUATE LAND BASE IS AVAILABLE FOR LEASING WITH REASONABLE STIPULATIONS

While we recognize that oil and gas leasing may be controversial in some parts of the NFS, we encourage the agency to take particular care in making sure that an adequate land base is available for leasing with reasonable stipulations in accordance with President Bush's Executive Order 13211. The FS must certainly recognize that industry has repeatedly demonstrated its ability to conduct oil and gas operations in a sound environmental manner, with little or no long-term disturbance. (Business, Denver, CO - #A25688.65310)

183. Public Concern: The Forest Service should reevaluate its application of Executive Orders 11644 and 11989.

WITH RESPECT TO RESOLUTION OF CONFLICTS BETWEEN USERS

Executive Order 11644 was passed on February 8, 1972 and Executive Order 11989 was passed on May 24, 1977. These Executive Orders have been used to enact thousands and thousands of motorized recreation and access closures since the 1970s. The cumulative effect of Executive Orders 11644 and 11989 has been a dramatic loss of recreation and access opportunities for motorized recreationists and a dramatic increase in recreation opportunities for non-motorized recreationists.

Executive Orders 11644 and 11989 allowed the reason "minimize conflicts among the various uses" to be used to enact motorized closures (see attached Executive Orders). It did not state "minimize conflict with other users". However, the implementation of Executive Orders 11644 and 11989 has been largely based on the incorrect usage of "minimize conflict with other users". The crux here is that "use" conflict is rather different from "user" conflict. There are certainly "uses" that are incompatible from an objective standpoint. For example, a ski run and a mine cannot operate in the same place at the same time . . . it is physically impossible and therefore a clear "use conflict." But there could be a case where a mine is located next to a ski hill and both can operate without interference, with no genuine use conflict. Whether there is a "user conflict" or not depends primarily on user attitudes. (Organization, Helena, MT - #A13226.20300)

184. Public Concern: The Forest Service should comply with executive orders directing federal agencies to expedite permitting and to reduce impediments to energy development.

We also believe the Roadless Initiative is in direct contrast to the President's Executive orders directing federal agencies to expedite permitting and to reduce impediments to energy development. (Business, Bismarck, ND - #A19270.20300)

Other

185. Public Concern: The Forest Service should comply with Public Law 96-550.

BY RESCINDING THE ROADLESS AREA CONSERVATION RULE

An Executive Order on the Roadless initiative will:

1. Overturn the Public Law 96-550 enacted by the 96th Congress December 1980
2. Be contrary to the 1986 Carson National Forest Plan concerning Sipapu Ski Area
3. Negate 15 years of work and expense by the Forest Service and Sipapu in developing an EIS for ski area expansion
4. Be an environmental injustice by creating economic and social hardships on the poorest counties in northern New Mexico
5. Circumvent the right for appeal

Public Law 96-550 enacted by the 96th Congress December 1980

The purpose of the act is very specific with its main points:

1. Designate certain National Forest lands to be included in the National Wilderness Preservation System.

2. **Insure certain other National Forest System lands in NM be promptly available for non-wilderness uses including but not limited to campground and other recreation site development, timber harvesting, intensive range management, mineral development and watershed and vegetation manipulation.**

3. Designate certain other National forest System land in NM for further study in furtherance of the purposes of the Wilderness Act.

The land surrounding the ski area was not included as wilderness lands, not included for further study and **was included in other lands promptly available for non-wilderness uses.**

The EIS for the Carson National Forest Plan, completed in 1986, is in accordance with Public Law 96-550 and designated management area 15 for ski area expansion. (Permit Holder, Vadito, NM - #A20142.10140)

186. Public Concern: The Forest Service should comply with Public Law 105-359.

BY PROVIDING RECREATION AND OUTDOOR OPPORTUNITIES FOR THE HANDICAPPED, ELDERLY, AND PHYSICALLY IMPAIRED

Handicapped, elderly, or physically impaired, can only recreate on motorized roads and trails and recreation opportunities must be considered for them. On November 10th, 1998, President Clinton signed Public Law 105-359, requiring the Secretary of Agriculture and the Secretary of the Interior to conduct a study to improve access for persons with disabilities to outdoor recreation opportunities made available to the public.

The Study prepared to address P.L. 105-359 (Improving Access to Outdoor Recreational Activities on Federal Land, prepared by Wilderness Inquiry, June 27, 2000) found and recommended the following areas of action:

- 1) Agencies must re-dedicate their efforts to achieve the goal of equal opportunities for access to outdoor recreation by persons with disabilities.
- 2) Agencies should conduct baseline assessments of existing facility and programmatic accessibility, and develop and implement transition plans for facilities and programs that are not now accessible to bring them into compliance.
- 3) Increase accessibility related awareness and educational opportunities for agency personnel, service providers, and partners.
- 4) Increase funding to federal land management agencies for accessibility.
- 5) Increase accountability and oversight in implementing accessibility initiatives.
- 6) Improve communications about opportunities for outdoor recreation to persons with disabilities.
- 7) Clarify the balance between resource protection and accessibility.

The document and decision must adequately address and comply with the recommendations of the Study conducted to address P.L. 105-359 including items 1 and 7. (Organization, Helena, MT - #A13226.20200)

187. Public Concern: The Forest Service should comply with the 1997 guidance document by the Council on Environmental Quality regarding environmental justice.

AS IT RELATES TO EQUAL TREATMENT AND ACCESS TO PUBLIC LANDS

The document and decision must comply with the requirements of Environmental Justice as presented in the 1997 guidance document by the Council on Environmental Quality. These requirements must be evaluated as they relate to equal treatment and access to public lands for all people including disabled and motorized visitors. One example of unequal treatment can be seen demonstrated by the number of publications and web site information pages that each forest provides for non-motorized visitors versus

the publications and web site information pages provided for motorized recreationalists. Non-motorized recreation opportunities are easy to find using agency web sites and printed information. Often very little information is provided about motorized recreation opportunities. (Organization, Helena, MT - #A13226.20300)

Chapter 3

Public Involvement

This chapter includes three main sections: Informed Decisionmaking (Question 1), Working Together (Question 2), and Competing Values/Limited Resources (Question 9).

Informed Decisionmaking (*Question 1*)

Question 1: Informed Decisionmaking. What is the appropriate role of local forest planning as required by NFMA in evaluating protection and management of inventoried roadless areas?

This section includes four subsections: Informed Decisionmaking General, Decisionmaking Authority, Local vs. National Decisionmaking, and The Forest Planning Process.

Informed Decisionmaking General

Summary

The most persistent general remark regarding informed decisionmaking is that the Roadless Area Conservation Rule, in the form in which it was signed in January, 2001, represents informed decisionmaking at its best. This remark follows a recurring theme in comment on the Advance Notice of Proposed Rulemaking—the Rule, respondents state, is the result of more than 600 public hearings and 1.6 million public comments, which they believe should prove that the American public is behind this policy. These respondent consider the Rule as it now stands is a good example of informed decisionmaking. Respondents also encourage the Agency to make the best decisions it can within existing constraints, to streamline the decisionmaking process, and to avoid making decisions merely to avoid litigation. To aid in decisionmaking, some suggest making roadless area decisions through an allocation process, or issuing a preliminary document for public review.

188. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule is a good example of informed decisionmaking.

Informed Decision making: The Roadless Area Conservation Rule as it now stands is the result of more than 600 public hearings and 1.6 million public comments, the vast majority of which supported protection of our national forests. The rule as it now stands is a good example of informed decision making. Future NFMA planning for these inventoried roadless areas should be guided by the Roadless Area Conservation Rule. (Individual, Reno, NV - #A5110.10152)

The RACR was an appropriate resolution of the RACR, being universally available to public comment, and demonstrated the sometimes-overwhelming need to respect a national demand. Every interested

party mentioned had the ability to comment, early and often. If the Forest Service is going to switch to another model of decision-making, now is not the appropriate time. The RACR is an appropriate national sidebar for management of all National Forests, akin to avoiding harvesting on slopes greater than a certain degree or on lands that have not been surveyed for wildlife, neither of which we question as being an abridgement of local authority. (United States Representative, Georgia - #A693.14410)

The Roadless Rule was signed following almost 30 years of research and an extensive public review and comment period, which generated the largest number of responses ever in the rulemaking process—mostly in favor of the rule. Many citizens spent much time and thought responding to the Roadless DEIS. This administration is, in essence, discarding the efforts and input of 1.6 million Americans by ignoring the previous process. The current ANPR process, by comparison, has had little publicity and no public meetings and asks us to respond to questions, which have already been answered. Others, when asked if they have comments on Roadless, reply that they have already done that—last year. This process is not fair and open. It is not soliciting meaningful dialogue and input; many are not even aware it is occurring. The administration is attempting to recount the votes, relying on a low response, so it can change the Rule to fit its own agenda to the benefit of the extractive industries. As justification for issuing the ANPR the USDA cited eight lawsuits, which shared the common allegation that there was an inadequate opportunity for public review and comment on the Roadless Rule. The Attorney General, whose responsibility is to uphold federal law, did nothing to defend the Rule or the process—there was no defense of this federal rule by any federal entity. We have had a fair and open process on the Rule. The ANPR process is the opposite. (Individual, Klamath Falls, OR - #A5118.14000)

189. Public Concern: The Forest Service should recognize that informed decisionmaking processes have occurred under the National Forest Management Act and state wilderness bill processes.

I can't help address point one on informed decision-making. I believe this process (informed decision-making) has occurred under the NFMA and individual state wilderness bill processes. I have been involved in both processes in Colorado and Montana over the years, and can vouch for the thoroughness of these exercises. RARE I and II were nearly exhaustive in their scope, and later roadless inventories on individual districts rounded out the investigations. Forest Planning was not always so detailed, but this process gave ample opportunity for input and informed decision-making.

One positive benefit of these exercises was the opportunities for heightened awareness on the part of the public who participated. Whether our learning came from advocacy groups, or from planning and forest staff, anyone who went through these exercises was the wiser for the experience. When I, and thousands of others attended roadless area meetings that led to the rule, we benefited by the earlier processes. I have to say, that if the opponents to roadless areas are complaining about the rule, what they are really complaining about is government . . . (Individual, Bozeman, MT - #A6287.10157)

190. Public Concern: The Forest Service should use the best available means within existing constraints in decisionmaking.

Many assert that the appropriate process for evaluating and making long-term resource management direction—including inventoried roadless area protection and management—is through the local forest planning process, which is governed by the rules at 36 CFR 219.

The phrase “the most appropriate process” fails to reflect the fact that decisions are made and must be made within specific contexts. The Forest Service, for example, can not spend the entire GNP of the United States in its efforts to make any particular decision. Other parameters limiting decision-making include but are not limited to time, staff, uncertainties in communications, and imperfect information. Decisions should be made using the best available means within constraints active at the time. (Individual, Nederland, CO - #A19016.11110)

191. Public Concern: The Forest Service should streamline the decisionmaking process.**TO ELIMINATE LONG DELAYS**

The decision process should be timely and eliminate the long delays brought about by layer after layer of legal traversing.

Paper shuffling and multiple studies on the same research topic or proposed management action must be eliminated. The USFS [should] become more time constrained, more oriented to actual on-the-ground results. (Individual, Libby, MT - #A10531.12000)

Finally, make a decision and implement the decision as quickly as possible. It's OK if everybody doesn't like it. The roadless issue has dragged on far too long. Our resources are suffering because of indecision. (Business or Association, Spokane, WA - #A21364.10130)

192. Public Concern: The Forest Service should not make decisions merely to avoid litigation.

The Forest Service must make decisions based upon the welfare of the forests and the interests of all Americans in that welfare. Therefore, it must not consider the litigiousness of participants in any of these processes. In other words, the Forest Service must not make decisions based upon its desire, or upon the desire of local Forest Service employees, not to be sued in court. Where a pattern of frivolous lawsuits is discernable, the Forest Service should petition the Department of Justice or U.S. Attorney's Office to seek monetary sanctions against the offending groups and the attorneys that represent them. (Organization, Denver, CO - #A29624.15100)

The Forest Service cannot let the fear of a lawsuit unnecessarily influence its forest management decisions or the timely implementation of actions such as timber harvest. The Forest Service also has a responsibility in the continued viability of the United States industrial base, and cannot let the fear of lawsuits result in an over dependence on foreign products due to a lack of U.S. production. (Individual, No Address - #A28621.15166)

193. Public Concern: The Forest Service should make roadless area decisions through an allocation decision process.

I think this rule should specify a process that allows people with a wide range of views to participate as representatives. The letter writing campaign approach voting for or against a decision is not what was specified by congress and the president through the NEPA law. I think this IRA issue is of such import and is steeped in strong opinions that it needs an allocation decision process that facilitates participation of the stakeholders but forced to go through an analytical process reporting the effects and trade-offs with a decision at the end that allows a portion of finality at least for a specified time period (15 years) and during that time then projects don't have to reanalyze the roadless value issue again. (Individual, Missoula, MT - #A28297.15100)

194. Public Concern: The Forest Service should issue a preliminary document for public review.

Preliminary forest plan rewrites or updates can be prepared using known interests of various groups including local communities and tribes. Suggestions can be solicited. It's important to issue a preliminary document for review because it will generate the needed thought, especially if there are areas or items of disagreement such as road closures. Meet and work out the details. (Individual, Minneapolis, MN - #A8016.15111)

Decisionmaking Authority

Summary

The Forest Service – A variety of respondents suggest that decisionmaking authority should remain with the Forest Service. Some say the Chief should make decisions regarding management of roadless areas, but others defer to the Agency in general. Respondents say the Forest Service should make decisions rather than Congress, rather than politicians in general, and rather than the public. One association states that collecting comments from all interested parties does not divest the Forest Service of its obligation to make decisions based on what is best for the land and its inhabitants, within the confines of the current framework and congressional direction. This respondent does not believe the general public qualified to direct decisions nor should they be held responsible for land management decisions.

Respondents offer a number of suggestions on how the Forest Service can best carry out its decisionmaking responsibility. Some of these include developing uniform direction for the procedures to be used in roadless area management decisionmaking; conducting large regional meetings of forest officials; allowing each national forest to assume the lead responsibility for developing management proposals; giving the district ranger greater decisionmaking authority; and allowing local forest managers to have complete decisionmaking authority.

Some suggest that the Forest Service should insulate local officials from decisionmaking so they will not suffer negative repercussions from locally unpopular decisions. Finally, some ask the Forest Service to clarify its authority and relationship with Congress, as well as the discretionary authority of the responsible official.

Legislative Bodies/Other Groups – A number of respondents assert that Congress should manage federal lands. According to some individuals, federal land, in general, should be managed at the federal level in Congress, where there is equal representation. Those who take this position say congressional decisionmaking would allow better consideration of local conditions, an end to the present stalemate over roadless area management, and more consistency in forest plans. Others suggest that the Forest Service develop management plans, then submit them to Congress for final approval.

Other respondents suggest that states should manage federal lands. What would be most useful, submits one individual, would be to turn all federal land over to the states and let them manage. Both those advocating congressional management and those advocating state management stress the point that decisionmaking should be the purview of elected representatives. Elected representatives, they argue, would be more responsive to local concerns and more accountable for their decisions.

Finally, people suggest that various other groups be decision makers. Suggestions include committees composed of various groups: unaffiliated individuals, representatives of different interests, scientists and Forest Service specialists, or a committee assigned by county commissions.

Trust and Integrity – Comments evincing distrust toward the Forest Service and/or the prior or current Administration are among the most prevalent comments on the Advance Notice of Proposed Rulemaking. Respondents assert that the Forest Service should avoid making decisions in secrecy or with preconceived outcomes in mind. These respondents frequently comment that

politics should be kept out of the decisionmaking process. According to one respondent who uses the Tongass Forest Plan Revision as an example, the conceived failure of that planning process did not come from local decision authorities, but because the national office became involved in the decisions, decisions considered political but not applicable for the Tongass National Forest. This respondent sees this as proof that national level policies are politically driven, while local planning is based on science and what is best for effected citizens.

People state that the way the Forest Service handled the Roadless Area Conservation Rule has damaged its public relations and community support. One individual believes that local managers were pressured by higher management to identify roadless areas during development of the Rule.

At the same time, other comments reflect the public's suspicions regarding the motivation behind this round of comment. One individual alleges that this administration must be trying to get rid of the Roadless Rule, by sending it out for comment again. Along this same line, some say the Forest Service should acknowledge its bias toward resource users, claiming that the agency will screen out suitable roadless areas to be conserved, in order to satisfy consumer needs.

Both those who ask that the Rule be implemented, and those who ask that it not be implemented, assert that the Forest Service should work to regain the public's confidence. According to one individual, there have been times, especially under the Clinton administration, that the government seemed to do whatever it wanted, regardless of what the majority of people wanted. This person points out that it is hard to have confidence when people do not believe they are being listened to. Other respondents reference the fee demo program as an example of violating public trust, while charging permittees, such as grazing, under market value, the Forest Service seems to be taxing recreationists for low impact use of the land while resource users are subsidized for impacting the environment. (See the Executive Summary for a more general discussion of trust and integrity comments on the Advance Notice of Proposed Rulemaking vis-à-vis those on the Roadless Area Conservation Rule Draft EIS.)

The Forest Service

195. Public Concern: The Forest Service Chief should retain decisionmaking authority.

Chief Bosworth, you are the one who can decide for the common good, for the long-term. You and I both know that once the beauty and serenity of wild nature is gone, it is gone forever!!! We can't change our mind. Please do not let us lose any more of our fabulous national heritage of nature and wilderness!! (Individual, Denver, CO - #A11769.12122)

The role of forest level planning is to involve local public interest in advising and informing decisions on national forest management. Due to the need for informing decision making on the remaining small percentage of public lands represented by the roadless area conservation plan I feel the decision level [appropriate] for these lands is at minimum the Regional Forester and best at the Chief's level. (Individual, No Address - #A30117.13100)

OVER ROAD CONSTRUCTION IN ROADLESS AREAS

Retain any final decision authority to build roads in roadless areas with the Chief of the Forest Service. (Individual, Lyons, NY - #A1737.12122)

196. Public Concern: The Forest Service should decide the management direction for roadless areas.

We expect you to manage our public lands. We expect you to decide, by yourselves, if necessary, on the correct course to take and then take it. You are not referees between competing relations or philosophies. You are professional land managers and we expect you to go out and manage the land. The only real mistake you could make would be to do nothing while the situation grows more desperate. (Business or Association, Spokane, WA - #A21364.12120)

Surely the primary responsibility of a conservation administration is to conserve; in particular, to preserve this precious American heritage that has survived since Colonial times. If the United States Forest Service will not protect these forest fragments, then who will . . . ? (Individual, Tallahassee, FL - #A6255.12120)

While we recognize the predicament the agency faces as land manager, it is still up to the management agency to make the final decision on how its lands will be managed. Clearly, the Forest Service would like to be all things to all people, but this is unrealistic. Simply put, the Forest Service must conduct a comprehensive analysis of the lands in question, take into account scientific data, take into account community needs, make reasonable land use decisions and accept responsibility for its management selection. If the decision is appealed or challenged through litigation, the Forest Service must only prove it made an informed decision. (Business, Denver, CO - #A29112.12120)

RATHER THAN CONGRESS

The management for roadless areas should be maintained and managed by local forest service personnel under a code adopted by the Forest Service and not Congress. (Individual, Spring City, UT - #A25950.25240)

RATHER THAN POLITICIANS

This continues to be an issue, which will impact Americans for centuries to come. Roads are necessary often become pathways of destruction for the forests. There continues to be individuals who destroy forest property wantonly or harass game or poach it. Careful consideration is essential. Political gesturing does not help. Please allow the Forest Service to make the decisions, not a lot of politicians. (Individual, Ventura, CA - #A7814.12120)

RATHER THAN THE PUBLIC

We would like to emphasize that gathering viewpoints of all interest parties does not relieve the Forest Service of its duty to make management decisions based on what's best for the land and its inhabitants within the current framework and Congressional direction. Gathering comments from the public should in no way resemble or encourage a quasi-voting system. The direction for managing our nationally owned forests is given through our elected officials in Congress and managed by the Administration. The general public is not responsible or qualified to make decisions regarding these lands. (Business or Association, Portland, OR - #A19004.15150)

Competition for competing priority uses will continue to be an integral part of the management of the National Forests. This is proper, but the Forest Service must remember that in the end they are the agency that must make the decisions and implement the actions. Abrogating that responsibility based on input letters, polls, etc. is neither proper nor ethical. The closer to the action the better the final decision will be, which speaks volumes for delegating the decision to the local agency leadership provided they decide within the confines of approved policies and programs. (Individual, Seeley Lake, MT - #A8075.15160)

It is my impression that the Forest Service has very good skills in carrying on open public processes, but then has difficulty reaching and implementing decisions. Perhaps there needs to be a clearer delineation between the role of the public in commenting and the role of the Forest Service in deciding.

Unfortunately, that is precisely what we all thought the early NFMA planning regulations did, yet here we are today. (Individual, Spokane, WA - #A17819.15161)

BECAUSE IT HAS A DUTY TO APPLY ITS EXPERTISE

The agency needs to take a leadership position in managing the forests. The Forest Service has tremendous expertise in managing natural resources, and it has a duty to apply that expertise. Recently, the agency has explored various roles for itself in forest management, including those of facilitator. From the ski industry's perspective, it is crucial the Agency takes a leadership role in the management of NFS lands, whether it is at a planning or site-specific project level. The agency is not merely a participant in the process, it has a statutory duty to provide outdoor recreational opportunities to the public under NFMA, the Multiple-Use Sustained Yield Act, and the National Forest Ski Area Permit Act. As we witness an increase in involvement (in our approval processes) from other federal agencies with little or no experience in providing recreation, the leadership of the Forest Service becomes even more vital. (Permit Holder, Hood River, OR - #A13230.12120)

AS PROFESSIONALS, RATHER THAN REFEREES BETWEEN COMPETING INTERESTS

Forest policy should not be made by popular vote. The Forest Service has asked for substantive comments to help with decision-making on this issue. We expect you to manage our public lands using the best available science and substantive public input. We expect you to decide as professionals on the correct course to take and then take it. You are not referees between competing religions or philosophies. You are professional land managers and we expect you to go out and manage the land. (Business or Association, Coeur d'Alene, ID - #A22058.12120)

BY DEVELOPING UNIFORM DIRECTION FOR THE PROCEDURES TO BE USED IN ROADLESS AREA MANAGEMENT DECISIONMAKING

There must be regulations that aid Forest Supervisors and the plan revisions team that provide a consistent procedural approach to Roadless Area management.

The final rule of 1/12/01 erred in being a "decision document", unilaterally prohibiting certain activities in Inventoried Roadless Areas. The new procedural regulations should avoid making decisions and instead give uniform direction for the procedures to be used in making decision relating to Inventoried Roadless Areas. (Organization, Chesapeake, VA - #A11804.10130)

BY CONDUCTING LARGE REGIONAL MEETINGS OF FOREST OFFICIALS TO DECIDE THE USE OF ROADLESS AREAS

Regarding your second issue, that of working together, I offer no suggestions for solutions, but I do say that while small committees would seem to be the most efficient means of deciding issues, they are also prone to corruption or bias. I dare say that issues as important as the use and protection of our roadless areas demand to be treated with great respect and I wonder if large regional meetings of forest officials would be useful in deciding how best to use the areas. Large bodies of diverse, geographically scattered members would certainly be harder to corrupt or bias and would yield more productive discussions. (Individual, Cambridge, MA - #A11912.15000)

BY ALLOWING EACH NATIONAL FOREST TO ASSUME THE LEAD RESPONSIBILITY FOR DEVELOPING MANAGEMENT PROPOSALS

As the federal agency which has been charged with the responsibility for the administration and management of all National Forest system lands, each National Forest should assume the lead responsibility through the forest planning process to gather and compile the necessary data in a format which can then be presented to the general public, elected officials, other state and federal agencies, and other interested groups in an effort to arrive at a management plan that will gain the support of a majority of the various interested participants within the constraints of the various laws and regulations that are pertinent to the area. (Individual, Eagle, ID - #A3368.12100)

BY GIVING THE DISTRICT RANGER GREATER DECISIONMAKING AUTHORITY

Strengthen the staff and decisionmaking authority of the Ranger Districts. Districts should have the necessary specialists to do the work and know the land, animals, landscapes and the social economic environment with the District. Reaffirm the District as the doing level of the Forest Service and give the

District Ranger greater authority for decision making and carrying out plans. Planning at the District level should generally answer the how to questions using the best science, economic and social information available to do projects. (Individual, No Address - #A26264.12125)

BY ALLOWING LOCAL FOREST MANAGERS TO HAVE COMPLETE DECISIONMAKING AUTHORITY

Require the Forest Service line officers to make decisions about each roadless area at the local level after involvement with the public and other appropriate agencies.

We must bring the decisions about which areas should really be roadless and how they will be managed on an individual basis using the forest planning process with all the players involved. (Individual, No Address - #A20465.13110)

When not specified by law, in support of a more localized planning process, all forest plans, environmental impact statements pertinent to timber sales and other projects on a national forest, science based roads analyses and actions which meet compelling needs should be the responsibility of the Forest Supervisor, who should be the Responsible Official, not a higher level of authority. Specifically on the Tongass NF, the Forest Supervisor should be the Responsible Officer regarding determinations to harvest in inventoried roadless areas in order to meet the market demand requirements of the Tongass Timber Reform Act (TTRA). This is the level at which local knowledge is at its greatest. In addition, this returns authority and responsibility to the level where it belongs.

In the administrative process, all appeals of rulings by the Forest Supervisor would be to the Regional Forester who would be allowed to make the final determination. Additional remedies would have to resort to seeking redress in the Federal court system. (Tribal Corporation, Seattle, WA - #A20468.12125)

Most definitely, the activities that should be expressly prohibited are United States Forest Service national direction. Local forest planning professionals should be allowed complete authority to incorporate or exclude activities within such areas, after weighing and considering all public input. Plainly put, professional staff at the local level should have the competency and self-confidence to make these calls. (Business or Association, Cody, WY - #A19163.13214)

197. Public Concern: The Forest Service should not give local forest managers greater latitude in management decisions.

Do not give local managers of these federal lands greater latitude in management decisions. Along with what we create, our age will be remembered for what we chose not to destroy. (Individual, Boulder, CO - #A26125.13110)

198. Public Concern: The Forest Service should insulate local officials from negative repercussions of decisions.

This perpetual problem is best addressed just the way it was done in establishing the Roadless Area Conservation Rule. The only way to make such national policies work is to insulate local managers for decision-making. If you change the rule every time someone complains or, put the decisions in the hands of local managers who have to live with those who might disagree with the decisions is a guarantee that no rule will work. We have lots of experience with this approach, so perhaps it is time to learn from that experience. (Individual, Sebastopol, CA - #A2990.13120)

The current review is a not-so-subtle effort to return management decisions to local officials, a policy whose consequences are revealed by the scares of 400,000 miles of roads in our National Forests. Experience shows that decisions related to protection of roadless areas should be based on national policy, not the whim of local officials. In fact, the local officials need to be insulated from decisions made in the national interest that might be locally unpopular. (Individual, Sebastopol, CA - #A2990.13120)

199. Public Concern: The Forest Service should clarify its authority and relationship with Congress.

The Forest Service should not blur the separation of powers among the 3 branches of government by having Congress validate rules of local forest plan revisions. Congress should set general policy in laws and the executive branch (in this case the F.S.) should implement and operate under those policies, via rule adoption and action. (Individual, Olympia, WA - #A8793.12100)

200. Public Concern: The Forest Service should clarify the discretionary authority of the responsible official.**AND CEASE DELEGATING AUTHORITY TO THE RESPONSIBLE OFFICIAL WITHOUT REGULATIONS REQUIRING AN EIS AND PUBLIC COMMENT**

Responsible official's discretion for future road decisions are too broad. Coeur supports a management approach that provides for site-specific flexibility. Under this proposal the "Reasonable Official" would have unlimited discretion in determining when additional protections should apply to inventoried roadless areas or when unroaded areas should be placed off limits to future roads. It is also unclear if this discretion of the Responsible Official would be subject to public comment, review, and appeal procedures. Coeur opposes this delegation of authority to the Responsible Official without clear regulations in place requiring preparation of an EIS, and opportunity for public comment. (Business or Association, Juneau, AK - #A23080.12125)

201. Public Concern: The Forest Service should adhere to its agency mandate.

Forest Service should have a mandate that was part of their creation and the winds of political opposition should not sway that mandate, if not in fact created as of yet, one should be created and never swayed by **any political force**. Compliance with mandates of agency could be used as defense in litigation if approved by Congress. Each Federal Agency has a mandate and should not be used to provide more for one agency such as Forest Service Land being conveyed to Wilderness Designated Areas. Preservation works both ways. (Individual, Lacey, WA - #A17762.15160)

*The Legislative Branch***202. Public Concern: Congress should manage federal lands.**

For several years the public has been pushed into one plan after another, one battle after another . . . all rulemaking should be suspended until one grand plan that incorporates and encompasses the entire process is created. Such a rule should then be brought before Congress to become law, such as the Federal Land Management Policy Act. Rulemaking is a job for our elected officials who truly represent the people. (Individual, Sun Valley, NV - #A30102.10110)

Federal land in general and the roadless issue in particular should be decided on a federal level in Congress where all people from all states are represented. To allow federal land use policies to be dictated by local and state governments usurp our rights as citizens to have national issues decided democratically. (Individual, Kalispell, MT - #A26974.13120)

I believe that an act of Congress should be required to designate future roadless areas or implement any sweeping changes to the public lands use policy. (Individual, Mayfield, UT - #A6629.12120)

An extensive collection of comments have already been provided on this subject to the Administration concerning this matter.

Since President Bush and special interest groups evidently disagree with this Record of Decision (published as part of the final rule, 36 CFR Part 294, Special Areas; Roadless Area Conservation, on January 12, 2001 at 66 CFR 3244), this matter should be handled by a Congressional Subcommittee for review with legislation designed for a vote. (Individual, Bethel Park, PA - #A29859.12130)

This initiative goes against the core mandate of the Forest Service, to manage forests. This initiative is not the way public land policy has been made in the past and should be made today. The best way to get the issues aired is through hearings headed up by our elected representatives, such as in a congressional debate over a wilderness bill. Otherwise the Forest Service becomes the mere political plaything of pressure groups and environmental extremists. (Organization, Missoula, MT - #A28141.12100)

TO ALLOW INPUT FROM CONSTITUENTS

Congress should be involved in any Roadless plan so the people the Congressman represents can have input. (Individual, No Address - #A457.12130)

TO ADDRESS LOCAL CONDITIONS

Forest planning should only be done through elected representatives using constitutional principles. Our representatives should direct you what to do—not vice versa. The local representatives should be the ones to determine local conditions where possible. I, or my proxy (local Representatives and Senators) should not have a say in what is done in Vermont any more than Vermont should have a say in what is done here. (Individual, Ogden, UT - #A494.13110)

TO ALLOW A CHANGE IN MANAGEMENT DIRECTION WITH EACH ELECTION, AND TO END THE PRESENT STALEMATE OVER ROADLESS AREA MANAGEMENT

Designation of these Roadless Areas is a POLITICAL decision. It is not dependent on the physical or biological characteristics of the site. Therefore, I feel that the Forest Service should identify the areas that meet whatever criteria are established for Roadless Areas, display the resources of the areas evaluate the environmental effects of designation of the area and have the local Congressman designate the area establishing whatever management direction they feel is appropriate. If there is enough dissatisfaction within the Congressional District the next election can address the issue. In this case the agony of an unpopular decision will only last for two years [with] the local community. The Congressman can be defeated in the next election and the process can be redone. As it is now we seem to be in an eternal stalemate with no end in sights. (Individual, Olympia, WA - #A278.12100)

TO MAINTAIN CONSISTENCY IN FOREST PLANS

We need long-term funding and infrastructure for maintenance, timber stand improvement and prescribed burning. Have all decisions go to Congress for approval, so there is consistency in the plans, unchanging under different administrations. (Organization, Reno, NV - #A5987.17100)

DUE TO THE POLARIZATION OF THE ISSUES

This effort started as a political effort by President Clinton and VP Gore. It was then passed on to the Forest Service to make it legally proper. Unfortunately, I cannot believe that this issue is ever going to be resolved, either nationally or locally. Agreement is impossible due to the polarization of the issues and there will never be total agreement on how much wilderness or natural area is needed. If a national solution is possible, it should be made by Congress, not by administrative order. (Business or Association, Colville, WA - #A3091.12130)

203. Public Concern: The Forest Service should recognize Congress's authority to create, modify, or terminate withdrawals of public lands.

TO ENSURE THE CONTINUED INTEGRITY OF NATIONAL RESOURCE MANAGEMENT SYSTEMS

Based on comments made by the Clinton Administration, this plan appears to be a thinly veiled attempt at turning what should be a public process into a political one. In efforts to push the plan through as quickly as possible, both public input and Congressional approval were ignored and denied despite legal requirements. According to the Congressional Record of the 94th Congress-Second Session 1976, House Report NO. 94-1163, pg. 6183, FLPMA reserved to the Congress the authority, "to create, modify, and terminate withdrawals for national parks, national forests, the Wilderness system, Indian reservations, certain defense withdrawals, and withdrawals for National Wild and Scenic Rivers, National Trails, and for the "national" recreation units, such as National Recreation Areas and National Seashores. This will insure that the integrity of the great national resource management systems will remain under the control of the Congress." (Business or Association, Boise, ID - #A20607.12220)

204. Public Concern: Congress should review all land use policies adopted by the Forest Service.**SO THAT THE PUBLIC CAN HEAR THE DEBATES**

All land use policies adopted by the Forest Service should be reviewed by congress and passed into law through the resolution and not the veto process by congress. It is in this best regard that the rights of the public will be protected and not destroyed by an out of control federal agency or a dictatorial president. It allows the debate to be heard by we the public and it holds our representatives accountable. (Individual, Napa, CA - #A7093.12130)

205. Public Concern: The Forest Service should make recommendations regarding forest management to elected representatives for their approval.

USFS plans and recommendations should be made to our elected representatives with clear, concise economically derived choices using defendable, peer reviewed science and management techniques. Our elected officials must then decide jointly with the USFS any significant/recommended management action. . . . The elected officials should have power to determine the priority of various forest projects, be reviewed regularly as to the progress of said projects, and determine whether a project shall proceed or not. (Individual, Libby, MT - #A10531.12151)

206. Public Concern: The Forest Service should submit forest plans to a local vote, then submit voter-approved plans to Congress for approval.

Forest plans should not prevent resource development or place unnecessary burdens on mining, timber harvesting, or recreation. Forest plans should be voted on by voters in the local jurisdiction, then the vote-approved plan submitted to Congress. (Individual, Albuquerque, NM - #A10497.25000)

*State, County, and City Governments***207. Public Concern: States should manage federal lands.**

Roadless areas do not necessarily need to be protected by a federal bureaucracy. What would be more useful, in my mind, would be to turn all federal land back to the states and let them manage it in the way they see fit. Communism believes there is an elite group that knows what is best for society and that they—we should just turn everything over to that group and all will be well.

DIDN'T WORK IN RUSSIA. HASN'T WORKED HERE OR YOU WOULD [NOT] BE ASKING THESE QUESTIONS. (Individual, Hamilton, MT - #A94.12150)

In Nevada we have a limited quantity of privately held ownership of lands. Consequently, we are sometimes "dictated to" by Federal edicts. I believe that individual States representing the people in their states should determine the use of those public lands within their boundaries. (Individual, Carson City, NV - #A1065.15130)

I believe that each state should have the ability to make the best decisions regarding the use of public lands that reflects the views of local residents. More local control of public land use by individual forest service managers is needed. The forest service should look at who the decision affects the most. A greater consideration, regardless of the numbers, should be given to local residents, governments and communities when making a decision that affects public lands and resources. A very minimal consideration should be given to the view of those who do not live in the area affected, regardless of the number of comments. (Individual, No Address - #A21353.13110)

Every state should control their own forests. (Individual, Polson, MT - #A1679.15130)

I believe that each state should have the ability to make the best decisions regarding the use of public lands that reflects the views of local residents. More local control of public land use by individual forest service managers is needed. (Individual, Price, UT - #A26952.12150)

208. Public Concern: The Forest Service should not allow local government entities to have a role in decisionmaking.

BECAUSE EXCESSIVE LOCAL CONTROL LEADS TO EXPLOITATION-DRIVEN POLITICAL PRESSURE

If, by “local,” the question means government entities other than federal, these bodies should have no role in decision making. They can and should make suggestions and recommendations, but should have no part in final management decisions. History has demonstrated that excessive local control leads to exploitation-driven political pressure and over harvesting, with little attention to scientific resource management. That characterizes the Forest Service’s past; we should not backtrack to previous days of failed management paradigms. (Individual, Missoula, MT - #A17700.15130)

Other

209. Public Concern: The Forest Service should allow various groups to be decision makers.

DISINTERESTED, UNAFFILIATED INDIVIDUALS

Decisions should be made by a group of individuals whose interests and affiliations include even proportions of all involved groups. Decisions should not be made by single individuals whose biases and personal opinions will sway the decisions. (Individual, Saint Louis, MO - #A629.12000)

A COMMITTEE OF EXPERTS

I am a strong believer that a committee of experts is the best way in evaluating a protection area especially if it is public grounds. Most definitely the local forest agency should be part of evaluation. (Individual, Vancouver, WA - #A389.12100)

SCIENTISTS AND OTHER FOREST SERVICE SPECIALISTS WHO WORK WITH THE LAND

I believe that evaluating the needs of local forests should definitely fall on the shoulders of those scientists and other forest service specialists who work and live with the land. Who else could possibly be better qualified to determine these needs than those who tend to them daily? (Individual, Eagle Creek, OR - #A29956.15169)

A PANEL OF APPOINTED PEOPLE REPRESENTING DIFFERENT INTERESTS

With all the varied values and considerations perhaps the Forest Service should not be the final authority on designating roadless areas but a panel of appointed people representing the different factors. No one is happy with a compromise but at least the Forest Service would not have to take the total blame. (Individual, Ogden, UT - #A2288.12100)

A COMMITTEE APPOINTED BY COUNTY COMMISSIONS

Each forest should have a 9 member “ground truthing” committee out of 18 nominees initially selected by the county commissions in public hearings, apportioned according to population. These people will be elected in the general election, with the person gathering the most votes chairing, paid by the Forest Service to go out on the ground for a year as a team, paid the prevailing wage with benefits, with a deadline to hammer out a package for voter approval. Equip these teams with GIS and other mapping equipment, supply timber cruisers and other forestry/biology professionals on demand, and the authority to make a decision. (Individual, Whitefish, MT - #A13242.15152)

Trust and Integrity

210. Public Concern: The Forest Service should maintain high ethical standards.

The Forest Service would be less torn if it maintained solid standards of resource protection and didn't pretend that the public is its "customer". Too often, biologists, hydrologists, and ecologists are muzzled because the district ranger, supervisor, or regional forester has made a decision based on politics, connections, ambition, or even personal financial self-interest . . . Standards of ethics are badly needed by your agency at the upper levels. (Individual, Victor, ID - #A20625.12230)

Very strong guidance should be provided from the Washington office in regard to ethics and fairness and ensuring that the same is carried out in all land use decisions. Beyond that wide discretion should be given local managers. (Individual, Ellensburg, WA - #A17772.13100)

211. Public Concern: The Forest Service should avoid making decisions in secrecy.

REGARDING MANAGEMENT OF ROADLESS AREAS

It came as a surprise to Forest Service employees and the general public when President Clinton announced the Roadless Initiative on October 13, 1999. The Forest Service field units were not consulted, nor was their Union consulted as to possible employment impacts. At the time of that announcement, it was not known which areas were being considered.

On May 8, the Draft Environmental Impact Statement (DEIS) was released. Again, the upper management of the FS strictly forbade any release of information prior to that date, and no one knew which areas were going to be proposed, nor what the proposed management of those areas was going to be. Some attempt had been made by local Forest Service offices to determine roadless areas suitable for the President's announcement, but that information wasn't used in the DEIS.

Consequently, the May 8 DEIS came again as a surprise to Forest Employees as well as other publics who were not consulted on which areas were to be considered. The DEIS's inventoried roadless areas (IRAs) were mainly selected by using the RARE II areas that were inventoried over 25 years ago. This past inventory was a result of a report to Congress as an outgrowth of the 1964 Wilderness Act. As a result of that report, about 40 million acres (22%) of the National Forests were made into Wilderness Areas. 54 million acres (28%) of the National Forest lands were inventoried by RARE II, but Congress has elected not to make these into Wilderness Areas and it was expected that these non-designated areas would be converted back to multiple use. But these were the areas that the Administration selected as IRAs in its new Roadless Initiative. (Union, No Address - #A28881.10135)

212. Public Concern: The Forest Service should avoid making decisions based on preconceived outcomes.

We think that keeping open lines of communications, listening to concerns, and responding to them, are the keys to laying a foundation for mutual cooperation on these issues. . . Ultimately, the Forest Service must keep an open mind about the issues before it, and must not come to the table with preconceived positions or outcomes in mind. Many of the concerns raised by the state, local and tribal governments, as well as industry and other organizations, about the roadless rule as published on January 12, 2001, came directly from a belief that the process that preceded that final rule was a predetermined outcome in mind; the ultimate shutdown of the lands, regardless of the impact on localities, and regardless of the health of the actual forests. (Business or Association, Washington, DC - #A6211.15100)

213. Public Concern: The Forest Service should keep politics out of the decisionmaking process.

Please no Politics. This is too important and you're in a position to make a non-political decision. (Individual, Mesa, CO - #A13738.10160)

Over half of our public lands are open to exploitation. Let's be good stewards and protect the other half from this political tug of war. These magnificent forests and the diverse wildlife they support are neither Republican nor Democrat, nor should this be our agenda when deciding its fate. (Individual, Whitefish, MT - #A13343.10160)

The failure of the planning process of TLMP and its revision, comes not in the local planning process, but in the national political arena to summarily dump years of heartache among stakeholders, who bought into the process to develop those plans, in deference to a national political agenda. This political route was chosen over the recommendations and decisions of the local planning effort, which proved that the system in place could work, especially when based on science not politics. (Business, No Address - #A29718.12200)

Decisions on forest management plans and projects must be based on credible science, local knowledge, and professional experience, not on political objectives supported by the counting of pro and con public comments. When I was a District Ranger, I knew of no law, regulation, or policy that directed me to make a decision based upon the number of comments received. Public input and participation in the project was to assure that the planning team and line officer were fully knowledgeable of the project resources and impacts, yes. Counting votes, no! The Forest Service has lost its credibility on this issue. (Individual, Ketchikan, AK - #A28983.12230)

Consider that you spend days reading material from the forest service, took time from your work to attend special public hearings and made great efforts to participate in a specific, concrete way in federal decision-making. Then, as soon as a new President comes in, you find that the rule representing that body of comments is being suspended until it can be completely reconsidered and rewritten, with the clear intent to overturn the integrity and intent of the whole decision. You would feel angry, cheated, and cynical about the words in the new pronouncements speaking about Science and Public Participation when it seems so obvious politics. (Individual, Grass Valley, CA - #A23575.12200)

First, it should be established once and for all time that the national forests and all their resources are permanent reservations which must be managed according to permanent policies that are based on merit and science and not politics. Some of the problems facing the Forest Service and the lands it manages have been created by irresponsible politicians, congressmen and presidents, such as the destructive aspects of logging, mining, and ranching, for over a century. These are our lands, held in trust for us by the federal government in perpetuity. National Forests are not the personal Monopoly board of the president, his flacks in the Department of Agriculture, and the Congress to play with at the whim of special interest groups.

Now we are confronted with an all-out-assault on our public lands, including the national forests, by a president intent on opening the gates for all the extraction industries—oil, gas, mining, and logging, because they ponied up an estimated \$40 million for his campaign for non-election, and now it's payback time. Why should the American taxpayers have to close ranks and fight every anti-environment, pro-mega business president who comes along and assaults our public lands, as we did under the Ronald Reagan attacks? Why can't we enjoy the security of permanent public policy which will manage and preserve our public lands for our enjoyment and generations yet unborn, much as we enjoyed the security of the Social Security Trust Fund before the politicians began dipping into it for their own purposes? (Individual, Loveland, CO - #A9080.12200)

214. Public Concern: The Forest Service should consider that the way it handled the Roadless Area Conservation Rule has severely damaged its public relations and community support.

The Roadless Area Initiative is very controversial, both inside and outside the Forest Service. It has magnified the conflict between the urban environmental community and other national forest users. The battle lines are drawn. On one side is the federal administration and every environmental organization;

on the other, every rural state and its governor, every county board, hunters, recreation vehicle users, and logging and mining associations.

The Roadless Area issue is steeped in controversy. The decisions that led to this initiative were not open and transparent. Only one group of forest users was consulted, and the other side was clearly and intentionally locked out of the process. No effort has been made to consult local Forest Service decision-makers. The local Forest Service staff is caught in the middle. Forest Service employees live in rural communities affected by the Roadless Area Initiative. Because of the way this initiative was handled by the federal administration, the level of distrust toward the Forest Service and its employees has reached an unprecedented level. A little bit of consideration by the Administration for Forest Service-community relations could have gone a long way toward diffusing the heated situation. As it now stands, the damage that has been done to Forest Service public relations and community support may take years to repair and rebuild. (Elected Official, Catron County, NM - #A15538.14120)

While Forest issues have often been steeped in controversy, the Roadless Area issue festers like an open sore on the Forest Service horizon. Why did this come about? Largely because of the Administration's manipulative political maneuverings, the issue is lopsided, raw, and offensive. The decisions that lead to this initiative were not open and transparent. Only one group of Forest users was consulted, and the other side was clearly and intentionally locked out of the process. There was no effort by the Administration to gather consensus or agreement. There was no effort to consult with the Union. This is an example of politics at its worst.

We Forest Service employees are caught in the middle. We are here to carry out government policy the best that we can. But we also live in rural communities affected by the Roadless Area Initiative. Because of the way this initiative was handled by the Administration, the level of distrust toward the Forest Service and its employees has reached an unprecedented level. This is very sad, because a little bit of consideration by the Administration for our diverse populations could have gone a long way toward diffusing the heated situation. As it now stands, the damage that has been done to our public relations and our community support may take years to repair and rebuild.

We are asking that a moratorium be placed on this initiative and that all sides initiate honest communication to diffuse this unpleasant situation. (Union, No Address - #A13245.10120)

215. Public Concern: The Forest Service should consider that local managers felt constrained to identify roadless areas during development of the Roadless Area Conservation Rule.

The Superintendent of [a national forest] stated in the public meetings in this area, that he had been tasked to come up with some "roadless" areas for the Roadless Initiative project. In response, his staff pulled out some studies from the 1970s in which certain areas had been identified as candidates for "roadless" designation. He further remarked that, as anyone can plainly see, these areas were not roadless in the 1970s and contained more roads now than then. Nonetheless, these were the areas that were designated as "roadless" because he had to designate something due to orders from higher headquarters. As one of his staff later remarked, this whole episode "marked a low point in our careers". Within the designated "roadless" areas were numerous private parcels of land which would require access to be maintained by existing roads. (Q1 and Q5) Also, these areas contain numerous double and single track trails that are open to motorized use. (Individual, Ruidoso, NM - #A17775.45512)

216. Public Concern: The Forest Service should address the public's suspicions regarding the *real* motivation behind this round of comment.

I am one of the 1.6 million citizens who submitted written comments on the roadless initiative, and one of thousands who testified at well-publicized meetings. The vast majority of testimony supported keeping inventoried roadless areas roadless, so I question the real reason for this second round. I am suspicious that it may be an attempt to overtrun the roadless rule because:

1. The Republican controlled/ Bush administration has been relentless in its assault on every aspect of the environment - air, water, endangered species, preserves, as well as the roadless initiative.

2. The pathetic defense the Justice Department presented, and the absence of Forest Service representation, at the Idaho suit against the Forest Service over the roadless initiative. This was a suit against the Forest Service, which was denied the opportunity to respond, substituting Bush-controlled Justice Department lackeys instead.
3. The government's decision not to appeal this decision.
4. The difficulty in obtaining the questions that format this response.
5. The complexity of these questions, which will discourage participation by citizens in favor of responses by funded extractive and exploitative industries and organizations (e.g. lumber, mining, snowmobile, ATVs). (Individual, Lolo, MT - #A111.10000)

It is evident that the ANPR has a strong bias for abandoning the Roadless Rule in favor of the Forest Service's traditional forest-by-forest planning process. The ANPR failed to mention that the Rule was developed with the most extensive public participation ever in a federal rulemaking process. The ANPR instead just focuses on the allegations in lawsuits that "there was inadequate opportunity for public review and comment on the roadless rule." Does this mean that the administration is completely ignoring the support of 1.6 million people who want to see roadless areas protected? Furthermore, the ANPR questions the legal adequacy of the environmental impact statement for the Rule. The ANPR states, "it is difficult, and perhaps infeasible to collect in a short timeframe, on a national scale, the local data needed to produce a sufficient EIS that analyzes all relevant information or that proposes an adequate range of alternatives." But the Bush Administration is utilizing the same type of time line, and places the comment period during the summer months. (Organization, Bozeman, MT - #A15467.14400)

Personally, I feel the current public comment period is redundant and wasteful, considering the fact that the first round of roadless was the single largest public involvement campaign the Forest Service has ever conducted. The reasons given for undertaking this process are vague and misguided. (Individual, Lewiston, ID - #A29569.10152)

217. Public Concern: The Forest Service should acknowledge its bias toward commercial interests.

The ANPR implies that local decision-making is needed because protection is warranted for some roadless areas but not others. It states that most roadless areas previously were not recommended for wilderness designation due to low wilderness values, inadequate public support, or "other resource potentials". It observes that the resource values of roadless areas "vary in importance"; specifically pointing out that roadless areas contain 9 million acres of "productive timberland". These statements exhibit the anti-wilderness, pro-timber mentality that has eroded public trust in Forest Service planning and created broad support for national regulatory protection of roadless areas. If the Forest Service is going to claim some roadless areas have low wilderness values and measure their importance as sources of timber, they should disclose that this is a bias to commercial extraction that is not based on science. (Organization, Spokane, WA - #A18013.12230)

The Forest Service can work with individuals and groups with strongly competing views, values, and beliefs in evaluating and managing public lands and resources by managing all existing roadless areas as nonmotorized, nonlogging, nonmining areas. Then the Forest Service can look at the remaining majority of federal lands and determine appropriate areas that can be reclaimed as roadless and reclaim it. The remaining area would still be the majority of federal lands. Manage that as you have, which means logging, roading, and general exploitation by industry. Industry would still have control of more than half of the public lands. That should be enough. Maybe the remaining roadless lands will be sufficient to provide a minimum amount of healthy forests, wildlife habitat, fisheries, water quality, clean air, and wildlife recreation for humans, while industry plies its trade on the rest of the federal land, as it always has. Wouldn't that be fair? Protect, say 40% of healthy forest by keeping industry and Forest Service "managers" out. Allow the rest to be pillaged as it has been for 40 years. Better yet, put the Forest Service in charge of the industry land and a new conservation-oriented agency in charge of the wildlands. How about it? Shouldn't 60% of the land be sufficient for industry exploitation. I'd make the

trade, right now. How about you? Oh, I see. You want it all. Well, therein lies the rub. Until you realize that greedy little side of your agency and industry, then do something about it, you'll never get people together. (Individual, Libby, MT - #A14047.10150)

My concern is that the timber industry provided a lot of input to these questions to guide the discussion away from ecological values and toward economic values. My concern is that you are disregarding 1.5 million comments in favor of preservation. My concern is that this administration could care less about our planet and only want big profits for rich people, at any cost. My concern is that the outcome of this discussion is a foregone conclusion and you are going to sell out. (Individual, Corvallis, OR - #A2352.12210)

218. Public Concern: The Forest Service should avoid asking the same questions until it gets the desired answer.

I have read your questions regarding the proposed changes. I think another question is far more important, and that is: **Why are you second-guessing a plan that was established based on two years of effort, over 600 public hearings, and the input of 1.6 million people?**

The current roadless rule is an excellent plan, with enormous compromises already built in to come as close as possible to satisfying all factions. It was established based on a long, arduous, and bipartisan process. For you to turn around and say "oh, a few of us don't like the results so we will try again" is highly offensive to all who worked for, and supported, the bipartisan compromise currently in place.

My father got a degree in chemical engineering just before the start of World War II. During the war he worked in a plant which made tetraethyl lead, the gasoline additive which of course was crucial during the war. Part of his responsibility was helping to monitor the ambient levels of lead in the factory (since of course lead is a poison). When the numbers his group obtained were too high, managers above them responded quickly-by saying "go back and try again". He was sufficiently disgusted to leave the field of engineering; after the war he got his Ph.D. in chemistry and taught at the University of Florida for the rest of his life.

Your proposal to modify this carefully considered, well crafted plan reminds me of those managers who by fiat overturned the careful measurements of competent engineers. (Individual, Greensboro, FL - #A18256.10152)

219. Public Concern: The Forest Service should work to regain the public's confidence.

It seems the open meetings and comments in writing are very good ways of communication. My concern and the concern of others is whether or not the federal gov. pays attention to what we say and what the people want. There have been way too many times, especially under the Clinton administration, that the government just did what ever it wanted, regardless of what the vast majority of people said. Somehow, confidence must be regained so that we the people feel like we are actually being listened to. (Individual, Stevensville, MT - #A17902.10131)

THE FOREST SERVICE CHIEF

Following are the comments of the Park County Environmental Council in support of the Roadless Conservation Rule signed into law in January of this year. As requested in the process laid out by the Bush administration's new Forest Service, our group presents the following answers to the questions composed, presumably by your staff. Though most of these questions have been more than adequately addressed in the FEIS produced by your predecessor, and these questions, we believe, are an attempt to confuse the public and provide a tactical avenue for delaying progress in protection of the public's last remaining roadless lands, we nonetheless will complete this task. Our group is disappointed in you, Chief Bosworth, for your blatant retreat from your respected position as a steward of the land to your new role as political puppet. Our group has difficulty with your apparent lack of integrity and we can only ask, what or who has co-opted you? The public is not as ignorant or naive as many in your administration seem to believe and this episode will only add to the discredit that accumulates daily from actions taken by your administration. We ask that you make every effort to redeem yourself and restore

our confidence in you by supporting the rule as it stands. (Organization, Livingston, MT - #A19219.12230)

BY MAINTAINING ITS OBJECTIVITY

Everyone must have equal access to the process and equal opportunity to express their views. We hope the back-room deals at the national level, which marred the initial rule making, are things of the past. The word “collaboration” carries a negative connotation, one of cozy deals and distorted information favoring one point of view or another. Decision makers must maintain their objectivity and assure a lack of bias in data collection and its use. The image of your agency has been badly tarnished by real or perceived coziness with special interest groups. The NEPA process was corrupted in the rush to complete massive national initiatives before the last administration left office, becoming a means to confirm decisions already made. The Forest Service as an agency will have to prove its professionalism before re-earning the public’s respect, especially at the local, adjacent community level. (Business or Association, Olympia, WA - #A3619.12120)

Everyone must have equal access to the process and equal opportunity to express their views. We hope the back-room deals at the national level, which marred the initial rule making, are things of the past. The word “collaboration” carries a negative connotation, one of cozy deals and distorted information favoring one point of view or another. Decision makers must maintain their objectivity and assure a lack of bias in data collection and its use. The image of your agency has been badly tarnished by real or perceived coziness with special interest groups. The NEPA process was corrupted in the rush to complete massive national initiatives before the last administration left office, becoming a means to confirm decisions already made. The Forest Service as an agency will have to prove its professionalism before re-earning the public’s respect, especially at the local, adjacent community level. (Individual, Cloquet, MN - #A8272.12200)

BY BEING HONEST ABOUT THE ROADED/UNROADED STATUS OF AREAS

Unfortunately, in our community, the Forest Service and their representatives have lost all credibility on this issue. Why? Because the most basic rule in public relations is to tell the truth, and the Forest Service representatives did not tell the truth.

While there are many instances of this, the two key untruths told by Forest Service representatives were that: 1) Certain areas that are designated “roadless” in fact have roads, and some have been clear-cut at least once and 2) Areas improperly designated as “roadless” which in fact have roads, could be reclassified as “roaded” areas. This was fundamentally dishonest of the Forest Service and its representatives.

Several of your questions concern how the Forest Service can best work with often time competitive users of Forest Service administered lands. You can only do that by maintaining your integrity as a professional organization. Otherwise you simply are a pawn of whatever happens to be politically correct at the moment, a servant of those who believe that their “end justifies the means.”

To regain your integrity on this issue it is necessary to acknowledge that some of the “roadless” areas were improperly classified, and rectify the situation. If you have integrity, with time you will be able to resolve the other problems, even if it sometimes means telling people things they don’t want to hear. But without integrity you cannot get the support that you need from the reasonable majority of people who are on the middle ground of most issues. (Individual, Markleeville, CA - #A15429.12230)

There is a great deal of frustration in North Dakota because the rulemaking and forest planning process has failed to honor the promises made about collaborative decisionmaking. Instead, the western counties face a shrinking economic base, threatened by cuts in livestock grazing, unavailability of land for future energy development, denial of royalty rights, and continued conflict over what the United States originally promised. If the agency has predetermined the outcome, no amount of process is going to make the decision any more valid. Moreover, we do not believe that process will address the flaws nationwide based on the experience in North Dakota. Unless and until the Forest Service is willing to reconsider the roadless policy by recognizing these areas are developed and have roads, then the Forest

Service is condemned to continue to make the flawed decisions and to further alienate the public that the agency allegedly serves. (Elected Official, McKenzie County, ND - #A27737.12200)

BY CONSIDERING PUBLIC CONCERNS AND MANAGING USERS AND RESOURCES FAIRLY

The Resources Planning Act/National Management Act provides the US Forest Service with many opportunities. Sadly, they have been squandered. The fault rests mostly on the shoulders of the Service itself, which has failed to provide responsible leadership.

The US Forest Service was once one of the most highly regarded of federal agencies. In the recent issue of High Country News Publishers, Ed Marston writes “The Forest Service organization, that has been publicly humiliated for the last 15 years by environmentalists, by the courts, by industry and by Congress. It is an agency that has lost to those interests the only power that counts: The power to manage its 300,000 square miles of land.” How the US Forest Service manages roadless lands over the next twenty or so years will significantly determine whether stature rises or humiliation continues. And perhaps whether the US Forest Service continues to exist at all.

Some times spent generating this response and I ask that you give due consideration. I have been to a few dozen events where a Forest Service executive remarked that everyone seemed angry with the Service or disagreed with them and this indicated to the forestry agent that they (USFS) were doing something right. Can you imagine a bank executive saying, “Since all of our customers are angry with us, I must be doing my job well.” A common response to public input is something like this. “Well, everyone has an opinion, you know.” I always take that to indicate the government agent making the comment ignores good suggestions along with bad. The reality is worse, of course. The United States Forest Service has been inclined to ignore good advice and follow bad. (Individual, Colville, WA - #A20889.12230)

The other day I was talking to an older, local community leader in our rural area. We don't agree on resource management. But we were talking about how federal land managers insisted that old growth stands of timber needed to be converted to young, vigorous stands of timber just a decade ago, and now those same managers tell us it is important to protect old growth. We both agreed those managers were either wrong then or they are wrong now and those forest managers don't have much credibility. We don't take what the US Forest Service says very seriously.

How can you take an agency seriously when they want to charge owners of the lands five dollars to take a three hour hike and a dollar and thirty five cents for a rancher to graze a cow with a calf for a month? How can you take an agency seriously when they tell you to camp two hundred feet from a stream and allow cattle to stomp down the same stream banks and crap in the stream? The majority of Forest Service campgrounds are perched right on the shores of lakes, rivers and streams. How do you expect anyone to take what you say or do seriously? (Individual, Colville, WA - #A20889.12230)

220. Public Concern: The Forest Service should honor existing agreements between citizens and the government.

Existing agreements between citizens and government should be respected at all costs. Where such agreements have been violated by the government, citizens should be duly compensated. A government, which violates either contract or Constitution, is by definition a tyranny. It cannot stand, and with its demise will die all the good it had hoped to accomplish. (Individual, Modesto, CA - #A14006.12200)

221. Public Concern: The Forest Service should be abolished or replaced.

There is precious little real, on the ground management being done anymore. In fact, insofar as I can see, even the so-called professionals at the upper echelons of administration—including Forest Supervisors and District Rangers are so deeply imbedded in the protectionist movement that they can no longer see the viewpoints of the rest of us, and worse, they don't care. When a Forest Supervisor can tell me to my face that a recent fire in an area of over 50,000 acres left individual canyons without so much as one seed tree within 10 miles, but that he couldn't manually reseed the area because of various restrictions placed on him by “higher authority”, and then immediately turn away and vociferously support the roadless plan of Clinton's, then I think either he is the world's largest hypocrite, or he is particularly

stupid, and in either case should be replaced. Perhaps the problem is with the forest Service itself . . . perhaps it should be replaced, or simply abolished. (Individual, Pendleton, OR - #A666.12230)

Local vs. National Decisionmaking

Summary

Local (Forest level) Decisionmaking – Some respondents ask the Forest Service to define what and who comprises “local forest planning.” These people state that virtually all national forests span numerous counties, local jurisdictions, and in many cases, state boundaries. Thus, explains one individual, the ramifications of decisions made at the ‘local’ level do not remain at the local level. This person explains that the cumulative impacts of site specific decisions are far reaching and can not be made on a site by site basis without taking into account the impacts on all communities and the environment, not just the local one.

Some respondents do not find the distinction between local and national decisionmaking problematic and advocate that decisions be made at the local (forest) level (see also Chapter 1: National Roadless Protection – General Remarks: Need for the Roadless Area Conservation Rule: *Do Not Implement the Roadless Area Conservation Rule*). Individuals, businesses, lands rights organizations, recreational motorized organizations, industrial associations, special use permit holders, and county commissions offer a number of reasons why decisionmaking should occur at the local level. They assert primarily that it is not the role of the Washington Office to micromanage resources; that local decisionmaking is required by the National Forest Management Act; that only local decisionmaking can adequately respond to the unique conditions and needs of different areas; that local residents have the most knowledge about the resources and the most to lose if a bad decision is made; and that resources available in roadless areas are vital to adjacent communities. Following this line of reasoning, some respondents state that individual national forests should be allowed to opt out of the Roadless Area Conservation Rule.

Others comment that no national forest should be exempt from the Roadless Area Conservation Rule. These respondents question the value of “local expertise” as opposed to that of professional Forest Service specialists, and ask how local expertise will provide more reliable information than was gathered for the Rule.

Local (Forest Level) Decisionmaking with National Guidance – Most who address the issue of local (forest level) decisionmaking with national guidance urge the Forest Service to ensure that local forest planning adheres to the Roadless Area Conservation Rule. Others state that the Forest Service should establish general guidelines for the consideration of roadless areas while allowing exceptions as approved by the Secretary of Agriculture; while allowing forest supervisors to nominate areas suitable for a roadless designation; while allowing forest plans to allocate lands; while allowing forest plans to address specific forest activities that are both feasible and sustainable; or while allowing forest plans to determine the relative merits of their roadless areas and need for roads.

National Decisionmaking – Respondents believe that decisions regarding management of roadless areas should be made at the national level (see also Chapter 1: National Roadless Protection – General Remarks: Need for the Roadless Area Conservation Rule: *Implement the Roadless Area Conservation Rule*). These respondents point out primarily that national forests are national resources “and should likewise be governed by a national policy;” that decisions

should be in the best interest of the whole country; that a uniform policy is needed; that local interests are too often tied to profit of local interests and do not represent the collective will of the state or the nation; and that the forest planning process has failed to adequately protect roadless areas. According to one organization, the administration extols the local forest planning as a highly collaborative process but does not point out perceived past failures of the forest planning process to protect roadless areas, as shown by allowing roads to be built in the remaining roadless areas. According to some, management decisions should be made *only* at the national level.

Local vs. National Decisionmaking General

222. Public Concern: The Forest Service should review the Western Governors Association 1999 Policy Resolution, *Principles for Environmental Management in the West*.

FOR GUIDANCE IN RESOLVING THE TENSION BETWEEN NATIONAL AND LOCAL FOREST PLANNING

Strategies and decisions regarding protection and management of inventoried roadless areas should be made during local forest planning. However, consistency with regional assessments and plans is important. This and the following nine questions all seem to reflect on the tension between national and local forest planning. For a template of how to resolve this tension, we recommend you closely review the Western Governors Association 1999 Policy Resolution *Principles for Environmental Management in the West*. (Business or Association, Washington, DC - #A17887.13110)

223. Public Concern: The Forest Service should tailor the level of decisionmaking to the scope of the issues.

NATIONAL LEVEL DECISIONMAKING FOR ISSUES OF NATIONAL IMPORTANCE, FOREST LEVEL DECISIONMAKING FOR ISSUES SPECIFIC TO THE FOREST, AND SITE-SPECIFIC DECISIONMAKING FOR PROJECTS WITHIN THE FOREST

EPA believes that certain undeveloped areas such as inventoried roadless areas and unroaded areas should be evaluated and conserved at several scales. EPA supports the hierarchy of land management decision making principles outlined in the National Forest Management Act (NFMA), i.e., issues of national importance are best resolved at the national level; issues that are primarily of importance only to a specific National Forest are best resolved on a Forest-by-Forest basis; and issues that pertain to a particular project within a single National Forest are best resolved on a local, site-specific basis. (Federal Agency, Washington, DC - #A28843.20201)

The Forest Service must match the public involvement process to the scope of the issues. Where issues of national import, such as the conservation of wild areas such as embodied in roadless areas, are on the table, the public involvement process must be national and open to all citizens. Where the issues are primarily of local concern, such as the availability of firewood, then the public involvement process is best targeted to local interests. (Individual, Corvallis, OR - #A8027.15110)

Local (Forest Level) Decisionmaking

224. Public Concern: The Forest Service should define what and who comprises “local forest planning.”

BECAUSE VIRTUALLY ALL NATIONAL FORESTS SPAN NUMEROUS COUNTIES, LOCAL JURISDICTIONS, AND IN MANY CASES, STATE BOUNDARIES

Virtually all national forests span numerous counties, local jurisdictions and in many cases, state boundaries. Considering this, defining what, or who, comprises “local forest planning” is vague at best

and, to be accurate, misleading. The expression “local forest planning” is an arbitrary distinction and an inherently discriminatory one as well. How is “local” defined? Everyone within 50 miles of the forest lands to be managed? Within 100 miles? Within a day’s drive? Or should such a definition be based on forest use? If so whose use gets priority (i.e. logging versus dispersed recreation)? Obviously attempting to weight forest planning towards “local forest planning” is discriminatory at best and subject to legal challenge should management of our public lands be based on such. (Organization, Richland, WA - #A962.13100)

The term “local” in the context of forest planning must be clearly defined. What exactly constitutes local planning when it involves a national forest that extends across county and state boundaries? The ramifications of decisions made at the “local” level do not necessarily remain at the local level. Here in the northwest, past decisions on logging, roadbuilding and grazing in the national forests have had an impact on communities well outside of national forest jurisdictions in terms of their ability to obtain clean water or to pursue commercial or recreational opportunities. Decision on the national forests in the northwest have directly affected the commercial and sport fisheries in areas as far away as northern British Columbia and Alaska. The development by the National Marine Fisheries Service (NMFS) of the 4H rules for the watersheds of the northwest is a testament to what can go wrong with the Forest Service’s version of “local” planning. (Individual, Anchorage, AK - #A20934.13110)

225. Public Concern: The Forest Service should make management decisions at the local level.

I do not want freedoms restricted by the government or any other outside influence. If decisions are going to be made regarding my Local Forest I want them made with the input of the local people and not some Washington Bureaucrat. (Individual, Anaheim, CA - #A337.13110)

BECAUSE IT IS NOT THE ROLE OF THE WASHINGTON OFFICE TO MICROMANAGE RESOURCES

Allow District Rangers and Forest Supervisors to make decisions for the public lands entrusted to them and support their actions that are in line with Gifford Pinchot’s maxim of ‘Greatest good for the greatest number in the long run’. The Forest Service has some of the world’s best natural resource specialists working at the District and Forest staff level. Allow them to use their knowledge, skills, and experience to make decisions on what is best for the land.

The role of the Washington Office should be to set broad policy and management philosophy, not micromanage the resources or look over Ranger’s and Supervisor’s shoulders. On-the-ground decisions should be made by people on the ground.

Trust Forest Service employees. Support local decision making. (Individual, Westwood, CA - #A360.13110)

They should be managed locally. If the local USFS personnel determine that a new road is necessary to protect the forest or create a significant benefit to the community, then why should a national directive that has not taken into consideration such issues be in the way? There is no way that the cumulative effects of this plan have been taken into account for every single area designated. (Permit Holder, Vadito, NM - #A20142.13110)

Other Concerns: The Forest Service must empower local managers and specialists to craft solutions to their unique challenges on individual sites or units. Site-specific or project-level decisions on any scale must not be initiated from the agency’s Regional or Washington Office. (Organization, Twain Harte, CA - #A13434.13110)

The Forest Service must allow local managers to craft solutions to their unique challenges on a site-specific basis. What works on one forest may not work on another. Project level decisions should not be constructed or dictated from the Forest Service Washington Office. Forest planning and regulatory processes should be given back to the professional in the agency. Planning and Regulation should not

become a political popularity vote counting process. (Organization, Lake Isabella, CA - #A20945.13110)

BECAUSE NATIONAL MANAGEMENT WILL NOT RESULT IN PROTECTION OF THE VALUES PEOPLE REALLY CARE ABOUT

During the last few years we have seen a steady erosion of the local decision making authority and responsibility. This has resulted in centralizing the decisionmaking authority at the National level. This has impacted the local unit's morale and reduced the local accountability. We feel that it is critical to return to a decentralized decision making process, at least to the National Forest level.

Without a comprehensive and locally based process, including decision making, monitoring and accountability, the future decisions concerning National Forests management will not result in the protection of the values people really care about. We encourage you to reestablish local authority and provide a meaningful process that will allow those that are most affected by resource decisions on public land to be meaningfully involved. (Business or Association, Colville, WA - #A3091.12125)

TO ENSURE THAT GOVERNMENT ACTIONS DO NOT INTERFERE WITH THE OBJECTIVES OF LOCAL PLANNING EFFORTS

In many communities adjacent to national forests, the good faith effort of local people to develop plans for the management of natural resources, land use and development zoning are inseparably tied to the uses occurring on Federal lands. Local communities as well as the individuals that make up the community develop long term financial and cultural commitment based on their local plans and authorities. Therefore, the USFS should conduct and coordinate all planning at the local forest level with local planning entities whether State, Local or Tribal to assure that government actions do not interfere with or disrupt the goals, objectives and management actions specified in local planning efforts. (Organization, Murphy, ID - #A18024.15111)

Under the Forest and Rangeland Renewable Resource Planning Act, land use planning on the National Forest was to give major consideration to their impact on plans developed by local governments, including the impact of the Forest Service road network on the local road system (See Senate Report No. 93-686 (1974)). Since the closure, and lack of reconstruction, of Forest Service roads has the potential to affect local government plans and roads systems the specific impacts on the governments prior to adoption of the proposed action. (Elected Official, Douglas County, OR - #A11811.15130)

More local input by the people affected, so local industries are not closed by some rule made in the higher offices of the Forest Service. These people still receive their money no matter what stupid decision they make. A little accountability would go a long way in defusing any disagreements. (Individual, Fallon, NV - #A21953.13110)

BECAUSE IT IS REQUIRED BY THE NATIONAL FOREST MANAGEMENT ACT

Maximizing the multiple use aspects of the forest is mentioned numerous times throughout the NFMA, and it is the sole purpose of 16USC532. Local forest planning is the only way in which the mandate of the NFMA can be met adequately. At times this may involve decisions concerning maintaining the integrity of a roadless area, decisions which can only be made locally because each forest has its own unique blend of local interface, history, culture, and the problems associated with those characteristics. (Individual, Denver, CO - #A5433.20201)

The NFMA makes the land and resource management plan (forest plan) the focal point for management of each National Forest. After adoption of the forest plan, all "resource plans . . . and other instruments for the use and occupancy of National Forest system lands shall be consistent with the land management plans." 16 U.S.C. 1604(i). If a proposed "resource plan" is not consistent with the forest plan, the NFMA requires analysis of a proposed plan amendment and the opportunity for public comment before the plan amendment can be adopted and implemented. *Id* [Section] 1604(d) and (f)(4). Forest plans are the engines that drive the forest management process.

The NFMA similarly recognizes the need to consider relative values and local conditions. In the NFMA, Congress concluded that it was “unwise to legislate national prescriptions” for all national forests because of the “wide range of climatic conditions, topography, geologic and soil types,” and different local perspectives on appropriate land uses in a particular National Forest. S. Rep. No. 94-893, at 26 (1976). This prohibition against national prescriptions also extends to Forest Service actions:

The Committee bill directs that guidelines be developed by the Secretary of Agriculture for the land management planning process. While planning guidelines will apply at all levels, *there is not to be a national land management prescription*. The general framework for the plans and appropriate management direction would be established on a national basis The *detailed application of this framework and direction would be reflected in individual plans* The Committee believes that in the development of land management plans, the land manager must pay particular attention to the identification of land suitability and capability for various types, level, and combinations of resource use . . . and special resource relationships where hazards exist for the various resources [e.g., forest health issues]. S. Rep. No. 94-893, at 35. (emphasis added). (Business or Association, Spokane, WA - #A17351.20201)

Chief Bosworth, it is our contention that: (1) this ‘roadless discussion’ is intrinsically and legally inappropriate because it is intended to override the determinations of existing forest plans which have their legal basis and credibility under the National Forest Management Act. (2) As you brought out in your advance notice of proposed rulemaking the scale of this discussion is infeasible and duplicative of the forest planning process.

It would serve the public’s best interests for the United States Forest Service to lead the public back to the legal framework with which such values/topics can be legally considered, i.e. forest plan revisions. (Business or Association, Cody, WY - #A19163.13110)

BECAUSE DIFFERENT AREAS HAVE DIFFERENT CONDITIONS AND NEEDS

I feel that local forest plan should be given the biggest role in evaluating management of inventoried roadless areas. Every section of our country, state, county or area has its own “little signature”. How can someone in California tell us in Chester South Carolina how to protect our forest. We seem to do a great job here because we have not had the forest fires that California seems to have. Even a state as close as Florida has problems with fires. These states must have problems that do not exist in SC, or they would be doing a better job. (Individual, No Address - #A57.13110)

The disposition and management of inventoried roadless areas should be determined in forest plans on a unit-by-unit, site-specific basis. These areas and their resources are vital to adjacent communities. A full range of alternatives must be developed for each unit and carefully examined under the NEPA process. Some may be best managed as roadless in perpetuity or recommended for wilderness designation, while others should be developed for commodity production. A myriad of factors must be considered, such as fuel loading, forest health, proximity to private or other public property, size, terrain, soils, watersheds, minerals, wildlife and fisheries. Each unit is unique and needs a tailored prescription. While rules may guide how the determination is to be made in a broad sense, the decisions should be made in the forest plans. (Individual, Lewiston, ID - #A2872.13130)

It is inconceivable that anyone, especially professional foresters, would try to write a single EIS to address all the diversities of the various areas included in the roadless policy. A separate EIS should be written for each area. A committee in one central location cannot possibly cover all concerns and diversities of the many separate areas included in the roadless policy. (Individual, Miami, AZ - #A880.13230)

It is agreed by all that we need to protect our forest and make sure we address forest preserve part of our forest for the animal habitat and water quality. I believe this can be done best on a local level. Each community has their own set of standards or rules that need to be followed. The same applies to other countries. What may work for one may not work for the other? There standards or rules . . . why would

we agree to give someone or a group total power to make decisions for us that affect us but not them without a fight? (Individual, Argonne, WI - #A11688.13100)

Federal policy-making must recognize that not all “inventoried roadless” areas are of equal quality. Much time has passed since the 1979 RARE II inventory, and conditions in many areas once considered roadless—for purposes of the 1979 inventory—have changed. Likewise, we have seen dramatic changes in the public’s use of NFS lands for diverse outdoor recreation. Given these dynamics, the Association believes the local forest planning process is the most appropriate means for making roadless protection decisions. (Permit Holder, Hood River, OR - #A13230.13110)

BECAUSE LOCAL PLANNERS HAVE A BETTER UNDERSTANDING OF LOCAL NEEDS AND CONCERNS REGARDING LAND MANAGEMENT

I feel strongly that local land-use managers should be able to make the decisions on whether to allow new roads and facilities to be built on public forest service lands. The federal government should have guidelines and rules set for reviewing and making sure that environmental concerns are resolved, but the decisions on how to manage the land should be made locally. Local governments and managers have a much better understanding of the needs, issues, and concerns that are involved with land management. Therefore the decisions should be made by those who are the most informed and knowledgeable with the issues. These decisions should undoubtedly be made by the local authorities and experts. Please don’t let local issues be decided by uninformed bureaucrats in Washington that are only concerned about what their constituents from their states want. Decisions made on land usage have major impacts on the lives and lifestyles of those in the local area. Let the local experts be the ones making the decisions. (Individual, Houston, TX - #A4613.13130)

Local Forest Planning should be paramount in evaluating such areas. We’ve gone through RARE I and RARE II and spent a tremendous amount of money doing so; then we’ve gone through study after study until no one knows where we are anymore. To make a “cookie cutter” plan for the entire National forest system is absurd. Only local planners can truly evaluate roadless areas for what they are, and should be. (Individual, Pendleton, OR - #A666.13110)

The people of the local area should do the evaluating not the FS [Forest Service], their economy should be a leading factor, is their minerals there, is their timber there, what’s the best way to get at it, how about recreation, a camp ground, a park all these things should be looked at before it is environmentally locked up. (Individual, Baker City, OR - #A1038.13230)

Informed Decision Making. The roadless areas are best planned and the management needs identified by the local offices of the Forest Service. A substantial problem with the present rule is that there is no provision for local Forests to make exceptions when it is necessary. Local public input was limited by the way the information was collected and local problems were not identified or considered. The Rule identified the values to be protected were national in scope, but did not consider the impact on local communities nor was local input considered. The information about local impacts resides at the local Forest offices and was not a part of the decision making process. These local offices have the information on impacts and can acquire local input on the important local roadless issues. They should be allowed to do this job. (Business, Viburnum, MO - #A11695.11110)

I value the decisions made on a local forest service level. They know the areas around them and the people who impact and use the land. Comments should be made to them on a local level and not on a wide scale basis. There are many areas that are inaccessible already. One local canyon was recently locked up. Now, we are suffering many consequences: 1) the local sheep ranchers are unable to get groceries and supplies to their herder. It was impossible to take the camp for a three-month stay, so the herder was forced to live in a tent. Therefore, the grazing rights are currently for sale. This threatens the livelihood of the ranchers. 2) The elk have reached an unhealthy population and hunters are not able to take an animal. It would spoil before they could get it out of the mountains. Now the elk are running

down on the highway. Over thirty big bulls, valued at \$6,000 to \$20,000 each has been killed by motorists. The DWR have had to pay extra expenses to hire help and herd them off the highway each night. 3) A local timber company has had to lay off 20 workers. This was a huge impact for our little rural town since we only have three major employers. Satterwhite had the possibility of becoming the fourth, but now we watch as the beetles continue to destroy our forests and we are helpless to watch. The timber companies were responsible for taking all the dead lumber and also improving our canyon roads. Most of the people who enjoy recreating here are from Salt Lake City and surrounding counties. We don't have the tax base necessary to maintain the roads in each canyon. But volunteers, the National Guard and the timber company have taken care of us. No one in Washington DC is able to know and understand any of the issues or their impacts. (Individual, Las Vegas, NV - #A26123.13100)

It is our opinion that the best form of environmental review is the one that is most closely linked to the area in question. Forest planning issues should always be reserved for the local Forest Supervisor/District Ranger review. Only he/she has the history and background necessary in order to completely review a project for all its merits and/or shortcomings. While we understand that Washington based mandates are more easily established and quicker to implement, they are often times negligent in their ability to foresee opportunities or issues that may potentially arise. For this and many more in-depth reasons, we adamantly oppose any Forest Planning decisions made at a level above the Forest Supervisor's Office. (Business, Twin Bridges, CA - #A8808.13100)

BECAUSE DIFFERENT AREAS HAVE DIFFERENT USE DEMANDS

While all of the national forests are open to the public, it is also true that forests in different areas have different majority of use demands than other forests in other areas.

As an example, while the forests in upper New York state would naturally have a high usage of backpackers and hikers, the national forests in southeast Texas would see almost no backpacking or hiking. While some forests would draw a high percent of boaters and fishermen, other forests would not be represented by those same type of users.

So, it's almost imperative that each national forest be considered on an individual, and local, basis. (Individual, Mesquite, TX - #A28471.13200)

The only appropriate avenue for considering land allocations on any national forest is through the NFMA-mandated individual forest plans in which all multiple use considerations and social and economic impacts must be considered. The basic premise of a nationwide roads prohibition is counter to the existing Forest Service planning process and its current set of proposed planning regulations. Both the current forest planning process and the proposed planning regulations emphasize local decision-making. The preferred alternative of this proposal is a top-down management decision that forces managers to make decisions based on a national policy that does not reflect local conditions. A perfect example of the need for local decisions is the assertion in the FEIS that "there is currently a trend of decreasing interest by the mineral industry in exploration and development of domestic mineral resources" (p. 3-143). The opposite is true for the largely under-explored Chugach National Forest, yet there is no recognition of this fact in the FEIS or proposal. (Professional Society, Anchorage, AK - #A21707.20201)

BECAUSE A MANAGEMENT CHANGE IN ROADLESS AREAS MAY ADVERSELY AFFECT THE REMAINING AREAS OF THE FOREST

We question whether changing the management character of the roadless lands outside the context of the forest plan is consistent with the National Forest Management Act, Renewable Resources Planning Act, and the Forest and Rangelands Renewable Resources Planning Act. Since a management change in these areas has the potential to adversely affect the remaining areas of the forest, we suggest that the roadless issue only be addressed in the context of the forest plan. (County Attorney, Grant County, OR - #A17667.20200)

BECAUSE PROFESSIONAL FOREST MANAGERS ARE TRAINED FOR MANY YEARS

In this political vote-for-your-favorite-forest-use-process, the professional forest manager is being totally ignored. Schooled and trained for many years, these are the people who best know how to manage

forests for multiple uses. Today, over 100 preservationist groups are petitioning to have all motorized traffic banned from the 56 million acres. If that happens, the roadless areas become nothing more than wilderness areas. In wilderness there is no need for management, no need for managers or foresters, no forestry, just lock it up and leave it alone. (Individual, Salem, OR - #A5958.12100)

BECAUSE GREATER WEIGHT SHOULD BE PLACED ON THE GREATER FOREST EXPERIENCE

A mere counting of “ayes and nays” is not adequate. Perhaps a “stakeholder’s questionnaire” needs to be developed that ascertains how many hours the person has spent in the forest. Is this someone who has spent a lifetime in the forest, through all sorts of public policy fluctuations, or is this a person who spend two weeks in July camping? All opinions definitely need to be heard, but in the final analysis the greater weight needs to be placed on the greater forest experience. (Individual, Emmett, ID - #A110.15110)

BECAUSE LOCAL RESIDENTS HAVE THE MOST KNOWLEDGE ABOUT THE RESOURCES AND THE MOST TO LOSE IF A BAD DECISION IS MADE

[Rural people] largely understand the relationships between resources and our national quality of life because they grow cattle, farm the crops, harvest the trees and mine the minerals. They are also the people who rely on our national forests for jobs, raw materials and the fun things in their lives. They love undeveloped wild lands and wilderness. However, they also value the variety of recreation opportunities the national forests are capable of supporting, motorized and non-motorized. They understand that our nation needs the valuable products that can be produced from our national forests, such as wood, forage, minerals and water. They understand the importance of an adequate infrastructure to provide access to these forest land-roads, bridges, and trails. Effects of proposals such as this are immediate and devastating to the people who live close to and depend upon the national forests. Please keep in mind this urban vs. rural conundrum when evaluating input. Consider who has the most knowledge about the resources and the most to lose if a bad decision is made. Don’t deepen the divide. (Business or Association, Olympia, WA - #A3619.15100)

BECAUSE LOCAL RESIDENTS KNOW HOW THEIR FORESTS HAVE BEEN USED THROUGH TIME

The Forest Service is notoriously ahistorical—old cabins with years of history are burnt down without notice, old mine shafts are plowed under and destroyed, seemingly without a thought for the lost human legacy. Managing a natural landscape does not mean ignoring historic use. Local inhabitants know how their forests have been used through time, and their input should weigh heavily for any road closures and new limits on currently roaded areas. (Individual, West Yellowstone, MT - #A1045.15111)

BECAUSE ROADLESS AREAS ARE VITAL TO ADJACENT COMMUNITIES

The disposition and management of inventoried roadless areas should be determined in forest plans on a unit-by-unit, site-specific basis. These areas and their resources are vital to adjacent communities. A full range of alternatives must be developed for each unit and carefully examined under the NEPA process. Some may be best managed as roadless during the life of the forest plan or recommended for wilderness designation, while others should be developed for commodity production. A myriad of factors must be considered, such as fuel loading, forest health, proximity to private or other public property, size, terrain, soils, watersheds, minerals, wildlife and fisheries. Each unit is unique and needs a tailored prescription. While rules may guide how the determination is to be made in a broad sense, the decision should be made in the forest plans. Whatever the case, it is absolutely necessary that the forest plans be completed in a timely manner. (Business, Lewiston, ID - #A7991.13110)

The Forest Service should work with the local communities that are directly affected by any decisions concerning these wild lands overseen by tribes or state directly affected. Any organizations or individuals who claims to be “acting in the interests of the wilderness areas” are just that . . . acting! There is no way to put this much land back to 100 years ago”, nor should we. Our very lives depend on these watersheds, minerals and wood products. (Individual, Three Forks, MT - #A697.15100)

Local values should be of utmost consideration. Too many times have national decisions been made that have been very damaging to local economies and local lifestyles based solely on the desires of very vocal groups who seldom are directly impacted by those decisions. I know of no one who wants to

destroy or damage our local forest for the very fact that our lifestyles would suffer the most if we were to lose our access privilege either through loss of quality of forests or through regulations based on foreign decision making. Rural Utah does not have the population required to sway federal decision makers so making decisions based on political or nationally popular agendas is unfair and not necessarily best for the forests. (Individual, Richfield, UT - #A27881.13100)

BECAUSE NATIONAL PLANNING DOES NOT ALLOW AN ADEQUATE TIMEFRAME TO CONSIDER IMPACTS ON INDIVIDUAL ROADLESS AREAS

It is hard to fathom how a national policy could adequately evaluate all impacts to roadless areas within the eighteen months it took to develop and finalize the policy. Single National Forest planning, and even single project planning by the Forest Service, can take anywhere between one to five years to complete with a minimal average of least two years. These simple facts raise serious doubt as to the appropriate and adequately deliberated consideration of roadless policy impacts. An agency policy that affects all roadless areas through one national decision cannot address the unique forest conditions of each individual Forest or roadless area. Due to the time consuming nature of NEPA processes, and the lack of detailed roadless area information, there is much cause to support roadless area consideration through the normal National Forest Management Act (NFMA) authorized National Forest System planning process. (Professional Society, No Address - #A29920.10134)

BECAUSE LOCAL PLANNERS ARE BEST ABLE TO DEAL WITH PROBLEMS IN A TIMELY MANNER

I feel local situations require local decisions. Not only forest fires but insect infestations, watershed, and plant life trends need to be dealt with locally so those with the most information about a problem are able to design a program that best fills the needs in a timely manner. Too often invasive plants, insects, watershed problems and such have done so much damage by the time any local effort is allowed to be put into action. (Individual, Richfield, UT - #A27881.13110)

IN SPITE OF THE THREAT OF LITIGATION FROM WILDERNESS ADVOCACY GROUPS

Site specific and project level decisions should not come from the Washington D.C. office. The decisions should remain at the local level with input from the communities. We would like more advanced notice of public meetings. More public announcements of such meetings with lengthier comment periods in order to properly address issues of public concern. We urge you not to be influenced by the threat of litigation from Wilderness Advocacy Groups. We wholeheartedly support multiple use management for our public lands. (Organization, Bullhead City, AZ - #A12066.12100)

226. Public Concern: The Forest Service should consider that localizing decisionmaking requires that current law be revised.

Localizing decision authority is impossible, and will remain so, until NEPA, NFMA, and a pile of other Seventies-vintage laws are reformed. (Individual, Whitefish, MT - #A20672.20200)

227. Public Concern: The Forest Service should allow local decisionmaking only if an easily accessible appeals process is in place.

Local planning is too easily swayed by local issues and often fails to see the "big picture" that is more easily addressed on a national and international level. While local input is useful and should not be disallowed, the entire decision should not be left at a local level unless there are available and easily accessible appeal processes that can be accessed by any concerned person. (Individual, No Address - #A27088.10130)

228. Public Concern: The Forest Service should develop regional guidance for implementing the Roadless Area Conservation Rule.

The Douglas Indian Association, a Federally recognized tribe, respectfully requested that the USDA Forest Service revert back to regionalized planning in each of the national forests in the United States. The Roadless Policy placed on all the national forests last year minimized the benefits of the regionalized approach to land planning. The local management concerns are largely ignored with blanket policies such as the Roadless Policy. (Tribal Association, No Address - #A23324.12311)

WHICH RECOGNIZES THE DIFFERENT CONDITIONS AND MANAGEMENT NEEDS OF FORESTS IN DIFFERENT AREAS OF THE COUNTRY

Ecological needs and human values differ, for example, between eastern and western forests and the people who use them. The Wildlife Management Institute would support a provision in the modified Rule that authorizes the development of regional guidance to aid in implementation of the roadless Rule by allowing the consideration of factors that could vary geographically such as forest size, vegetation types, watershed configuration, and proximity of human populations. We believe these types of exceptions would address the principal concerns raised by stakeholders. If coupled with the establishment of categories of roadless areas for which exceptions would not apply . . . this limited expansion of the Rule's exceptions could furnish the basis for seeking consensus on a modified Rule. (Organization, Washington, DC - #A21762.45340)

Wisconsin forests and Wisconsin forest policy debates are different from western forests and western political issues. The roadless rule does not recognize this distinction, but should. (Professional Society, Eagle River, WI - #A19071.45600)

As you work toward a reasonable approach to this problem, remember that the one-size-fits-all theory that is so often used by government agencies is not appropriate in this case. The south is different from the Pacific Northwest, Lakes states and other sections of the country. It should be treated as such. (Business, No Address - #A17224.45341)

229. Public Concern: The Forest Service should allow local districts to manage forests under a sustainable yield harvest plan.**TO ENABLE DISTRICTS TO BE ECONOMICALLY SELF-SUFFICIENT**

I say let each local district manage their forests on a sustainable yield harvest plan—trees in Colorado grow at a different rate than trees in Montana—trees around Seeley Lake grow at a different rate than trees by Philipsburg. Multiple-use is good and it fits well but again let each local district make their decisions. Each district needs to be self-supporting economically and decisions of their resources need to be made based on that. Example all the jobs in that district need to be supported by the resources of that district. (Individual, Seeley Lake, MT - #A5437.13110)

230. Public Concern: The Forest Service should allow individual national forests to opt out of the Roadless Area Conservation Rule.

I strongly support changes to the Roadless Area Conservation Rule. I particularly support allowing individual national forests to opt out of the rule and decide to go back to logging, building roads in, or otherwise developing these areas, including all those in Alaska's Tongass forest. (Individual, Marthasville, MO - #A6704.10130)

OR TO MAKE LOCAL EXCEPTIONS TO THE RULE'S PROHIBITIONS

I am in favor of allowing flexibility in the ruling to allow individual communities through local councils the ability to recommend areas that are practical for road building given circumstances unique to that community. For example, if the Ketchikan Assembly feels that areas within their jurisdiction are sensible for development, then there should be allowance in the law for that to happen, such as potential development on Gravina Island. There should be reasonable concession for recreation, mining and timber activities to continue. (Individual, Juneau, AK - #A23200.15111)

The FRWG supports opportunities for local input to the Rule in two basic ways. First, citizens living near the inventoried areas should have the opportunity, individually or through their organizations, to persuade the Service, in this review, that clearly defined and limited exceptions to the prohibitions, specifically designed to enhance the ecological values of roadless areas, should be made a part of the Rule, e.g. that geographic differences justify greater flexibility to address unique characteristics. Second, local input is important, and already provided for in the Rule, with respect to proposing and justifying

exemptions for specific activities in specific places. What should not be allowed, and cannot be justified if the Service is to keep its pledge, is the wholesale granting of discretion to adopt local proposals for road building or timber harvesting in the inventoried areas for whatever reason that may be put forward, such as, for vague and ill-defined forest health reasons. (Organization, Washington, DC - #A23283.15111)

231. Public Concern: The Forest Service should not allow individual forests to opt out of the Roadless Area Conservation Rule.

Local forests should implement and augment national policy protecting roadless areas (the Roadless Area Conservation Rule). They should NOT be allowed the option to ignore the Rule and develop their roadless areas. Instead, they should work to identify roadless areas that were omitted from inventories used to create the Roadless Area Conservation Rule, protect those newly identified roadless areas in the same manner as inventoried roadless areas (as Wilderness Study Areas are protected in the same manner as Wilderness), and submit them to the Forest Service national office for addition to the national inventory. (Organization, Escalante, UT - #A27872.13200)

232. Public Concern: The Forest Service should recognize that “local expertise” may or may not be superior to professional Forest Service expertise.

DEPENDING ON THE MOTIVATION

The notion that “local expertise” is superior to professional Forest Service expertise is both true and false, depending on the expert to whom you are listening. For the most part, in recent years, that notion has been promoted, not so much by local residents as by those who have invested in local land for mining, timber, recreation and/or grazing. I am well acquainted with a successful Colorado rancher who has been recognized by the USFS as a model steward of leased grazing land, and who is a supporter of roadless areas. Good business and conservation are not necessarily at odds, but greed and conservation are. “Local experts,” like my rancher friend, can indeed be more knowledgeable than well-educated government scientists familiar with a different part of the country, but they are often experts in only their own self-interest, not in the long-term best interests of the country. (Individual, Fort Collins, CO - #A12852.13110)

233. Public Concern: The Forest Service should clarify how local expertise will provide more reliable information than was gathered for the Roadless Area Conservation Rule.

The USDA apparently believes that the only true basis for decision is based on local input. The May 10, 2001 press release states that the USDA will examine “more reliable” information and accurate mapping, including drawing on local expertise and experience through the local forest planning process.” It is unclear how local expertise and experience will provide more reliable information than that gathered in the extensive review leading to the January 12th rule. The USDA should certainly be responsive to local input and information, but not to a greater extent than any other interested party. Local input is not the only source of reliable information. (Individual, Chico, CA - #A17483.15112)

Local (Forest Level) Decisionmaking with National Guidance

234. Public Concern: The Forest Service should ensure that local forest planning adheres to the Roadless Area Conservation Rule.

If you are asking what the job of the local Forest Service administrator is, it should be to manage the local forest as the public wishes, which the public has expressed previously concerning the roadless initiative. So, local forest planners should follow the national policy. (Individual, Macomb, IL - #A95.13130)

The current rule does not allow decisions to be made at the local level through the forest planning process under a set of national criteria.

The Secretary of Agriculture must establish national standards to guide roadless area conservation. The new rule should require Forest Service line officers to apply those standards through the forest planning process.

Further, the new rule should require Forest Service line officers to make decisions about roadless at the local level with adequate state and public involvement processes.

The new rule should eliminate the national application of the current rule.

I am in support of roadless area conservation of these roadless areas that meet the national standards based on the information available by area. (Individual, McMinnville, OR - #A818.13130)

Inventoried roadless area prohibitions must be codified in Forest Plan revisions and amendments but, for consistency, they must be decided Nationally for all roadless areas. This direction must apply to all National Forest roadless areas that exist. The local Forest manager should not be free to choose what may or may not take place on a roadless area. They must be involved in deciding how to best implement National direction.

This should be true even if that means rejecting an alternative project that is proponent driven, or a project that is strongly supported locally. (Individual, Grangeville, ID - #A830.13130)

These areas should clearly not be subject to local control, as this is clearly an issue that must have participation of the entire nation. Simply because land exists in a certain state or locality does not mean it is theirs to control in any way they wish, to possibly sacrifice long-term planning for short-term jobs. The Roadless Area Conservation Rule is required and protection of these areas must be secured into the future. Local areas can be involved in securing these areas and in making sure other suitable regions are likewise identified and protected. (Individual, Lexington, KY - #A1077.13130)

The role of local forest planning is to protect and manage inventoried roadless areas in accordance with RACR. These are National Forests, not local forests. (Individual, Livingston, MT - #A8306.13130)

Forest plans as they come up for renewal should be brought into alignment with the decision to protect remaining roadless areas. (Individual, Santa Fe, NM - #A11703.13130)

BY NOT ALLOWING LOCAL FOREST PLANNING TO MAKE EXCEPTIONS TO THE ROADLESS AREA CONSERVATION RULE

The Rule expressly allows for exceptions to the prohibitions, such as to protect public health and safety. Allowing forest plans to make additional exceptions for specific activities would completely undermine the Rule, setting the stage for a return to the incremental destruction of roadless areas that the Rule intended to stop. Roadless areas should receive additional protection through the forest planning process, especially from destructive off-road vehicles and mining. (Individual, Fresno, CA - #A1593.13100)

The regulations need to be more specific and to leave less decision making to the discretion of local responsible officials. They need more specific guidance in implementing the roadless area regulations. The vagueness of parts of the regulations make them subject to challenge in the courts. It is an important subject and the regulations are too brief, lacking in clarity and too open to interpretation by local "responsible officials." (Organization, Fullerton, CA - #A3705.13100)

BY MAINTAINING A HIGH THRESHOLD FOR GRANTING EXCEPTIONS

Procedures for granting exceptions based on local input should include public comment and place a high threshold to be crossed for granting exceptions. (Individual, Denton, TX - #A156.14410)

235. Public Concern: The Forest Service should evaluate local decisions regarding inventoried roadless areas within the context of the Roadless Area Conservation Rule.

WITH REGULAR AND ON-GOING NATURAL RESOURCE INVENTORIES AND ASSESSMENTS

The national public desires roadless areas to be continued in their unroaded condition. This question has been decided overwhelmingly. Within the RACR there is substantial flexibility and there are many local issues to be resolved within the framework of that flexibility. Many in the environmental community strongly argued that the RACR was too open ended in many regards, and these very issues now face local forests for planning and resolution. How the local forests make these decisions and implement plans may preclude additional issues from reaching the same level of national concern (e.g. off-road vehicle use and other activities . . .).

As the Forest Service evaluates local decisions regarding inventoried roadless areas within the context of the Roadless Area Conservation Rule (and other national policy guidance), this evaluation needs to be done in the context of regular, on-going natural resource inventories and assessments, and at the time when decisions are to be proposed which may affect roadless areas covered by the Roadless Area Conservation Rule. Any evaluation prior to such decisionmaking process seems to be academic and a waste of time. (Individual, Corvallis, OR - #A15303.13130)

236. Public Concern: The Forest Service should establish general guidelines for the consideration of roadless areas.

Give local forest managers guidelines (like installing roads along contour lines and far away from streams) but allow them the responsibility to make decisions regarding management of local forests, inventoried or not. State Forestry agencies manage on a local level very well. (Individual, Princeton, WV - #A18086.13110)

Allow local forest planning to apply broad National standards in managing the roadless areas. Consultation with Wisconsin's citizens and resource professionals, not a directive from Washington D.C., should be at the forefront of such change. (State Agency, Madison, WI - #A28775.13110)

WHILE ALLOWING EXCEPTIONS AS APPROVED BY THE SECRETARY OF AGRICULTURE

A national rule should provide the overarching criteria for the preservation of inventoried unroaded areas and specify the exceptions. The designation of reconsidered or new candidate roadless areas should be screened to select those inventoried areas that are ecologically important. Examples of ecologically important areas would include those that are: critical to water quality; provide endangered species protection; include ecosystem values; and where there is public support to remain roadless and opportunities exist to minimize potential use conflicts. Any construction of new roads or improvement of existing ones in areas designated as roadless should be based on specific exception criteria set forth in a national rule. In cases where important national priorities need to be addressed, a mechanism should be developed to enable the Secretary to authorize an exception to a national rule. (Federal Agency, Washington, DC - #A28843.50000)

WHILE ALLOWING FOREST SUPERVISORS TO NOMINATE AREAS SUITABLE FOR DESIGNATION

The key question is. How many million of acres must be designated for such purposes, thereby essentially excluding all other uses and users? I believe this is suitably answered by allowing Supervisors of individual forests to nominate those portions most suitable for such designation following very specific scientific, economic and common sense criteria and guidelines that are applicable to all of our National Forests. Such criteria and guidelines must consider factors such as: The presence and abundance of sensitive species and amount and types of suitable available habitat present; the amount and type of commercial timber present and the economic and environmental costs and benefits associated with the harvesting and removal of the mature timber, accessibility of the areas to the public via existing roadways and trails and current and projected rates of use by the public (including ranchers holding grazing permits), the societal impact that closure of these areas to vehicular traffic would have on members of the public engaged in camping, bird watching, wildlife viewing, hunting, fishing, hiking,

trapping, collecting firewood, cutting Christmas trees, logging, livestock, grazing, and other economical and recreational pursuits. (Individual, Cedar City, UT - #A20426.12125)

WHILE ALLOWING FOREST PLANS TO ALLOCATE LANDS

The regulations should be general, short and simple, providing direction to guide consideration of roadless units in the forest plans. They should not make any blanket, nationwide set-asides of roadless lands. Allocation of these lands should be done in the forest plans. (Organization, No Address - #A8227.15100)

WHILE ALLOWING FOREST PLANS TO ADDRESS SPECIFIC FOREST ACTIVITIES THAT ARE BOTH FEASIBLE AND SUSTAINABLE

Agency goals for US Forest Service system ecosystem management should be broadly set at the top levels and should serve as an umbrella of guidelines for regional and local forest units to work within.

Within the overall guidelines for the agency, variations at the regional and/or individual forest levels should be allowed to address specific forest activities that are both feasible and sustainable. (Individual, No Address - #A29334.13130)

WHILE ALLOWING FOREST PLANS TO DETERMINE THE RELATIVE MERITS OF THEIR ROADLESS AREAS AND NEED FOR ROADS

The role of the National office of the Forest Service should be to provide direction or guidelines to help the forest or regions determine the relative merits of their roadless areas. This guidance shouldn't be a strict, by the numbers direction, but more general such as, amount of critical wildlife habitat, presence/how much spectacular scenery, relative regional abundance of undisturbed areas, how much local demand there is for roadless vs. roaded recreation, etc. A decision needs to also be made on whether an area is best managed with roads or without. Some areas in the West have tremendous accumulations of fuels that cannot be efficiently dealt with without building roads. Many of these values can be protected without declaring an area totally hands off. (Individual, Wrangell, AK - #A30478.13130)

237. Public Concern: The Forest Service should use local knowledge to enhance national planning.

Local planning is essential, but should not outweigh federal planning efforts. Local planning is subject to too much manipulation by one or two powerful interests—for example, a large lumber company or mining outfit that employs a lot of people in a small town can corrupt the process. (Not that the USFS doesn't have the same problem, but at least there's some semblance of national oversight.) Federal planning should be in concert with local efforts. No one should need to reinvent the wheel to get something done—use local knowledge to enhance federal efforts. Use the people already on the ground, who have built up relationships with local people, and give them a clear cut set of criteria that they can defend, and send them out to do inventories. Make sure they understand that what they are doing is critically important, and that their work will not be overlooked or used against them down the road. Ensure there are systems in place to check for data anomalies, etc. (Individual, No Address - #A29275.13130)

National Decisionmaking

238. Public Concern: The Forest Service should make management decisions at the national level.

BECAUSE NATIONAL FORESTS ARE NATIONAL RESOURCES

The local role should be highly limited in decisions about which areas should be subject to which conservation measures. National forests are national resources, so decisions about them should be made in the national interest. The interests of local players should receive a weight proportional to their membership in the national polity. Because local players often have more intimate knowledge about the national forests in their areas, they should be given a platform to voice their opinions and observations,

but not as deciding voice in matters that are of importance to all Americans whether or not they are in a position to live near a national forest. (Individual, New Haven, CT - #A616.13120)

I believe that national forests are national assets, and should be safeguarded as repositories of both tangible and intangible riches. It is the role of the government to examine the role of the whole national forest in the whole country, and to recognize and protect these designated national treasures for the long-term good of our country. It may be that local areas appreciate the importance of preserving local forests, or it may be that they do not. Because the latter situation will necessarily occur in some places, federal government must stand behind its name of “national” forest. (Individual, Fairfield, VA - #A15817.13130)

Roadless areas are part of our National Forest System and are a national resource that should be regulated by national policy. The administration does not contend that water quality should be governed by local opinion, or that nuclear safety and nuclear waste concerns should be governed by local opinion, or that drilling for oil, or that location of gas pipelines and energy transmission lines should be subject to veto by local citizens. In all of those areas the administration asserts that national environmental policies are essential. We believe that roadless areas are an important national resource and should likewise be governed by a national policy. (Organization, Seattle, WA - #A21702.13120)

The role of the local forest managers in the planning and administration of protection and management of our national forests should be limited to enforcement of a national policy only. National forests are a public trust that belong to all Americans and are not suited to be managed according to the whims and limited perspective of a local manager. A national policy dictating the protection of all remaining national forests should govern all local managers administration with no allowance for interpretation.

National forests are for the use of all people and are not to fall under the dominion a local community. (Individual, Vallejo, CA - #A27573.13120)

The attempt to gain more “local control and input” into the management of public lands under national management fails to consider that nationally managed public lands be managed in the national interests. We have already seen an explosion of influence buying and selling in Congress, and that same buying and selling of the public’s interests for private gain is also carried out at the local level, only at a reduced cost. Under this divide and conquer practice, local individuals can be pressured into, or influenced into accepting, incursions into the roadless area, ignoring existing protection and the reasons they have been put into place. I believe that since these public lands belong to all of the people, not just locals, management of the national forests should reflect this position. (Individual, Lewiston, CA - #A28731.13120)

Local input should be taken into account making management decisions; the degree to which local interests hold sway is the issue. Often local interests are at odds with the interests of the nation as a whole in preserving roadless areas in an undisturbed state. We would never stand for letting local citizens harvest timber in Yellowstone National Park, though some citizens of neighboring communities might want to, because we want to preserve the splendor of a national treasure. The same reasoning should apply to most roadless areas—they are also national treasures. (Individual, Bozeman, MT - #A20412.13120)

BECAUSE DECISIONS MUST BE IN THE BEST INTEREST OF THE WHOLE COUNTRY

Local forest planning must be given important consideration in evaluating protection and management of roadless areas of course. But remember that the forests belong to all of us including future generations. Any decisions must be truly national decisions that are in the best interest of the whole country. Remember that local folks, although they usually know the territory best, often have short-sighted goals. And local USFS personnel are often influenced too strongly by the local people with whom they live and work. (Individual, Boulder, CO - #A5250.13000)

Roadless areas have great national, regional, and local value as important watershed headwater areas, for rapidly growing outdoor recreation, and for wildlife, including, endangered species, habitat. The local planning process has failed to protect these values as local planners have routinely and narrow-mindedly given in to local timber, mining and ranching interests, often foolishly ignoring the economic value of recreational uses and clean, pure water. For example, the Southern Appalachian national forests have lost countless roadless areas to timbering and misguided road construction in the last few decades, even after study after study showed that the economic value of these lands for outdoor recreation far exceeded the timber values. I have no confidence in the failed local planning process. National forests belong to all Americans, not just local timber companies, mining companies, and ranching interests. Local interests should have input that is fully and fairly considered, and I believe that local interests should be met where reasonable. However, decision makers should consider the views of all Americans in managing the lands that those Americans own. (Individual, Conyers, GA - #A13536.13100)

Local forest planning and management has been the rule for the last hundred-plus years. The result has been the steady loss of wilderness and a network of forest service roads that exceeds the entire US interstate highway system in length and is impossible for the Forest Service to maintain. The local planning process is generally dominated by interests that stand to make personal financial gain through exploitation of a resource that belongs to ALL the citizens of the country. The remaining roadless areas are a national treasure and can only be protected by a consistent national policy. (Individual, Roseville, CA - #A10567.13120)

Local Forest Service representatives should be responsible for gathering information and submitting it to the offices in Washington, D.C. Their expertise is valuable towards understanding the specific attributes of individual federal forests. However, to allow these same local representatives to set policy is a mistake. This would have the effect of setting too many separate rules and guidelines across the country. While some people might find this appealing, it is flawed. These are federal lands. As such they should be managed by a broad set of rules across the board. Someone from Iowa who travels to Montana on vacation should not have to gaze upon clear-cut forests because local officials decided that they wanted to increase timber harvests. This visitor should have the comfort of knowing that when he travels to another state that the protection and management of forests is being macro-managed back in Washington D.C.

There exists an array of state, county and city land, which is managed and controlled at the local level as well as private lands. Our federal lands belong to everyone and must be managed as such. (Individual, Bozeman, MT - #A21355.13100)

BECAUSE A UNIFORM POLICY IS NEEDED

Regarding the role of local forest planning, it must be remembered that one of the primary reasons why the roadless rule is needed so badly has been the failure of the local forest planning process. While it is important that the local foresters, who are supposed to be intimately familiar with their forest, to play a key role in evaluating options for the protection and management of roadless areas, the process for doing so needs to be standardized at a national level. Policies should be uniform, not localized. These lands are Federal lands, not State or local lands, and as a U.S. citizen I want to be assured that the maximum level of protection is afforded to roadless lands across the country. (Individual, Renton, WA - #A22439.13120)

There is a need to provide a strategic view of roadless areas nationwide to avoid a patchwork approach to the management of our National Forest resources and to ensure adequate protections for these lands. The Roadless Area Conservation Rule addresses this strategic approach. As provided by the rule, local forest planning should provide additional protection to prevent damage to roadless areas and ensure that the roadless inventories are complete.

The record shows that local forest planning is not adequately protecting roadless area and going forward, current forest plans make about 60 percent (34.4 million acres) available for road construction, logging and commodity development. The Roadless Area Conservation Rule prevents this loss. (Business, Sumner, WA - #A21731.13110)

BECAUSE THE FRAGMENTATION CREATED BY ROADS TRANSCENDS LOCAL AND REGIONAL MANAGEMENT

The problems associated with fragmentation by roads are too complex to rely on decisions made at the Forest or Regional levels. Many species that depend on National Forest such as grizzly bears, wolves, and Canada lynx must be managed over very large scales. For this reason, fragmentation of our National Forests by roads is a problem that transcends management at the local or even regional level, particularly near the border of two Forest Service Regions. It is essential that Roadless Areas be protected by a uniform, national rule. (Individual, Evergreen, CO - #A20492.13120)

BECAUSE FEDERAL DOLLARS SUPPORT THE FOREST SERVICE AND THE LANDS IT ADMINISTERS

As long as federal dollars support the Forest Service and the lands [it] administers, these lands should be subject to protection and regulation on the federal level. (Individual, Reno, NV - #A20755.13120)

BECAUSE LOCAL INTERESTS MAY BE TIED TO THE PROFIT MOTIVE OF LOCAL INTERESTS AND NOT REPRESENT THE COLLECTIVE WILL OF THE STATE OR THE NATION

Local planning should be considered but not be given too much weight if there is a conflict-of-interest. For example, local interest may be tied to the profit motive of local business interests and not represent the collective will of the state or the nation. (Individual, Gaithersburg, MD - #A5191.13000)

The Forest Service has long been a servant of local interests. District Rangers, in an effort to endear the communities in which they live, often place local logging over the good of the forest as a whole. These are NATIONAL forests, not local forests! The Forest Service has lost sight of that fact. The National Forests were created in the early 1900s in response to the abuse of logging of the private sector. We now need to set aside Roadless Areas in response to the abuses of logging within the National Forests. (Individual, Olympia, WA - #A614.13120)

Local USFS supervisors and planners should never be allowed to determine roadless area objectives, goals and prohibited activities on a given forest. Local planners should not decide what to do with roadless areas. They should decide how to best implement National roadless policy and direction. If left up to local managers to decide how the roadless areas should be managed, a myriad of personal commodity extraction favoring values (for those who have them) will enter the picture. If this is allowed to happen, some roadless areas will be roaded/clearcut and others will be preserved. (Individual, Grangeville, ID - #A830.13120)

I firmly believe that our national forests are just that. They are national lands that should be governed by national policy. States already have separate resources that fall under the direct control of state agencies. In my state of Washington, the Department of Natural Resources is currently looking into logging of old-growth forests in these areas to provide state funds in direct threat to endangered species. I firmly believe that increasing local influence on roadless areas conservation will lead to a slow but certain destruction of these areas. Local influence almost always means that there are specific extraction advocates that stand to make substantial financial gains from reduced protection. These interests are thus willing to place significant money behind their lobbying efforts. It is more difficult for the many varied interests of the citizens to organize against such focused moneyed interests, and it is an undue and unrealistic burden to expect the citizens to marshal forces against each and every individual threat. Let us citizens feel safe that these roadless areas will remain preserved as is, without having to continually watch over our shoulders for the next assault by "well meaning, local" interests driven by profit. (Individual, Seattle, WA - #A21682.13120)

BECAUSE THE FOREST PLANNING PROCESS HAS FAILED TO ADEQUATELY PROTECT ROADLESS AREAS

The ANPR never mentions that the Rule was developed with the most extensive public participation ever in a federal rulemaking. Instead, it just cites allegations in lawsuits that "there was inadequate opportunity for public review and comment on the roadless rule." Thus, the administration seems to ignore the 1.6 million public comments in support of roadless area protection.

The administration seeks to undermine the legitimacy of the environmental impact statement (EIS) for the rule. The ANPR states that “it is difficult, and perhaps infeasible to collect in a short timeframe, on a national scale, the local data needed to produce a sufficient EIS that analyzes all relevant information or that proposes an adequate range of alternatives.”

The ANPR implies that local decision-making is needed because protection is warranted for some roadless areas but not others. It states that most roadless areas previously were not recommended for wilderness designation due to low wilderness values, inadequate public support, or “other resource potentials.” It observes that the resource values of roadless areas “vary in importance”, specifically pointing out that roadless areas contain 9 million acres of “productive timberland.”

The administration extols the local forest planning as a highly collaborative process involving local, regional, and national interest, using the best available forest-level information and maps. It does not point out the past failure of the forest planning process to protect roadless areas, allowing roads to be built in most of the remaining roadless land. Nor does the administration mention that it is in the midst of amending the forest planning regulations to greatly weaken environmental safeguards and public participation opportunities in the planning process. (Organization, Pinckville, TN - #A5167.12200)

The National Forest planning process has clearly failed to provide adequate protection of roadless areas, and most certainly will continue to be the case in the future, especially given that the Administration is also weakening forest planning regulations. In existing national forest plans, about 60 percent of remaining roadless areas are open to road construction and logging. Continued incremental loss of roadless areas will continue without the Roadless Areas Conservation Rule. (Individual, Hewlett, NY - #A4748.10111)

The Forest Service’s legacy, unfortunately, is not a pretty one. Decades of mismanagement have led to the fragmentation of forest ecosystems, liquidation of old growth forests, and the demise of many fish and wildlife species. In the Pacific Northwest, for example, less than 10 percent of old growth/late successional forests remain and species such as the northern spotted owl, salmon, and marbled murrelet teeter on the brink of extinction. The Sierra Nevada, christened the Range of Light, by John Muir, is unraveling after over a century of logging, mining, and ranching. Species in the Sierra, including the California spotted owl, wolverine, Pacific fisher, American pine marten, and northern goshawk are quickly disappearing. In the southwest, cows have driven out native species, degraded riparian areas, and eroded soils. Off road vehicles run roughshod over public lands across the country. Forests in the mid-west, northeast, and southeast have been so heavily fragmented that few contiguous, large roadless areas exist. And oil, gas, and mining projects, as well as ski resorts, in the northern Rockies have severely compromised the biological integrity of the region. All of these developments were made possible under the forest planning process. (Organization, Nevada City, CA - #A4941.10111)

The Administration appears bent on ignoring the fact that 1.6 million comments were submitted the FIRST time around. A hearty ninety-five percent of these comments SUPPORTED the Roadless Plan and some advocated even stronger protections. Moreover, to propose now that all decisions are made on a local basis is a giant step backwards. History demonstrates that local decision-making hasn’t worked to protect roadless areas for a long time. Therefore, a national policy designed to protect our nation’s roadless lands is imperative. (Individual, Durham, NC - #A934.10111)

The Forest Service’s legacy, unfortunately, is not a pretty one. Decades of mismanagement have led to the fragmentation of forest ecosystems, liquidation of old growth forests, and the demise of many fish and wildlife species. In the Pacific Northwest, for example, less than 10 percent of old growth/late successional forests remain and species such as the northern spotted owl, salmon, and marbled murrelet teeter on the brink of extinction. The Sierra Nevada, christened the “Range of Light,” by John Muir, is unraveling after over a century of logging, mining, and ranching. Species in the Sierra, including the California spotted owl, wolverine, Pacific fisher, American pine marten, and northern goshawk are quickly disappearing. In the southwest, cows have driven out native species, degraded riparian areas, and eroded soils. Off-road vehicles run roughshod over public lands across the country. Forests in the

midwest, northeast, and southeast have been so heavily fragmented that few contiguous, large roadless areas exist. And oil, gas, and mining projects, as well as ski resorts, in the northern Rockies have severely compromised the biological integrity of the region. All of these developments were made possible under the forest planning process. (Individual, Boise, ID - #A20396.10111)

I do not want to see Congress and our federal officials make any changes to the current Forest Service's Roadless Area Conservation Rule.

We spent a lot of time (and tax dollars) carefully gathering public opinion to promulgate this rule in the first place. Our country clearly wanted the remaining 30% of our wild national forests protected from human intervention into forest ecosystems through mining, drilling and logging operations. The present Conservation Rule nicely addresses access and local input. The proposal to address each forest area individually will NOT maintain these critical protections. (Individual, Northville, MI - #A179.10111)

The Roadless Rule is needed because local forest planning has failed to protect significant roadless areas in the past. For example, the HD Mountains inventoried roadless area includes over 30,000 acres of lower elevation old-growth ponderosa-pine forests and pinyon-juniper woodlands. Ignacio Creek in the heart of the roadless area is one of the most pristine lower-elevation riparian systems in the Rockies. This ungrazed, unlogged, unroaded watershed is a proposed Research Natural area. Despite the superlative values of the HD Mountains, the existing forest plan adopted in the early 1980s left the area open to oil and gas exploration and development. Consequently, most of the area was leased in the 1980s and 1990s without consideration of the impacts that cutting roads through this pristine landscape will have on a rare, unroaded, lower-elevation ecosystem. Forest Planning utterly failed to protect the HD Mountains which is why the Roadless Rule is needed now. (Individual, Durango, CO - #A11655.10111)

BECAUSE LOCAL PLANNING HAS RESULTED IN AN \$8.5 BILLION ROAD MAINTENANCE BACKLOG

Forest-by-forest decisions have resulted in nearly 400,000 miles of roads and an \$8.5 billion road maintenance backlog in our National Forests, all borne by the taxpayer. Indeed short-sighted local decisions on forest management are what created the need for the RACR. (Individual, Minneapolis, MN - #A10523.17240)

BECAUSE REGIONAL OR NATIONAL PERSONNEL HAVE BETTER ACCESS TO QUALIFIED SCIENTIFIC OPINION

Local decisions will be influenced by politics and personal agendas and do not incorporate the large picture. Regional or national FS personnel are more immune to local politics and have better access to qualified scientific opinion. (Individual, Hamilton, MT - #A26764.13000)

BECAUSE LOCAL PLANNERS ARE OFTEN INCOMPETENT

Local forest planning should be considered so long as it is done by competent planners, which is often not the case. Local input to knowledgeable planners is most certainly a positive. (Individual, Corvallis, OR - #A1132.13100)

BECAUSE THE POLITICAL WILL TO PROTECT ROADLESS AREAS CAN NOT BE FOUND AT THE LOCAL LEVEL

Informed decisionmaking. The roadless areas have already been inventoried, their descriptions are in the forest plans, and their values are listed. Local planning is finished. We need only the political will to protect them. You won't find political will at the local level; it's hard enough to find it at the national level. Local meetings were held nationwide. I attended them, and I heard overwhelming support for complete protection. (Individual, Eugene, OR - #A13952.12100)

BECAUSE ALLOWING LOCAL DECISIONMAKING WOULD WEAKEN THE ROADLESS AREA CONSERVATION RULE

Forest-by-forest decisions do not need to be made. Not meaning to sound overly dramatic, but when we begin discussing and considering changing the protection for the national forest so decisions are made on a case-by-case basis, it will become too easy pick apart each forest one at a time with time, eventually

leaving us and future generations with nothing but a raped, wasteland. Please don't allow these protections that have already been put into place to be weakened. Know that not only do I strongly oppose weakening of our national forest protection through forest-by-forest decisions, but so do many of the other voters in America. We DON'T want to see logging and development in roadless areas. (Individual, Saint Petersburg, FL - #A202.13120)

As to "local control," I have serious reservations about ceding control of federal assets to any entity which is not directly accountable for their misuse. The Forest Service, through the President and unlike state or local entities, is accountable to the federal taxpayers and I expect them to take that responsibility seriously. The administration's current attempts to weaken the Roadless Rule do not appear to take this responsibility into account. (Individual, Broomfield, CO - #A211.13120)

WITH LOCAL FOREST PLANNING SERVING IN AN ADVISORY AND TECHNICAL ASSISTANCE CAPACITY

Local forest planning should serve in an advisory and technical assistance capacity. Ultimate decision-making authority should be maintained by the federal government. National Forests belong to all citizens of the United States of America; not just the local people in the vicinity of a subject forest area. (Individual, Olympia, WA - #A26693.13120)

239. Public Concern: The Forest Service should make management decisions *only* at the national level.

WITH NO ROOM FOR LOCAL INTERPRETATION

Management of our national forests should be limited to enforcement of a national policy only. National forests are a public trust that belong to all Americans and are not suited to be managed according to the whims and limited perspective of a local manager. A national policy dictating the protection of all remaining national forests should govern all local manager administration with no allowance for interpretation.

National forests are for the use of all people and are to fall under the dominion a local community. (Individual, Petaluma, CA - #A17057.13210)

240. Public Concern: The Forest Service should not change the management guidelines of the Roadless Area Conservation Rule to conform to local government plans.

The Forest Service has already provided states and local governments with ample opportunities to comment on the proposed roadless area rule, and incorporated many changes suggested during the public comment period into the final roadless area conservation rule. Under no circumstances should the management guidelines of the national roadless area conservation rule be "bent" to conform to local government plans. This is a national protection program to conserve a resource of national interest, undisturbed and unroaded natural areas. A national perspective must be maintained at all times. (Individual, Palo Alto, CA - #A15827.15130)

The Forest Planning Process

Summary

General Comments – General comments on the forest planning process are varied. According to one individual, the Secretary of Agriculture's five principles effectively states that the local forest planning process must be used, an implication that the Secretary gives no weight to any method of decisionmaking other than the local forest planning process. Others assert that roadless issues have already been adequately addressed in the forest planning process.

Some respondents say the Forest Service should clarify that, even with the Roadless Area Conservation Rule in place, many management decisions would continue to be made through the

forest planning process. Further, others assert, the local forest planning process is complementary and consistent with the Rule, and can therefore proceed in tandem with the Rule's full implementation.

Finally, some organizations claim that the National Forest Management Act does not actually mandate local forest planning (for more on the National Forest Management Act, see Chapter 2: National Forest Management Act).

Development/Implementation of Forest Plans – Some respondents comment on the development and implementation of forest plans. According to one individual, the Forest Service should ensure that any national forest without a forest plan in place immediately begin the public process of creating one. On a similar note, others recommend that forest plans be amended and/or revised in a timely manner and that the Agency make efforts to remove institutional impediments to implementing existing forest plans, especially in light of the considerable time and money that have already been invested in forest plan development.

Public Participation in the Forest Planning Process – A number of individuals comment on public participation in the forest planning process. Some suggest the Forest Service should ensure all stakeholders equal access to the forest planning process by proactively seeking them out and inviting their participation. Others state that forest plans should more adequately reflect the concerns expressed by the public during their development. One respondent says of his own experience that many people worked hard, both Agency and the public to develop a meaningful plan but when the final was released, it did not resemble their input. Finally, one individual suggests opening all local forest planning processes to the American public at large by posting local decisions on the internet for all to review and comment on.

Appropriate Role of the Forest Planning Process – Respondents offer a wide array of suggestions regarding the appropriate role of the forest planning process. Suggestions range from identifying local concerns, attitudes, issues, and problems that might otherwise remain unknown at the national level to implementing national directives and maintaining and protecting maximum amounts of remaining roadless areas. Some suggest its role is to restore natural processes to roadless areas, and to protect public lands from undue use. Others suggest that its role is to identify roadless areas that are not in the current inventory and roadless areas that need to be restored; to address management of uninventoried and unroaded areas; to determine roadless area boundaries and develop site-specific resource prescriptions compliant with the Roadless Area Conservation Rule; and to identify local resources that may merit additional protection. According to one organization, however, the appropriate role of the forest planning process cannot be determined until changes to the Planning Regulations are finalized.

The Forest Planning Process General

241. Public Concern: The Forest Service should consider that the Secretary of Agriculture's five principles imply that only the forest planning process must be used for managing Roadless Areas.

On May 4, the Secretary of Agriculture presented five principles on which the protection and management of roadless values should be based: 1. Informed decision making, using reliable information and accurate mapping and drawing on local expertise and experience through the local forest planning process.

Very interesting. The Secretary of Agriculture is effectively stating that the local forest planning process must be used. . . . this statement implies that the Secretary gives no weight whatsoever to any method of decisionmaking other than the local forest planning process. This implication is grave indeed, as a closed mind is a most dangerous weapon. It also further erodes my personal confidence in the capability of the Secretary and the directives that issue from that office. And, in all cases where a position reports to another position higher in a hierarchy, such a case also erodes the confidence on the capabilities of selection, management, oversight, and acceptance of responsibility of the higher position. In this case, that position is the President of the United States. (Individual, Nederland, CO - #A19016.11110)

242. Public Concern: The Forest Service should consider that roadless issues have been addressed in the forest planning process.

There appeared to be a misconception that the roadless issues had not been addressed in earlier planning processes. The draft EIS noted that the roadless issues:

“ . . . have not been effectively resolved at the local level in many places”

However, review of the land use plans reveals that this is a very subjective statement that ignores the long history of this issue being addressed and resolved in local LRMPs, the Oregon Wilderness Act of 1984 and other Wilderness Acts, the Hells Canyon National Recreation Area Act, Oregon Omnibus Wild and Scenic Rivers Act. In every case the applicable roadless areas were reviewed and decisions made to allocate them to other land uses or otherwise release them from roadless or wilderness reviews. While Congress intended these acts to be compromises, the interest groups have clearly seen them as merely a shift in the goal posts and not the good faith compromises intended by Congress to resolve the issues. To maintain stability in the local communities it is important that the Forest Service adhere to these compromises and the land and resource management plan outputs. (County Attorney, Grant County, OR - #A17667.20200)

243. Public Concern: The Forest Service should recognize that implementation of one of the Roadless Area Conservation Rule action alternatives amounts to an amendment to or modification of forest plans.

THE INYO FOREST PLAN

The intent behind the Roadless Initiative is to in effect update or modify RARE II. The problem with this approach is that the entire Forest Plan process which resulted in the current Plan for the INF [Inyo National Forest] is now being leap-frogged or bypassed without USDA complying with NEPA or other applicable federal law. Implementation of one or more of the Action Alternatives in the Roadless Initiative will not only supersede or amend RARE II, but more importantly will amend or modify the [Inyo National Forest] Plan. (Business, Mammoth Lakes, CA - #A30296.20200)

244. Public Concern: The Forest Service should ensure that the forest planning process is interdisciplinary and based on site-specific ecosystem considerations.

The role of local forest planning is to prepare plans from an interdisciplinary perspective. Considerations are to be made on the requirement of all flora and fauna and how they all interact in the ecosystem. Mankind's desires for the use of these ecosystems are to be weighted against the impact of such uses. Such ecosystem based plans can only be developed on a site-by-site basis. (Individual, Evergreen, CO - #A19178.13200)

245. Public Concern: The Forest Service should clarify that, with the Roadless Area Conservation Rule, many management decisions would continue to be made through the forest planning process.

In addition to the numerous ways in which the Rule preserves local discretion to regulate those aspects of road-building and logging that do not threaten the greatest, most indelible harm, it leaves many other

roadless area management decisions to regulation through the National Forest Management Act (NFMA) planning process. For example:

The Rule does not bar off-highway vehicles (ORVs), instead leaving them subject to local regulation. As on other non-wilderness lands, ORV routes in roadless areas that are designated and managed as trails by the local national forest are not considered roads and therefore can be maintained by the agency.

The Rule does not prohibit or regulate mining for locatable minerals. Miners who would have a right to build a road through a roaded area will continue to have one through roadless areas.

Areas too small to be included by national forests in their roadless area inventories or never inventoried for other reasons are not covered by the final Rule. Their management is determined through local processes, under the Rule.

Regulation of grazing is left unaffected by the final Rule, despite the demonstrated link between grazing domestic stock in forestlands and increased in-growth of flammable understories. (Organization, Olympia, WA - #A20145.13130)

246. Public Concern: The Forest Service should ensure that decisions reached through the local planning process cannot easily be changed by Congress.

The results of properly conducted forest planning must be respected. Otherwise, planning is just a sham. The rules should make it more difficult for politicians to change decisions that were reached through the planning process. (Individual, No Address - #A17292.13000)

247. Public Concern: The Forest Service should recognize that the local forest planning process is complementary and consistent with the Roadless Area Conservation Rule.

AND CAN PROCEED IN TANDEM WITH THE FULL IMPLEMENTATION OF THE RULE

The Roadless Area Conservation Rule is not a substitute for local forest planning, nor is such local planning a substitute for the Rule. Local forest-by-forest planning is thoroughly complementary and consistent with full implementation of the Rule, and can proceed in tandem with it as it does with other national rules and legislation designed to protect our public lands. Those who have criticized the Rule as a top-down federal imposition on local forest planning ignore that fact, as well as the Rule's remarkable public support throughout the country and the critical role of enlightened federal policymaking in conserving our public lands. (Individual, Wonalancet, NH - #A8275.13110)

248. Public Concern: The Forest Service should recognize that the National Forest Management Act does not mandate local forest planning.

The NFMA does not provide any specific direction for "local forest planning".

Section 1612 of the Act deals with "Public Participation"; subsection (1) addresses "Adequate notice and opportunity to comment"; and subsection (b) deals with "Advisory Boards." Subsection (b) states:

In providing for public participation in the planning for and management of the National Forest System, the Secretary, pursuant to the Federal Advisory Committee Act (86 Stat. 770) and other applicable law, shall establish and consult such advisory boards as he deems necessary to secure full information and advice on the execution of his responsibilities. The membership of such boards shall be representative of a cross section of groups interested in the planning for and management of the National Forest System and the various types of use and enjoyment of the lands thereof.

Note that there is no reference to "local planning, the advisory boards are not mandatory, and if implemented should show a cross section of groups. WildLaw interprets this to include environmental organizations. WildLaw also believes that the absence of "local" planning in the Act was intentional. (Organization, Montgomery, AL - #A27512.15121)

The NFMA does not provide any specific direction for "local forest planning". Section 1612 of the Act deals with "Public Participation"; subsection (a) addressed "Adequate notice and opportunity to comment"; and subsection (b) deals with Advisory Boards." Subsection (b) states:

In providing for public participation in the planning for and management of the National Forest System, the Secretary, pursuant to the Federal Advisory Committee Act (86 Stat.770) and other applicable law, shall establish and consult such advisory as he deems necessary to secure full information and advice on the execution of his responsibilities. The membership of such boards shall be representative of a cross section of groups interested in the planning for and management of the National Forest System and the various types of use and enjoyment of the lands thereof.

Note that there is no reference to “local” planning, the advisory boards are not mandatory, and if implemented should show a cross section of groups. The UEC interprets this to include environmental organizations. The UEC also believes that the absence of “local” planning in the Act was intentional. Congress set aside the public lands for the enjoyment of all Americans, not just those who live in the state where the land exists. (Organization, Salt Lake City, UT - #A17170.13110)

249. Public Concern: The Forest Service should consider that, by its own actions, it has disabled itself from managing roadless areas through the normal planning process.

The role of the Forest Service in evaluating roadless areas has been a catch 22. The Forest Service was not legally compelled to perform its RARE studies, but having done so in a way that was then deemed unsatisfactory to the federal courts, the Forest Service inadvertently disabled itself thereafter from managing the roadless study lands through the normal planning process. (Individual, Spokane, WA - #A17819.45400)

The Forest Planning Process – Development/Implementation of Forest Plans

250. Public Concern: The Forest Service should ensure that any national forest without a forest plan in place immediately begin the public process of creating one.

BECAUSE FORESTS WITH PLANS IN PLACE DO NOT NEED ADDITIONAL ROADLESS AREA PROTECTION

The decision of how to manage individual inventoried roadless areas should be broadly based on the five principles outlined by Secretary Venneman on May 4, 2001. For each national forest it should be a function of the forest plan. Any national forest with forest management plan in place should have no immediate need of any additional roadless area protections added at least until a forest plan revision is done. Any forest without a plan in place should immediately begin the public process of creating one. (Individual, Ketchikan, AK - #A23219.13200)

251. Public Concern: The Forest Service should ensure that forest plans are amended and/or revised in a timely manner.

Forest plans must be amended and/or revised in a timely manner in order to address the protection of roadless areas. However, the Forest Service cannot, on the one hand, acknowledge the role of forest plans to make future decisions about roadless area management while on the other hand ignoring forest plan decisions about roadless area management. This is especially true for the national forests that have completed a revision of their forest plans. Inventoried roadless areas have been subject to in-depth analysis and evaluation since the first Roadless Area Review (RARE I) in 1972. During development of the forest plans, the presence or absence of a road did not exclusively drive the decisions on land allocations, but more appropriately, decisions were based on examination of the full range of values on these lands. This should be the same for future amendments and revisions of the plans. (Business or Association, Washington, DC - #A26728.13200)

252. Public Concern: The Forest Service should consider the time and money that has already been invested in forest plan development.

We are especially concerned that the Roadless Rule changed portions of the just-revised Black Hills National Forest Plan dealing with management of roadless areas. Many public and private organizations and residents of the Black Hills Region invested a lot of time and energy over the 7-year process to revise the Plan. (Business, Rapid City, SD - #A30145.20201)

NFMA makes the land and resource management plan (forest plan) the focal point for management of each national forest. The proposed rules runs counter to the NFMA and the 36 C.F.R. Part 219 provisions on forest planning. The national rulemaking would override most of the 124 forest plans the agency has prepared at great public expense. Our tax dollars are being wasted as a result of lack of consideration for local forest planning. (Professional Society, Anchorage, AK - #A21707.20201)

253. Public Concern: The Forest Service should make efforts to remove institutional impediments to implementing existing forest plans.

The Forest Service's focus on planning while failing to implement its existing plans in a timely manner has had a significantly negative impact on our local communities. It is our position that the time and monies of the Forest Service would be better spent in removing the institutional impediments to implementing the existing forest plans. (Elected Official, Douglas County, OR - #A11811.13000)

254. Public Concern: The Forest Service should use the National Forest Management Act processes in developing forest plans rather than the Forest Service Manual 7710 road management policy.

The policy (FSM 7710) governing road management must be re-examined also. It does not allow for adequate input from those affected and has probably been the cause for much of the distrust and anger many of the citizens have displayed and continue to display towards the Forest Service. Roads have been closed to protect the environment (erosion into streams) while cattle continue to damage the stream bank and put more silt into the stream than the road ever did. Roads have been closed off a couple hundred yards from ideal campsites used by elderly and disabled for causing safety concerns with backing and congestion at the road end. All this could be avoided if properly administered NFMA processes and not the FSM 7710 road management policy were used to develop plans. Individual area advisory groups are critical to the process. (Individual, Rock Springs, WY - #A22428.20500)

The Forest Planning Process – Public Participation

255. Public Concern: The Forest Service should ensure all stakeholders equal access to the forest planning process.

BY PROACTIVELY SEEKING OUT STAKEHOLDERS AND INVITING THEIR PARTICIPATION

The Forest Service should ensure that all stakeholders have equal access to the deliberative process and have an equal opportunity to provide input. No single group or individual should be granted special access through private meetings or similar arrangements. The Forest Service should be proactive in seeking out stakeholders and inviting their participation. At a minimum, one individual in each regional office should be designated with this responsibility as a full-time job. A better, but probably not cost-effective approach would be to have one individual in each national forest. The key perception to be created is that all stakeholders have an equal opportunity to participate in the process and that no stakeholders are granted special privileges. (Individual, Marietta, CA - #A4827.15000)

256. Public Concern: The Forest Service should encourage timely participation in the forest planning process.

States, tribes, local communities, other organizations and individuals can be led to the process but cannot be forced to participate in it. However, if they do not participate in a timely manner there should be

some way of preventing their coming up out of the woodwork at a later date to function as spoilers. (Individual, Olympia, WA - #A278.15111)

257. Public Concern: The Forest Service should ensure that forest plans reflect public concerns.

Some years ago my wife and I drove 200 miles (one-way) to participate in the public meetings for a Forestry Plan which lasted about six months. The two dozen well educated Citizens and USF professionals worked hard to build a meaningful PLAN. But in the END the FINAL PLAN I was mailed had no resemblance to the meetings I attended. (Individual, Center Sandwich, NH - #A3669.15110)

Working Together. The best way for the Forest Service to work with the various government entities and publics is through the NEPA and NFMA public involvement processes. These provide for public input in an open decision-making manner. That is, people are encouraged to enter into collaborative discussions early and often in the decision-making process, and the agencies not only listen carefully to those publics but incorporate their wishes and desires in a range of alternatives that considers all view points.

The open decision-making process often breaks down at this latter point. For instance, in the preferred alternative for the Wasatch-Cache revised forest plan, the Forest proposes to adopt the Clinton roadless rule and treat all roadless areas exactly the same. This is in direct opposition to the input the Forest received, which suggested some areas remain roadless and some be developed. The Wasatch-Cache personnel listened to the public, but then it imposed its own values on the interested parties.

The hard part of an open decision-making process is that it requires the agency to give up some control over the forest and share that control with the public. Some Forests have not mastered this technique yet. Our point here is that the Forest Service should use the NEPA/NFMA regulations to collect public input and then incorporate that input into management direction in a fair and impartial manner without overriding that input with their own values. (Elected Official, Clark County, Dubois, ID - #A23504.20200)

258. Public Concern: The Forest Service should recognize local contributions to forest plans.

We are very concerned about the lack of attention being afforded the local communities' contributions in the land and resource management planning processes. In a rather arrogant and patronizing manner, the DEIS arbitrarily and capriciously dismissed the LRMPs as being adversely influenced by the local communities. The DEIS implied that the land allocations and management decisions relative to the roadless areas were made by the local Forests without input from the regional offices or Washington office. Contrary to the DEIS implication, review of the planning process reveals that prior to adoption, all of the LRMPs were reviewed by the Regional and Washington offices. Likewise after adoption, any appeal or challenge to the LRMPs were resolved at the Regional office and generally only after concurrence by the Washington office. The DEIS statement is simply an insult to those parties who participated in the LRMP process and serves to discourage public participation in any future planning efforts. Absent a more in-depth justification for this proposed rule, it is our position that this action is not supported by history and undermines the entire forest planning process. (Elected Official, Douglas County, OR - #A11811.15111)

259. Public Concern: The Forest Service should open all local forest planning processes to the American public at large.

BY POSTING LOCAL DECISIONS ON THE INTERNET FOR ALL TO REVIEW AND COMMENT ON

I recommend that all local forest planning processes be opened up to the American public at large. Decisions made at these local forest planning sessions should be made public on the Internet for all Americans to review and comment on. These are our lands, after all, and we have the right to know what is being done to them, and how well the local administrators are implementing the wishes of the American people. (Individual, Ballwin, MO - #A17037.13210)

The Forest Planning Process – Its Appropriate Role

260. Public Concern: The Forest Service should consider the appropriate role of the forest planning process.

TO IDENTIFY LOCAL CONCERNS, ATTITUDES, ISSUES, AND PROBLEMS THAT MIGHT OTHERWISE REMAIN UNKNOWN AT THE NATIONAL LEVEL

I agree with the USFS [United States Forest Service] conclusion that the best way to reduce conflicts involved with the management of roadless areas is through a national level rule. The fact that over half of the roadless area acreage has prescriptions allowing road construction and reconstruction indicates input at the local level does always promote national policy.

I believe the appropriate role of local forest planning in evaluating protection and management of inventoried roadless areas (IRAs) is to provide constructive input. This would include identifying local concerns, attitudes, issues, and problems that might otherwise remain unknown at the national level. This local participation would at least “flavor” national directives, and regional and forest level resources will still be responsible for day-to-day management. (Individual, Vista, CA - #A4838.13100)

TO ASSESS THE IMPACTS OF A PROPOSED ACTION

The appropriate role of local forest planning in evaluating, protecting and managing of inventoried roadless areas is to assess the impacts of the proposed action and to integrate those impacts into the process so the public is aware of the consequences. (Business or Association, Sandy, UT - #A15656.15111)

TO RESOLVE ROADLESS ISSUES

FOIA notices that questions #1, #2, and #9 deal with public input as required by the National Environmental Policy Act of 1969 (NEPA). We strongly feel that Congress in passing the 1969 act did not intend for public input to become a tool to stop management activities on federal lands. It is very unfortunate that some groups have used this tool for that purpose. Diverse groups will work together in a collaborative manner only when there is the common desire to resolve an issue. It is unfortunate that some groups have no desire or incentive to see the roadless issue resolved. Solving the roadless issue is best accomplished through the forest planning process as directed in the National Forest Management Act of 1976 (NFMA) and settlement of the RARE II lawsuits. The Forest Service should proceed in a responsible manner. (Business or Association, Coeur d'Alene, ID - #A15260.15000)

TO MAINTAIN MAXIMUM AMOUNTS OF REMAINING ROADLESS AREAS

The appropriate role of local forest planning is to maintain a large-scale inter-connected national view, and thus maintain the absolute maximum amounts of remaining roadless areas, for the greatest local and national public value. (Individual, No Address - #A4499.13100)

TO PROTECT ROADLESS AREAS

Your agency is supposed to be managing the forest on behalf of a national constituency, the vast majority of which is overwhelmingly supportive of conservation-based management practices as exemplified by RACR. Therefore here are some short answers to “What is the appropriate role of local forest planning:”

- a. Insure the roadless areas remain protected.
- b. Prevent damage from off-road vehicles. (Individual, Somers, MT - #A11866.13210)

The appropriate role of the local forest planning (as noted, required by NFMA) is to manage the roadless areas as roadless areas. This means exactly what it says, no roads. Access is restricted to non-motorized vehicles that can negotiate trails or trail-less areas. The local forest planning should regard this charge as seriously as it regards any other charge it has, including timber or mineral production. (Individual, Cleveland, SC - #A21250.13200)

The proper role of local forest officials should be to protect the roadless areas from destruction thru the unnecessary creation of emergency (i.e. fires) and from other maintenance activities that necessitate road building.

The local officials should become stewards of the land. They should develop an intimate knowledge base, and a connection with the land around them. However, they should not have the final say as to the fate of these roadless areas and a system ensuring decisions are made with best interest of the ecosystem in mind should be put in place. Ensuring both local and national opinions are heard on these matters is essential.

Local officials should be the first people to profess the sacredness of the land they oversee. They should be the first line of defense against those who would expose these pristine roadless areas to the affects of increased traffic, loss of habitat, and edge effects. (Individual, Walla Walla, WA - #A17698.13110)

Local forest planning should incorporate a strong Roadless Protection Policy. Logging and road building should be prohibited in the plans. Local forest planning should then focus on all the other multiple uses which occur in inventoried roadless areas, balancing them in a way that best serves the needs of today's Americans, wildlife, clean water, and ecosystems processes with the future. Consideration should be given to creating quiet trails, where motorized use is prohibited, while ensuring that there are opportunities for motorized recreation in other places—a process also known as zoning. Logging and road restoration and maintenance may continue on roaded lands as determined in the local planning process. (Individual, Sun Valley, ID - #A20628.13110)

TO RESTORE NATURAL PROCESSES TO ROADLESS AREAS

The matter concerns wilderness not forest lands, which are already considered silva/agricultural use lands. As far as these roadless lands are concerned the appropriate role of forest planners should be to get out of the way and let nature take back its role. Officious demands of forests planners only seek to upset the balance unless it includes the reintroduction of native species to their ancestral home. When it comes to these roadless areas we should not entrust our future to those who would respond to undue political pressure to abuse them for commercial exploitation such as is being designed in the ANWR and many other precious places that thieves might wish to eviscerate. (Individual, No Address - #A13403.13110)

TO PROTECT PUBLIC LANDS FROM UNDUE USE

Sight should not be lost that the Forest Service represents the people of the United States. Public forums and correspondence should not be used to let the various interests unduly influence management and protection of public lands. It is the duty of the Forest Service to primarily inform local interests of intended procedures for management and protection and incorporate worthy suggestions in the agency's plans certainly not to negotiate away the people's right to expect that public lands will be protected from undue use and exploitation by interest groups. (Individual, No Address - #A9085.15120)

TO IMPLEMENT SUSTAINABLE FOREST MANAGEMENT PRACTICES

The role most appropriate for forest planning is to implement sustainable forest management practices for the common good of ecosystems, water quality and quantity, game and non-game wildlife, recreation and scenic value for all Americans in perpetuity, with appropriate low impact (light human touch) sustainable use of forest resources and products with appropriate avoidance measures and restoration. I truly believe that our National Forests can provide to our society, while identifying key roadless areas which promote biodiversity and critical connecting corridors to sustain wildlife populations that have been omitted from the Forest Service inventories, and locating and managing ORV use in ways that provide this popular outlet while avoiding or minimizing damage to sensitive areas. (Individual, Watsonville, CA - #A6767.15160)

TO DETERMINE ALLOWABLE ACTIVITIES IN ROADLESS AREAS

In question 7 you asked of specific activities forbidden or allowed. As I previously pointed out, if the Forest Plan is used as the vehicle to deal with the roadless question I think many areas will have specific prohibitions, as well as more allowances, but may remain roadless. These should fit the expected management goals and direction. These should be decided during the Forest Planning process for each

Forest. This will make the decisions and the expectations relatively clear and hopefully compatible with the ecosystem's capability to sustain the goals that are set forth. When roads are a high-risk element for a number of reasons it seems appropriate for the area to remain roadless. When priorities in management direction require treatments that require roads they should be allowed and controlled to meet those goals. (Individual, Cambridge, ID - #A11714.13200)

TO ADDRESS ACTIVITIES NOT REGULATED BY THE ROADLESS AREA CONSERVATION RULE

New Forest plans should address activities not already regulated by the existing roadless rule. These include wildfire for resource benefits, prescribed burning, wildlife habitat improvement, noxious weed control, off-road vehicle and other recreational uses. Road building and timber harvesting are sufficiently addressed by the existing rule. (Individual, Bend, OR - #A27922.30100)

TO DETERMINE ROADLESS SUITABILITY, RECREATION OPPORTUNITY, AND DESIRED FUTURE CONDITIONS

Forest planning should only determine roadless suitability, recreation opportunity, and determine desired future condition for ecological as well as social values. Management of the roadless areas should fall within a national roadless area management strategy. (Individual, Ennis, MT - #A2249.13120)

TO COLLECT DATA AND ENFORCE FEDERAL REGULATIONS

Forest planners on the local level should be responsible for data collection and enforcement of federal regulations. Local-level forest service officials should have a say in how these areas are managed, but theirs should be one voice in contribution toward federal level enforcement and protection. (Individual, Reno, NV - #A20755.13130)

The appropriate role of local forest planning in the evaluation and protection of roadless areas should extend exclusively to the collection and distribution of data regarding threats to the roadless status of these areas. Management of roadless areas should be similarly limited. (Individual, Seattle, WA - #A21681.13200)

TO IMPLEMENT NATIONAL DIRECTIVES

Local forest plans should be done to implement national directives and to make clearly local, ecosystem-specific management decisions. However, these are "National" Forests, not state or county property. Roadless designation and overall management guidelines for roadless area management are national issues. Where local Forest Service managers can provide evidence that variation from national policy is necessary, they should present proposed modifications for public scrutiny and higher level approval; with the "public" clearly meaning all citizens of the United States. (Organization, Helena, MT - #A20874.13130)

Given the role of local forest planning in the history of declining watersheds and entire ecosystems in the Interior Columbia Basin, as well as other Forest Service and BLM-administered regions, and adding to that the vast supply of examples from every national forest of deplorable local decisions on watershed and forest management, we all should be loathe to turn crucial decisions on remaining roadless areas over to those "who know local conditions best." Relying on local managers to resist industry, local business and vociferous local public pressure to develop the national public roadless lands is the opposite of good public administration or natural resource stewardship and preservation. The appropriate role of local forest planning as it relates to roadless areas is to carry out the national policy and nationally established goals, objectives, standards and guidelines for roadless areas. There is much exaggeration of local and regional differences, but before ICBEMP was emasculated by the Supplemental EIS decision, clearly workable provision for regional climatic and other differences was made in the standards and guidelines.

Considering the current weakening of the forest planning regulations by the present national administration, I have no reason to believe that future forest plans will protect roadless areas any better than they have in the past. Almost 3 million acres of roadless lands have been lost in the last 20 years through the individual national forest planning process, and the Forest Service has estimated that an

additional 6 million acres could be lost over the next twenty years if the Roadless Area Conservation Rule is not retained. (Individual, Bigfork, MT - #A17221.13120)

TO IMPLEMENT AND ENFORCE EXISTING LAWS, RULES, AND REGULATIONS

The appropriate role of local forest planning is **to obey the laws of the land**. Although many wish we did not have a Multiple Use-Sustained Yield Act of 1960 . . . I like the thing. And I will tell you why. It is one page long, a simple document, and it says that the public's lands must not be managed for the greatest dollar return or the greatest unit output. It also says, and I quote: "The establishment and maintenance of areas of Wilderness is consistent with this Act." Therefore, I repeat, the appropriate role of local forest planning is to implement the laws Congress has given it. (Individual, Albuquerque, NM - #A19061.15161)

The Forest Service's legacy is not a pretty one. Decades of mismanagement have led to the fragmentation of forest ecosystems, liquidation of old growth forests, and the demise of many fish and wildlife species. In the Northwoods, for example, less than one (that's the numeral 1) percent of white pine remain and species such as the Canada Lynx teeter on the brink of extinction. The area that is the birthplace of John Muir, Aldo Leopold, and the location of Sigurd Olson's "singing wilderness", is unraveling after a century and a half of logging and mining. Species in the Northwoods, including the Boreal owl, wolverine, and northern goshawk are quickly disappearing. Off road vehicles run roughshod over public lands across the country. And mineral hard-rock mining projects have severely compromised the biological integrity of the region. All of these developments were made possible under the forest planning process.

Local planning should be used to determine how protective laws, rule, and regulations can be enforced, and how existing uses should be apportioned (increased or reduced; limited to certain areas and times, and not allowed on/at others) so as to meet the demands of the 90% of Americans who said they favor total protection of roadless areas. Local planning should include better and more diligent surveying of the Forests to find smaller patches (down to 1,000 acres) of roadless area, so those can be protected. (Individual, Minneapolis, MN - #A10523.13110)

TO CARRY OUT APPROVED PLANS

Part of the "appropriate role for national forest planning" includes carrying out approved plans. Local forests have evaded the law and failed to follow their own plans in many cases. For example, the Jefferson National Forest routinely fails to meet Forest Plan requirements for road densities in bear, turkey, and even some deer feature habitat and refuses to take steps to comply with the Plan (See JNF Forest Plan IV-153-55; Mand E Rpts; My appeals of the Hagan Hall, Bark Camp, Wilson Mtn., Bannister Br., Peters Mtn., and other JNF timber sales.) See also my 3/30/98 Roadless Letter, pp. 3-5 on George Washington NF mismanagement in Management Area 14 (MA 14—remote habitat for wildlife) and elsewhere in the GWNF. (Individual, Roaknoke, VA - #A23081.13210)

TO SERVE AS THE MEDIATOR BETWEEN INDIVIDUALS AND THE FOREST SERVICE IN IMPLEMENTING THE ROADLESS AREA CONSERVATION RULE

The local Forest Service officials should be the middlemen and women between the concerned individuals and the National Forest Service. For instance, the local officials should be communicating with individuals with inholdings within the inventoried roadless areas, trying to make sure that access to their parcel of land is not a problem. Local officials should also be in communication with all those who have preexisting mining rights in these areas, working with them to see how they can best extract the resources to which they are entitled. Moreover, local officials should determine where forests require thinning in order to prevent devastating forest fires, etc. The provisions and exceptions to the rule should be overseen and administered by local Forest Service officials in consultation with National Forest Service representatives and, of course, Chief Bosworth. In other words, the Forest Service should work with the communities affected in order to expedite the transition and work out specifics, but the National Forest Service should not cater its forest management policies to the best interests of local communities. The best interest of the country and the preservation of its forests should be the basis of any legislation. (Individual, Dallas, TX - #A17005.13210)

TO IDENTIFY SITUATIONS THAT MEET THE EXCEPTIONS ALLOWED IN THE ROADLESS AREA CONSERVATION RULE

Local forest planning, including forest plan revisions or amendments should be use to identify situations that meet the exceptions adopted under the previous Roadless Rule and suggest that these exceptions be stated narrowly and explicitly, and addressed through forest plan revisions or amendments. (Columbia River Inter-Tribal Fish Commission, Portland, OR - #A20331.13211)

TO IDENTIFY ROADLESS AREAS THAT ARE NOT IN THE CURRENT INVENTORY AND ROADLESS AREAS THAT NEED TO BE RESTORED

There are 10,000 miles of roads on the one national forest that I work with most closely, the Wallowa-Whitman National Forest in northeastern Oregon. Local forest planning has not been protecting roadless areas. The Roadless Area Rule will provide for protection of the last remaining areas that are roadless. Local planning should identify areas that are roadless, and are not yet in the forest's inventory. Local planning should also identify areas that should be restored to roadless, where the only current roads are those that have been illegally made by users, without any public input, scientific review, or landscape-level considerations. (Individual, Eugene, OR - #A15651.13110)

Update roadless inventories to catch what staff missed, inadvertently or deliberately the first time around. (Individual, Somers, MT - #A11866.13210)

TO ADDRESS MANAGEMENT OF UNINVENTORIED AND UNROADED AREAS

Forest planning has a role to play in determining management of these areas as allowed under the rule (for example, trail location or construction, endangered species management actions, etc.). Forest planning should also be used to address the management of un-inventoried and unroaded areas, which are not addressed by the current rules. (Organization, Boston, MA - #A23083.13210)

The local forests should have total control over designating what are true roadless areas and which areas are not. They further need to have full authority to determine road conditions, access, and route locations without costly analysis or approvals from the regional or national levels. The local forests need to have authority to remove areas or designations if inventoried roadless areas have been roaded or had vehicle access for the past 10 or 100 years. (Individual, Alturas, CA - #A28581.13110)

It is appropriate at the local level, in local forest plans, to indicate not whether (it is a given under the Conservation Rule), but how roadless areas will be preserved. Also at the local level, forest planners should examine uninventoried roadless areas and their potential for preservation and use by OHVs, which was not addressed in the national rule. (Individual, Minneapolis, MN - #A30387.13000)

TO DETERMINE ROADLESS AREA BOUNDARIES AND DEVELOP SITE-SPECIFIC RESOURCE PRESCRIPTIONS COMPLIANT WITH THE ROADLESS AREA CONSERVATION RULE

NFMA provides that plans may "be amended in any manner whatsoever after final adoption after public notice" Thus, a national rule setting forth standards for the protection of Roadless areas that has the effect of amending local forest plans is fully consistent with NFMA's procedures. Just as local planning must incorporate the effect of other national-level decisions, e.g., congressional wilderness designation, Forest Service Manual and Handbook directives, and national monument designation, so, too, local planning has to accommodate national level policy decisions regarding road building and protection of Roadless areas. Unless national circumstances change, e.g., the 8 billion dollar road maintenance backlog is eliminated and social preferences for protecting backcountry wild lands are reversed, local forest planning is not the appropriate venue to revisit national Roadless policies.

On the other hand, local forest planning can more precisely determine Roadless area boundaries and develop site-specific resource prescriptions within the constraints of national Roadless area policy. (Organization, Craig, AK - #A23228.20201)

The role of local Forests is not to determine if roadless areas should be protected, but how they should be protected. The reason the public demanded a national rule to conserve roadless areas was because

local Forest Service officials were unwilling or unable to do this themselves. Once the national RACR is reaffirmed, this should provide the framework for local forest planning to determine the best means and methods for fully implementing the rule. For example, local Forests should determine which roads may need to be blocked, decommissioned, and/or obliterated. Also, boundaries for roadless areas can be located to include previously uninventoried and unroaded areas for protection. (Organization, Eugene, OR - #A21798.13110)

TO CONSIDER EACH ROADLESS AREA AND HOW IT IS INTERTWINED WITH SURROUNDING LANDS

When Big Mountain went through the NEPA process, the Flathead Forest requested us to provide them with cumulative Efforts Mode (CEM) for an area encompassing approximately 100 square miles. Our permit area covers 2300 acres. We did this, and it has been a valuable tool for both our staff and Forest Service staff. This process forces everyone to consider all the resources, uses, and values when considering an array of alternatives. The Forest Plan could be the venue to consider each of these proposed roadless parcels, and how they are intertwined to surrounding lands. (Permit Holder, Whitefish, MT - #A20669.13220)

TO IDENTIFY LOCAL RESOURCES THAT MAY MERIT ADDITIONAL PROTECTION

As provided by the Roadless Rule, the appropriate role for local forest and grasslands planning is to identify local resources that may merit additional protection within or adjacent to roadless areas, such as by infrastructure retirement or site restoration. Local plans should also identify roadless areas that were omitted from current Forest Service inventories. Local planning processes can also develop improved management plans for the existing road network, to be implemented using resources that may otherwise have been expended developing roadless areas. (Organization, Reston, VA - #A21625.13200)

TO ADDRESS MANAGEMENT OF NATIONAL GRASSLANDS

Management of the National Grasslands should include decisions made through the forest planning process, which utilizes local knowledge and best available science. A decision based on one national directive negates the well-established planning process and collaborative approach used in the forest planning process. The Roadless Rule now under comment demonstrates a lack of information in formulating the rule. (Governor, State of North Dakota - #A22065.13110)

The National Grasslands contain a checkerboard pattern of state, federal and privately owned surface and mineral acres that the rule does not recognize or consider. The Grasslands contain a host of diverse values including oil and gas production, ranching and tourism all of which are integral parts of the economic and social fabric of the state and western North Dakota. The management planning process provides the best method of addressing the needs for accessing diverse properties and accommodating the values and uses associated with the Grasslands. (Governor, State of North Dakota - #A22065.13200)

TO FOCUS ON EDUCATION AND RESEARCH

Local forest planning needs to focus on education and research to try to sustain the forest that we have left. (Individual, No Address - #A17946.13200)

TO EDUCATE COMMUNITIES ON THE ECOLOGICAL IMPORTANCE OF ROADLESS AREAS

The appropriate role of local forest planning is to educate planners and communities as to the importance of roadless forests to both biodiversity and ecosystem functions that sustain fisheries and provide flood control (among other ecosystem services). Local communities should be educated that remaining roadless habitats represent a vast minority of Forest Service lands and that protecting them merely helps to balance roaded areas—those that already contain an excessive 400,000 miles of roads. (Individual, Davis, CA - #A30523.15163)

261. Public Concern: The Forest Service should recognize that the appropriate role of the forest planning process cannot be determined until changes to the Planning Regulations are finalized.

The “appropriate role” of the planning procedures required by NFMA is impossible to determine since the planning regulations have been recently revised and then subsequently temporarily withdrawn. It is impossible for the general public to answer this question until the Planning Rule changes are finalized.

Since the primary purpose of any NEPA process is full public disclosure of proposed changes and their impacts on the human environment we would advise the agency to withdraw the rule until the planning regulations are finalized. (Organization, No Address - #A30533.20000)

Working Together (*Question 2*)

Question 2: Working Together. What is the best way for the Forest Service to work with the variety of states, tribes, local communities, other organizations, and individuals in a collaborative manner to ensure that concerns about roadless values are heard and addressed through a fair and open process?

This section includes three subsections: Adequacy of Public Involvement Processes/Methods, Public Involvement in Decisionmaking, and American Indian Rights and Interests.

Adequacy of Public Involvement Processes/Methods

Summary

General Comments – A number of respondents advise the Forest Service to reevaluate its public participation processes to ensure fairness and honesty. People suggest methods to enhance the public participation process, ranging from using mass media, to revising language, to emulating the processes of other agencies or field unit such as the Bureau of Land Management and the White Mountain National Forest. Some comment that the Forest Service should not claim that the amount of public input received on the Roadless Area Conservation Rule constitutes quality public involvement. However, the greater part of responses regarding public involvement processes assert that the public involvement efforts for the January final Roadless Rule were adequate.

Adequacy/Availability of Information – Most who comment on this topic address the need for adequate public notification of pending management proposals. Writers furnish various suggestions to address this need including notifying people on Forest Service mailing lists and posting information on web sites. Along these same lines, people also suggest establishing consistent terminology and reporting procedures for advance notices. Some state that the Forest Service should provide site-specific information in order to allow informed comment. One organization reminds the Agency that decisions relative to the designation of roadless areas cannot be made in a vacuum. They believe that there must be access to information regarding specific inventories before reaching consensus.

Adequacy of Public Meetings – A number of respondents request that the Forest Service conduct another round of public meetings. Some request fewer, more productive meetings. People also suggest conducting public meetings that are, what they consider, legitimate, that comply with federal rules, that are held at convenient times and places, and that discuss local areas of concern and possible modifications to the Roadless Area Conservation Rule. Some comment that the Forest Service should conduct as many public meetings as were conducted for the Rule. Others request that the Forest Service improve citizen participation in public meetings.

Adequacy of Comment Period/Timeframe – Some comment that the Forest Service should allow a more adequate comment period for the Advance Notice of Proposed Rulemaking. As one

individual remarks, the comment period of 60 days is believe to be inadequate and unfair to the American public, and reflects requests for extensions, —some to 90 days, others to as much as 240 days. Another respondent suggests that the final Rule had so many deficiencies that an additional comment period would be insufficient. Several others assert that extending the comment period to seek out a more diverse public sentiment is a way of killing the roadless proposal.

Just as respondents comment on the adequacy of the comment period, they comment on the adequacy of the time frame for rule development in general. Some people suggest that the time frame for development of and comment on the Rule was adequate while others say it was not. Those who state that the timeframe was adequate say that enough time has been spent asking for public input and that more delay would only allow more harm to the environment and undermine the Rule. Those who claim the timeframe was inadequate state that the process was used to rush the Rule through without enough attention to detail, as is evidenced, they claim, by poor data and numerous mistakes.

Use of Science/Best Information Available – The use of science in decisionmaking is a topic of comment to a number of respondents. One individual states that the Agency should not be biased by user needs but by good, reliable, peer reviewed science. People also provide suggestions as to how the Forest Service should best incorporate science into decisionmaking and why science should take precedence. Several respondents advise the Forest Service to heed the counsel of scientific committees. Others comment that opinions submitted by the public should not be accepted as scientific fact and that the Forest Service should scrutinize the studies submitted by representatives to validate the information.

Adequacy of Public Comment – Many assert that the opportunity for and volume of public comment on the Roadless Area Conservation Rule was adequate. Some suggest that there was sufficient local input on the Rule as well, and one individual requests the Forest Service explain its assertion that there was inadequate local input. A few respondents suggest that the only groups objecting to the adequacy of the public comment process for the Rule are those that don't want it.

Analysis of Public Comment – Some respondents comment about the way public comments are analyzed and suggest that they should be adequately and quantitatively analyzed and reported. One organization states that it was disappointed in the review process of comments on the Roadless Area Conservation Rule] and found that the manner in which the comments were analyzed and reported made it extremely difficult to determine the desires of the respondents. Suggestions to improve analysis include accurately tabulating comments, creating transcripts of public meetings, verifying the validity of organized response letters, and disclosing the details of late submissions.

Scope of Public Comment to be Considered – A number of respondents advise the Forest Service to respect the comments already received for the Roadless Area Conservation Rule, frequently suggesting that those comments be considered along with those submitted for the Advance Notice of Proposed Rulemaking. Some suggest that the Forest Service should disregard organized response letters, while others suggest it not accept mail-in public comments.

Consideration of and Response to Public Comment – A number of respondents assert that the Forest Service should consider all comments. One individual believes that all comments should receive sincere consideration, regardless of whether they are form letters. Some suggest that the

Forest Service should give all parties' comments equal weight while, on the other hand, others provide suggestions on how the Forest Service should differentially weigh public comments. Suggestions include giving greater weight to local and resource-dependent interests; giving less weight to organized response letters; and giving greater weight to professional foresters, wildlife biologists, and fire managers. Some also suggest that the Forest Service should evaluate the consideration it ought to give to the majority opinion—and believe the Agency should give serious consideration to the majority opinion (see also Chapter 3: Competing Values/Limited Resources (Question 9): Managing Competing Interests: *Will of the Public/Elected Representatives*), while others say the comment process should not be turned into a vote. Finally, some comment that the Forest Service should not only adequately consider public comment, but should adequately respond to it as well.

Adequacy of Public Involvement Processes/Methods General

262. Public Concern: The Forest Service should reevaluate public participation processes.

TO ENSURE FAIRNESS

I feel strongly that President Bush's 60 day notice period is too short of a time period for the public to make informed comments, or to have enough time to hear about the reopening of the comment period. Instead, I am concerned that it favors wealthy corporations and special interests with the resources necessary to quickly mobilize a desired message in a short amount of time. First and foremost, I believe that the process itself needs to be evaluated for fairness, or the final outcome will represent the interests of institutions and corporations with money and mobilizing power, not necessarily those of the public.

I feel that your biggest mistake would be to reconfirm in the minds of Americans the suspicion that the government and the USFS doesn't work for them, but works for large, powerful corporations and special interests. Perhaps you can devise a good series of soundbytes and marketing strategies to convince most of the people that you have done everything you can to get their input, but people are getting wiser to and less patient with such tactics. I think you may be better off admitting the limitations of a 60 day comment period, 'scientific' forest management, and 'local collaboration', and working toward re-winning the public trust, with a more democratic national forest planning process. (Individual, New Haven, CT - #A706.14400)

TO ENSURE HONESTY

One thing you could do is modify your vigorous national public relations campaign so that it's honest and not misleading to the people of this nation who can't look out their window and see, with their own eyes, what "management" in the national forests amounts to (e.g. roads and logging). (Individual, Libby, MT - #A8346.14120)

Being forthright and honest (what a concept!) with all those groups involved with certain areas of the forest should be a big step in the right direction. (Individual, Lopez Island, WA - #A15240.15000)

263. Public Concern: The Forest Service should enhance the public participation process.

BY ENSURING THAT IT IS OPEN AND COMPREHENSIVE

As with other Forest Service initiatives and plans, the agency too often inappropriately shrinks the decision space before initial scoping. In line with the language of the 2000 revision to the NFMA forest planning rules, improved public involvement includes more discussion of the issues with the public in various forums prior to a formalistic scoping document released for public comment.

If nothing else, the agency needs to use a more comprehensive, open and transparent public involvement process than it used in promulgation of the January 2001 rule the District Court of Idaho felt compelled to enjoin. (Business or Association, Washington, DC - #A17887.15150)

BY ADEQUATELY PUBLICIZING PROPOSED ACTIONS AND OPPORTUNITIES TO COMMENT

Improve communication with communities, and forest user groups, that are directly affected by Forest Service actions. I am most upset when closures, or changes, are made in my local forest (San Bernardino, Cleveland . . .) and then to find out that a well funded national activist group had petitioned for these closures months ago. The US Forest Service should provide better local notification of planned meetings, or when public comments are requested for local forest management planning. California Prop. 65 required using hazardous chemicals to print in the local paper large vicinity maps and descriptions of operations. Why can't the Forest Service do the same thing for proposed changes? (Individual, Irvine, CA - #A937.14100)

Although the Forest Service does make attempts to solicit input from the public, these attempts are not well publicized. Local administrators should try harder to solicit local opinion regarding land use issues. This should include the use of local newspapers to publicize these issues, provide means of gathering public input, and provide notice of public meetings concerning land use issues. (Individual, Saint Louis, MO - #A629.14100)

"Hearings should be held in areas most effected by your regulations. In addition, you should inform all of those that own land within a 50 mile radius of all potential land that is being considered for any new designation, to be given a thorough explanation of your intentions in specific language (without 'legalese') so the average person can understand the path you are considering and why you are considering it. I know you will inform Native American Groups, the Sierra Club, etc., of your intentions since these groups seem to be more important to you than 'regular citizens' but you can do a better job letting the rest of us know what your intentions are, and how you intend to achieve them." (Individual, No Address - #A834.14100)

A better effort should be made to publicize this opportunity. (Individual, Arlington, MA - #A1152.14120)

We have precious little left of our natural resources to protect as a direct result of the public being left in the dark while laws designed to benefit special interest groups have been passed without the public's awareness. This has to stop. This is our land and we have the right to protect it and to designate how our tax dollars are spent in the protection and maintenance of our priceless and irreplaceable natural resources. (Individual, Monroe, GA - #A4875.15000)

BY UTILIZING MASS MEDIA

Involve all interested parties in the process adequate opportunities to offer their views and help to define the issue. The Forest Service should hold public hearings and entertain written comments during the planning process for the individual roadless areas. Notice by the Forest Service should include notification not only by print media, but [also] by mass media that includes local radio and TV stations. Public Service Announcements and/or News Bulletins should be used. All of the public should be given ample opportunity to be informed that planning for management and use of nearby roadless areas is taking place and will affect the future of these National Forest areas. (Individual, Edgewood, NM - #A5638.15150)

The impact of the roadless rule must be made known to the entire public by better use of the news media. As it is now, you are only getting feedback from a small percentage of the public that learned about it, or initiated it, as part of a special interest group like the Sierra Club. The majority of the public does not know that this rule is being reviewed right now or how the result will impact their lives. (Individual, Fountain Hills, AZ - #A5990.14000)

BY ACCEPTING INPUT THROUGH ALL MEDIUMS OF COMMUNICATION

Accept input via any and all methods. Some individuals communicate better through particular means than do others. Each person's voice should be heard. In particular, those parties who are not outspoken in their communities, due to personality, or simply being outnumbered, such as in a situation where most of their neighbors and friends work in the timber industry), will not be heard via a town meeting type of format. (Individual, No Address - #A1702.15100)

BY USING AN INFORMAL METHOD OF COMMUNICATION

[Question 2] Working Together: Informal communications rather than structured communications provide better information to the local officials (Forest Supervisor) and reduce the cost. (Individual, No Address - #A16447.14120)

BY ADEQUATELY SOLICITING PUBLIC INVOLVEMENT

The Forest Service under Chief Dombek did a wonderful job of soliciting public comment on the Roadless Rule last year. I was pleased to testify in support of it, as did 95% of the people who attended the hearing in New Hampshire that I did. In fact, the only ones who did not support the rule were the local politicians and the timber companies. Is the Forest Service going to conduct an equally extensive solicitation of public comments for the current attempt to reverse the Clinton roadless rule? Or are they going to try to do a dirty, back room deal between lawyers in the same way as the dealings between the so-called Justice Department and the snowmobile manufacturers in order to reverse the Yellowstone snowmobile ban? (Individual, Portland, ME - #A1461.14000)

How do you know that environmentalists won't flood your office and E-mail with responses and drown out "real" people (like me) and the voting public? You do need new and varied public comment. (Individual, San Diego, CA - #A1614.14000)

It is difficult to keep the entire public involved at every stage of decision-making but all attempts to do so should be made. Public meetings, solicitation of commentary and even referendum are methods of maintaining that kind of involvement. It is my firm belief that commentary and even referendum are methods of maintaining that kind of involvement. It is my firm belief that the citizenry will help promote good decision-making if they get the chance to remain involved and are listened to. So often though, interests that hold economic values above those moral [values] see to it that the public is not fully informed or involved in this crucial kind of decision-making. (Individual, No Address - #A1728.14000)

BY USING SURVEYS TO SOLICIT PUBLIC COMMENT

We feel the Forest Service should take advantage of objective survey methodology to better gauge public opinions. Our experiences with such surveys have been extremely beneficial. Survey results often are much different than comments from public meetings and help our agency to objectively manage wildlife resources, habitat, and competing uses. (State Agency, Social Circle, GA - #A22054.14120)

You have meetings in the evening after the working class has worked all day! They stay home with their family or friends, not out of FS meetings; Mostly local people believe that their voice does not matter, does it? Send out a mail survey to local P.O. Box holders! (Individual, Bethel, MN - #A19708.14100)

BY CONDUCTING NATIONWIDE POLLING

Public hearings are often not the best forum for public input. However, where the Forest Service is developing national policy it is impossible for the taxpayers in New Jersey to sit down with loggers from Libby in a meeting room every week. Nor is it appropriate to assemble a group of "stakeholders" in some far flung rural community to dictate the goals for a forest supported by the American people as a whole. The Forest Service is a trustee of these lands, and as trustee has a responsibility to see that its lands are managed properly. The only way that the Forest Service can ascertain whether it is doing the job it has been asked to do is polling the American people in general. Tools may be available, such as the Internet, for the Forest Service to facilitate a "discussion" of ideas on a national basis. The question

remains whether the outcome will differ under such a scenario than what has already been stated to the Forest Service in the first round of comments. (Individual, Bozeman, MT - #A17508.14200)

BY USING SIMPLE ENGLISH RATHER THAN AGENCY JARGON

The Forest Service planning process, including the process for the protection and management of inventoried Roadless areas is not very user-friendly. Agency personnel rely heavily upon the use of jargon and acronyms that are unfamiliar to all but those who make a career out of forest planning. (Organization, Maryville, TN - #A8754.14100)

Please refrain from using words like “collaborative effort” and “consensus groups”, etc. A meeting is a meeting—call it that. Use simple English to communicate with the public. (Individual, Libby, MT - #A10531.14120)

BY GIVING DUE CONSIDERATION TO ALL RELEVANT INFORMATION AND PERSPECTIVES

I believe that the key to a collaborative relationship is valuing a variety of perspectives and respecting the validity of opinions that differ from the perceived goals of the Forest Service. Too often Federal agencies have planning sessions with public and private partners in which it appears that the goal is convincing the partners to agree to an agency goal rather than to improve the plan by giving due consideration to all relevant information. (Individual, Atlanta, GA - #A873.15162)

BY EMULATING THE BUREAU OF LAND MANAGEMENT

The best thing about this public comment process that I am participating in is that I can e-mail it in and it will be visible to anybody who wants to read it. I am just like the redneck grandstanding in a public meeting. I say my privately arrived at piece and he says his and there is hardly a chance for us to come together on the issue. The BLM seems to be better at canvassing the public will. See how they do it. (Individual, No Address - #A22183.15165)

BY EMULATING THE WHITE MOUNTAIN NATIONAL FOREST

The system of public involvement processes that the White Mountain National Forest is using for its plan revision is a good example of how a local public involvement process should work. (State Agency, Concord, NH - #A28779.14000)

BY REQUIRING PARTICIPANTS TO INTERACT

But for future forest planning, I like processes where people are randomly seated around tables, are provided with good information, and have to interact with each other to come up with ideas. Public hearings that allow people to grandstand can be polarizing and counterproductive. (Individual, Northfield, MN - #A22395.14200)

264. Public Concern: The Forest Service should not confuse the large number of public meetings held and letters received for the Roadless Area Conservation Rule as quality public involvement.

AS MANDATED BY THE NATIONAL ENVIRONMENTAL POLICY ACT

Fundamentally, the state of Utah believes that the rulemaking is outside the bounds of authorizing legislation, and is outside the bounds of any definition of a proper and reasonable public process. The state understands that the previous administration, and many citizens, have loudly proclaimed that the process to prepare and evaluate the Roadless Area Conservation Rule was, once revealed, very open and “public,” and therefore complied with the requirements of the National Environmental Policy Act. The Department, under the previous Administration, certainly arranged for a lot of meetings the public could attend, and allowed for written comment by the public. Unfortunately, many of those meetings in Utah, and I am told those held elsewhere, provided little or no substantive information to the public which attended. The state believes that the information presented, the manner of its presentation, the lack of localized examinations, and other factors, requires the Department, under the current administration, to find that the process did not meet the standards of the “hard look” required by NEPA. The [state] believes the process is not valid, and must not be given any further consideration, or must be

significantly reworked in order to achieve compliance with NEPA and Forest Service organized legislation. The Department must not confuse the large quantity of public meetings held on this proposal, or the large number of letters submitted, for quality analysis and adherence to law. (State Agency, Salt Lake City, UT - #A20742.20203)

265. Public Concern: The Forest Service should recognize that public involvement efforts for the Roadless Area Conservation Rule were more than adequate.

The U.S. Forest Service conducted a fair and open public process, including 34 meetings or hearings in Montana communities. Public debate was open, healthy and vigorous. Newspapers and press were full of roadless news, public hearing schedules, editorials, columns and letters-to-the-editor.

In contrast to this (ANPR) process—with no hearings to date—scoping for the roadless rule began with public hearings on every national forest in Montana between November and December 1999. This process could be viewed as a continuation of [the] public involvement . . . process used to develop the interim rule in 1998.

After the draft EIS was published in May 1999, a second round of public meetings, open houses with opportunities to discuss and comment on the draft, were sponsored on every national forest and many smaller communities throughout Montana.

Finally, public involvement in the proposed national forest roadless conservation policy reached its peak in June 2000, when 15 additional public hearings were conducted in 10 Montana communities.

The process used to develop the roadless rule—through open public meetings—was a model of public involvement. Leave the rule. Move forward, not backwards. (Organization, Helena, MT - #A21370.10153)

Since BREDL was founded we have advocated that governing bodies listen to legitimate public concerns. In our 17-year history we have encountered numerous situations where the public was shut out. However, this is not one of those occasions. On the contrary, the Forest Service went through the legal, fair and open process in gathering public comments. We commend the Forest Service in providing ample notice and opportunity for the public to comment. Over 600 public hearings were held nationwide including at least one in every national forest. No other federal agency has gone to such positive lengths in providing information and gathering public comments. In the future, we can only hope that all drafts of important rules from all agencies utilize the process as effectively as the Forest Service did during the Roadless Area Conservation Rule process which ended in January 2001. (Organization, Roanoke, VA - #A10565.10153)

Assertion: decisions about roadless areas should result from an open and fair process and address concerns (pp. 3 and 4). In fact, the ANPR contains no basis whatsoever for assuming that the Roadless Rule process was not open and fair, and fully responsive to concerns. The ANPR does quote at some length from the District Court's opinion in Kootenai Tribe, et al v. Veneman to the effect that the comment period was "grossly inadequate" (p. 5). The errors in that opinion are too manifest to ignore, however. The opinion faults the DEIS process for an absence of maps, too little comment time, inadequate public meetings, and lack of response to public comments. In fact, as the agency well knows, the DEIS provided maps of roadless areas (except some small ones it later dropped from its proposal), and it allowed 69 days for comment rather than the legally required 45. Moreover, the agency nationwide held hundreds of public meetings, and prepared an entire volume of responses to comments, volume 3 of the FEIS. The opinion, in attacking the DEIS process, confuses it with the scoping stage 6 months earlier, for which there is no legal requirement of public meetings or responses to comments, repeatedly citing as evidence of perceived DEIS process flaws testimony that dealt only with the scoping phase. Had the Forest Service defended itself against this lawsuit even perfunctorily, it would have had the opportunity—as well as the obligation—to correct these factual errors in court. Having declined to do so, it is hardly in a position to rely on the judge's misapprehension here. (Organization, Olympia, WA - #A20145.10155)

266. Public Concern: The Forest Service should recognize that the public involvement process under the National Environmental Policy Act is biased in favor of local interests.

The NEPA process, which has been used extensively in national forest planning, is usually biased in favor of local interests due to the choice of public involvement media. By allowing important decisions regarding roadless status and associated values to be made locally on a case basis, there is limited opportunity for broader national concerns over conservation, protection for future generations, biodiversity, water quality etc, to be articulated. People who live far from a given forest are shut out of the process. The Forest Service needs to awaken to the fact that these are National Forests, and as such, requires broad, national public involvement for important issues like roadless area integrity. (Individual, Lacey, WA - #A17998.15100)

Adequacy/Availability of Information

267. Public Concern: The Forest Service should adequately notify the public of pending management proposals.

NOTIFY PEOPLE ON ITS MAILING LIST OF PENDING MANAGEMENT PROPOSALS

Only by chance did I read in a July, 2001 newspaper about the Forest Service (FS) renewed request for comments on roadless areas long after the final rule of Jan 12, 2001 was issued. This demonstrates a problem in the rulemaking process. A National Forest user such as myself, in the FS files, is not informed of proposed rules except through the Federal Register. I do not get the Federal Register, I do not have time to wade through that voluminous publication for pertinent proposals, and I do not belong to any organization that would inform me of comment periods for such proposals. I regularly receive mailings from the BLM warning of upcoming deadlines for paperwork. Why can't I also receive from the FS or BLM warnings about pertinent Federal Register proposals? At least extend comment periods for significant proposals to many months. (Individual, Leamington, UT - #A8030.15150)

MAINTAIN A CURRENT MAILING LIST

Many of the decisions that were made by the local forest planning management of inventoried roadless areas were made to satisfy the pressure from the powerful environmental groups. Let us hope that this is not a repeat performance. This includes a current mailing list. For some unknown reason there were some of us who were dropped from the mailing list. This presents the problem of not being aware of the changes they are undertaking. They now plan 4 miles of new road in the Kinky Creek area and the first I knew of it was when I read it in the newspaper. It is hard to convince many that I have talked to that this was not intentionally done. When things like this happen it makes it very difficult to have any faith in the management of our forest. (Individual, Rock Springs, WY - #A5695.12200)

NOTIFY STUDENTS THROUGH UNIVERSITY CONTACTS OR RANGERS

We are a group of concerned students from James Madison University located in Harrisonburg, VA. We were shocked to hear that approximately 2.6% of the United States land base was about to be auctioned off to industry. We couldn't believe that such an important issue had been unknown by a vast majority of JMU students. We then contacted other students from across the country asking them about this proposed policy change. Not one student was aware of such a proposal. The Forest Service should consider broadening the ways of public announcement. Ways of reaching out to students would be contacting universities, public broadcasts, or local speeches by park rangers in the area. (Individual, No Address - #A30028.14120)

POST ALL INFORMATION ON LOCAL AND NATIONAL WEB SITES, INCLUDING OPPORTUNITIES TO RESPOND

USFS should post all information on local and national web sites. (Organization, Reno, NV - #A8730.14120)

Design a web site in order to allow everyone to post their comments instantly by subject; match and search similar recommendations and comments from all comments submitted from everyone in order to verify a proper accounting of how many Americans support a particular solution. (Individual, Jefferson, OR - #A775.14130)

Perhaps it is possible, but I could not find a way to respond to your questions via your website. My impression was you are soliciting public opinion for YET MORE STUDY on opening wilderness areas to “mis”management. If my impression is correct, I find it very hard to believe you wouldn’t make it easier for the public to comment, i.e., put the questions on your website with a link for people to respond directly to a question as they read it. Why wouldn’t you take advantage of technology to help guide policy making in this area? (Individual, No Address - #A5196.14130)

ENSURE THAT THE RESPONDING EMAIL ADDRESS WORKS

I am glad to see that the President has reopened comment on the USFS’s roadless proposal. I sent comment to the USFS during the previous comment period, but my comments were returned as undeliverable. I rechecked the E-Mail address and it was correct as advised. I wonder how many others were rejected. (Individual, Stayton, OR - #A1042.14130)

I could not get your e-mail to work so I am faxing the reply! (Individual, Reno, NV - #A1184.14130)

268. Public Concern: The Forest Service should address the biased and inadequate information on the roadless area homepage.

Further biased material is found through the link to “Summary of Key Information” on your roadless area homepage. The link leads to a document entitled “Appendix B—State-by-State Summaries of Key Information,” which is a table. I comment here on this table as it relates to Alaska, since that is the part of the national forest system that I know best.

One column of the table lists “Percent of NFS land that is Inventoried Roadless Area.” For Alaska, the percentage is 66.9 percent. This is an absolutely meaningless figure in regard to logging, and is extremely misleading to members of the public that rely on this table in preparing comments (or forming opinions) on the proposed changes to the rule. The vast majority of this 66.9 percent of the Tongass and Chugach National Forests is land that is unforested or is covered with forest that has no commercial value!

The next column is “Estimated Reduction in annual Harvest from Inventoried Roadless Areas.” In fact, this figure has little meaning from an economic perspective. What would have been meaningful in its place would be the annual amount of timber that could be obtained with inventoried roadless areas removed from the timber base.

A further problem with the table is its last column, which purports to show “Potentially Affected Areas.” In the case of Alaska, these “areas” are all communities. The implication is that these communities would be affected by the reduction in number of jobs shown in the adjacent column and by the reduction on timber yield from roadless areas as shown in the other column. In fact, most [if] not all of these communities would benefit in the long term from protection of roadless areas. For example, Metlakatla has opposed the project (now for a ROD) in the roadless area on Gravina Island, which the people of Metlakatla rely upon for subsistence resources. Hoonah and Klawock have had their watersheds and viewsheds logged by Native corporations as well as the forest Service, and protecting federal roadless areas near these communities will provide the highest long term benefit. In summary, the Forest Service appears to have done everything it possibly can in this process to skew the results of public comment to be those which the Bush administration desires. I am flabbergasted by this blatant tinkering with the ballot box (as it were) of the public process, although after the shenanigans in Florida in the presidential election what else should I have expected? Nonetheless, I’m mad as hell about how this so-called public process is being conducted. (Individual, Sitka, AK - #A24495.14130)

269. Public Concern: The Forest Service should establish consistent terminology and reporting procedures for advance notices.

RACR should establish a common terminology and reporting procedure so advance notices in Quarterly Reports and NEPA documents fully explains when and why activities are proposed in Roadless Areas. . . there is a history of inadequate and divergent approaches to public information sharing in proposed action in Roadless Areas. (Organization, Boise, ID - #A20363.14120)

270. Public Concern: The Forest Service should provide site-specific information.

TO ALLOW INFORMED COMMENT

The proposed rule set prohibitions on construction and reconstruction of roads, but **did not propose to prohibit timber harvest in the regulated areas**. The proposed rule also **deferred consideration of including the Tongass National Forest**. The public was not given the appropriate opportunity to comment how a timber harvest prohibition would affect them or their local area. The Forest Service has claimed that the public had ample opportunity to comment on the possibility of a prohibited timber harvest because it was generally discussed in the Draft EIS. 66 *Fed. Reg.* 3257. However, the Draft EIS listed several timber harvesting prohibition alternatives and did not adequately analyze the environmental and social impacts of those alternatives on each individual unit of roadless area identified by the proposed rule. **Due to the existence of several alternatives, the lack of insufficient analysis, and a severely limited comment period, the public in fact, did not have ample opportunity to adequately comment on the possibility of a prohibited timber harvest.**

On November 17, 2000, the Forest Service announced the availability of the Final EIS. Like the Draft EIS, the Final EIS did not adequately analyze the impacts of the proposed rule on each individual Roadless forest unit as required by NEPA. The analysis instead, was very broad and general. **The Final EIS also encompassed 58.5 million acres of land - a substantial increase of 4.2 million acres over the amount addressed by the Draft EIS.** For example, large chunks of land were added to the Final EIS in areas such as the Chugach National Forest in Alaska (1.9 million additional acres) and in the Tongass National Forest in Alaska (860,000 additional acres). **The public was not notified that these areas could be included in the final analysis and therefore were never afforded an opportunity to comment.** (Business or Association, Washington, DC - #A28689.10135)

Decisions relative to the designation of roadless areas cannot be made in a vacuum. Rather, access to information such as whether a specific area has been inventoried for both classified and unclassified roads is critical in reaching a consensus and the appropriate policy. This information must be made available to the general public in order that a consultative process among various interests parties can be undertaken prior to a final decision on whether a particular area should be designated as Roadless. A basic tenet of our democratic process is information to its citizens. Those entrusted with government have a responsibility to ensure that such information is widely disseminated so that an informed citizenry can make informed decisions. (Organization, Huntsville, AL - #A13542.14100)

SHOWING THE RELATIVE IMPORTANCE OF SPECIFIC ROADLESS AREAS

I believe that the IRAs on each National Forest should also be displayed as to their relative importance and value from a Statewide (FS), Regional (FS) and National (FS) perspective (i.e., higher or lower than average number of acres of roadless areas) so people can grasp the importance of the IRAs on the Forest they live on or adjacent to, or are concerned about. (Individual, Libby, MT - #A2301.45100)

271. Public Concern: The Forest Service should not use the Federal Register to announce comment periods.

Why the Federal Register? Hardly anyone reads it. Was this an effort to hide this issue or what? Fortunately, the media do check this out and let us know. (Individual, Stevensville, MT - #A779.14110)

Adequacy of Public Meetings

272. Public Concern: The Forest Service should conduct public meetings.

Keep the doors of communication open and encourage public involvement through meetings. (Individual, No Address - #A583.14200)

Open public meetings go a long way to insure all get heard and also help to understand other's viewpoints. (Individual, Olympia, WA - #A615.14200)

The Forest Service has never worked effectively with individuals and groups with strongly competing views. However, more public hearings where the Forest Service personnel actually listen to the people in attendance would be a first step toward effectively working with individuals and groups. Listen to the arguments, add good science and make good decisions based on that good science. (Individual, Miami, AZ - #A880.14200)

THAT ARE LEGITIMATE

The best way to involve all parties in the process would be for the FS to simply hold legitimate public hearings before any decisions are made that would impact the recreational public. . . In the formation of the original rule meetings were held, but the public perception of these hearings was that the FS was just "going through the motions" in fact, barely tolerating the motions based on the meetings I attended, with the outcome having already been determined. It is essential that the stakeholders in forest use policy decisions be fully involved in the formation of those decisions and that the agency try to rebuild the trust with the recreational public that has been lost due to this debacle. (Individual, Denver, CO - #A5433.14200)

THAT COMPLY WITH FEDERAL RULES

The Meetings that were held on this matter were not in compliance with any Federal rules, as we know them. Staggering of meetings for information and written comments and the actual public hearings is offensive if not illegal. Many people here in Nevada have to drive over 100 miles just to attend. I attended the hearing in Austin on 6/13 and heard many participants ask questions that went unanswered followed with a comment that information was given out at the earlier meeting and that that meeting was reserved for a three minute testimony. The three-minute rule was another slap in the face for 1 gentleman that indicated that he had to drive for 2 hours to speak for 3 minutes. (Individual, Austin, NV - #A15794.14200)

IN A FAIR AND IMPARTIAL MANNER

The best way for the USFS to work with States, tribes, local communities and other organizations and individuals is to listen to, and take into account, their views and uses. The USFS should stop dividing the meetings into splinter groups where different subjects are discussed. This only causes distrust of the USFS and casts doubt as to the value of the public meeting process. (Individual, Mount Hood Parkdale, OR - #A1084.14200)

If the Department of Agriculture chooses to propose revisions to the roadless area conservation rule, we advocate including additional hearings in the vicinity of each Forest supervisor's Office, Region Office and Washington Office. These hearings should be conducted in a fair and open manner to assure that representatives of states, tribes, local communities, other organizations, as well as individuals will be heard. (Civic Group, Roanoke, VA - #A1713.14200)

AT CONVENIENT TIMES AND PLACES

The best way for the US Forest Service to work with states, tribes and local communities is to initiate and maintain a continuing dialogue with a broad section of individuals representing the above mentioned groups. It is important that any and all meetings be held at a TIME and PLACE convenient for all individuals to attend and participate. Any meeting notification should be done far enough in advance to allow for proper planning and attendance by those groups. Local Foresters should use Friends of the

Forest Groups as much as possible and communicate directly with groups that presently have access to and a high level of interest in the forest. Those groups should include but not be limited to: snowmobile clubs, camping clubs, timber related organizations, fishing groups, bird watchers, hiking groups, biking groups, horseback riding groups, etc. (Business, Haslett, MI - #A4861.14200)

WITH ADEQUATE NOTICE

I have read where there were 600 public hearings and 1.6 million comments in which 90% of the people said they wanted to preserve the National Forest Roadless Areas. I don't know when or where these hearings were held because I never heard of them. Evidently they were by invitation only and strictly partisan. (Individual, Rydal, GA - #A5408.10132)

Although many public meetings were held, they were often announced last minute and there was little time to prepare comments, particularly specific comments as there was little specific information. (Individual, Coeur d'Alene, ID - #A7914.14100)

THAT DISCUSS LOCAL AREAS OF CONCERN

[Question 2] Public hearings that discuss localized areas of concern and not forest wide proposals. (Elected Official, Sanpete County, UT - #A15546.14200)

THAT DISCUSS POSSIBLE MODIFICATIONS TO THE ROADLESS AREA CONSERVATION RULE

I would urge that the Rocky Mountain Region of the Forest Service convene a public hearing regarding possible modifications of the roadless rule sometime before the end of the public comment period on September 10, 2001. Given the importance of this rule and the ramifications of possible modifications, it is essential that the Forest Service provide an opportunity for the public to express its views in much the same way that it was provided at the time of its initial development. (United States Representative, Colorado - #A21467.14000)

INSTEAD OF SOLICITING ONLY WRITTEN COMMENTS

Through public, open meetings such as those previously held for the Roadless Rule. Do not use the instant approach (a single written comment period) to justify adulterating the roadless rule or other policies of national interest. (Individual, West Glacier, MT - #A5946.14000)

273. Public Concern: The Forest Service should conduct as many public meetings for the Advance Notice of Proposed Rulemaking as were conducted for the Roadless Area Conservation Rule.

In this current ANPR process the Forest Service has asked the public for responses to ten questions. We question the validity of this approach. The public may not have the information or background to make informed responses to open-ended questions. This weights the process towards industry and local government (which is often dominated by business interests). The proper procedure would be to present the public with a proposal and ask the public to comment, providing the maximum opportunity for them to do so. This is precisely what the Forest Service did under former chief Mike Dombeck during the Roadless Area Conservation Rule public process. If the current Forest Service leadership wishes to make changes to the Rule, they should initiate a complete public process with at least as many hearings as were conducted to formulate the rule. (Organization, Sitka, AK - #A12003.11100)

274. Public Concern: The Forest Service should conduct fewer, more productive public meetings.

Working with local communities, organized groups, states, tribes and individuals is desirable. However, our experience has been that current FS processes are too long and tedious for many citizens to endure. Organizations with paid staff for such purposes tend to be the ones that most influence the process. Fewer, more productive meetings with a wider representation of forest users are needed. (State Agency, Social Circle, GA - #A22054.14200)

275. Public Concern: The Forest Service should improve the way forest personnel conduct public meetings.**ENSURE THAT PERSONNEL ARE WELL INFORMED REGARDING PROPOSED ACTIONS**

I was amazed when I went to the public hearings last year in Kalispell, MT and the officials could not even tell us which specific areas would be included in the 60 million acres to be put under lock and key. I've already seen too much of Montana's National Forest area gated off over the last decade. (Individual, Kalispell, MT - #A1700.14200)

ENSURE THAT PERSONNEL USE UNBIASED LANGUAGE

"Do you want clean water? Do you want clean air?" This is how the Forest Service started the public comment periods here. Well who doesn't want clean water and air. But they implied that if the roadless rules didn't go through as presented, that was the outcome to America. The Forest Service personnel were so biased and arrogant it surprised me. But then they must have figured the administration had this one in the bag. The presenters even implied that more area could be included than was proposed. It seemed the Forest Service at that time wasn't interested in managing the resources but would like to see the National Forests as big parks. (Individual, Port Angeles, WA - #A30310.10135)

276. Public Concern: The Forest Service should improve citizen participation in public meetings.**ENSURE THAT LOCAL CITIZENS ARE ADEQUATELY REPRESENTED AT MEETINGS**

The forest service should make sure that all voices are listened to. Most meetings are attended by very few people. Environmental groups bus in people to overwhelm the local voices. Many local citizens don't hear about them and if they do they don't understand the impact of decisions that concern them. Make sure all meetings are well attended. If the locals are not represented, don't hold the meeting until they are! (Individual, Olympia, WA - #A444.14120)

ELIMINATE BRIBED ATTENDANCE AT MEETINGS

During the initial roadless meetings/hearings a number of local green groups paid college students and other young people to attend. This is not fair. In talking with some of those young people I discovered that they had never been in any of the disputed areas in our state! I believe the Forest Service can eliminate bribed attendance by asking if a participant received money to attend and to ask what areas their comments pertain to. (Individual, Palmer Lake, CO - #A23361.12230)

ALLOW ADEQUATE SPEAKING TIME AT MEETINGS

We had 3 minutes to speak at the initial roadless meetings—this was not enough. I would say 10 minutes minimum is needed. (Individual, Fraser, CO - #A30203.15152)

277. Public Concern: The Forest Service should conduct meetings on the model of those held by the Sequoia and Kings Canyon National Parks

Consider the format of the excellent public-input gathering meetings that were held not too long ago by SEKI (Sequoia and Kings Canyon NPs) on their (ongoing) WMP (wilderness management plan): these meetings were by far the best in my experience. (Unless I felt assured of similar arrangements, I would be reluctant to make much effort to attend a meeting where my questions or input might be curtailed).

SEKI mailed out information about the purpose and nature of these meetings in advance. They opened with a brief slide show and presentation. They took audience questions without limitation, and because of their good prior presentations, and because questions could be asked of agency personnel during the remainder of the meeting, this public question period "self-limited" in a reasonable period of time.

Then public input was gathered as follows: some bulletin boards had been set up around the hall, each labeled with a generalized "issues category" such as, "Trails, Signs and Bridges", "Fires", "Desired Wilderness Conditions", "Solitude v. Free Access", "Permits and Reservations", "Bears and Food Storage", "Group Size", "Camping/Campsites", "Wastes/Sanitation", "Administrative Methods/Minimum Tool Concept", "Meadow and Streambank Management and Stock Use",

“Commercial Users/Permitting”, etc., an “Other Issues” board might have been useful as well. Paper and pencils were provided and all were invited to write down their suggestions and comments on any topics they wished, and pin these up under appropriate category headings (signed or unsigned).

Everyone could read all posted comments and make additional comments/proposals/counter proposals.

This continued until everyone felt satisfied, people being free to leave at any point, since the only remaining agency action was to take down all the comments and file them for subsequent processing.

This method admirably avoided heated argumentation and aggressive people monopolizing the debate. No one ended up having to leave with the feeling they had not been given a fair chance to participate as fully as they wished. Nor did the meeting last inordinately long, public participation had voluntarily concluded within four hours of the meeting’s scheduled start. (Individual, Bishop, CA - #A20954.14200)

278. Public Concern: The Forest Service should televise public meetings.

Keep up the democratic process used in decision-making. Televise hearings for local and cable channels. (Individual, Woods Hole, MA - #A12805.14120)

279. Public Concern: The Forest Service should conduct day-long workshops.

The best way to get input may be to have day-long workshops (Saturday) in local communities, where people can provide input on the roadless areas that they are familiar with. May be good to have a set of questions/issues/information to be addressed for each one (current use, suitable timber, wildlife habitat, wilderness attributes, unique features etc). . . Again, have whole day work sessions to individually discuss the roadless areas around the local communities. Discuss the current situation over the whole Forest (how much is open to motorized use, how much isn’t, past and current levels of timber harvest and distribution of capable/suitable acres) so that everyone gets an idea of the big picture. (Individual, Iona, ID - #A13529.14120)

280. Public Concern: The Forest Service should hold a national public convention.

Hold a national public convention. (Individual, Elko, NV - #A3656.14200)

Adequacy of Comment Period

281. Public Concern: The Forest Service should allow an adequate comment period.

This comment period is even more bogus than the first comment period. In our area, (potentially one of the areas most affected by the roadless rule), there was virtually no notification that the comment period was even going on. Then when the Forest Service responded to our questions they sent a form so confusing that very few people would even try to respond to it. This of course leads many of us to believe this comment period is set up to achieve a forgone conclusion. (Individual, Kalispell, MT - #A19138.14100)

TO ENSURE A FAIR AND OPEN PROCESS

[Question 2] Allow an adequate period of time for Americans to submit official comments on the roadless area plan. (Individual, Arvada, CO - #A17160.14300)

282. Public Concern: The Forest Service should extend the comment period.

TO 90 DAYS

We advocate that any revisiting of the roadless area conservation rule allow for a 90-day comment period to assure adequate time for the Forest Service to develop needed information, schedule meetings, and give all interested members of the public sufficient time to comment. (Civic Group, Roanoke, VA - #A1713.45100)

TO 120 DAYS

Due to the lack of proper awareness of what questions are to be commented on, as the Chairman of the Montgomery County Advisory Committee with the approval of the committee, I am asking for an extension of 60 days. This is to get the information where it is understandable to the citizens of Montgomery County where they can comment. (Association, Sims, AR - #A3086.14310)

TO 180 DAYS

The comment period of 60 days is totally inadequate and unfair to the American public. This is a vital issue and the complex nature of this issue is reflected in the "Ten Questions to Help Guide the Decision Process." As an educated and involved American, I feel that I need additional time to formulate appropriate comments.

It is evident that the short comment period is designed to minimize the input of ordinary citizens and favor of the influence of developers, miners, loggers who have preformulated agendas. I heard about this issue today for the first time and the deadline for comments is less than two weeks away. . . . It was reported in the media that the Clinton administration held a comment period of 200 days with public meetings. The Bush administration is giving only 60 days to comment without public meetings. The Bush administration seems to think that public comment on this issue is unimportant or the public is unaware and/or uninterested, and that the short term financial objectives of a few privileged individuals is more important.

I hereby protest this attempt by the Bush administration to silence the voice of actively involved common American citizens in the management of public lands and public resources.

Please extend the comment period to at least 180 days so that I may formulate an informed comment. (Individual, Tampa, FL - #A16478.14310)

TO 240 DAYS

Extend comment period by 180 days. Because of the significant size and far reaching implications of this proposal the comment period should be extended to allow for better public education and participation in the process. (Professional Society, No Address - #A27584.14310)

283. Public Concern: The Forest Service should recognize that extending the comment period would work against the Roadless Area Conservation Rule.

Perhaps I'm cynical, but I also think that extending the comment period and seeking out people who are critical of any non-extractive use of the NFs is a way of killing the roadless proposal entirely. (Individual, Merrill, WI - #A9014.14320)

284. Public Concern: The Forest Service should recognize that the comment period for the Roadless Area Conservation Rule was too short.

The Forest Service recognizes that one of the major concerns with the rule is that the agency did not provide the public adequate time to comment on the proposed action. 66 *Fed. Reg.* 3244, 3248, The Forest Service's response however, is that the comment period was sufficient because it received approximately 1.6 million comments. *Id.* This argument is misleading and deceptive. When important policies are being considered, concerned parties will submit comments no matter how much time is allowed. The fact that over 1 million of these responses were "postcards or other form letters" is likely a product of the unreasonably short comment period, not an indication that the time allowed was adequate. *Id.* Responding to a proposed action by postcard or form letter does not require extensive analysis of the proposed rule and the Draft EIS. A policy that will substantially affect 43 million acres of forestland by effectively halting all major economic activity within those areas requires a substantial period of time for the public to thoroughly analyze and provide meaningful comments. It took the Federal government over a decade to study and analyze the inventoried roadless areas covered by this rule, yet it provided the public a mere 60 days to comment on the proposal. Providing ample opportunity for public comment would not have added such a substantial amount of time to the process as to have any noticeable delay in producing a rule. (Business or Association, Washington, DC - #A28689.10132)

285. Public Concern: The Forest Service should recognize that an additional comment period would be insufficient to address the deficiencies in the Roadless Area Conservation Rule Final EIS.

The Idaho litigation specifically took the national roadless regulation process to task for the failure to do a site-specific inventory, to provide accurate maps, or to provide sufficient information and time for the affected interests and state and local governmental entities to comment. *See Kootenai Tribe of Idaho v. Glickman*, No. 01-10, Complaint [sections] 71-72; *Kemphorne v. U.S. Forest Service*, Complaint [sections] 63-66. It is inaccurate to suggest that additional notice and comment will address the legal deficiencies of the FEIS. (Elected Official, McKenzie County, ND - #A27737.10135)

286. Public Concern: The Forest Service should notify previous respondents to the Roadless Area Conservation Rule of the comment period for the Advance Notice of Proposed Rulemaking.

We are concerned that the 1.6 million citizens and owners of our National Forests who commented on the RPR have not been contacted about this 60 day comment period. We were not contacted and found out fortuitously because someone sent us a fax about the proposal. (Organization, Bellaire, TX - #A883.14100)

I sincerely hope that the Forest Service remembers to notify all those who previously commented on the so-called Roadless Initiative for our country's national forests.

In the interest of fairness, all those who took the time to comment on this subject should be given the opportunity to make comments on this new and extended effort. There are many of us who are interested in this subject and do not wish to be disenfranchised on the matter. (Individual, No Address - #A1708.14120)

Adequacy of Timeframe

287. Public Concern: The Forest Service should recognize that the time frame for comment on the Roadless Area Conservation Rule was adequate.

There was PLENTY of time for public comment during the original planning phase. The George W. Bush administration is WRONG to allow more time to pass and more roads to be built in the meantime. I am very upset that more roads could be built and more forest could be destroyed during this summer while this roadless plan is further debated in congress. I urge you to endorse the Clinton Roadless Area plan!! (Individual, Edmonds, WA - #A495.10154)

This process of asking for public input has been done, a process that took three years (not 60 days) that included all perspectives. The answer from the American people is overwhelmingly to protect our wilderness areas for our future generations and for the good of the earth. (Individual, Walnut Creek, CA - #A579.10154)

It appears that the Forest Service (FS) is attempting to undermine and disenfranchise the comments that have already been submitted. Approximately 600 meetings were held and at least two years of effort went into the RPR. About 95% of the total 1.6 million comments were in favor of protection of more Roadless Areas.

In Texas of the 29,111 Texans who submitted comments 28,718 supported more Roadless Protection while 393 were opposed to Roadless Area Protection. This means that 98.65% of Texans who participated in the RPR supported Roadless Protection while 1.35% were opposed. That is a 73 to 1 margin of support for Roadless Protection. At the two public meetings held in Texas public comments were in favor of Roadless Protection by 2 to 1.

We attended both public meetings that took public comments as well as two public meetings which were informational in nature. Where were the local people that you have said should have more say on this

issue? There were news stories in the papers about the RPR and the public meeting. We believe the local people who really cared were at the meetings and the local people who really cared sent in comments. Any suggestions that there was not enough opportunity for public comment is simply untrue. We believe you are aware of this situation and that you should speak out and tell the truth. (Organization, Bellaire, TX - #A883.10152)

288. Public Concern: The Forest Service should recognize that the time frame for developing the Roadless Area Conservation Rule was not adequate.

In the flawed and hurried process used to ramrod the Roadless Initiative through, a major mistake made was the inclusion of nearly three million acres of roaded areas in the policy. This is an indicator of a process so rushed attention to detail got lost in the rubble. It is the same reason that citizens who did attend the public hearings—sometimes with very little notice—did not have their questions answered by Forest Service personnel conducting the meetings. Issues as simple as asking to see maps to determine the actual area covered could not be answered by those in charge. The Forest Service personnel were not trying to be uncooperative. They simply did [not] have in many cases even the most rudimentary information to present to the public. This, in my judgment, cannot be disguised as “public participation.” (Business or Association, Helena, MT - #A17074.14100)

AS EVIDENCED BY POOR DATA AND NUMEROUS MISTAKES

[From Attachment 2] Records reveal that poor data and erroneous documents were being developed and used, and mistakes being made as a result of efforts to move the process too quickly in an attempt to finalize the rule-making by the end of the year. A number of letters from Forest and Regional Officers in response to data requests from the Washington Office express concern over the accuracy of their numbers: “numbers less than precise,” “This is an estimate that I hope we are not held accountable for,” “Data derived from forest plans and based on questionable assumptions,” “Some of our management prescriptions do not easily fit in the categories provided.”

A revealing Forest Service letter to the Office for the Federal Register says, “In our haste to get the notice to the Register as quickly as possible, we failed to notice that the document heading was missing.” In a telling internal Forest Service e-mail, dated 6-9-99 from Deputy Chief Jim Furnish to the Chief’s top assistant, Chris Wood, the desire to move quickly is again emphasized, stating: “If we wait until the planning rules are in place and plan revision occur, it will be too late and the quality of the product will be quite varied. If we’re going to look at roadless separate and apart from the roads policy issue, then we should put together a team and address it head on, not indirectly through forest planning. That’s my advice!” (Individual, East Helena, MT - #A20422.10135)

Use of Science/Best Information Available

289. Public Concern: The Forest Service should make decisions based on science.

Science should guide us all in our decisions but it is up to us to teach the American public how forest ecology operates and then let them make the decisions. Hopefully we will come to a point where the majority of Americans will understand the science and make the right choice for the good of all. Today and in the past, too often economics have dominated our decision making process and we are now at the point where old outdated modes of management are at an end or we will lose parts of our heritage forever.

The Agency should not be the voice of corporations or economics—they should be the source of good, reliable, peer reviewed, and repeatable science. The agency should be where we can turn for unbiased, sound information about the American Public’s Forests. We should be able to trust the agency to tell us the whole truth and let us tell the agency what we then want for our future. The state foresters and Tribal foresters can be part of the science gathering process. (Individual, Cascade, ID - #A4.14500)

Decisions should be made based on sound scientific principles and studies as performed by independent and unbiased groups. (Individual, Saint Louis, MO - #A629.14500)

National Forest lands were designed to be utilized intelligently in ways that will benefit humans, wildlife, and preserve our precious natural resources. Those who counsel complete isolation of these areas in a misguided effort to preserve them in a static, and in their view, pristine condition fail to see their efforts are in vain. Change is inevitable; therefore managed change, based on sound science, is the only logical policy. (Individual, Olivia, TX - #A4334.14500)

RATHER THAN POLITICS

We feel the FS is basing their decision more on perceived popularity than sound science. The FS needs to allow good science and the multiple-use mandate to significantly affect the roadless area planning process as well as public opinion. (State Agency, Social Circle, GA - #A22054.14500)

RATHER THAN A VOTE

Forest policy decisions are not about voting. They are about making the right decision for the land in question. The Forest Service as an agency will have to return to its roots and reaffirm itself as a professional management agency, making decisions based upon the best available science and professional judgment. (Business or Association, Coeur d'Alene, ID - #A22058.15169)

BY CONSIDERING THE BENEFITS AND COSTS OF EACH ACTION

Proposals for the creation of roadless areas or the removal of existing roads must be reviewed in a scientific and economic fashion which considers all benefits and costs associated with each action. This level of review cannot be accomplished through an agency program or Executive Order. (Business or Association, Boise, ID - #A20607.14500)

BY MAKING BETTER USE OF EXISTING INFORMATION

Better use of existing information is needed. Some present day issues were resolved during unit planning or by research, but people act like they are new. Some people argue that more research is needed, but they ignore existing research because they either don't like the answers or they have not done their homework. (Individual, No Address - #A17292.14100)

BY ACQUIRING SUFFICIENT DATA TO UNDERSTAND THE ISSUES

In order to have informed decisionmaking, the USDA should have sufficient data to understand the nature of the issues. The western national forests have gone through the management plan process and in some cases have gone through the process more than once. The Gunnison National Forest is currently approaching the revisions to its management plan by beginning to collect data from the public. It would seem that the process for creating the management plans is certainly an excellent model for the Forest Service to follow as a means of working together with communities, states, tribes and other organizations. (Business or Association, Denver, CO - #A29223.15161)

BY VERIFYING THE CONTENT AND VALIDITY OF DATA

All economic, social and environmental data must be carefully reviewed and verified for content and correctness. Qualified scientific third party data should be used whenever possible in making these important considerations. (Business, Haslett, MI - #A4861.14500)

TO AVOID A ONE-SIZE-FITS-ALL CONCLUSION

Where is the science? Again and again, in instance after instance, KARE notes that the claims, assumptions and positions taken in this Roadless proposal are not backed up by accurate scientific evidence. WE cannot treat animals, plants, or any aspect of Nature as if they will all respond alike to certain circumstances. The one-size-fits-all look at this situation, the conclusion that all roads are harmful to all species, is an opinion, and the reason there is no scientific evidence to support the conclusion, is that it is unprovable. This lack of scientific backing is a fatal flaw in this Plan, and all the other Forest Service proposals put forth recently. (Organization, Yreka, CA - #A8381.14500)

TO AVOID BIAS IN DECISIONMAKING

If "roadless" area conservation is to be properly forwarded then I urge the USFS to complete an unbiased study. This has not occurred to date. Get a respected and neutral team of experts, such as the National Academy of Sciences, to complete a science-based study with subsequent recommendations.

Have local and regional community leaders and activists and individuals a part of that process, so that local concerns are addressed and national, impacting a very significant amount of acreage. (Individual, Reno, NV - #A20857.14000)

TO BALANCE ECOSYSTEM STABILITY AND ECONOMIC ACTIVITY

America faces a quiet crisis of unparalleled proportion, that of the long-term maintenance of its biological heritage. This crisis has arisen because of our failure, both locally and nationally, to manage successfully for economic activity and environmental protection at the same time. If we are to create conservation strategies that truly benefit imperiled species and ecosystems while promoting responsible economic activity, science must become the fundamental foundation for decisionmaking. Scientific consensus on issues of critical national interest should not be treated as a special interest to be negotiated or compromised. (Organization, Washington, DC - #A27037.14500)

290. Public Concern: The Forest Service should avoid relying on weak scientific analysis.

I am most concerned about what I perceive as a recent trend of the Forest Service to rely on weak, incomplete and invalid scientific analysis to support a predetermined policy objective rather than the stated policy of making a complete and objective analysis of the situation and then basing the policy decision on the objective facts. In some cases this includes ignoring published scientific work that is contrary or inconsistent with the desired outcome. Reliance on invalid scientific analysis not only results in bad public policy, it sets a precedent for the use of bad and invalid science that others may exploit in the future and it creates public mistrust in the objectivity of science. In order to avoid this scientifically untenable situation, I recommend the following:

- 1) The Forest Service should rely only on valid scientific analysis using quantitative methods, experimental methods of assessing the impact of roads and the use of control data to determine the statistical significance of the data.
- 2) The Forest Service should use only data obtained by objective sources and exclude studies from groups that have conflicts of interest.
- 3) Each proposed closure must be analyzed on a case-by-case basis because the scientific facts pertaining to the situation will also vary uniquely. The current proposal uses many "one-size-fits-all" responses to perceived problems.
- 4) The results of the study should be interpreted in terms of the impact on the entire ecosystem or range of affected species. Just because you can identify a local effect does not mean that the overall effect will be statistically significant.
- 5) The ability to mitigate any local effects without resorting to closure must also be considered.
- 6) Any proposed changes should have the minimum impact on other mandated uses of the National Forest, including recreation. (Individual, No Address - #A27083.14500)

291. Public Concern: The Forest Service should recognize that the best available science regarding individual areas is maintained at the local level.

Any future rule-making should recognize that the best information regarding individual roadless areas is often maintained at the local level. The previous rule-making was flawed by the need for nationwide consistency in the data employed in the NEPA process. In many instances, this led to use of data that was either outdated, or of such a coarse scale that it masked local and regional impacts that may have otherwise proved unacceptable if exposed to the light of day.

For example, the RACR was constructed using a coarse scale fire regime and condition class assessment that was useful only as an approximation for national strategic planning purposes. This assessment showed that 767,000 acres of roadless areas within Idaho were at medium to high risk of catastrophic fires that would damage ecosystem health. A more refined assessment done by regional personnel, however, suggested that the actual number of acres in Idaho at medium to high risk of catastrophic wildfire was actually greater than 2.5 million acres.

Despite having access to the refined Idaho data the EIS team chose to omit it, since similar data was not available nationwide. In the team's mind, the need for compatibility across data sets outweighed the need to use the best available data. Any future rule-making should recognize, and rely upon, local fine-scale data in determining the proper management regime for each roadless area. (Governor, State of Idaho - #A20141.14500)

292. Public Concern: The Forest Service should recognize that science does not change with geographic location or political affiliation.

They also maintain that environmental analysis and resource management decisions effecting individual national forest should be based on local information and knowledge and the best available science rather than applying one standard uniformly to every inventoried roadless area, no matter the location.

Local information and knowledge has been supplied in the previous efforts by citizens in over 600 public meetings, by citizens in over 1.5 million written comments, and presumably by Forest Service professionals working within each of the National Forests affected.

Science operates by . . . identifying general processes within these models, and using these processes, sometimes inaccurately as "laws", to make predictions about the systems that are being modeled. The way science is done does not change with respect to geographic location or political affiliation. Unfortunately what is passed off as "science" is often highly biased and misleading. The "Information and science" sentence above implies that the results of science would differ from place to place. If that is the case, then the Forest Service is not dealing with true science. For example, the speed of light in a vacuum is a constant—whether you are a conservative Republican multimillionaire in Texas or an environmentally-aware progressive in Massachusetts who is broke but hopes to make a change on the world that the Lorax would welcome (If you are not familiar with Dr. Seuss' story The Lorax, then go read it now—you should have read it a long time ago).

True science can provide general principles that are designed from the outset to be applied in every system that reasonably approximates the modeled system. I have not reviewed the work done in this matter, so can not comment on its quality. But the language of the sentence means that true science should not be used even if available. That meaning, if inadvertent, is an unfortunate reflection of the state of ignorance regarding science or, if intentional, is deceptive, inaccurate, and underhanded. (Individual, Nederland, CO - #A19016.14500)

293. Public Concern: The Forest Service should avoid multiple studies on the same research topic or proposed management action.

TO ELIMINATE LONG DELAYS

The decision process should be timely and eliminate the long delays brought about by layer after layer of legal traversing.

Multiple studies on the same research topic or proposed management action must be eliminated. The USFS must become more time constrained, more oriented to actual on-the-ground results. (Business, Libby, MT - #A20686.14400)

294. Public Concern: The Forest Service should heed the counsel of scientific committees.

REVIEW INFORMATION FROM THE UNION OF SCIENTISTS

Please review information provided by the Union of Concerned Scientists, before accepting so-called science from corporations.

Corporations will say or do almost anything to make a buck. (Individual, Miamisburg, OH - #A208.14500)

FOLLOW THE RECOMMENDATIONS OF THE COMMITTEE OF SCIENTISTS REGARDING THE PLANNING PROCESS

The proposed roads prohibition rule is contrary to the recommendations of the Committee of Scientists (COS) in their 1999 Report of the Committee of Scientists. The COS recommendations necessitate an open democratic planning process that includes a broad range of values, uses, products, and services with a high degree of public participation from all stakeholders. The COS recommends that the Regional Forester remain the highest level of decision making with planning efforts oriented strongly to local areas and local issues. In that way, the planning process can mold the plan to the needs and issues of local communities adjacent to or within roadless designations and lists criteria by which roadless designations are precluded if those criteria are met by particular affected communities. How can the Forest Service justify complete rejection of this most recent analysis by such a highly qualified team? (Professional Society, Anchorage, AK - #A21707.13110)

CONSULT WITH THE UNION OF CONCERNED SCIENTISTS REGARDING THE NEED TO PRESERVE BIODIVERSITY

Everyone had ample opportunity to comment on the plan, (Unlike your current fast track approach). And now you guys are just going to undue all that work? You're going to just blow the fair, democratic process out of the water and substitute your own foolish, status quo plan? Thanks for spitting in the face of democracy once again. You people disgust me.

The best way to maintain healthy roadless areas is to keep them roadless. Duh! Don't you understand it's time to stop destroying nature and preserve the little of it that is still intact? It is extremely important to all of us, even people like President Bush who just doesn't 'get it'. Bush is wrong, environmentalists are right. One of the greatest mass extinctions in human history is taking place right now. The majority of scientists are in agreement that it is important to save what is left of biodiversity and attempt to improve habitat that has been destroyed or degraded. If you don't believe me, contact the Union of Concerned Scientists. (Individual, Palouse, WA - #A6756.12200)

295. Public Concern: The Forest Service should provide access to science and research regarding roadless areas.

The public should have access to the science behind some decisions to allow for open review of the validity of the research and for public education. (Individual, Brimley, MI - #A3659.14100)

296. Public Concern: The Forest Service should not accept as scientific facts the anecdotes or opinions submitted by the public.

Throughout the process, user-reported information related to facts that require scientific analysis should be ignored entirely. That is, where concerned individuals or organizations purport to provide scientific "fact" in the form of anecdote or opinion, this information should be disregarded by the forest service, which has its own scientific methods and personnel. (Organization, Denver, CO - #A29624.15110)

297. Public Concern: The Forest Service should consider "The Roadless Area Initiative: Politics Makes Poor Policy."**BECAUSE IT IS WELL GROUNDED IN FACTS, SCIENCE, AND BREADTH**

I urge the team to give great weight to the input statement by the Forest Service Council, National Federation of Federal Employees under the title "The Roadless Area Initiative: Politics Makes Poor Policy". It seems well grounded in facts and science and breadth, in contrast to statements of advocates from both sides of this controversy.

In sum, I feel the current proposal is too broad in its current form, and urge that it not be adopted. Instead, modify the proposal or continue programs mentioned above. (Individual, Asheville, NC - #A6248.10130)

298. Public Concern: The Forest Service should scrutinize scientific studies submitted by representatives.

TO VALIDATE THE INFORMATION

If representatives are planning to put forth “scientific studies” to substantiate their views, these studies need to be scrutinized by objective peer review, otherwise they should be considered suspect. (Individual, Holtville, CA - #A8729.14500)

299. Public Concern: The Forest Service should develop a sense of perspective when evaluating environmental impacts.

TO AVOID ARBITRARY AND CAPRICIOUS REASONING BASED ON BIASED SCIENCE

The lack of defensible and logical reasoning is an indicator of bias. The environmental document evaluations and decision-making must work hard to avoid arbitrary and capricious reasoning based on science with a bias. The Interdisciplinary Team must develop and use an overall sense of magnitude when evaluating positive benefits to the natural environment versus negative impacts to the human environment.

For example, the lack of adequate policy and implementation of fire management practices has led to many catastrophic fires. The sedimentation resulting from these fires is many times that of all OHV activity in the forest. The natural rate of sedimentation is many times that of all OHV activity in the forest. These are examples of the sense of magnitude that must be exercised when evaluating impacts in the document and decision-making. (Organization, Helena, MT - #A13226.14500)

Adequacy of Public Comment

300. Public Concern: The Forest Service should recognize that there was adequate opportunity for public comment on the Roadless Area Conservation Rule.

More than 600 public hearings were held nationwide on the Roadless Rule, making it the most extensive public involvement process in federal rulemaking history. More than 1.6 million Americans submitted official comments, 95% of which supported strongest possible protections for remaining roadless areas. Ample opportunity was given to tribes, states, communities, and the public to comment on the Rule. Many views and suggestions presented during the public comment period were included in the final rule. (Individual, Edwards, CA - #A4547.10150)

While I only attended the hearings in Eugene, Oregon, it appeared to me that the original process was fair and open. I attended an informational hearing in December of 1999 and gave testimony at a public hearing in June of 2000. The meetings were well publicized and held at a convenient time. I am attaching a copy of my testimony. I find it difficult to believe that the process was not fair and open. Some people who didn't get what they wanted are asking for another [turn] at bat. (Individual, Deadwood, OR - #A881.10152)

The hearing I attended in June 2000 was one of a series of well-publicized hearings where the public (I) was heartily invited to participate. The outreach was so well done that I felt informed about every step of the process. No other USFS request of public input has reached me as did the roadless comment period. I applaud the outreach efforts of the USFS and the work involved in hosting 600 public hearings. My experience of the process makes the allegation that there was inadequate opportunity for public review and comment on the roadless rule (Federal Register Advance Notice web page 2) laughable. It was the most public invitation to comment that I have experienced in my lifetime.

I am both saddened and insulted that after this highly visible comment I have to again express my views on a rule that should have taken effect on March 12, 2001. The public participated in the process in incredible numbers as evidenced by the receipt of 1.6 million comments. It is as if the 95% of the 1.6

million comments gathered in support of the January 12 policy are not to your liking and should be disregarded in this new review process that is far less public than the initial process. (Individual, Portland, OR - #A3713.10152)

The 1.6 million public comments already collected in support of strong protection for roadless areas is evidence that the public has already been given ample opportunity for the forest service to hear their concerns. The abundance of public meetings and other opportunities to become informed of the proposal already appears to have secured a fair and open process. If the forest service delays and modifies the roadless area conservation rule, which was widely supported by the American public, the forest service is in danger of imparting the sense that the process has been neither fair nor open. (Organization, Missoula, MT - #A613.10152)

After a record of 600 public hearings and an unprecedented 1.6 million comments, in which 90 percent of the people said they wanted to preserve the national forest's roadless areas, you want to know what people think about preserving roadless areas. Huh? (Individual, Tampa, FL - #A4555.10152)

With 1.6 million public comments and 600 public meetings, the roadless program had more public participation than any other rulemaking in the US federal government's entire history.

The assertion that "there was inadequate opportunity for public review and comment on the roadless rule" is grotesquely preposterous and betrays phenomenally profound ignorance of the subject.

The only way anyone could say such a thing is if they are so staggeringly clueless that they are utterly incompetent to deal with this issue, or if they have so prostituted themselves to exploiting industries that they are disqualified for gross conflict of interest.

Don't you realize this damages your organization's credibility and reputation? (Individual, Oakland, CA - #A28134.10152)

301. Public Concern: The Forest Service should recognize that the volume of comment received on the Roadless Area Conservation Rule was more than adequate.

Do not in any way weaken this rule. 1.6 million people commented in the first (and we thought final!) round, and 600 public meetings were held — I simply can't believe the Bush administration is declaring that there was insufficient public comment. (Individual, Seattle, WA - #A84.10153)

I'd like to go on the record as being in 100 percent support of the Clinton Administration's decision to keep much of the national forests roadless, and I can't understand why this is being revisited after enormous amounts of public input last time around. (Individual, Bethlehem, PA - #A2.10153)

Please defend the Forest Service's Roadless Area Conservation Rule in its present form. As you know, this rule came about in response to the largest outpouring of public support for a conservation measure in the nation's history. (Individual, Bloomington, IN - #A127.10153)

302. Public Concern: The Forest Service should recognize that there has been sufficient local input.

In fact, local voices have spoken - and continue to demand that the Forest Service reevaluate its stewardship of forests that are increasingly valued for recreation rather than just logging. Protecting roadless areas on the East Coast is particularly important because its natural forests are smaller, more heavily timbered and closer to urban centers. (Individual, Charlotte, NC - #A592.10150)

I have lived in the Tongass National Forest for more than 30 years. Hunting and fishing in the Tongass provide the staple foods in my home, and I use the National Forest for many kinds of recreation. I

believe that I represent what is meant by a local community resident who is strongly concerned about the Tongass National Forest, and especially about the roadless areas.

I commented on the original roadless plan, and like the overwhelming majority of the million and a half respondents, I strongly supported that plan. My most important comment is that I would like to see the roadless area policy implemented as it was written into the Federal Register on January 12, 2001.

Instead of reopening this process to address the concerns of the extremely small minority who did not support that plan, I would urge the Forest Service to implement that original policy. (Individual, Sitka, AK - #A698.10150)

I live in Pocahontas County, WV, which is more than 50% National Forest. There is a significant timber industry here with several local mills. The Roadless Initiative received more publicity than any FS project in our area since the creation of the Cranberry Wilderness. Besides the legal advertisements, there were prominent stories in the local paper and interviews with the Forest Service on our local community radio station discussing the impacts, such as the number of acres involved, the number of jobs affected, etc. This local coverage occurred over several months, before both the public meetings the Forest Service held to explain the Roadless Initiative and the formal public hearings held (ours was at Seneca Rocks here in WV) to receive comments. So many people showed up to make comments that they couldn't fit in the room. Of the dozens of people who spoke, only a handful opposed the Roadless Initiative.

So what difference is more local input going to make? How more local can you get? Or is more local input a euphemism for selective input from the timber industry, i.e. those who made sizeable contributions to the Bush campaign? (Individual, Hillsboro, WV - #A4600.10152)

303. Public Concern: The Forest Service should explain its assertion that there was inadequate local input on the Roadless Area Conservation Rule.

The Forest Service should provide empirical evidence to support its assertion that there was not enough "local input" in the previous Roadless Rule public involvement process.

Which brings us to an ancillary point. Who ultimately decided that there wasn't enough "local" input in the last go round? Did someone analyze the 1.6 million comments and determine that "local" input was lacking? I doubt it. I want to know what empirical data was used to determine that this current comment period was necessary. This is a serious request for information. I am a "local person," living in a "local" community, surrounded by national forests. It would appear my opinion is the one you are seeking out. So please inform me as to why my last letter was insufficient. (Individual, Lewiston, ID - #A29569.13110)

304. Public Concern: The Forest Service should consider that the only groups objecting to the adequacy of the public comment process for the Roadless Area Conservation Rule are those that don't want it.

The roadless rule's promulgation clearly satisfied any rational test for sufficient opportunity for public involvement. The roadless rule garnered more comment than any other Forest Service decision in history. The combination of over 600 local public meetings combined with national media exposure ensured that anyone with an interest in roadless area protection would have an opportunity to learn about the Forest Service's proposal and comment upon it. That over one million people chose to do so is testimony to the outreach effort.

The interest groups who now object to the adequacy of the public comment process share one thing in common - they don't like the outcome so they are crying foul about the process. However, if the situation were reversed (as it soon may be!), those same interests won't be heard objecting to the inadequacy of a much less involved public process so long as they get the results they want. (Union, Eugene, OR - #A6245.10152)

The interest groups who now object to the adequacy of the public comment process share one thing in common - they don't like the outcome so they are crying foul about the process. (Individual, Corvallis, OR - #A8027.15120)

305. Public Concern: The Forest Service should recognize that there is inadequate opportunity to comment on the Advance Notice of Proposed Rulemaking.

I think it is very interesting that this is being opened to public comment again, because the Administration . . . feels not enough people had an opportunity to comment the first time. Yet, the reality is that this 60-day comment period is not only during the warmest of the summer vacation days, but has no real public involvement component. The local Olympic National Forest has no public meetings planned, nor have mailings been sent to those who commented the first time. Given that members of the public would have to actively search for a way to make comment, one questions the motivation.

I urge the Administration to move ahead with the Roadless Area proposal, which has already gone through the public involvement process, ad nauseam. (Individual, Olympia, WA - #A4503.10152)

Analysis of Public Comment

306. Public Concern: The Content Analysis Team should adequately analyze and report public comments.

SO THAT THE ACTUAL DESIRES OF RESPONDENTS CAN BE DETERMINED

I was also extremely disappointed in the review process and found that the manner in which the comments were analyzed and reported made it extremely difficult to determine the actual desires of the commenters. The Comment Analysis Team simply categorized the comments and then chose polarized "representative" comments in each category. I have participated in BLM planning process and was much better able to determine the direction the comments were coming from in the reports their Comment Analysis team developed. Each individual commenter was listed along with a listing of which categories his or her comments belonged in. (Organization, Huntsville, AL - #A13542.15150)

307. Public Concern: The Forest Service should quantitatively analyze public comment.

. . . throughout this process and all others, use of quantitative language whenever possible would lead to a more open and sincere dialogue. As I understand it, the law requires comments to be entered into an official record. If that is correct, then the Forest Service can determine the number who assert as claimed and the percentage of the total commentors who assert as claimed. Citing those numbers would be clearer . . . (Individual, Nederland, CO - #A19016.11110)

ACCURATELY TABULATE COMMENTS

I believe this plan was rushed through without adequate comment from the public that uses the forests. I further believe the comments received by the Forest Service have not been accurately tabulated. For example the Forest Service apparently told "Heritage Forests Campaign" that I support the plan—I'm now on their mailing list as an ally. (Individual, Shingle Springs, CA - #A971.15151)

QUANTIFY HOW PUBLIC OPINION HAS CHANGED SINCE EARLIER PLANNING PROCESSES IN WHICH ROADLESS AREAS WERE ADDRESSED

If the basis for the proposed rules is in response to public opinion, the environmental documents should quantify how this public opinion has changed since these issues were addressed in the earlier, RARE, ReRARE, RARE II, Oregon Wilderness Act, Northwest Forest Plan, Hells Canyon National Recreation Area Act, and the various land and resource management plans. The issue of roadless area management was extensively debated in all of these processes, and the final decisions were designed to balance the various needs for the national forests. Any alteration in this balance should be addressed in the forest

plan revision process and not on a generic one-size-fits-all strategy. (County Attorney, Grant County, OR - #A17667.14140)

308. Public Concern: The Forest Service should create transcripts of public meetings.

Those people who appear and make comments at meetings near a particular forest know that forest far better than the eco-fundraisers with their form letters. A transcript should be made of all local meeting comments, and the commenters given a Week or two to make corrections before the comments are published both as hardcopy and on the Internet. A transcript on a computer can be instantly searched for keywords, and will be a permanent asset for local USDA forest managers. It will also be a clear indication that USDA is actually listening, rather than merely going through the motions prescribed by the Administrative Procedures Act. (Organization, Tonopah, NV - #A20337.14200)

309. Public Concern: The Forest Service should verify the validity of organized response letters.

As a taxpayer and a member of the forest products community I am writing to express my concerns over the validity of the Roadless ANPR comments now being received by your CAT from the enviro-radical e-mail list members.

First of all, the content of these comments addresses the political agenda of the authors rather than the science of forest management as it relates to your 10 questions.

Second, the transmittal of the comments both to your CAT and to the internet loops of "environmentalists" harps on the value of previous comments in favor of the existing roadless plan. It conceals the facts that this plan was illegally crafted in violation of the NEPA, ignored local input at all levels, and was based on inadequate mapping and inventorying of road classes in the various National Forests themselves. In essence, the entire previous public comment period was flawed because of the basic illegality of the plan actually presented for comment.

Third, the volume of e-mail to your CAT now being produced by enviro-radical call for internet action is suspect because of the repetitive nature of point-and-click on their prepared comments. You receive identical comments from thousands, with no limitations on the same person sending the same comment many times.

When Congress mandated multiple use for our National Forests, I am sure its members did not foresee the phenomenon of science-by-popular-vote springing from the explosion of the Internet. I do hope that the USFS will adhere to the science of forestry and the interests of all taxpayers in the revision of Roadless Area Conservation. (Business or Association, Keysville, VA - #A4946.15121)

310. Public Concern: The Forest Service should disclose the details of late submissions.

The Federal Register and the documents purporting to support the decision to reopen the issue fail to properly inform the readers of the details of the late submissions. The USDA must specifically advise the public of the following:

The identity of the parties making these late comments, and who they represented;

The specific content of the submissions, including their date and method of submission;

Whether the comments have become part of the official record;

Whether they were in writing or were presented orally during conversations with decision makers or someone with access to decision makers;

Whether such decision makers were involved in any conflict of interest, actual or implied. (Individual, Chico, CA - #A17483.14120)

Scope of Public Comment to be Considered

311. Public Concern: The Forest Service should respect the comments already received for the Roadless Area Conservation Rule.

Apparently, the Administration feels that the comments in the form of: 1 million postcards or other form letters; 60,000 original letters; 90,000 electronic mail messages; and several thousand telefaxes—430 public meetings were held—about 230 for information sharing and written comments and about 200 for collecting oral and written comments including at least two meetings on every national forest and grassland that cumulatively drew over 23,000 people nationwide received on the proposed roadless area rule were too few. I would disagree, and think that the prior administration did everything possible to include ALL sides of this issue in the debate. Although I feel the public mandate is clear, I want to emphasize that there is still the support for the roadless ban and that those people who originally commented have not changed their minds. (Individual, Medford, MA - #A16.10150)

Environmental and natural resource issues seem to illuminate the polarized positions. However, it has been demonstrated that the RACR enjoys the overwhelming support of the American people. While there are those who disagree with the rule, the Bush administration needs to respect the expressed views of the vast majority, who have already made it clear that they want roadless areas protected. More importantly, the Rule reflects a balanced approach to managing National Forests. The majority of the National Forest land is managed for multiple-use and is already open to logging, mining and drilling. A mere 18% is designated wilderness. The Rule will protect the remaining 31% of the National Forests as a natural legacy for future generations.

The RACR should be implemented and retained as it stands. The Bush administration needs to do all that it can to ensure protection of America's roadless areas. We, as a nation, have ONE chance to protect our nations roadless forestland. (Individual, Durham, NC - #A934.10150)

I am writing to express my dismay at the Secretary of Agriculture's plans to reexamine the forest roadless area rule (Forest Service Roadless Area Conservation, USDA Forest Service, November 2000 and Record of Decision (published as part of the final rule, 36 CFR Part 294, Special Areas; Roadless Area Conservation, on January 12, 2001 and 66 FR 3244) and to protest the decision.

The previous administration published this rule in answer to the overwhelming desire of the people to protect our national forests. They followed the rules, received a huge amount of input from the people, and heard from every segment of the public before publishing the rule.

Now this administration is trying to undo all the good work and ignore the will of the people. The country needs to be able to rely on our government to follow the rules and play fair and reach supportable decisions and then have some degree of finality and stability. We can't constantly revisit every decision just because special interest groups that represent a small minority disagree with the desires of the majority. And you can't make decisions that benefit primarily large corporations. You just can't run the country this way.

Please please please, do the right thing: Implement the forest roadless area rules as soon as possible. (Individual, Elk Grove, CA - #A227.10152)

The Forest Service held more than 600 meetings in local communities across the country—including at least two on every National Forest—to inform their decision to protect roadless lands. This helped to generate a record-breaking 1.6 million public comments, an astonishing 95 percent in favor of stronger protection for roadless areas. Public comments on agency rulemakings are not vote counts, but it is significant that the Forest Service allowed public sentiment to help shape the outcome of the roadless rule. In so doing, the agency reaffirmed the value of public opinion in management of public lands.

The stated rationale for re-opening the roadless rule is to hear from more local communities and to subject the future of roadless areas to the local forest planning process. It is exceedingly unlikely that reopening the roadless rule will surface new issues. What is certain is that the 600 local public meetings

and the 1.6 million comments—from people that care deeply about public lands and presumably live in local communities—are being discounted. (Individual, Points, WV - #A21262.10152)

BY CONSIDERING COMMENTS SUBMITTED FOR THE ROADLESS AREA CONSERVATION RULE ALONG WITH THOSE SUBMITTED FOR THE ADVANCE NOTICE OF PROPOSED RULEMAKING

I hope that the comments you receive at this time will be considered along with the many comments you received during the development of the EIS. It would not make sense to require the many people who commented in the first round to resubmit those comments. (Individual, Grangeville, ID - #A798.10152)

My first suggestion is that the existing comments on the previous roadless area decision represent several months of hard work and thought of citizens who had more ample time to consider their positions, and should be given AT LEAST equal consideration in your decision-making process. Failure to do so, I believe, threatens to erode the public trust in the USFS. (Individual, New Haven, CT - #A706.10154)

The President himself, in another and different context, recently stated, “The American people deserve a President who will listen to people and make a serious, thoughtful judgment.” However, if that is to be true, then the Administration would make a judgment to sustain the Conservation Rule, for the American people have certainly expressed themselves in favor of it and can hardly be expected to do more. For these reasons, we strongly urge that, in order that all who have evinced a desire to comment on this issue be included, the record on this public notice incorporated by reference—and you could use summaries where practicable—all comments previously submitted on the Conservation Rule. This is needed particularly so that those who went to the trouble to comment previously will not be left out. This is a very real problem since those who are voluntarily submitting comments (as distinguished from those who do so as part of their jobs) often might find there are too many things for them to handle in their volunteer or spare time and might not comment again. Yet, they should be heard. Consequently, we strongly recommend that all the previous comments be incorporated by reference. (Organization, Birmingham, AL - #A21582.15165)

312. Public Concern: The Forest Service should include all previous comments regarding roadless area management in the record for the Advance Notice of Proposed Rulemaking.

We respectfully request that all previous testimony, letters and comments from the people of Montana regarding national forest roadless area management, including that provided to the U.S. Forest Service in 1998 (interim roadless rule), in 1999 (scoping hearings and public comment record) be incorporated into the current public comment record initiated by the advance notice published July 12, 2001. (Organization, Helena, MT - #A21370.14000)

INCLUDING THE COMMENTS SUBMITTED BY THE ENVIRONMENTAL PROTECTION AGENCY ON MAY 21, 1973

The entire comment package that was submitted by the U.S. EPA to the U.S. Forest Service on May 21, 1973 should be included as part of the record for the Roadless ANPR comments. (Organization, Coeur d’Alene, ID - #A13314.15140)

313. Public Concern: The Forest Service should not accept mail-in public comments.

BECAUSE THAT ENABLES GROUPS TO HAVE UNDUE INFLUENCE

I know that my own cynicism is showing, but I have never yet seen a “fair and open” process occur in a Forest Service hearing on anything. I don’t really believe that the Forest Service should do anything beyond hosting a meeting of select, local interested people who would work out all details and present a proposal to the local FS that must be followed for the local forest. To allow any one group or viewpoint to have “super influence” through opening it to mail-in public comments (as happened with the

environmental industry during the last Roadless Area go 'round) would make it as the last one was, another travesty. (Individual, Pendleton, OR - #A666.14200)

314. Public Concern: The Forest Service should disregard organized response letters.

Many of the cards and letters supporting the Initiative were sent at the behest of radical environmental groups. Many senders did not actually read the Initiative, have no comprehension of its certain and negative impacts upon forest health and rural residents, and responded only to a 'feel good' campaign. All form comments, whether by letter, post-card, or e-mail, should be disregarded. This issue is too complex and too far-reaching to be decided by someone with 5 minutes to sign his name and add a stamp or click a button. (Individual, Cedaredge, CO - #A10364.14100)

Consideration of Public Comment

315. Public Concern: The Forest Service should consider all comments.

The agency's consideration of comments was deficient in critical respects. For example, the Vail Resorts filed substantive comments in December 1999 on the scoping notice and filed additional comments in July 2000 on the proposed rules and draft environmental impact statement. (A copy of our July 2000 comments is attached. Our December 1999 comments will be resubmitted under separate cover). Our comments were the product of significant effort and addressed specific inventoried roadless areas and other issues of concern to the Vail Resorts. The Forest Service, however, ignored many of the comments we raised and made no attempt to respond to our comments concerning specific inventoried roadless areas. We do not offer these observations lightly. They are based upon careful review of the draft and final environmental impact statements, the agency's responses to comments, conversations with [the] Forest Service Roadless Project Leader . . . and a December 2000 visit by Vail Resorts representatives with . . . members of the Forest Service's comment response team in Utah. (Permit Holder, Avon, CO - #A28852.10134)

Never mind the stacked hearings in Denver, Pueblo, and later Missoula and Kalispell that I attended. All the hired guns spouted their scripted message and clapped at the proper points . . . a substantive discussion of what was in the document and the "intellectual" origins of the proposal was never possible. As for the comments I submitted—done in tandem with a retired USFS planner—they were blown off as not substantive.

Well, my time was substantive and uncompensated. I live in a community that will be substantially affected by the outcome of this process, and it is my concern for my hometown, its citizens, the local wildlife and forest, and my own damned future that motivated me to put in this effort. The fate of the forest matters a lot to me and to my neighbors . . . in light of the Moose fire and the untreated fuels and the management paralysis . . . implementing a "roadless" policy that in any way resembles the Dombeck effort would be a crime against not only humanity, but nature.

The consequences are on the ground . . . and that's where the decisions should be made. (Individual, Whitefish, MT - #A20672.10130)

BY GIVING EQUAL CONSIDERATION TO EVERY VIEWPOINT

There is a place within the management of the National Forest system for each and every one of us, for each and every use. There has been significant change in the management of America's National Forests, and there is sure to be more. It is only fair and just however, to expect that the process of change follows the laws and principles of the nation and [to] give equal consideration to every aspect of the effects of this change. (Business, Juneau, AK - #A30599.10000)

TO ENSURE A FAIR AND OPEN PROCESS

Because there are so many different levels of interested people in our forests and how they are managed this may well be one of the most difficult portions of this program to reach. Every individual of each

level thinks that his or hers is the only way and they want first attention. This can only be captured in the most part by a fair and open process.

Each and every concern must be addressed no matter how trivial it may seem. Anyone left out is cheated out of their input. All comments should be given the utmost sincere consideration. (Individual, Rock Springs, WY - #A5695.15150)

WITHIN THE CONTEXT OF MAINTAINING FOREST HEALTH

NEPA provides for all to contribute comments through an Environmental Assessment or Impact Statement, but all comments should be put into the context of the highest priority—forest health. Advertising in local and regional papers and allowing for comment through email seems to work well. (Individual, Ennis, MT - #A438.14100)

316. Public Concern: The Forest Service should not reject consideration of issues just because they were already addressed in the Roadless Area Conservation Rule Final EIS.

The Forest Service has represented that the Final Plan Revision will have a public comment period of six months, from July 27, 2001 to January 27, 2001. However, the Forest Service officials have stated orally that if a public comment issue was addressed in the FEIS, it will not be considered. Read literally, this means that the public comment process on the final plan revision and FEIS will not address the issue of roads in the roadless areas, section lines, and energy interests, because those issues were raised and rejected previously. (Elected Official, McKenzie County, ND - #A27737.11000)

317. Public Concern: The Forest Service should give all parties' comments equal weight.

BOTH LOCAL AND NATIONAL COMMENTS

Base decisions on sound science, not politics. Listen to all views, but give each citizen's comments equal weight regardless of where they live in relation to the forests (these are national treasures for all Americans to use, not private sanctuaries to be locked up for locals only. (Individual, Layton, UT - #A5139.15000)

The danger of local management is that the local people don't always have the interests of the majority of people at heart—they are concerned with maintaining their way of life at all costs. I truly believe that we need to use our remaining natural resources with the long term in mind. Local people cannot be left out but deserve no more of a vote than any other American who owns the national forests. It is absolutely essential that all American's votes count equally. If that rule is violated you violate the founding principle of our government. (Individual, Cascade, ID - #A4.15112)

COMMENTS FROM ALL INTEREST GROUPS

One group's or individual's interests should not be put ahead of another's just because the agency decides it is expedient or because one group or individual threatens litigation. As mentioned earlier, all decisions that impact the public should be open to public comment, and those comments should be given their full weight regardless of whether or not they agree with real or desired FS policy or opinion. And in no circumstance should any party be given the opportunity to meet with FS officials without any and all other interested parties being given the opportunity to be present. This was a major problem with the formation of the original rule, the anti-recreation groups' input was solicited and valued without benefit of potentially contrasting opinion and input of other stakeholders. The public should not find fault with a process that is done fairly and openly, but it has every right to find fault with a process that favors one party over another. (Individual, Los Alamos, NM - #A3720.15110)

We need the establishment of an overall roadless plan so that interested lay persons, like myself, can communicate our vision for these federal lands, which belong to all citizens, and not just to the logging and motorized toy industries. Unlike the paid lobbyists for these industries, citizens like myself are not

always available for endless meetings or public comment on individual forest plans or the micro managing of specific tracts of land. Always making decisions at the local forest level often leaves citizens in other areas of the country out of the process. These citizens have just as much right for their vision to be heard as the paid lobbyists and local business people who often have economic interests at stake that might be in conflict with the overall health of the land. (Individual, Missoula, MT - #A5325.14000)

COMMENTS FROM ORGANIZED RESPONSE LETTERS

I am angered by newspaper articles and remarks from senators, congressmen, and members of the Bush administration stating that the majority of support for the roadless policy comes from email based form letters and that such support for the roadless given lesser consideration. I cannot express enough how strongly I disagree with such remarks. How is this any different than writing a petition and getting a list of signatures? I take the time to read the contents of the form letters that I submit. If I do not agree with everything stated, I will not click the send button. I am sure that most everyone else who has sent an email form letter would agree. (Individual, Bozeman, MT - #A3947.15150)

318. Public Concern: The Forest Service should differentially weigh public comments.

BY GIVING GREATER WEIGHT TO LOCAL AND RESOURCE-DEPENDENT INTERESTS

In evaluating comments and input for management decisions from individuals and groups with strongly competitive views, values and beliefs, the USFS should apply a weight or priority system. The most weight should be to those who derive their livelihood from the public land. The next priority should be given to LOCAL public land users; sportsmen, campers, hikers, off road vehicles, and recreation users. All general and out of the local community area comments and input should be given last weight. It is important to understand that we, the local people, live near public land because we choose to and we resent outstand influences (those who have never visited the area and do not understand the local issues) dictating our lifestyle and livelihood. (Individual, Prairie City, OR - #A15474.15160)

BY GIVING GREATER WEIGHT TO PROFESSIONAL FORESTERS, WILDLIFE BIOLOGISTS, AND FIRE MANAGERS

Professional foresters from federal, state and private entities, as well as wildlife and fish biologists and wildland fire managers from those same entities must provide their experience and expertise and that should also be heavily weighed when forming any resulting policy. (Organization, Moscow, ID - #A15318.15110)

BY GIVING GREATER WEIGHT TO INDIVIDUALS THAN TO BUSINESSES

We realize that the American Forest and Paper Association has a particularly important role in the decisions being made concerning these areas. It is our firm belief that, while a corporation such as the American Forest and Paper Association does have a say in these matters, a corporation is not a constituent, therefore, should not be accorded the rights and privileges identical to those of individuals. In today's world, big businesses are often dealt with as if they were constituents, being given the same rights and privileges. Yet, big businesses are not people, and should not be treated as such. We urge you to recognize that the voice of a single person is far more important than the concerns of any corporation. Every American should be concerned with the protection of our Nation's wildlife and the preservation of our forests. Any person who shows an interest in protecting the nation's forests will hopefully be doing so with his or her own intentions in mind, however, a corporation would be more interested in achieving selfish goals. The American people have nothing to gain from the destruction of the Nation's forests, however, they have a lot to lose. Many people enjoy spending recreational time in our forests: biking, camping, fishing, hunting, and even gaining spiritual and religious experiences. If we continue to allow our forests to be destroyed, soon there will be little remaining for anybody to enjoy. On the other hand, a corporation such as the American Forest and Paper Association would be gaining, not losing, from the destruction of our forests. (Individual, No Address - #A28553.15122)

BY GIVING LESS WEIGHT TO ORGANIZED RESPONSE LETTERS

The proponents are quoting the fact that you received over a million responses to your original proposal—and that “the American people have spoken”. Maybe. How many of these were real letters and how many sent in a canned response proposed by some pressure group or was a paid advertisement on my e-mail to be activated by a single click. You need to discriminate between the responses. I put little weight on all those canned messages—and I hope you do too. (Individual, No Address - #A29894.15152)

The process of determination using comments from the public as an indicator of approval/non-approval is flawed. The vast majority of the citizens of the State of Montana are opposed to the roadless area but I believe that less than 1% of those people would ever respond to your request for comment. Those in favor of the roadless area as proposed are well organized with letter and e-mail writing campaigns. I would hope that you understand that process and discount it appropriately. (Individual, Kalispell, MT - #A27110.15110)

BY GIVING LESS WEIGHT TO UNFOUNDED AND BIZARRE VIEWPOINTS

I should add that most of those against the roadless policy also went on to comment about the Forest Service being an extension of a worldwide United Nations/communist conspiracy trying to take over land in the US. When you ask for fairness and collaboration do you mean that these obviously unfounded and bizarre viewpoints should honestly be working in partnership with the Forest Service to help shape public policy? (Individual, Atlanta, GA - #A26430.15110)

Hey, what was unfair about the process last year? Who (among 1.6 million respondents) did not have his or her chance to weigh in on this issue? The USDS Forest Service does not have to try to find a new and better way to elicit comment on roadless values as the best way was already used last year. I personally attended 3 public hearings in Gainesville, Ga. and Atlanta. The only unfair thing I experienced was state DNR representatives in uniform openly advocating against the roadless policy. I thought that was very unfair. I should also add that most of those against the roadless policy also went on to comment about the Forest Service being an extension of a worldwide United Nations/Communist conspiracy trying to take over the land in the US. When you ask for fairness and collaboration do you mean that these obviously unfounded and bizarre viewpoints should honestly be working in partnership with the Forest Service to help shape public policy? (Individual, Santa Rosa, CA - #A25389.10152)

BY GIVING LESS WEIGHT TO “NON-PARTICIPANTS”

The National Forest Planning process for each National Forest is the most suitable method by which the USFS can employ collaborative groups made up of local citizens and organizations. Caution must be observed in recruiting, organizing and recording a collaborative group’s recommendations. The USFS must be empowered to assign consequences to “non-participation” for whatever the reason. While dissent from those not participating should be captured and recorded, without participation in the process, the dissent should carry far less weight than that of those willing to participate. Rules for voting and for “qualifying to vote” must be part of the collaborative process framework. “Participation” would imply being present for most of the interactive process from inception to a true and recognized ending. (Organization, Moscow, ID - #A15318.15162)

BY CONSIDERING RESPONDENTS’ QUALIFICATIONS AND IMPLICATIONS OF SUGGESTED COURSES OF ACTION

The demands of the public that you need to weigh must be qualified both as to the level of information the respondent is forming their opinion upon, as well as that course of action’s result on the total base which you manage. Dale, fundamentally, as agency chief, you need to make some critical decisions that will be of paramount importance to the continuing health of the forest. They may not suit the loud catcalls that are trying to drown out the simple fact that the lands you are Chief over are not parks, but live, working forests that produce not only emotional but tangible commodities for the American public. Trite as it might sound, consider that every purchase of OSB, studs, dimension of plywood from the American Forest Products Industry is a vote for pro-active management of the national forests that

clearly opposes waste of potential wood products. (Business or Association, Hamilton, MT - #A25779.15160)

AT PUBLIC MEETINGS

The Forest Service should conduct public hearings that invite all interested parties, who should be asked to identify not only their opinions, but also what financial interests they have in the outcome of the proceedings. The interests of recreational and other transient users should be solicited from lists of people who register with the Forest Service, rather than relying on their serendipitous ability to attend hearings in areas far from where they live. Corporate interests should have no more weight than those of others, and the interests of people who benefit from the existence of forest sanctuaries but are not aware of either the forests or the hearings—for instance, people who benefit from the environmental processing of air and water that occurs in forests—should be given substantial consideration, perhaps through the assistance of expert testimony. (Individual, New Haven, CT - #A616.15000)

319. Public Concern: The Forest Service should consider special interest groups' comments with caution.

SPECIAL INTEREST GROUP LEADERS DO NOT NECESSARILY REFLECT MEMBERS' OPINIONS

The leaders and lobbyists of national special interest groups such as the Sierra Club do not necessarily reflect the opinions of their members. In fact, it is my opinion that these people only reflect the opinions of the most extreme of their membership. (Individual, Saint Louis, MO - #A629.15121)

SPECIAL INTEREST GROUPS DO NOT NECESSARILY REPRESENT THE VIEWS OF THE LOCAL COMMUNITY OR OF THE PUBLIC AT LARGE

I noted a Letter to the Editor in the August 24, 2001 Crested Butte News by Mr. Sandy Shea of HCCA indicating among other proposals the reversion to roadlessness of Flat Top Mountain. Fortunately via the excellent websites of USDA Forest Service I was able to acquaint myself with this issue relatively quickly. It appears that HCCA has the purpose of providing the Regional Forester with a community consensus of the Roadless Conservation Rule to soon be formulated and implemented. I can state clearly that this group has had no input from me, seems to be exclusive on any outside input, and gives every indication of recommending policies compatible to that of HCCA. I have asked for minutes, meeting dates, and other information regarding this group to no avail. I am concerned that my situation will be replicated with other individuals and small groups concerned with specific issues in public land use access in Gunnison County and elsewhere. (Individual, Littleton, CO - #A13845.15120)

The public meetings have been more convenient for organized groups and paid lobbyists than for many local citizens. In Georgia, we have seen the same few individuals making the same comments at every meeting. It is no surprise that the preservation agenda is so prevalent among the citizens at these meetings. Although public meetings are an important tool in obtaining input, we feel they are biased and do not necessarily give an accurate representation of overall public desires. (State Agency, Social Circle, GA - #A22054.14200)

320. Public Concern: The Forest Service should identify input from those with a monetary stake in the outcome.

In all cases, efforts should be made to identify and “flag” input coming from those with monetary stakes in the outcome of any planning process, including employees of the Forest Service as well as employees/owners of potentially-impacted timber-related businesses, etc, so as to achieve, at the very least, full and open disclosure of all factors possibly influencing the process and its results. (Individual, Bishop, CA - #A20954.15120)

321. Public Concern: The Forest Service should recognize that those with financial interests in forest resources have an incentive to submit detailed and aggressive responses.

Open, on the table, broad based public participation is appropriate, remembering that those with schemes for destruction of our forests for financial gain have an incentive to be much more detailed and aggressive than many of the citizens who generally [support] the roadless rule. (Individual, Pasadena, CA - #A17237.15110)

322. Public Concern: The Forest Service should evaluate the consideration it ought to give to the majority opinion.

GIVE SERIOUS CONSIDERATION TO THE MAJORITY OPINION

As noted recently by an Agriculture Department spokesman, a rulemaking is not a vote. However, in a circumstance where public opinion weighs heavily in a particular direction, that public opinion must be granted serious consideration, and the possible actions should be tempered accordingly. I look forward to seeing that consideration of the public comments received reflected in any modifications that are put forward in the course of this rulemaking. (United States Senator, Washington - #A30693.15110)

DECIDE THE MANAGEMENT OF ROADLESS AREAS THROUGH A PUBLIC VOTE

The Forest Service should try to put the Roadless act on a ballot in the Fall, and let the general public decide the issue once and for all. The inventoried roadless area is on our land so why not let us, as a country decide the fate of our National Forests. We decide on our presidents this way, why can't we decide the fate of our forests this way as well? (Individual, No Address - #A17702.15151)

DO NOT ALLOW THE PUBLIC COMMENT PROCESS TO TURN INTO A VOTE

In the previous rule making process we saw public involvement become a voting process orchestrated by the giant environmental organizations and involving masses of people with no real knowledge of the roadless areas or the real issues surrounding them. They responded to what they were told, even though much of that information was false and misleading. We would hope that this new effort would be more professional, looking at content, not numbers. (Individual, Boise, ID - #A5165.15120)

Solicitation from user groups is extremely important in the context of roadless decision-making. The agency must also ensure that accurate, up-to-date maps of inventoried roadless areas are provided in the forest planning process. As a general matter, the agency should judge the quality, not quantity, of comments submitted in the forest planning process. Too often emphasis is placed on the number of form letters or emails received by activist groups rather than the thoughtful, individual comments of stakeholders or local user groups. (Permit Holder, No Address - #A5285.15150)

If this 60 day review is reduced to a massive letter writing campaign, Alaskan's wishes and opinions cannot prevail. For more than thirty years, the lower 48 decision makers have viewed their vote on Alaska as the place to win the support of the preservationists while doing less in their own state. There is no way that a uniform roadless policy can be applied to all national forests. Please support the majority of Alaskans and not allow the decision to be made based on which side sent the most comments. (Business or Association, Juneau, AK - #A879.15111)

Don't look at numbers of comments as a deciding factor. It is the quality and substance of comments that should weigh into decisions. Many comments come from people with no knowledge of the lands or issues being addressed. They simply respond dutifully to pleas for cards and letters. At the initial rule making hearings we saw busloads of activists arriving in a party mode to present testimony from cards randomly handed to them. We see thousands of cards and letters generated by campaigns that tell them what to say. This is a game originated by environmental organizations that everyone has learned they must play. How many of the responses come from people who have actually read the documents they are

commenting on? When a few hundred documents are distributed and several thousand responses are received, the answer is pretty evident. (Individual, Montpelier, ID - #A9058.10153)

This is not a vote. Don't pretend to make it a vote. You are asking for substantive comments to help with decisionmaking. If a group sends you 10,000 cards with the same comment, it still only counts as one substantial comment. If you want a vote, get it on the ballot in every state. The only vote that counted took place in Florida last November. (Business or Association, Spokane, WA - #A21364.10133)

I read this week in the local paper that the Sierra Club and allied environmental groups "say they hope to have collected 2 million written responses" to the Forest Service's July 10, 2001, ANPR. I cannot recall a time in our history when the regulatory comment process has been so captured by such a "vote" mentality. It certainly was never the intent of the Federal Administration Procedures Act. I wish for the day when we can turn management of our national forests back to the Forest Service professionals. (Individual, Spokane, WA - #A17819.10133)

RECOGNIZE THAT MAKING DECISIONS BASED ON MAJORITY PREFERENCE IS A VIOLATION OF THE AGENCY'S CONGRESSIONALLY MANDATED DUTY

The mandate of the Forest Service, as an agency of the Executive Department of the United States government, is not determined by meeting the desires of concerned individuals or organizations, it is determined solely by congressional directive. The Forest Service is bound to meet congressional mandate as set forth in federal statute, including NFMA (16 U.S.C. [sec] 1600, et seq.), the National Environmental Policy Act (NEPA) (42 U.S.C. [sec] 4321, et seq.) and FLPMA (43 U.S.C [sec] 1701, et seq.). The Forest Service may not consider the desires of individuals and groups as to a particular outcome of the forest planning process as "votes" and thereafter make its decision on a majority-rule basis. Such is a derogation of the Forest Service's congressionally mandated duty. (Organization, Denver, CO - #A29624.15100)

323. Public Concern: The Forest Service should avoid relying on public opinion surveys.

BECAUSE THEY ARE ERROR PRONE AND UNRELIABLE

We caution against the reliance on public opinion surveys and interpretations thereof relative to the public's position on NFS management. Absent a close scrutiny of the question and the manner in which the poll was taken these reports are fraught with error and are notoriously scientifically unreliable. (Elected Official, Douglas County, OR - #A11811.15150)

324. Public Concern: The Forest Service should consider material comments.

AS REQUIRED BY THE NATIONAL ENVIRONMENTAL POLICY ACT

North Dakota Litigation: *Billings County, et al. v. Veneman*]

The ANPR incorrectly describes the North Dakota litigation as sharing a common theme with the other seven pending lawsuits that there was inadequate opportunity for public review and comment. 66 Fed. Reg. at 35919. The North Dakota litigation does not make that allegation. The complaint filed by several North Dakota counties and the Friends of the National Grasslands does allege that the Forest Service violated NEPA by ignoring the material public comments regarding the proposed wilderness or roadless conservation areas, road rights and county royalty rights. Complaint [sections] 11,70. The North Dakota case takes the position that countless comments on the Dakota Prairie Grasslands Draft Plan Revision, the roadless rule and forest road transportation regulations that North Dakota lands managed by the Forest Service are not subject to the same laws and roadless management is both without legal authority and not feasible given the extensive network of roads and rights-of way which run through each and every one of the "roadless conservation areas" in North Dakota. The North Dakota situation is also different because the final plan revision converts the proposed wilderness areas to roadless conservation areas, while purporting to make site specific determinations that these areas have roadless or wilderness

values. The decisions in the DPG Plan Revision are no more accurate nor valid than the roadless regulation now so heavily criticized throughout the country.

The commenters believe that the remedy is not a matter of additional public comment but one of compelling the Forest Service to deal with the facts and the legal issues which apply to North Dakota. So far the Forest Service has largely ignored the material facts because they did not fit the policy decisions already made at the national level. (Organization, Denver, CO - #A21358.10131)

The ANPR incorrectly describes the North Dakota litigation as sharing a common theme with the other seven pending lawsuits that there was inadequate opportunity for public review and comment. 66 Fed. Reg. at 35919. The North Dakota litigation does not make that allegation. The complaint filed by several North Dakota counties and the Friends of the National Grasslands does allege that the Forest Service violated NEPA by ignoring the material public comments filed on the proposed wilderness or roadless conservation areas, road rights and county royalty rights. Complaint [sections] 11, 70. This is an important distinction, because the remedy is not additional public comment but a requirement that the Forest Service actually deal with the facts presented. So far the Forest Service has ignored the material facts because they did not fit the policy decisions already made. (Elected Official, McKenzie County, ND - #A27737.14000)

Response to Public Comment

325. Public Concern: The Forest Service should adequately respond to public comment.

REGARDING SPECIFIC ROADLESS AREAS

We are troubled by the agency's failure to respond to comments about specific areas that have never been identified as inventoried roadless areas in a process subject to public comment or are otherwise not appropriate for roadless designation. Our July 15, 2000 comments devoted considerable effort to addressing whether particular areas had been properly inventoried as roadless. See July 15, 2000 Comments at 13-19. The Forest Service did not respond to these comments. See Final Environmental Impact Statement Vol. 3. (Permit Holder, Avon, CO - #A28852.10131)

TO COMPLY WITH THE COUNCIL ON ENVIRONMENTAL QUALITY REGULATIONS

I would also hope that this time around that the Forest Service does a better job in responding to public comments than you did for the DEIS on the Roadless Area Conservation Plan (RACP). Combining, paraphrasing, and then giving general responses to comments resulted in a total loss of any meaning of the comments themselves. Negative comments related to the legality of the whole process, etc. were either glossed over or totally ignored in the RACP FEIS. As a former Environmental Coordinator at the National Forest level (Modoc NF, R5, 1978-86) I find this disregard for the provisions of the CEQ Regulations to be most disturbing. In my opinion this approach violates 40 CFR 1503.4 (a) and (b), both of which require that responses to comments be more detailed, and that the comment letters themselves, or a summary of lengthy letters, be published in the FEIS regardless of their content or perceived merit. Letters from public officials were published, but none from the general public, and this does not meet the spirit of the regulations by any means. (Individual, East Kingston, NH - #A4893.14000)

Other

326. Public Concern: Organizations which solicit comment for federal land policies should assure the public that all comments will be submitted to the appropriate agency.

REGARDLESS OF THE POSITION TAKEN BY THE RESPONDENT

I am a reporter for the Record-Courier in Baker City and last week I wrote a guest editorial about Roadless Areas and gave readers an address to write to with your name on it, from a flyer sent out to all college students by the Oregon Natural Resources Council.

Now I believe the address given by the radical ONRC, although addressed to you, was their own address and they have in mind sorting and destroying those letters against the Roadless Areas.

From what I can find out—"American Lands" is "American Lands Conservancy" 726 7th street SE: Washington DC: 20003, and not a part of the U.S. Forest Service as I and others were led to believe at first glance at these flyers.

Thinking that I was writing to the Forest Service, and you, I sent a 21 cent post card, my sister sent one, and my husband signed one and had me mail it. Others also sent cards but I do not know which ones. OPPOSING Roadless Areas.

I want to know whether or not you receive the mail addressed to you at the American Lands address.

If what I suspect is true you are receiving only the part of your mail these people want you to see. (Individual, Richland, OR - #A19215.14140)

Public Involvement in Decisionmaking

Summary

General Comments – One frequent comment regarding public involvement is that the Forest Service should protect the right to public participation in forest planning. Respondents state that the public "owns" public lands and should always be involved in decisions concerning these lands. People say the Forest Service should be responsive to the public and address concerns from all sectors of society. In order for the Forest Service to do so, respondents suggest establishing strong lines of communication with the public and understand how National Forest management affects local communities. Another respondent also believes that it is critical that dialog with the public be intensive and ongoing, rather than limited to closed-ended comment periods on specific plans. One individual urges the Forest Service to require those who want to participate in forest management decisions to contribute to forest stewardship activities, asserting this would create "a good working relationship between local entities and national management."

Role of the General Public – Respondents suggest that the Forest Service should allow all citizens full access to the decisionmaking process and that all viewpoints are considered fairly. Along these lines, others suggest the Forest Service should also ensure interested parties the opportunity to provide site-specific input regarding individual roadless areas so if there is a recognizable local need in a specific area, procedures for granting exceptions to the roadless rules may then be provided.

Role of Local/Rural Residents – Some comment that the Forest Service needs to be more inclusive and attentive to local opinions and desires. while others claim that there has never been a federal regulation that considered local input as much.

Role of Special Interest Groups – A number of respondents comment on the role of special interest groups. Some request that the Forest Service include certain interest groups in the

decisionmaking process; a few suggesting they be put in charge of public involvement. However, of those who address this topic, most advise the Forest Service not to “pander” to organizations because, they say, such groups want to prevent the majority of the nation from enjoying their lands. A number of respondents assert that the development of the Roadless Rule was orchestrated by specific special interest groups, hence it was not an open, fair rule-making process.

Respondents who comment on the role of resource user groups in decisionmaking advise the Forest Service not to “pander” to such groups. People suggest that the process should respect the will of the people rather than that of “special interests that profit from the consumption of natural resources. Others suggest that the Forest Service exclude resource user groups from the decisionmaking process altogether, because of perceived ulterior motives that do not take into account the health of the land.

Collaboration Processes – A number of respondents comment on collaboration processes. Some state that the Forest Service should adequately incorporate collaboration in the decisionmaking process. According to one organization, they do not believe there is any decision made by the Agency that demonstrates collaboration in the planning process, as opposed to simple comment opportunities. Some also suggest models that the Forest Service should follow in collaboration. These models include the Winiger Ridge Ecosystem Management Pilot Project and the Enlibra Process. Others, however, doubt the effectiveness of collaborative processes. Some advise the Forest Service to avoid over-reliance on collaboration. These respondents believe that collaboration is limited to solving easy problems; gives resource user interests unfair influence in decisionmaking; displaces traditional sources of legitimacy, such as the electoral process of representative democracy; and is an unrealistic solution because of the required time commitments. Respondents also state that agreement between parties may not be possible, and that an emphasis on collaboration may lead to policies that are agreeable rather than high quality. In addition, some suggest that the term “collaboration” carries the connotation of bias in decisionmaking.

Collaboration with States, Local Governments, and Agencies – A number of respondents offer comment regarding collaboration with specific entities. Some request that the Forest Service collaborate with states and local governments in managing roadless areas. Respondents suggest that this should be done by respecting state regulatory authority, by creating a staff position for a state liaison, or by establishing a state oversight team. Others suggest various entities that the Forest Service should designate as cooperating agencies, such as the states of Montana and Wyoming, and Wyoming county commissioners and conservation districts. In connection with these suggestions, writers state that the Forest Service should establish a consistent system for extending cooperating agency status to local entities. Some also assert that the Forest Service should collaborate with counties and local communities in managing roadless areas.

Collaboration with Other Groups – In addition to collaborating with state and local governments, people also suggest the Forest Service collaborate with agencies such as the U.S. Fish and Wildlife Service in forest planning and management of roadless areas. Suggestions for effective collaboration with other groups range from creating a Board of Trustees to employing resource advisory committees to generally recommending guidelines to ensure adequate collaboration. Respondents state that the Forest Service should explain laws and how they apply to decisionmaking, arrange face-to-face working groups of all interests, create partnerships that

are inclusive of all economic levels, and recognize the collaborative efforts of special interest groups.

Education – Some respondents believe that the Forest Service should educate the public; they often assert that the Agency should educate people rather than lock them out of the land. Suggested education topics include the importance of managing public lands for the greatest good for the greatest number over the long term, the facts about and benefits of the Roadless Area Conservation Rule, and resource management needs. One individual suggests that the Forest Service adopt the “Wood is Good” campaign to change the way people view wood-based products. People also suggest how public education should be carried out. Suggestions include publishing informative articles, producing a television program regarding roadless areas, and developing a seminar for new users and monitoring all uses.

Volunteerism – A number of respondents advise the Forest Service to encourage volunteerism. As one person points out that if people feel strongly enough about an issue, they should be willing to pitch in and help out. Some respondents suggest that volunteerism would be an effective way for the Forest Service to cut maintenance costs. Suggested potential volunteer groups include various user groups, troubled youth, hunters, anglers, and retirees.

Public Involvement in Decisionmaking General

327. Public Concern: The Forest Service should protect the right to public participation in forest planning.

We understand that the Bush Administration is also trying to amend the laws concerning planning for our National Forests to limit public participation! Since the public “owns” our public lands, it is extremely important that our right to participate in planning be protected. (Organization, Escalante, UT - #A27872.15110)

328. Public Concern: The Forest Service should establish strong lines of communication with the public.

TO UNDERSTAND HOW MANAGEMENT AFFECTS COMMUNITIES

The Forest System Land and Resource Management Plan is a contract between the American people and the Forest Service that describes how the American people’s National Forests will be managed. We ask that you develop strong lines of communication with the public and understand how National Forest management affects our communities. (Business or Association, Jackson, MS - #A4824.15000)

BECAUSE MANY PEOPLE DO NOT UNDERSTAND HOW DECISIONS AND LIFESTYLE CHOICES ARE RELATED TO LAND MANAGEMENT

USFS efforts to communicate with the public about management of national forests can definitely be improved. Congress should allocate funds to allow the USFS to develop and maintain ongoing forums for dialog with the public. The agency should provide training and acquire personnel with backgrounds in social science and public communication, and de-emphasize its historic focus on natural science and extractive industries and material resources. Because humans are more disconnected from the natural world, and out of touch with ways our decisions and lifestyle choices are related to land management than at any time in history, it is critical that dialog with the public be intensive and ongoing, rather than limited to closed-ended comment periods on specific plans. (Individual, Corvallis, OR - #A650.15152)

329. Public Concern: The Forest Service should be responsive to the public.

BY ADDRESSING CONCERNS FROM ALL SECTORS OF SOCIETY

I appreciate your taking comments on the roadless area plan. I attended many of the meetings and feel that none of my concerns were met. There seemed to be a present plan to close roads with a five mile radius which could ultimately block out the entire forest. (Individual, No address - #A5229.10131)

They continue to say that they had over 600 public meetings and 1.6 million public comments, but of course, they are not available to the working people of the United States. If we had college students writing on our behalf, maybe the Forest Service would have to acknowledge our comments. I've been told by a Forest Service Supervisor that You are not the Sierra Club so I don't have to worry about your input. Needless to say, unless I can get Representative McNinnis to assist users in writing to the Forest Service, I believe our comments are useless. Even Rep. McNinnis was given the cold shoulder under the Clinton Administration and Bruce Babbitt. (Individual, Castle Rock, CO - #A3628.10132)

ARRA believes that the Federal Government in collaboration with the States, local governments, Native Americans, and other affected individuals and organizations can promulgate policies that truly reflect the needs and desires of a wide range of Americans. When the original Roadless Rule was developed, it was apparent that many sectors of our society were not invited by the government to provide input on this rule. True consensus and respect for policies cannot be achieved unless all stakeholders feel that they had a fair chance to have their voices and concerns heard. If we truly care about appropriately managing and protecting our national forests, then seeking a consensus among a variety of interested parties provides the best means of preserving the country's natural heritage. (Organization, Washington, DC - #A5069.10132)

Thank you for soliciting additional comments on this important rule. When the original rule was released earlier this year, I felt that many of us in the recreational community were not given adequate opportunity to express our concerns and ideas about the roadless issue. Therefore, thank you for re-opening this issue for additional input from those of us who care about the environment and who seek opportunities to recreate on public lands. (Individual, Anaheim, CA - #A5169.10133)

330. Public Concern: The Forest Service should recognize that public involvement during development of the Roadless Area Conservation Rule was sufficient.

The ANPR requests input according to a set of questions regarding issues, access, wildfire prevention, forest health, that have already been addressed in the existing policy. **I refuse to engage in a debate so inherently flawed.** We already had the debate to determine the future of public roadless lands, and the people spoke loudly and clearly. They asked the Forest Service to protect roadless lands with a strong national policy, ninety six percent of over a million who commented.

I've heard criticism lately of the "click-and-vote" approach to public input (utilized by both sides of any issue), and I respect your agency's desire for quality input. I don't deny that you received many form letters and "prepackaged" postcards during the earlier go-round that you found relatively useless, but I still take issue with the argument that public input wasn't good enough, wasn't local enough. (Individual, Helena, MT - #A20343.10152)

[Q2] Answer: It is incumbent upon the Forest Service to match the public involvement process to the scope of the issues. Where issues of national import, such as the conservation of wild areas, are on the table, the public involvement process must be national and open to all citizens. Where the issues are primarily of local concern, such as the availability of firewood, then the public involvement process is best targeted to local interests.

The Roadless Rule's promulgation clearly satisfied any rational test for sufficient opportunity for public involvement. The Roadless Rule garnered more comment than any other Forest Service decision in

history. The combination of over 600 local public meetings combined with national media exposure ensured that anyone with an interest in Roadless Area protection would have an opportunity to learn about the Forest Service's proposal and comment upon it. That over 1.58 million people chose to do so is testimony to the outreach effort. (Organization, Craig, AK - #A23228.10152)

[Q9] Again, the people have spoken. There were two years of well-publicized, well-documented public hearings in which all individuals and groups had the opportunity to make their "views, values, and beliefs" about public lands known. Over 90% of the comments generated supported protection of roadless areas. I suppose we could go through that whole process all over again—but what a tremendous waste of public money, time, and energy that would be. The process itself, the most extensive in Forest Service history, is not flawed—the Bush Administration's refusal to accept the results is. (Individual, Cumming, GA - #A21156.10153)

331. Public Concern: The Forest Service should consider that issues being raised now should have been raised during the public comment period for the Roadless Area Conservation Rule.

TO RAISE THEM AFTERWARD AND THEN CRY FOUL IS CONTRARY TO THE INTENT OF THE NATIONAL ENVIRONMENTAL POLICY ACT

The Federal Register Notices states that this advance notice is intended to give the public the opportunity to comment on key issues that have been raised regarding the protection of roadless areas. These issues should have been raised during the public comment period. To raise them afterwards and then cry foul is not what congress intended when it passed the National Environmental Policy Act. (Individual, Grants Pass, OR - #A30000.20203)

332. Public Concern: The Forest Service should consider that those who are satisfied with the status quo might not participate.

The FS must particularly take into account that those who are satisfied with the status quo will seldom make a great effort to participate, as they believe that the current situation will continue. (Individual, Center Sandwich, NH - #A5698.15000)

333. Public Concern: The Forest Service should consider that the Roadless Area Conservation Rule expressly includes the requirement that input be sought from state and local officials, tribes, and any other interested parties.

What is the best way for the Forest Service to work with a variety of states, tribes, local communities and individuals in a collaborative manner to ensure concerns about roadless values are heard and addressed through a fair and open process?

This has already been adequately addressed in the final rule of the Clinton Roadless Plan. Needless to say, there has already been a fair and open process over the last two years to hear concerns on the Roadless Plan. The final rule of the Clinton Plan specifically protects tribes, communities and individuals who might have pre-existing rights to activities in roadless areas, by statute or treaty. In addition, the final rule expressly includes the requirement that the Forest Service seek input from state and local officials, tribes and any interested parties in the land management decision-making process. It is important, however, to maintain the restrictions on road construction and logging as the basic legal framework for use planning. (Individual, Olympia, WA - #A6929.10152)

334. Public Concern: The Forest Service should list the tribes and communities that did not provide input on the Roadless Area Conservation Rule.

The states, tribes, local communities, and the general public had ample opportunity to review and comment on the proposal. We ask that the Forest Service list the tribes and communities that did not provide input on the original process. The final Roadless Area Conservation Rule addressed many of the

views expressed during the public comment period and incorporated many of the suggested changes. (Business, Spokane, WA - #A22047.15100)

335. Public Concern: The Forest Service should require those who want to participate in forest management decisions to contribute to forest stewardship activities.

I believe a good working relationship between local entities and national management would involve some kind of exchange of values. Those who want to participate in management would be expected to contribute some kind of stewardship, such as trail maintenance, wildlife surveys, search and rescue teams, creating educational materials and brochures, whatever they might propose to preserve the value of the forest. (Individual, No Address - #A30157.15100)

The Role of the General Public

336. Public Concern: The Forest Service should allow all citizens full access to the decisionmaking process.

The members of this chapter are unalterably opposed to weakening the access of citizens to the federal decision-making process, particularly as that process affects extractive industries like logging, mining, and grazing. (Organization, Davis, CA - #A21666.15120)

All sides of the issues must be given equal access to the process and equal opportunities to express their views. We hope to never again see the closed-door meetings and off-the-record deals that tainted the original rule making process. You must utilize the NEPA process as a means to make decisions, not to rubber stamp decisions already made. Finally, you must restore integrity to the agency and the process it uses. Quite frankly, the agency has a long way to go to regain the trust of any public sector, including those interests the Forest Service's leadership catered to a few months ago. They know first hand how easily strong handed politics could compromise the agency's objectivity. (Individual, Montpelier, ID - #A9058.12230)

337. Public Concern: The Forest Service should ensure that all interested parties have the opportunity to provide site-specific input regarding individual roadless areas.

It is unfortunate that the USFS [United States Forest Service] must be mandated by the Idaho District Court to seek meaningful comment from the citizens of the United States on how to best manage 58.5 million acres of public land. Consequently, if the USFS wishes to work with local communities, tribes, governments, and organizations in the management of this land, it is imperative that these entities be able to provide site-specific input regarding individual roadless areas, in addition to national issues pertaining to these lands. Those who wish to actively engage in forest planning and analysis should be actively encouraged by the USFS to help identify potential impacts of management decisions in rural communities. (Business or Association, Sacramento, CA - #A3681.13213)

SO THAT, GIVEN A RECOGNIZABLE LOCAL NEED IN A SPECIFIC AREA, AN EXCEPTION TO THE ROADLESS AREA CONSERVATION RULE MAY BE PROVIDED

If there is a recognizable local need in a specific area, then procedures for granting exception to the roadless rules may be provided. The "default" national management position should be to preserve the roadless state. (Individual, Denton, TX - #A156.13213)

The Role of Local/Rural Residents

338. Public Concern: The Forest Service should solicit and consider local input.

We strongly encourage the Forest service to solicit, encourage and take seriously comments made by local citizens; local, county and state governmental officials; and other community leaders. This should

occur regarding all actions taken by the agency affecting the various forest management plans and areas of jurisdictions under their supervision. Local citizens, officials and community leaders often have critical “on-site” knowledge on how individual actions on Forest Service lands will affect both the local communities as well as the various resources on the land involved. (Business or Association, Elko, NV - #A20856.15100)

The Forest Service needs to solicit and understand local opinions and desires in a more complete manner. It may take active efforts at conducting opinion polls of the local population, such as was done by the Bitterroot National Forest for their fire salvage efforts. Other methods might entail developing collaborative-based decision-making groups in affected states . . . wherein different interests and skills are brought to the table to manage watersheds. The Forest Service could contract with local mediators/facilitators to run these meetings. Even though many academicians, including the Committee of Scientists, applaud the use of collaborative methods, I highly recommend talking with local professionals and citizens who have participated in these groups for their own perspective. My own experience has taught me that without clearly-defined goals, strict timelines, equal representation, and limits on judicial review, many collaborative-based solutions will end in stalemate as is typical of many Forest Service decisions. (Governor, State of Montana - #A17660.15111)

339. Public Concern: The Forest Service should allow adequate local input into scoping and planning.

I want to see more local input into scoping, and EIS planning. I do not like it when the Forest Service comes to me with a plan in place and gives me 4 or 5 options of what they want. Most of the time, it is not what I want. I guess it is supposed to make me feel I have given input when I have not done so. I want more local control over what happens in my area of the forest and I want it up front and not at the end. (Individual, Seiad Valley, CA - #A5092.15111)

340. Public Concern: The Forest Service should acknowledge that local concerns have been fully and adequately considered.

I am writing to ask that you maintain current protection of all 58.5 million areas of roadless National forest land protected during the Clinton Administration.

The Bush administration is seeking to amend the policies of the Clinton administration by saying that local interests had not been fully consulted prior to the development of the rules. This statement is a lie. In fact, NO federal regulation has EVER been based on so much local input. The Forest Service held more than 600 hearings around the country, and reviewed a record 1.6 MILLION public comments. (Individual, Bloomfield, NM - #A1606.10151)

The Roadless Area Conservation Rule was developed through the most extensive public involvement in the history of federal rulemaking or environmental review. Of the official submitted comments, 95 percent supported the strongest possible protection for remaining roadless areas. The Forest Service contends that local opinions and comments were not adequately considered in the first public process, apparently because the views of logging, mining, and mechanized recreation were minority views in that process. These special interests had the same opportunity as anyone else to make their views known. Response like that is not generated if opportunities and announcements are sparse. (Individual, Seattle, WA - #A3716.10151)

The Role of Special Interest Groups

341. Public Concern: The Forest Service should include environmental interest groups in the decisionmaking process.

Seek response from Sierra Club, and other environmental groups. (Individual, Del Mar, CA - #A868.15121)

The Forest Service should stop preparing for timber sales that violate the rule, and they should stop collaborating to weaken the rule. They should begin a genuine defense of the Rule in court, and solicit the help of credible and publicly accepted environmental organizations. (Individual, Hatboro, PA - #A17972.12230)

THE THEODORE ROOSEVELT CONSERVATION ALLIANCE

The TRCA is one of the best conservation groups which applies common sense and not radical policies and tactics. Please listen to them and involve them in all policy making in this area. They are another sane voice who like the RMEF is making a difference for wildlife and the wild areas we love. (Individual, Boulder, CO - #A3954.15121)

342. Public Concern: The Forest Service should recognize that conservation organizations have the same interests as all citizens.

THAT IS, TO ENSURE GOOD PUBLIC POLICY AND PROTECTION OF FINITE RESOURCES

I would like to say a word about these [conservation] groups, which are often spoken of as if they were just another special interest. This is a misunderstanding; they do not represent their own interests in the same sense as timber companies, for example. They have no financial stake in the outcome. They are information gatherers. Their interest is the same as that of all citizens, to ensure that we make good public policy and do not squander our finite resources. (Individual, Juneau, AK - #A23012.15121)

343. Public Concern: The Forest Service should consider putting environmental groups in charge of public involvement.

BECAUSE THEY HAVE A RECORD OF DOING SO SUCCESSFULLY

The endless number of meetings that were held were fair and open. But the agency will never, in my lifetime anyway, learn to do public involvement. This won't change under Dale Bosworth/Mary Rey/George Bush and can be expected to get worse. There was a public meeting put on by the north end of the Gifford Pinchot National Forest and the Olympic National Forest. It was held in Olympia. It was poorly done, and all "sides" went home dissatisfied. Later, a local environmental group called the Gifford Pinchot Task Force obtained the mailing list and sent out a mailing to everyone and invited them to another meeting. This one was held at a local community gathering place in the rural community of Randle, Washington, on the north end of the Gifford Pinchot National Forest. The local District Ranger was invited and attended. There was a panel composed of a very diverse constituency. A lively discussion ensued. The Task Force even offered to assist local community members in writing their response to the draft RA rule—knowing that many of these folks did not agree with them. Perhaps one should put environmental groups involved in Forest Service public involvement. This was not the first time such groups had to take the lead on broad public involvement and did it successfully. (Note: the public involvement meetings for the new NFMA regulations were even worse.) But, again, public involvement occurred in spite of this and through way over one million letters, cards and emails. The American people felt heard (until now). (Individual, Olympia, WA - #A4503.14200)

344. Public Concern: The Forest Service should exclude environmental interest groups from the decisionmaking process.

ENVIRONMENTAL STAKEHOLDER COUNCILS

Remove environmental stakeholder councils immediately and remove seed money or grant money that is given with strings attached. The Forest Service should rely on local input and local control. (Individual, Albuquerque, NM - #A10497.15000)

345. Public Concern: The Forest Service should not pander to environmental interest groups.

There seems to be something dreadfully wrong when advocates for the preservation of public and private resources (retaining for posterity) have more influence over our government agencies and the

legislation than do the majority of the citizenry. The problem with the preservation segment of our society is that they will not be able to make a living if they cannot make a living off of the paranoia of a few misguided supporters. Human life, the ability to make a living and enjoy our natural resources is the framework on which this country was built. Roadless areas are part of the continuing saga of bureaucratic government control that continues to lead to improper use of our renewable resources. I assume that preservationists would like to see dinosaurs roaming the earth. (Individual, Warren, AR - #A9095.15120)

We must point out that pandering to preservation interests has not worked in the past and will not work in the future. When you are conducting forest planning in a responsible manner aimed at management of forest resources, you will have the support of IFOA. IFOA recognizes that we have a big stake in responsible management of national forests. (Business or Association, Coeur d'Alene, ID - #A15260.15120)

I am convinced the anti-forest use movements are movements of greed and selfishness. This was well illustrated by [a representative] of the Environmental Protection Information Center in Garberville, California. He was quoted in a recent *Backpacker* magazine article as saying, now that the Headwaters is preserved, "We need to be conservative and not throw the gates open to everyone." In other words, now that we have created our own private preserve, let's make sure no one else gets in.

A while back, on the Discovery Channel, I saw a program dealing with the Cold War and, more specifically, the roles the CIA and KGB played in the Cold War. The elder President Bush, a former CIA Director, was on the program. A former high-ranking KGB official was also on the program. The latter said the *KGB used the West's environmental movement*.

Just think of the implications of these statements. Could there be some relationship to PETA, ALF, ELF the Eugene, OR and Seattle, WA anarchists, Earth First!, and so on? Could these be indicative of a fundamental shift toward a more socialist American society? I have to wonder.

I am convinced the environmental community is holding the federal government hostage. They get what they want because the federal government routinely caves in to tree-sitting, tree spiking, etc. (Individual, No Address - #A25635.15121)

BECAUSE THEY WANT TO LOCK OUT THE MAJORITY FROM PUBLIC LANDS

The environmental radical movement has latched onto watershed, wildlife, and scenic value protection to lock out the majority of the nation for enjoyment of their lands. Urban dwellers who are sending in thousands of cards are uninformed on the resilience of nature and how special characteristics can be protected while allowing roads and motorized use. (Individual, Alturas, CA - #A28581.15121)

I have attended many USFS meetings and am appalled that "conservation" and "environmental" groups advocate non-use of national forests. At the Regional meeting held in Atlanta, GA. those groups advocated zero timber harvest, zero mining, zero grazing, and zero "motorized" use of national forests. They said they wanted all roads "decommissioned and obliterated," private property owners (inholders) bought out, and the lands proposed for Wilderness designation. This is totally unacceptable and inappropriate for national forest lands. They were established, by the US Congress, to "meet the needs" of the American people. That means ALL the American people, not just them, and includes natural resource production. (Organization, Three Rivers, CA - #A28739.15121)

346. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule was orchestrated by environmental groups.

The initial rule making, orchestrated by giant environmental organizations, was designed to lock up in perpetuity over 60 million acres of national forest lands in one massive land grab. To gain public support for this radical move, these groups targeted urban areas with misinformation and input drives, making the massive lockup appear overwhelmingly supported by the American people. Most of this input came from well meaning folks who didn't have a clue as to where these units were or what was on them. In fact, no one knew with any certainty where they were or what the trade-offs were. This strategy pitted

the interests of rural Americans in the sparsely populated areas where most of our national forest lands are actually located, against urban America, where much of the population and political power lies. (Individual, Lewiston, ID - #A2872.15121)

Remember, the huge amount of input on the first go around for the Clinton Roadless Area, was supplied largely by preservationists through mass e-mailing. There really is a silent majority out there and the Forest Service should not always try to grease the squeaky wheel, which was the case in the Clinton administration (or lack of administration). (Individual, Aloha, OR - #A3675.15121)

I have not answered the individual questions of the survey because I don't think I have anything specific to add to the response of the Retired FS Employees. I would just like to make one point and reinforce another. I am happy to see the Forest Service reviewing the Clinton Roadless proposal. It was a closed door deal made with selected "environmental" groups which was a done deal by the time it was announced. Most of us realized that even as we participated in the public comment process. The result was another step in the process to turn all the national forests into ad hoc wilderness. (Individual, Greensboro, NC - #A5306.15121)

In oversight hearings held by the U.S. House Resources Subcommittee on Forests and Forest Health, Subcommittee, it was found that the Heritage Forest Campaign, created by the National Audubon Society form more than \$3.5 million in tax-free grants from the Pew Charitable Trusts organized a coalition of environmental groups, including The Wilderness Society, the Sierra Club, and others, for the purpose of influencing future management of approximately 60 million acres of national forest lands. Based on the analysis of thousands of documents obtained from the past Administration and the agency, the House Subcommittee concluded that a handful of environmentalists in the Heritage Forest Campaign had unprecedented, and possibly illegal influence on the past Administration. These individuals had continuous access at all levels to the Federal employees that were directly involved in the creation of the RACR. This access was not limited to meetings, which were numerous, but included the providing of draft language, legal memoranda, and survey research data to the Administration, which was then used to develop and justify the roadless initiative. (Organization, Salt Lake City, UT - #A15263.15121)

[From Attachment 2] On October 28, 1999, the Committee on Resources requested documents from the Forest Service and the White House concerning the President's initiative to restrict use on 40 to 60 million acres of "roadless areas" on the National Forests. Staff has to date received, and conducted a preliminary review of, thousands of pages of documents provided by the Administration.

A preliminary review of these documents reveals that the Administration's decision was made improperly, in apparently violation of the due process rights of affected parties, as well as applicable statutes enacted by Congress to protect those rights, such as the Administration Procedures Act (APA) and the Federal Advisory Committee Act (FACA).

Information received in response to the document request indicates that the Administration's roadless area initiative was developed in an environmental vacuum—with virtually all input coming from a select few in the environmentalist community.

These individuals had continuous communication with, and access to, the Federal employees that were directly involved in the creation of the rule-making.

This access was not limited to meetings, which were numerous, but included the providing of draft language, legal memoranda, and survey research data to the Administration, which was then used to justify and frame the roadless area rule.

The structured relationship between the Administration and environmentalists is of serious concern, but more significant is the lack of any evidence of even a token effort by the Administration to involve other interested parties. This disregard for any balance in the advice being solicited is evidence of both the pretextual nature of the decision, which had clearly already been made, and of lack of concern for any adverse consequences on the affected users of the forest lands in question. (Individual, East Helena, MT - #A20422.15121)

347. Public Concern: The Forest Service should not use environmental groups as moderators in the public involvement process.

In my experience so far with HCCA, which seems to have assumed the role of gatherer of community input, there is anything but transparency, willingness to allow discovery, and open-mindedness. Since the new comment period and process of gathering input is unknown to the general public has not been well publicized, there should be more effort to recruit public opinion in a nonbiased arena. Biased groups such as HCCA should not be placed in a position as moderators of this process. (Individual, Littleton, CO - #A13845.15152)

348. Public Concern: The Forest Service should recognize that conservation groups falsely appear to outnumber those favoring responsible land access.

I would like to point out that in recent years it has been demonstrated to me through experience that organized groups in favor of banning land access and prohibited motorized vehicle use on public lands may at times falsely appear to outnumber those in favor of maintaining access, but only for now. As one who has many personal friends and family involved in several of the conservational groups, I realize their tactics and know they have been effective in fabricating the appearance that a vast number of Americans approve of limiting land access for recreational activities. However, my own and many, many others' personal experiences tell something quite different. Given time, Americans for responsible land access and motorized vehicle use will come forth, as is evidenced by several of these groups' recent growth. We should not ignore those Americans who have yet to speak their views on this topic, for there are a vast number of unspoken voices as yet in favor of maintaining land access for all. (Individual, Salt Lake City, UT - #A27590.15120)

349. Public Concern: The Forest Service should exclude industrial interest groups from the decisionmaking process.

Again, in the twilight of the last remaining relatively undisturbed sanctuaries of this nation's (and part of the world's) forest ecosystem biodiversity, the notion of bringing exploitative interests into the process will at best muddy the process of protection of roadless areas, and at worst, encourage "balanced uses", effectively emptying the last in our reservoir of undisturbed forest land. The goal of Roadless Area stewardship should be bringing the best science to the single goal of preserving the last remaining tracts of forest biodiversity.

Would one bring the Band-Aid salesman, the ambulance driver, the hospital gift-shop employee, the recovery ward night custodian into the decision making process for a case of major surgery? Certainly all of these folks are personally affected, but do they have anything meaningful to offer outside of their own parochial interests when the patient is nearly terminal? (Individual, Goldendale, WA - #A21668.50100)

350. Public Concern: The Forest Service should not pander to industrial interest groups.

Apparently you are counting on our ignorance of what is going on, or our sheer fatigue from previous efforts to further this most important initiative, in order to promote the interests of the logging companies and mining interests who use the National Forests as their private preserves.

The reshaping of our forests by extractive industries, road-building and poor management has left them vulnerable to fire, disease and the spread of exotic weed species. We are fortunate that some of the less desirable or accessible areas have so far escaped this degradation. I ask you to listen to the voices of individual citizens, and to reread the great number of letters already in your files, and make the wise decision to set aside these areas for the sake of our children and their children. (Individual, Marshall, NC - #A13223.15122)

If it were only an issue of just "individuals and groups with strongly competing views, values and beliefs" this would simple. But it is not. This is an issue of the interests of the people versus the interests of big money. The Forest Service (and Congress and the Bush administration) would do well to

remember that the National Forests belong to the American people, not the government and not industry. Bowing to the will of special interests that are backed by industries that profit from the consumption of natural resources and destruction of natural, life sustaining processes on public lands often at the taxpayer's expense is shortsighted and inherently a conflict of interest to the Forest Service's expressed claim of "Caring for the Land and Serving the People." (Individual, Seneca, SC - #A22097.15122)

It seems that this process is slanted to benefit industry and only industry. I urge you to respect the will of the millions of individuals who have already clearly stated that we want our remaining wild areas to remain wild. Don't change the rule for the short-term gain of the logging industry and others, while creating long-term loss for people and wildlife. (Individual, Missoula, MT - #A19233.15122)

351. Public Concern: The Forest Service should include special interest groups in the decisionmaking process.

LOCAL AND NATIONAL ORGANIZATIONS

Brundage feels that the solicitation of input from user groups, such as the Forest Service is doing by means of this July 12, 2001 request, is the best and appropriate means of ensuring that all of the various interested parties have an opportunity to be heard and participate in this process. This should include local as well as national organizations, such as the National Ski Areas Association (NSAA). National organizations are often able to provide broad, nationwide direction and concerns that local organizations sometimes overlook. (Permit Holder, McCall, ID - #A15317.15162)

OUTFITTERS AND BACKCOUNTRY GUIDES

More information could be obtained from outfitters and guides already in the backcountry than from forest service employees riding around in trucks on roads. I know this for a fact because I have been in the capacity of guide and outfitter and have seen the activities of the forest service; their range is too limited off road to be of much value to conservation. (Individual, Howell, MI - #A13742.14000)

OFF-ROAD VEHICLE USERS

I believe it is important to point out that ORV users have been unfairly singled out as the single cause of environmental damage on our public lands. All across our nation, public lands are being closed off to ORV users while hiking, backpacking, equestrian, bicycling, and in some cases even ATV access has been maintained, expanded, and encouraged. No other group of users has come forth and assisted in the cleanup and maintenance of public lands like ORV users have yet they still continue to be much-maligned and subsequently denied access. I personally consider this to be a mockery of the founding principles of our great country. The public lands are to be protected for the people, not from them.

Despite having representative organizations all across the nation, ORV users have often been left out or ignored in the planning process for public land use. (Individual, Saint Louis, MO - #A629.15123)

352. Public Concern: The Forest Service should exclude special interest groups from the decisionmaking process.

STAKEHOLDER COUNCILS

Stakeholder councils should be removed, and plans should be submitted by local users to local jurisdictions, whereby citizens of those jurisdictions can legally vote to approve the plan they feel best represents a balance of resource development and protection. (Individual, Aptos, CA - #A16303.15111)

Collaboration Processes

353. Public Concern: The Forest Service should adequately incorporate collaboration in the decisionmaking process.

Assertion: NFMA is a "highly collaborative process" (p. 3). Were this true, it would have, analytically, no bearing on whether that process failed systematically to account for the cumulative, national level

impacts of roadless area conversion and road system expansion. In point of fact, NRDC is aware of no study that demonstrates actual collaboration in the planning process, as opposed to simple comment opportunities. Moreover, our organizational experience has virtually uniformly been that, far from collaborating, national forest decision-makers routinely refuse even to consider the management alternatives suggested and substantiated by citizen activists, giving the public no "horse in the race." (Organization, Olympia, WA - #A20145.15150)

354. Public Concern: The Forest Service should allow flexibility in collaboration processes.

The Forest Service can also serve an important function in brokering agreements over the use of Forest Service lands for energy production. As an example, the amended rule should include the flexibility for all parties to enter into collaborative agreements that benefit the forest. This could include offsets for surface disturbance (i.e. an acre disturbed on the forest will be offset with reclamation of disturbance in another part of the forest as agreed upon by the parties). The net result is that when the mine reclaims the surface disturbance associated with the operation, as is required by state and federal law, the forest will benefit from not only the reclamation associated with the mining operation, but with the offset reclamation done in another part of the forest. The same principle could be applied to wildlife habitat or other important facets of forest management. (Business, Wright, WY - #A23085.15162)

355. Public Concern: The Forest Service should place limits on the number of active collaborative groups that operate regionally, on a concurrent basis.

The USFS must place limits on the number of active collaborative groups it operates regionally, on a concurrent basis. Presently, contributing volunteer members of multiple, concurrently active collaborative groups find themselves "coming and going", especially in situations involving multiple national forests and lower population density rural counties in and around those national forests. (Organization, Moscow, ID - #A15318.15162)

356. Public Concern: The Forest Service should follow the model of collaboration used in other planning processes.

THE COLLABORATIVE STEWARDSHIP PROCESS USED BY THE CHUGACH NATIONAL FOREST

The collaborative stewardship process used by the Chugach National Forests in its Forest Plan Revision provides an excellent model for meeting this objective. An important element of this effort is that a public survey was completed to verify that the attitudes of local residents were relatively consistent with the input that was being received by those who actively participated in the planning process. (Organization, Anchorage, AK - #A17358.15111)

THE WINIGER RIDGE ECOSYSTEM MANAGEMENT PILOT PROJECT

Instead of thinking in terms of the good guys and the bad guys we may come up with a very different philosophical understanding based on our observations of nature. In our area there is an effort that may serve as a helpful model of agencies, Forest Service, local landowners and environmentalists working together to become informed and create a situations where certain areas might be protected in a more natural state and in other areas of greater wildfire risk to landowners people are taught and offered a variety of means for protecting their homes and property. It is called the Winiger Ridge Ecosystem Management Pilot Project. (Individual, No Address - #A4477.15162)

THE ENLIBRA PROCESS FOR TAKING ACTIONS IN THE WEST

If the Fed wants to take actions in the West (just like it does back East), it needs to use as model the Enlibra process as outlined by Western governors. Here in Western Colorado, citizens have been doing just that with our regional Public Lands Partnership. In fact, our regional collaborative process is hosting a conference, Communities Engaged in Public Land Planning: Setting the Course for the Future (see <<http://www.fs.fed.us/r2gmug/>>). I invite you to attend. (Elected Official, San Miguel County, CO - #A4549.15152)

357. Public Concern: The Forest Service should recognize that groups unwilling to collaborate have no legal standing.

The Forest Service can effectively work with interests of competing values by requiring that they work collaboratively in the process. If they are not willing to sit down with other interests and work out a solution then they have no standing legally. (Business or Association, Sandy, UT - #A15656.15162)

358. Public Concern: The Forest Service should avoid over-reliance on collaboration.

TO AVOID DISPLACING TRADITIONAL SOURCES OF LEGITIMACY, SUCH AS THE ELECTORAL PROCESS OF REPRESENTATIVE DEMOCRACY

Popular ideas, such as collaboration, may not always be as good as they seem. Currently, popular ideology suggests that public agencies should shape public policy by relying on collaboration among local stakeholders. While collaboration has its appropriate uses, over-reliance on it can displace traditional sources of legitimacy. For example, agencies that have derived their legitimacy from the electoral process of representative democracy would be forced to secure a direct sanction from parties affected by the use of the collaborative process.

The collaborative process requires stakeholders of a community to seek agreement on the resolution of their dispute. Some proponents of the collaborative process believe that it entails finding stakeholders who have the power to make commitments to support an agreed upon solution, as well as persuading any of their followers to do likewise. Generally, the government is expected to embrace the agreed upon policies. This idea is being advanced particularly in the context of decisions that are made by land management agencies like the Forest Service. In the case of the roadless rule, the Bush administration is applying this concept to a policy decision of national scope. (Organization, Nevada City, CA - #A4941.15111)

TO AVOID CREATING POLICIES THAT ARE MERELY AGREEABLE RATHER THAN HIGH QUALITY

Local collaborative efforts shift the ultimate goal away from reaching a quality decision and move it toward reaching a merely agreeable one. Such a process can lead to policies that are based on cumbersome compromises of principles, the lowest common denominator, and on the most tractable but least important issues. In essence, collaboration can actually inhibit genuine innovation. (Organization, Plymouth, MN - #A7116.15000)

BECAUSE IT IS LIMITED TO SOLVING EASY PROBLEMS

As a long time participant in collaborative processes (which are good) they are limited to solving easy problems, and thereafter they stall when no consensus can be found to deal with fundamental problems. (Organization, Arcata, CA - #A21665.15162)

BECAUSE AGREEMENT BETWEEN PARTIES MAY NOT BE POSSIBLE

You are on the right track with your request for response on the roadless issue rather than the Clinton/Gore process, which everyone knew was a scam. Your questions are thoughtful and if responded to honestly, with real concern for the roadless areas by all parties, should give you a good basis on which to make your decisions. The process can be considered democratic but it is not a popular vote. You will never get anything close to agreement from all the stakeholders on the roadless question because the views are so polarized and strong. In the end the USFS will have to make the tough choices based on what is best for the forests themselves and the flora and fauna that live there, tempering that decision on what impact the choice made will have on man. In my opinion, local communities matter more than national environmental organizations on these matters. Impact on man matters at least as much as impact on other living things. You are having an open process now but it may not be possible to have a collaborative process. Take the Tongass National Forest for instance. Years of negotiations on the Tongass Land Management Plan produced a plan that took away most of the forest for timber production, but assured a small steady supply of timber for small business to manufacture forest products. Some roadless areas were open for harvest with aerial extraction. After the TLMP was put into place these same groups sued to stop the logging in the roadless areas and along comes the Clinton/Gore roadless plan and proclaims no logging at all allowed in the roadless. What god did all the good faith

collaboration do here? None at all. That is why in the end the USFS must make the decision and be supported by the legislative and judicial branches of the government. It is the only way. (Individual, Portland, OR - #A15710.15111)

BECAUSE IT GIVES RESOURCE USER INTERESTS UNFAIR INFLUENCE IN DECISIONMAKING

Local collaborative efforts have become little more than big group hugs where the stakeholders, mostly development interests, may feel warm and fuzzy all over but leave forests, fish, and wildlife out in the cold. The Quincy Library Group (QLG), a local consensus building group charged with developing a management plan for three National Forests in the Sierra Nevada, is a case in point. Most theorists agree that all stakeholders with a real interest in the outcome ought to be members of the collaborative group. But in rural communities, like those in the Sierra, such a broad representation of voices is not always feasible. Many environmentalists with an interest in the QLG are based in the urban centers of San Francisco and Los Angeles, making it difficult for them to attend regular meetings. Consequently, the QLG was largely dominated by Sierra Pacific Industries, the very timber company that would be awarded logging contracts on the Lassen, Plumas, and Tahoe National Forests. As a result, the QLG recommended a plan that would double the logging in those forests, push imperiled species such as the California spotted owl, Pacific fisher, American pine marten, wolverine, and northern goshawk closer to extinction, and create fuels management programs that would actually increase fire severity and risk to nearby communities. More often than not, local collaboration means big timber, mining, oil, ranching, and other development interests call all the shots. (Individual, Cottage Grove, OR - #A27337.15122)

BECAUSE THE TIME COMMITMENT IT IMPOSES MAKES IT AN UNREALISTIC SOLUTION

I have read several texts about collaborative stewardship and attended training sessions, some sponsored by the Forest Service. While an inspiring ideal, collaborative processes require an extensive time commitment difficult for citizens to maintain in today's world. There are several key ingredients required for success, such as a skilled impartial moderator, a diverse group of stakeholders willing to listen to each other, and commitment by leadership to implement the recommendations of the collaborative group. Because these are difficult requirements, I do not think it is realistic for the Forest Service to prescribe collaborative processes across the nation as a solution to conflict. (Individual, Sitka, AK - #A15506.15162)

359. Public Concern: The Forest Service should consider that collaboration cannot occur until those who are party to litigation over the Roadless Area Conservation Rule recognize the authority of federal acts.

The State of Idaho is suing the Forest Service over the Roadless Rule as well as the Fish and Wildlife Service over the reintroduction of gray wolves. The Forest Service should work with groups (including governments) that are willing to accept federal authority. Until the State of Idaho (and others involved in Roadless Rule lawsuits) recognizes the authority of federal Acts (ESA, NFMA, NEPA, CWA, etc.), there can be no "collaboration." (Individual, Lewiston, ID - #A29569.15162)

360. Public Concern: The Forest Service should recognize that the term "collaboration" carries the connotation of bias in decisionmaking.

Everyone must have equal access to the process and equal opportunity to express their views. We hope the back-room deals at the national level, which marred the initial rule making, are things of the past. The word "collaboration" carries a negative connotation, one of cozy deals and distorted information favoring one point of view or another. Decision makers must maintain their objectivity and assure a lack of bias in data collection and its use. The image of your agency has been badly tarnished by real or perceived coziness with special interest groups. The NEPA process was corrupted in the rush to complete massive national initiatives before the last administration left office, becoming a means to confirm decisions already made. The Forest Service as an agency will have to prove its professionalism before re-earning the public's respect, especially at the local, adjacent community level. (Business, Lewiston, ID - #A7991.15110)

Collaboration with State and Local Governments

361. Public Concern: The Forest Service should collaborate with state and local governments in managing roadless areas.

I hope and pray agreements can be reached between states and the USDA-Forest Service regarding roads and roadless areas. (Individual, Roy, UT - #A1655.12310)

The MCD would recommend that the process be re-opened but this time at the local forest level. As a procedural law, NEPA provides opportunities for the public input in federal land planning activities. The process allows for all citizens to participate, yet recognizes the importance of state and local government involvement. Locally elected officials (County Commissioners and District Supervisors in Wyoming) directly represent the people that live in the areas of the several national forests. By allowing and supporting the meaningful involvement of local and state government the Forest Service will surely obtain the information they seek concerning roadless values. These types of relationships should be the focus of the Forest Service planning efforts and local Forest Supervisors should be allowed and encouraged to continue and increase these working relations with state and local governments whose constituents are affected by these decisions. (Conservation District, Meeteetse, WY - #A17665.12313)

BY RESPECTING STATE REGULATORY AUTHORITY

Any rule governing roadless area management should provide for close collaboration with state governments. Congress has provided that States are to have a meaningful opportunity for participation in the forest planning process. 16 U.S.C. [section] 1612(a). In addition, the States' role within the federal system demands that management decisions respect the sovereign concerns of the States as the trustees of natural resources such as fish, wildlife and water. The States' authority to regulate environmental conditions also must be respected, especially as it relates to water quality. Congress has mandated that federal land management activities must comply with state water quality regulations. 33 U.S.C. [section] 1323(a); *see also Oregon Natural Desert Ass'n v. Dombeck*, 172 F.3d 1092, 1098 (9th Cir. 1998) ("Section 1323 plainly applies to nonpoint sources of pollution on federal land"). Collaboration during initial rulemaking can help prevent future conflicts and will promote the mutual goal of cooperative federalism.

Collaboration with state governments is especially needed in those situations where state lands are adjacent to, or intermingled with, national forest lands. While access to intermingled state lands is guaranteed by existing statutes, such access can be hampered by restrictive management prescriptions that do not provide, up front, for future road construction necessary to reach state inholdings. By working together, the state and federal government can build state access requirements into the forest land planning process, so that future access is expedited. (Governor, State of Idaho - #A20141.15130)

BY CREATING A STAFF POSITION FOR A STATE LIAISON

Forests should make available, on their staff, a position that is appointed and paid for by the state's governor. This position would participate in planning meetings, inspections and other activities and serve as a liaison between the governor's office and the National Forest. The incumbent in this position would give input and make recommendations to the Forest but would not have approval authority.

This would show a strong commitment by the Forest Service to consider the state's economic and social needs concerning Forest policy. (Individual, No Address - #A26264.15130)

BY ESTABLISHING A STATE OVERSIGHT TEAM

If roadless rulemaking is to legitimately proceed, we recommend that the Forest Service establish a state oversight team that can participate on a regular basis in future rulemaking. A good beginning model for such a team is the Interagency Team that had significant input into the promulgation of the Roadless Rule. A committee of state representatives could be established that would meet regularly with Forest Service personnel working on roadless issues to review work and suggest revisions or alternative approaches. Such a process could give the States a real voice in this important issue without intruding on the Forest Service's statutory authority to manage and preserve our National Forests. (Governor, State of Idaho - #A20141.15162)

362. Public Concern: The Forest Service should designate specific entities as cooperating agencies.**STATE OF MONTANA**

I again ask that the Forest Service designate Montana as a cooperating agency under NEPA and 40 C.F.R 1500-1508. After careful consideration, we believed that it was vitally important to the resources within Montana and our communities that we assume that role. We continue to subscribe to the view. (Governor, State of Montana - #A17660.15131)

STATE OF WYOMING, COUNTY COMMISSIONERS, AND CONSERVATION DISTRICTS

We feel that the State of Wyoming, County Commissioners and Conservation Districts should be given cooperating status at the earliest time. (Conservation District, Sublette County, WY - #A28888.15141)

WESTERN STATES

In order to establish an effective forest planning process at the local level the Forest Service must be willing to work cooperatively with the appropriate and necessary stakeholders. The Forest Service should grant Western States cooperating agency status under the National Environmental Policy Act (NEPA). This cooperative effort will allow local resource managers to undertake stewardship activities such as forest thinning that will return the forest to a more natural condition, reduce fire, insect and disease hazards and reduce the risks to public safety on a forest-by-forest level. (State Agency, Denver, CO - #A2332.15131)

363. Public Concern: The Forest Service should establish a consistent system for extending cooperating agency status to local entities.

The Forest Service needs to establish a consistent system of working with local governments, state agencies, and associations. In Wyoming, the Forest Service used a government-to-government format while giving county and state officials the impression that they had cooperating agency status under NEPA. In fact, in North Dakota and Wyoming, the extent of state and private land plus county legal interests qualify both the state and county officials for cooperating agency status. If this had been done, then the Forest Service would be required to follow appropriate agreement format so that each party understood the role and what its responsibilities were. (Organization, Denver, CO - #A21358.15130)

364. Public Concern: The Forest Service should include western governors in the development of roadless area guidelines.

We enclose two WGA policy resolutions regarding roadless areas, Policy Resolution 99-030 and 00-021. These resolutions state that Western Governors should be included in front-end development of guidelines implementing roadless plans and that collaboration by the federal government with the states is important in making sound land use decisions. (Association, Denver, CO - #A19392.15153)

365. Public Concern: The Forest Service should revise federal regulations.**TO BETTER SOLICIT INPUT AND COOPERATION FROM STATE AND LOCAL GOVERNMENTS**

The existing regulations contain provisions for Forest Service consultation with the involvement of each of the categories of persons and groups mentioned in Issue #2 at 66 Fed. Reg. 35919-20. However, the regulations don't necessarily provide the "best way" for such consultation and involvement to occur. COHVCO suggests that the following changes to the present process should be made.

First, regarding the involvement of state and local governments, the regulations are somewhat vague and therefore should be revised. The meaning of the phrase, "Contribute to the streamlined coordination of resource management plans or programs," (36 C.F.R. [sec] 219.14(b)) is not clear. The Forest Service should be required to solicit and obtain the cooperation of state and local governments throughout both the process of forest planning and the implementation of site-specific resource management decisions. Too often in the recent past have decisions made at the national level failed to include local participation to any significant degree. When this occurs, often local economies and ways of life are harmed or

destroyed. Avoiding consequences of this sort must be the highest priority of the Forest Service. (Organization, Denver, CO - #A29624.15130)

366. Public Concern: The Forest Service should collaborate with counties in managing roadless areas.

A very high percentage of the proposed roadless areas in our county have roads and have been managed for years. We would like to work with the United States Forest Service and manage the forest in our area to be healthy forest, including the animals, trees and the other aspects of the forest. It is important that we talk and work together because our county is 84 percent publicly owned and the county next to us is comprised of 92 percent public land.

Please believe me when I say we care about our area, but we need to be heard and be real part of the future plans. (Elected Official, Lake County, MN - #A1600.12313)

In December 1999, responding during the comment period on the Roadless Area NOI, Crook County sent a letter strongly opposing the proposed roadless rule on the grounds that the rule violates the multiple use principle upon which the Forest Service was founded and negates the forest planning process at the local level. Crook County has a land use plan in place that supports continued multiple use of the forest and identifies the involvement Crook County should be allowed in the decision making processes of federal and state agencies when actions are proposed that will potentially impact the county. (Elected Official, Crook County, WY - #A15545.50200)

The appropriate role of local forest planning regarding the Roadless proposal is to ensure compliance with all laws and regulations. The National Environmental Policy Act (NEPA) and the Council on Environmental Quality (CEQ) regulations are the key federal law and regulation. The pending Roadless proposal is under NEPA and its CEQ regulations. Sierra County Commission requested last year to be a partner in the Environmental Impact Statement process. Unfortunately, Sierra County Commission did not receive any response regarding our request pursuant to 40 CFR 1506.2. Hence, the appropriate role of the Forest Service is to follow the rules and procedures of NEPA and CEQ, and request that the State and affected counties be involved, government-to-government, in the environmental analyses and documentation. (Manager, Sierra County, NM - #A22059.20203)

367. Public Concern: The Forest Service should consider that consultation with other agencies, states, and American Indian tribes was not complete prior to issuance of the Roadless Area Conservation Rule Final EIS.

The FEIS fails NEPA by not providing a full disclosure of potential impacts to the public. Consultation with other agencies, states, and Indian tribes was not complete prior to issuance of the FEIS. (Professional Society, Anchorage, AK - #A21707.10131)

368. Public Concern: The Forest Service should *only* notify states and American Indian tribes of pending federal actions.

Of the groups listed above, the only ones which should receive special notification of pending Federal actions and who should be asked for their advice and counsel are the tribes, and to a lesser degree, the States. Special emphasis must be placed on tribal wishes for the lands. (Individual, Grangeville, ID - #A830.15130)

369. Public Concern: The Forest Service should make collaboration a goal of the public involvement process at the local level.

RATHER THAN AT THE NATIONAL LEVEL

The problem with collaboration is that it is difficult to achieve on a National level. The present rule does not consider individual area problems or any type of cooperative solutions. Collaboration should be a

goal of the process at the local level in developing the areas as well as solutions to issues and management guidelines. (Business, Nevada City, CA - #A11695.11120)

BY ENCOURAGING LOCAL GOVERNMENTS TO HELP IDENTIFY IMPACTS ON RURAL COMMUNITIES AND OTHER LANDOWNERS

States, tribes, and local governments who wish to actively engage in forest planning and analysis should be encouraged to help identify the potential impacts on rural communities and other landowners. (Elected Official, Boise County, ID - #A4889.14000)

BY ASKING LOCAL GOVERNMENTS TO PROVIDE THEIR PREFERRED MANAGEMENT PRESCRIPTIONS FOR NATIONAL FOREST SYSTEM LANDS WITHIN THEIR BORDERS

Each incorporated village, town or city with a functioning government that has national forest lands within its borders should be asked to provide, through statute, its preferred management prescriptions should be binding on forest service managers in so far as they do not prevent national, state or county mandates from functioning.

Tribes, organizations and individuals should be asked to provide local knowledge, expertise, preferences and ideas to their state, county and local government as well as directly to national forest planners. (Individual, Ketchikan, AK - #A23219.13200)

BY FOSTERING ADEQUATE DIALOG BETWEEN FOREST SERVICE MANAGERS AND LOCAL GOVERNMENT OFFICIALS

Seeking the input of local governments and its citizens adjacent to the national forests as to the best means of protecting the surrounding environs is a critical responsibility of the Federal Government. Last year we witnessed in New Mexico how a well-intended effort to eliminate hazardous material in a national forest had a devastating impact on the lives of many citizens who lost their homes to uncontrolled forest fires. Better dialog between forest service managers and local government officials might avert such a disastrous policy. (Organization, Huntsville, AL - #A13542.15111)

370. Public Concern: The Forest Service should recognize that revisiting the Roadless Area Conservation Rule ignores collaboration that has already occurred at the local level.

We spent years negotiating and crafting this policy. We debated and compromised with the environmental organizations and the operators of sawmills, local loggers, paid representatives from the big extraction industries, and committed citizens such as myself. I do not want our hard work ignored and thrown out by a new administration. We have worked too hard and too long to be treated like children. We deserve respect. We earned it through many hours of hard work, research, and discussion. (Individual, No Address - #A12834.10150)

371. Public Concern: The Forest Service should create policies and teams to work with state and local authorities in putting into place “right to manage” laws.

TO PROTECT THE FOREST SERVICE FROM LITIGATION

Policies and teams should be created to work with state and local authorities to put in place similar “right-to-manage” laws and ordinances to effectively protect the Forest Service (and all public land management agencies) from litigious fools who expect life to be a bed of roses from which the government has removed all the thorns. Unfortunately, just as right-to-farm laws do not protect farm owners from the carelessness or indifference of neighbors “living the country lifestyle” who allow pets to harass livestock, who vandalize crops and machinery, who destroy crops through inappropriate or unattended burning of trash and yard debris, and who damage crops through careless or improper use of pesticides, right-to-manage laws will not protect forests from their neighbors. (Individual, Dallas, OR - #A3697.70110)

372. Public Concern: The Forest Service should have an agency representative attend community meetings.

[Question 2] Making sure that the Forest Service is present at community meetings and activities, council meetings such as the Great Falls Conservation Council. But always remember that you represent the nation at large and the future. (Individual, No Address - #A17946.14200)

Collaboration with Agencies

373. Public Concern: The Forest Service should collaborate with the U.S. Fish and Wildlife Department.

Requirements to consult with Fish and Wildlife Personnel and to monitor species need to be maintained, and the importance of scientific input into important Forest Service decisions can't be overestimated. (Individual, Decatur, GA - #A19228.12312)

IN FOREST PLANNING

Every year each department has a new management plan on how to manage wildlife and for the life of me I can not understand why wildlife departments and forestry departments can't work together towards a plan that each knows about and jointly oversee the projects within our public forests. As the current system exists it is the animals that suffer every time the plan changes, which in my point of view is way too often. Make up a good plan and stick to it. (Individual, No Address - #A771.15141)

Those who have the knowledge of these areas should be responsible for forest planning. Groups to put forward input should be the forest service, fish and wildlife and ecology departments. (Individual, Olympia, WA - #A286.15100)

IN MANAGING ROADLESS AREAS

Forest Service with help from fish and game should protect roadless areas (they may have to restructure some debts, etc). Keep congress and big business out of it, they are part of the problem. (Individual, Bozeman, MT - #A665.12120)

374. Public Concern: The Forest Service should explain its relationship with the U.S. Fish and Wildlife Department.

We had hoped that President Bush's Administration would restore the Forest Service to its historic work, which benefited all of the people living in and working on Federal lands. Now we understand that the Forest Service now has to work in submission to the National Fisheries and Wildlife Service.

When will citizens (human beings) be considered in all this morass? (Individual, Boise, ID - #A2541.12200)

375. Public Concern: The Forest Service should collaborate with other agencies in managing roadless areas.

Though wildfire is a unique phenomenon—can we not try to make interagency cooperation a given in preserving the contiguity of roadless areas (for existing values and ones that may not yet be even clearly formulated) in the same spirit we all come together to fight a fire? (Individual, Craig, AK - #A778.12310)

The forest service should work with all agencies—the Interior Department, the Corps of Engineers, the BLM, and the US Park Service—to coordinate efforts and protection wherever possible. It should invite all parties (government, private and public) to create workable common goals. It should do whatever is necessary to keep all parties involved along the way. (Individual, No Address - #A29275.15160)

Collaboration with Other Groups

376. Public Concern: The Forest Service should ensure adequate collaboration with diverse groups.

BY EXPLAINING LAWS AND HOW THEY APPLY TO DECISIONMAKING

The Forest Service can work with groups whose views and values are at odds by first explaining to them, and making their decisions based on, the laws as outlined in the National Forest Management Act and Multiple Use Sustained Yield Act, laws that mandate balanced management of all resources and preservation of biological diversity throughout the national forest system. If the U.S. Forest Service makes their decisions based on these acts of law and not due to political and local pressures of groups who usually have their own personal agenda, then there should be no difficulty in carrying out their responsibilities of managing our forest lands. (Individual, Port Angeles, WA - #A1044.20200)

BY ARRANGING FACE-TO-FACE WORKING GROUPS OF ALL INTERESTS

Arranging face-to-face working groups of all interests is the most effective way to develop a consensus. Working groups were used during the 1975 Unit Planning process on the White Mountain National Forest. Each group of 10-15 people represented the range of interest groups and met for 4-6 weeks to come up with joint recommendations on 30-40 issues. Working face to face produced much more civil and constructive results than other forms of public input. (Individual, No Address - #A17292.15000)

BY BRINGING TOGETHER A CORE GROUP FROM VARIOUS INTEREST GROUPS TO DRAFT SOLUTIONS

The best way to work together on this ruling is to go through the NEPA process and form a core group from the various interest groups that will attempt to draft solutions and guidelines for accomplishing them. (Business or Association, Princeton, ID - #A27994.20203)

377. Public Concern: The Forest Service should create a Board of Trustees.

TO OVERSEE MANAGEMENT DECISIONS, MONITOR ENFORCEMENT, AND ENSURE ADHERENCE TO WELL-BALANCED PRINCIPLES

Create a Board of Trustees that would oversee the writing of Forest Service regulations, monitor enforcement, and review decisions made by Forest Service executives to ensure continuing adherence to well-balanced principles devoted to the public interest. Such a board should consist of representatives of all interested groups including us taxpaying owners of these public lands. (Individual, Loveland, CO - #A9080.15162)

378. Public Concern: The Forest Service should create partnerships that are inclusive of all economic levels.

Much of past FS direction has been to favor commodity driven consumptive interests such as grazing, timbering, to some degree mining, and agricultural water systems. In more recent times the FS has formed quasi-partnerships with various recreational interests such as back-packing, horse-packing, helicopter supported activities, snowmobiling, ORVing, and Ski Industry activities. The clientele served by these partnerships are generally from the middle and upper incomes. The FS should form a partnership that would be more inclusive for all economic levels. (Individual, Salt Lake City, UT - #A19068.15120)

379. Public Concern: The Forest Service should respect the role of the Continental Divide Trail Alliance.

It is our hope, that regardless of the decision over the Roadless Area Conservation Rule that the Forest Service and other land management agencies will respect the unique and critical role that the CDNST plays in our public lands. (Organization, No Address - #A30183.12120)

380. Public Concern: The Forest Service should employ advisory committees.

During the process, issues may surface that warrant an advisory committee to recommend an alternative to the interdisciplinary team, but we see no reason to superimpose such as advisory process as a matter of policy. Nor do we see the need to provide concerned parties with “special” accommodations outside the purview of the participating public. If advisory committees are employed to review the concern, the committee should be composed of individuals representing regional and national interests as well as those representing local interests. (Organization, Damascus, VA - #A17723.15110)

RESOURCE ADVISORY COMMITTEES

The NVWF [Nevada Wildlife Federation] stands ready to meet with the USFS at a local level and we would find people to sit on a RAC should you start one. We have members on every BLM RAC at this time. (Organization, Reno, NV - #A8730.12300)

USFS needs to bring all locals to the table. In Nevada, USFS has a seat at the table on the BLM RAC and that is great. USFS could even start their own resource advisement committee (RAC). (Organization, Reno, NV - #A8730.12300)

381. Public Concern: The Forest Service should accept the cooperative behavior between special interest groups as evidence of collaboration.

I feel that we have already proved that we are able to work together on access to the mountains. We formed a club called the Central Utah Multiple Use Club. We have directors from every avenue. We address hikers, bikers, truckers, ranchers, cabin owners and many others. I also belong to a three-county Access Management group. We openly discuss all issues. Why should the comments you receive be the only collective proof of collaboration? (Individual, Las Vegas, NV - #A26123.15160)

382. Public Concern: The Forest Service should collaborate with the Mono Collaborative Planning Team.

The Roadless Conservation Rule is a significant policy decision warranting the collaborative process of 64 FR 54074. As our comments of July 2000 emphasized, tribal governments, and local, regional, state and federal agencies in the Eastern Sierra have formed Collaborative Planning Teams (CPT) to facilitate such collaborative processes. The Mono CPT includes both the Toiyabe and Inyo National Forests. Included in the Memorandum of Understanding establishing our Collaborative Planning Team are directives to collaborate in responding to planning efforts such as the proposed rule that have the potential to affect or direct actions of our member agencies. We request that our collaborative team be given an opportunity for genuine participation in a collaborative process to clarify the rule. The upcoming update of the Toiyabe and Inyo forest plans could provide the appropriate collaborative format for local roadless policy clarification. (Elected Official, Mono County, CA - #A18107.12310)

*Education***383. Public Concern: The Forest Service should educate the public about specific topics.****ABOUT THE IMPORTANCE OF MANAGING PUBLIC LANDS FOR THE GREATEST GOOD FOR THE GREATEST NUMBER OVER THE LONG TERM**

In local areas, such as this county, that are dominated by federal lands and in which federal subsidies have historically been significant, I would like to see the Forest Service offer informational hearings and educational outreach activities to inform citizens about the importance of managing public lands for the greatest good for the greatest number over the long term. (Individual, Portola, CA - #A695.14120)

ABOUT THE FACTS AND BENEFITS OF THE ROADLESS AREA CONSERVATION RULE

In order for the agency to achieve the goal it set out to accomplish it is imperative to inform the public at large of the actual facts. Currently it appears that neither the public nor the communities most closely

affected are familiar with the details of the proposal. The impression exists that these rules will pose restrictions on vast land areas when in fact only 2-3% of the total land base of the U.S. are in question.

I would like to add (based on personal experience), that once people are properly informed about the issue, strong support for protection efforts can be expected. Unfortunately, the Forest Service has neglected public information and education on this important subject—including this public comment process—which in turn might explain a 30 year long evaluation process without little progress to show for.

I therefore urge the agency to do the utmost to properly inform the public and to proceed in the effort to protect National Forests. (Individual, No Address - #A26840.14000)

The service should work to educate the rest of the public, including persons opposed to the Roadless Rule, as to the benefits of the rule. (Individual, Dallas, TX - #A18002.15163)

The USDA and Forest Service should put the Roadless Areas Conservation Rule into effect right away, as it is a valuable policy that protects the national interest. The FS should also proceed with programs of public information to dispel misleading rumors and fears that have been spread by opponents of the rule. I have seen these scare campaigns in the past in the West, and I know this is just another one of the same. (Individual, Baltimore, MD - #A2321.10111)

ABOUT RESOURCE MANAGEMENT NEEDS

At the present time USFS requires, and taxpayers pay for, highly trained natural resource specialists for USFS field positions. But we let the Sierra Club and other special-interests environmental groups make resource management decisions by their influence over public opinion through their sophisticated media campaigns. The Forest Service needs to do a better job of educating the public about resource management needs. Resource management decisions must be made by Forest Service professionals who consider the benefits to the resource and the general public, not by environmental groups seeking to further their own self-interest agenda. (Individual, Walden, CO - #A20726.15163)

The Forest Service should focus on communicating and explaining the long-term social, economic and environmental benefits to local communities of maintaining roadless areas. (Individual, Deridder, LA - #A28678.15163)

384. Public Concern: The Forest Service should consider adopting the “Wood is Good” campaign.

TO CHANGE THE WAY PEOPLE VIEW WOOD-BASED PRODUCTS

There is currently a “Wood is Good” campaign underway, being sponsored by a number of private companies, with the goal of changing the way people (with emphasis on young people) view wood based products and the way they are extracted and processed. This is the sort of program that the Forest Service could hitch its wagon to and begin to help change the way people view this greatest of natural resources. (Individual, No Address - #A16378.15163)

385. Public Concern: The Forest Service should educate the public with new materials.

BY PUBLISHING INFORMATIVE ARTICLES

Publish Informative articles for educating and informing the local citizens. Send information to citizens on the mailing lists. (Individual, Mount Ida, AR - #A8739.14120)

BY PRODUCING A TELEVISION PROGRAM REGARDING ROADLESS AREAS

Evaluation by the public is best done through articles in newspapers throughout the US. The Forest Service could produce a TV show on National Roadless Forests for public TV. Communities adjacent to National Forests, particularly tribes could have public comment sessions set up by the Forest Service

personnel with a 2 page questionnaire sheet for participants to fill out. (Individual, Boulder, CO - #A3478.15152)

BY DEVELOPING A SEMINAR FOR NEW USERS AND MONITORING ALL USERS

Since I feel that these areas are of such grand value to us, I feel that we (the public) should be granted access to these lands; but since I feel that their value lies in their 'untouchedness', I feel it is important to regulate this access strictly. Certainly, it isn't possible to police all of these areas all of the time, but I feel it is important that any party that wants to make use of these lands (either for recreational or educational uses) must be adequately informed and responsible. I feel that first time users should be given a short seminar on how to use the lands responsibly and that their equipment be inspected for the first two or three times which they make use of the lands. Not at all to make sure that their packs are properly tied or anything, but simply to make sure that they don't take in anything which could harm the forest. Additionally, I feel that everyone who uses the forest should have to check in before and after they enjoy the forest. The inspections I've mentioned could well be random, but they are simply to ensure that nothing untoward gets taken into the forest, nothing improper gets removed and that everything that the campers, hikers, etc. take into the woods also comes back out and isn't left to litter the hopefully pristine area. (Individual, Cambridge, MA - #A11912.90000)

386. Public Concern: The Forest Service should educate the public.

RATHER THAN CLOSING MORE LAND

We need to educate people to help maintain and enjoy what we now have, not shut off more land in a failing effort to save something that if left alone and not maintained will burn up and be of no use to anyone or anything. (Individual, No Address - #A1053.14120)

Volunteerism

387. Public Concern: The Forest Service should encourage volunteerism.

All National Forests and Parks should look to San Bernardino National Forest and its Adopt-a-Trail program for ideas on obtaining community assistance in forest maintenance and management. The SBNF utilizes the OHV community to perform a variety of maintenance tasks in order to keep the forest routes open to all visitors. By using the Adopt-A-Trail program, volunteers from the community can do the work of several rangers. The OHV community would be an enthusiastic supporter of forest route maintenance activities if they were asked. We recognize that we are a small fraction of the visitors, yet the routes we like to travel take an inordinate amount of effort on the part of the Forest Service or Park Service staff. Through our volunteering, we can keep the remote routes open to all that wish to visit and keep the manpower and real costs associated with that maintenance to a minimum. (Individual, Murrieta, CA - #A367.17140)

I believe volunteer help in situations where manpower is limited is one option. If people feel strongly enough about an issue, they should be willing to pitch in and help out. (Individual, No Address - #A455.17140)

I should also like to make note of the many contributions ORV users have made to the clean up and maintenance of our public lands. ORV users, under the guise of organized ORV clubs, have organized clean-up and maintenance runs and spent countless man-hours cleaning up and maintaining trailsides, campsites, and hard to reach areas that are otherwise left to the ranger and cleanup crews. No other group of users has come forward in this manner and in these numbers to assist in protecting the natural environment. (Individual, Saint Louis, MO - #A629.17140)

I have been an active volunteer in the Roanoke Appalachian Trail Club for over 25 years and am well acquainted with the use of and need for more protected forests and wilderness areas due to increasing

recreational use. Please don't waste all the volunteer efforts that have gone into our preserving our forest lands. (Individual, Roanoke, VA - #A4738.10111)

TO CUT MAINTENANCE COSTS

Might it be worth looking at volunteer users of the forest resource to help maintain or repair roads, etc. so that uses can continue instead of being shut down or restricted due lack of manpower or funds within your agency? (Individual, Rock Springs, WY - #A22428.17140)

FROM USER GROUPS

If a kind of human use of an inventoried roadless area is proposed, the "user group" should be enlisted to study the use impact on several currently "roaded" areas. The users could be encouraged to provide resources and volunteer labor to assist the Forest Service. Obviously, the Forest Service needs assistance and additional resources if it does not have a budget of sufficient size to enable it to maintain the existing roads in the national forests. (Individual, Cottonwood, AZ - #A26396.17140)

FROM TROUBLED YOUTH, HUNTERS, AND ANGLERS

We have 50 states; all have wildlife hunters and anglers. Assign each state a sector to manage, use the troubled youth that is sent off to reform schools or prison to maintain roads, manage the habitat—while RE-BUILDING THEIR LIVES, and make them into productive citizens.

ALL AMERICAN HUNTING and ANGLERS WOULD VOLUNTEER TIME TO MAKE THIS PROGRAM WORK. (Individual, Athens, GA - #A11212.17140)

FROM RETIREES

Accept retirees as custodians of all wildlife into all United States Forest Services. Place them in pairs for security. Issue what equipment that may be needed. The retiree may prefer to use his own equipment. I for one would volunteer. (Individual, Gatesville, TX - #A11152.17140)

American Indian Rights and Interests

Note on American Indian Rights and Interests and the Organization of this Section – The United States Government has a unique legal relationship with Native American and Alaskan Native tribal governments that have been established by treaties, statutes, and court decisions. Agency activities and decisions are implemented in a knowledgeable, sensitive manner respecting tribal sovereignty and operating within a government-to-government relationship with federally recognized tribal governments following consultations which consider the rights, concerns, and potential impacts of federal government plans, projects, programs, and activities which may affect tribal governments and communities.

Similar to American Indians in other parts of the United States, Alaska Natives claim aboriginal rights, a trust relationship, and inherent governmental powers. Alaska Native tribes federally recognized by executive order are eligible for services, have the same governmental status as federally recognized American Indian tribes in the lower 48, and are entitled to the same protection and immunity privileges. These tribes have the right, subject to general principles of federal Indian law, to exercise the same inherent and delegated authorities available to other tribes and are subject to the same limitations imposed by law. In addition, Alaska Natives and Corporations have statutory rights that allow them to exercise their rights on portions of the Tongass and Chugach National Forests.

Because of the unique status of American Indian tribes and the government-to-government relation that exists between them and the U.S. Government, special care has been taken to review comments from tribes and tribal interests separately from comments of other respondents who discuss tribal interests. Accordingly, this section includes two subsections: Comments of

American Indian Tribes/Tribal Interests, and Comments from Other Respondents Regarding American Indian Tribal Interests. It should be noted that this distinction is based on how respondents identify themselves or their organization in their letters. It is possible that among comments attributed to other respondents are comments actually made by tribal members or tribal interests, but if so that is not determinable from the letters.

Summary

Comments of American Indian Tribes/Tribal Interests – One tribal representative urges the Forest Service to conduct meaningful consultation with American Indians regarding roadless area management. A tribal corporation requests that the Forest Service reevaluate its working relationship with such corporations, since federal regulations grant them the same legal status as tribes.

Some assert that the Forest Service should manage public lands for traditional tribal uses in accordance with treaties. To that end, one tribal representative states that the Forest Service should consider treaty rights during roadless area evaluations and requests these rights are not violated in the name of collaboration or conflicting objectives with other outside groups. Some tribal representatives who address treaty rights urge the Forest Service to adopt the Roadless Area Conservation Rule in order to protect and restore treaty resources including, some point out specifically, anadromous fish populations. Representatives also ask that the Rule be implemented in order to protect American Indian cultural practices and to protect American Indian sacred sites.

One tribal corporation requests that the Tongass National Forest be permanently excluded from any national roadless rule in recognition of treaty obligations to tribal corporations in Alaska. This corporation states that “the special trust relationship enjoyed by Natives includes recognizing Native corporations in a manner that assists in fostering their success,” and concludes that, in lieu of relevant statutory direction, the Forest Service should conduct no further roadless area reviews and evaluations on the Tongass NF.

Comments from other Respondents regarding American Indian Tribal Interests – Several individuals urge the Forest Service to give high priority to American Indian concerns when formulating a national roadless rule. One person states that American Indian tribes should be consulted on their gathering needs and traditional knowledge of the natural processes in and for adjacent roadless wilderness areas. They also need to be consulted on new areas to be designated roadless wilderness and their rights respected. Another individual asserts that the Agency should clearly distinguish between tribal rights and other special interests, stating that to combine the two together would be wrong and disrespectful to the Tribes. Some ask the Forest Service to assist tribes in protecting their tribal lands from outside commercial interests. An Alaska resident requests that the Forest Service recognize the environmental impacts of gerrymandered timber-rich land grant allocations to tribal corporations, as well as corporate accounting practices which favor liquidation of tribal corporation forest resources at a loss for tax purposes.

Some assert that federal land management should be delegated to American Indians due to their proven record of caring wisely for the land. Others stress that American Indians should be allowed access to roadless areas to continue traditional activities and cultural practices. A number of these respondents state that the Roadless Area Conservation Rule will not hinder this, and therefore it should be adopted in order to protect archeological and cultural sites from degradation or inadvertent destruction. Several respondents from Southeast Alaska describe the

importance of subsistence hunting and fishing, and state that the Rule should be applied to the Tongass National Forest immediately in order to prevent further degradation of these resources due to timber harvest and roadbuilding (see also Chapter 5: Designating Areas (Question 8): Inclusion/Exclusion of Specific Areas from a National Roadless Rule: *Inclusion*). Another individual requests that more sustainable forestry practices be adopted in the Pacific Northwest, where traditional weaving is threatened by commercial over-harvest and lack of sufficient old-growth cedar and other species to provide materials.

One respondent states that tribal governments should not adopt a similar roadless policy for reservation forests because it will have a negative economic impact on American Indians.

Comments of American Indian Tribes/Tribal Interests

388. Public Concern: The Forest Service should conduct meaningful consultation with American Indians regarding roadless area management.

Consistent with its trust responsibility, the Forest Service must conduct meaningful government-to-government consultation with tribes. This means sending appropriate officials with decision making authority to consult with the Tribe on issues surrounding development of any roadless area strategy and developing mutually satisfactory proposals. The Nez Perce Tribe expects such consultation to occur with Forest Service officials with decision-making authority over the ultimate decision for roadless protection. (Chairperson, Tribal Government, Lapwai, ID - #A11821.85100)

389. Public Concern: The Forest Service should reevaluate its relationship with tribal corporations.

Under the provisions of numerous CFRs, Sealaska, Native village and Native urban corporations have the same status as tribes. The Forest Service must review its position regarding how it interrelates with these special status corporations. (Tribal Corporation, Seattle, WA - #A20468.85100)

390. Public Concern: The Forest Service should manage public lands for traditional tribal uses in accordance with treaties.

BY CONSIDERING TREATY RIGHTS DURING ROADLESS AREA EVALUATIONS

The Forest Service is obligated to abide by Indian treaties, comply with state and federal water quality standards, and to protect fish and wildlife. It is not obligated to log. With respect to tribal treaty rights, the federal trust obligation requires that the Forest Service take actions to protect cultural resources and ensure harvestable levels of fish, wildlife, and plant resources to ensure meaningful exercise of treaty rights. The Forest Service must therefore consider the area's characteristics relative to its obligations during roadless area evaluation. (Columbia River Inter-Tribal Fish Commission, Portland, OR - #A20331.20000)

BY IMPLEMENTING THE ROADLESS AREA CONSERVATION RULE

It is critical that the Forest Service consider and honor its treaty and trust obligations to tribes in evaluating and implementing any roadless area strategy. This means that the Forest Service must take actions necessary for the protection of cultural resources and the protection and enhancement of harvestable levels of fish, wildlife, and plant resources necessary for the meaningful exercise of treaty-reserved rights. (Chairperson, Tribal Government, Lapwai, ID - #A11821.85100)

How can the Forest Service work effectively with individual and groups with strongly competing views, values, and beliefs in evaluating and managing public lands and resources, recognizing that the agency cannot meet all of the desires of all of the parties?

The Forest Service must take actions that are consistent with its statutory and treaty obligations. This means taking actions necessary to protect endangered species, protecting clean water, and protecting

greatly reserved resources. The Forest Service must develop proposals necessary to meet these obligations and then, and appropriate, solicit public comment and conduct appropriate and meaningful government-to-government consultations with tribes. (Chairperson, Tribal Government, Lapwai, ID - #A11821.85100)

391. Public Concern: The Forest Service should not abdicate tribal treaty rights in order to foster harmony between competing interests.

During the new round of comment the Forest Service must remain cognizant of the federal trust responsibilities associated with tribal treaty rights. The Forest Service does not have the authority to abdicate treaty guaranteed rights. Tribal treaty rights cannot be ignored or allowed to erode for the purposes of fostering harmony between groups with conflicting objectives. Treaty rights to fish and hunt require that protection of fish and wildlife be placed on a higher level than maintenance of a timber supply to a local mill or provision of off-road vehicle trails for recreation. A useful analogy would be to think of Indian tribes with treaty rights to take fish (a property right) as being akin to miners with patents on federal lands. The Forest Service does not manage mining on the basis of local "collaboration" processes, but instead on the basis of rights secured by the Mining Law of 1872. If the Forest Service were to treat Indian tribes with that same measure of legal force which it addresses the Mining Law of 1872 and the rights of miners, it is likely that fish and wildlife populations on federal lands would be in much better condition. (Columbia River Inter-Tribal Fish Commission, Portland, OR - #A20331.85311)

392. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule.

TO FOSTER TREATY RESOURCE PROTECTION

Many treaty resources have declined in abundance, most notably anadromous fish species, and roadless areas play an important role in the protection, conservation, and potential recovery of these species. Roadless areas contain and support important aquatic habitat, protection of which is essential to the continued existence of the species. Timber harvest, road building, and other 'development' in these areas would cause sedimentation, temperature increases, fragmentation in habitat, and other adverse effects for aquatic habitats both within the roadless area as well as downstream from it. This in turn contributes to the decline of both listed and unlisted species. It is for such reasons that the Commission's salmon restoration plan, (*Wy-Kan-Ush-Mi Wa-Kish-Wit, Spirit of the Salmon*) the Columbia River Anadromous Fish Restoration Plan of the Nez Perce, Umatilla, Warm Springs, and Yakama Tribes (CRITFC, 1995) calls for cessation of logging, mining, and road construction in all roadless areas of 1,000 acres or greater. (Columbia River Inter-Tribal Fish Commission, Portland, OR - #A20331.85200)

TO PROMOTE TRIBAL SALMON RECOVERY EFFORTS

The roadless areas of National Forests within the Tribe's treaty territory are central to both tribal and federal efforts to recover imperiled species. For example, in its recent salmon recovery plan for Columbia River basin salmon and steelhead, the Forest Service and other resource agencies state, "For tributary habitats on federal land, the federal land managers will protect existing high quality habitat and accelerate restoration in high priority subbasin,"

The Nez Perce Tribe carefully weighs and balances all the costs and benefits of natural resources management and protection to the recreational, cultural, religious, subsistence, economic, and commercial utilization of National Forests by its members. Tribal members are employed by the timber industry and can be affected by decisions to implement or endorse nature resources management strategies. On June 14, 2000, after a careful review and consideration of the proposed roadless area protection, including consultation with appropriate Forest Service representatives, the Nez Perce Tribe endorsed the previously developed Roadless Area Conservation Rules as a plan consistent with both the federal government's treaty and trust obligations and the Tribe's own salmon recovery efforts. A copy of these comments is attached.

The Tribe continues to support the system of roadless area protection developed by the Forest Service. (Tribal Government, Lapwai, ID - #A11821.85000)

TO PROTECT AMERICAN INDIAN CULTURAL PRACTICES

I am writing to express the concerns of the Leech Lake Reservation over attempts to diminish or repeal the gains made toward the implementation of the Roadless Conservation Rule. As I am sure you are aware, the Leech Lake Reservation and the Chippewa National Forest overlap, so we have first-hand knowledge of how excessive road building can affect the resources of an area and, in our case, the traditional activities of tribal members. (Tribal Government, Cass Lake, MN - #A31097.85311)

TO PROTECT AMERICAN INDIAN SACRED SITES

Many of these sacred sites are as spiritually important to Native Americans as the Sistine Chapel and the Wailing Wall are to others. Bulldozing a road directly through Arlington National Cemetery would cause public outrage, however sites as sacred and significant to Native Americans continue to be destroyed within Forest Service Lands. Building roads into the pristine wilderness environments will preclude religious use for many tribes. Noise, environmental degradation, and competition from increased recreational use would also effectively prevent continuation of tribal religious practices.

Native Americans have already lost so much of our culture and tradition. It is high time that the First Nations of this area are granted the same freedom of religion enjoyed by most Americans today. We urge you to keep native American Sacred Sites in the forefront of any decision-making regarding roadless areas. (Tribal Association, Arcata, CA - #A17205.80120)

393. Public Concern: The Forest Service should exclude the Tongass National Forest from a national roadless rule.**TO FULFILL OBLIGATIONS OF THE UNITED STATES' TRUST RELATIONSHIP WITH AMERICAN INDIANS**

The Tongass NF must be administered in a manner that is much more sensitive to Indian law, which recognizes ANCSA corporations as being tribal, ANCSA, and ANILCA. The special trust relationship enjoyed by Natives includes recognizing Native corporations in a manner that assists in fostering their success. Per USDA Departmental Regulation No. 1340-006; Subject: Policies on American Natives, dated October 16, 1992; Policies, b. states "Consistent with applicable law, USDA officials will consult with tribal governments and ANCs (Alaska Native Corporations) regarding the influence of USDA activities on water, land, forest, air, and other natural resources of tribal governments and ANCS." And c." . . . Consistent with applicable law, USDA officials will solicit input from tribal governments and ANCs on USDA policies and issues affecting tribes and will seek to reconcile Indian and Alaska Native needs with the principles of good resource management and multiple use."

Section 708 of ANILCA, when combined with Section 1326 of ANILCA, can only be read to direct the Forest Service to conduct no further roadless area reviews and evaluations on the Tongass NF. (Tribal Corporation, Seattle, WA - #A20468.20200)

Comments from Other Respondents Regarding American Indian Tribal Interests**394. Public Concern: The Forest Service should give high priority to American Indian concerns when formulating a national roadless rule.**

The Native American tribes tend to have values in line with the ones here expressed, and I expect that the inevitable differences of emphasis will not be so great that they cannot be resolved by straightforward negotiation. They have seniority on the land, treaty agreements supporting their interests, and a respectful attitude toward natural life and the land. Their opinions should be taken seriously. (Individual, Dallas, OR - #A3697.85110)

The concerns of Native Americans should receive high priority because they were the earliest inhabitants and, in many cases, their land was essentially taken from them. The spiritual values of early Native Americans include respect for natural settings and wildlife that other Americans would be wise to adopt. (Individual, Gallatin Gateway, MT - #A19100.85340)

395. Public Concern: The Forest Service should conduct meaningful consultation with American Indians regarding roadless area management.

I want Native American tribes and their elders consulted on their gathering needs and traditional knowledge of the natural processes in and for adjacent roadless wilderness areas. They also need to be consulted on new areas to be designated roadless wilderness and their rights respected. This is very important and may help us re-introduce fire into the ecology again. (Individual, Talent, OR - #A23553.85300)

396. Public Concern: The Forest Service should clearly distinguish between tribal rights and other special interests.

Distinguish between the rights of Native Americans and 4-wheeler clubs: the first are sovereign states, the latter are recreationists, and to muddle them together as “interest groups” is an astonishing affront. Tribes should have rights on a par with the Federal agencies who own the adjoining lands. (Individual, Bozeman, MT - #A27070.85300)

397. Public Concern: The Forest Service should protect American Indian lands from commercial exploitation.

The Forest Service should in all cases protect the rights of Native American groups to secure protection of their lands from commercial exploitation by outside groups. (Individual, New Haven, CT - #A616.85000)

398. Public Concern: The Forest Service should acknowledge the environmental consequences of the tribal corporation land grant selection process.

It is important to point out that during the land grant selection process by the newly formed Native Corporations, the property boundaries were manipulated to take in the most valuable timber stands, leaving the less valuable stands and barren land to public ownership. This was the epitome of gerrymandering, and has now resulted in vast areas of “cut-over” adjacent to and throughout National Forest Lands. (Individual, Sitka, AK - #A1056.85320)

399. Public Concern: The Forest Service should review native corporation and institutional logging contracts in southeast Alaska.

It should be pointed out that Shee Atica Native Corporation of Sitka has recently signed a contract with ITT Rayonier to liquidate the remaining timber on their Katlian River Watershed land grant near Sitka. Their plan is to generate net operating loss to reduce their corporate tax obligations. It can be expected that Mental Health Trust and University of Alaska land grants which comprise the remainder of productive timberlands in the Katlian watershed, will be added to Rayonier’s logging contract. (Individual, Sitka, AK - #A1056.85320)

400. Public Concern: American Indians should be allowed to manage public lands.

Tribes have suffered enough, and should have predominant say in the management of their lands. (Individual, Colorado Springs, CO - #A17259.15000)

BECAUSE OF THEIR PROVEN RECORD OF CARING WISELY FOR THE LAND

Regarding management of all public lands as well as fish and game! This job should have long ago been given to the people with the best resume as well as the people with the longest running and proven record of care for the land, and fish and game for thousands of years before we got here! (The American natives managed very well to the land and as far as I have been able to find out, never causing any kind of fish, animal or bird to become extinct!) The Forest Service, BLM and Fish and Game have tried, failed and next will restrict us more and more. This is not the answer! Every American native was born and raised to respect the land and everything on, above or below it! They provided us a very beautiful place to conquer, unmarked, unscathed. And look what we have done to it! It’s a simple matter of

educating the hordes of people from the cities prior to visiting our beautiful public lands. Teaching them to respect what they are about to experience when they get here-at a young age! I have seen deer taken, never gutted even though they were shot days before, hauled south for proof, pictures and discarded, never eaten! These people do not care-no one asked them or told them to respect the land they are about to visit or anything that might be there, or why! The job of educating the people as well as controlling public lands, fish and wildlife could be done no better than by Native Americans! (Individual, Hot Springs, MT - #A966.70000)

401. Public Concern: The Forest Service should allow American Indians to practice traditional religious and cultural activities in roadless areas.

Native American religious and cultural observances are also an appropriate use of roadless areas and could be used discretely to help us white, black, Latino, and Asian and Polynesian folk get in touch with our own ancestries and the spirit of the land and inner/outer god(desses) that is within all if us and surrounds us. (Individual, Watsonville, CA - #A6767.70000)

Activities by Native Tribes should be held to a different standard than those of the dominant Anglo culture. It is regrettable that some tribes may choose to manage their lands intensively for commodities, but that is their choice. I do not personally see the connection between roadless areas of public lands, and tribal land management concerns, but if there are conflicts, special consideration should be given to the Native Tribes, especially regarding preservation of their traditional life ways. (Individual, Corvallis, OR - #A650.85300)

Allow access to native peoples to practice religious observances on a non-continuous basis. (Individual, Atlanta, GA - #A873.85312)

Exceptions should be made for tribes. Tribes should have virtually unrestricted access to federal lands adjacent to their adjacent to their properties when such access is for the purpose of exercising traditional rites. (Individual, Olympia, WA - #A10330.85300)

USFS representatives must recognize the importance of maintaining traditional and historic cultural activities impacted by restricting access to or expanding roadless areas, such as preservation of Native American cemeteries and burial grounds, traditional activities such as pine nut harvesting, hunting and fishing, rock hunting, Christmas tree cutting and firewood cutting. (Elected Official, Alpine County, CA - #A8597.85330)

402. Public Concern: The Forest Service should implement a national roadless rule.

TO PROTECT AMERICAN INDIAN CULTURAL PRACTICES

[Roadless areas] preserve areas needed for traditional Native American religious and cultural observances. (Elected Official, State of New Hampshire - #A4536.85300)

Without intact forests, the cultures of Native Americans are threatened and will become extinct. This would be a terrible loss for all Americans. (Individual, Inver Grove Heights, MN - #A260.85310)

The FS has already identified IRAS, through extensive public input under the aegis of RACR. It is quite simply time to implement them. since the matter is under litigation, the least that FS could do in the interim is protect with due diligence the following values:

Native cultural values—These IRAS should preserve and protect the traditional religious and cultural ceremonies of the people of the First Nations, the Native Americans. To embark on a new road building program, like the one proposed for the Gravina Island in Tongass, would adversely impact the traditional way of life that the Tlingit and the Haida pursue. (Organization, Seattle, WA - #A11782.85310)

Native peoples need their sacred sites and wild areas for ceremonies and other activities, and it is hard to tune into the Great Spirit when you keep getting reminded and irritated about how reckless human “management” of the landscape is in most roaded areas. (Individual, Los Angeles, CA - #A17161.85311)

TO HELP PROTECT AMERICAN INDIAN SACRED SITES

Extremely important: protect the sacred lands of the various tribes so that they can maintain their cultural heritage. I find it hard to understand why Mt. Rushmore cannot be climbed, but Devil’s Tower is wide open to public destruction. Such unequal rulings diminish the Forest Services’ and Park Services’ credibility. (Individual, Lopez Island, WA - #A15240.85311)

403. Public Concern: The Forest Service should ensure subsistence needs are met for southeast Alaska rural communities.

BY MAINTAINING WILDLIFE AND FISH POPULATIONS

In addition to wage employment, traditional gathering of subsistence foods plays a substantial role in Southeast Alaska’s rural communities. Since time immemorial, subsistence has been a way of life and culture for Alaska Natives. Non-Native immigrants to the region have also learned to rely on harvest of wild game and fish. Eighty five percent of the rural households in Southeast Alaska harvest some kind of subsistence food and nearly one-third of rural households supply half their need for fish and meat by hunting and fishing. Subsistence may provide 70 to 80 percent of the protein consumed in less accessible households in the Gulf of Alaska region. Reductions in wildlife and fish populations threaten the foundation of Native culture and the classic Alaskan tradition of living off the land. (Organization, Nevada City, CA - #A4941.85210)

I would like to mention the perspective of Merle Hawkins, a leader in the native community of Metlakatla near Ketchikan. Merle is the one who taught me some of the secrets of subsistence gathering on Gravina Island. She, like many others, depends on the harvest of subsistence foods such as salmon, berries, deer, beach asparagus and other edibles in the intertidal zone. She has lived here her whole life, studied her history, and tried to pass it on. She feels very strongly that Gravina Island should be protected and that the local planning process, and EISs in developing this particular sale, are flawed and fail to represent the true impacts to the native culture and community. She says, “if you don’t like wild forests and this way of life, move somewhere else.” (Organization, Bloomington, IN - #A28110.85200)

BY ALLOWING AMERICAN INDIAN TRIBES TO HUNT IN NATIONAL FORESTS

Indian tribes who hunt in these forests may be allowed to do so. But no roads should be built to facilitate this hunting. No roads should be built for any reason whatsoever. (Individual, Anchorage, AK - #A518.85312)

404. Public Concern: Tribal governments should not adopt a similar roadless policy for reservation forests.

BECAUSE IT WILL HAVE A NEGATIVE ECONOMIC IMPACT ON AMERICAN INDIANS

With regard to Tribal roads, a roadless policy inside a reservation forest would have a negative economic impact. Tribal forests are utilized for timbering and recreation. These activities generate millions of dollars of revenue which support programs for Native Americans. (Elected Official, Gila County, AZ - #A3013.85320)

405. Public Concern: The Forest Service should support a more sustainable timber industry.

TO PRESERVE TRADITIONAL NORTHWEST WEAVING

I make my living practicing traditional Northwest weaving, using the native materials of Western Red Cedar, Yellow Cedar, Yew, and Birch. These resources have been diminishing at a rapid rate through

years of logging practices, which have not taken into consideration all the economic values of maintaining forest ecosystems.

When I am no longer allowed to gather from public land, and private land clearing is no longer an option because the slow growing cedar trees have not been replanted, I will stop practicing my profession as a traditional weaver rather than be a part of the further loss of the old growth forests on public land.
(Individual, Indianola, WA - #A25409.65290)

Competing Values/Limited Resources (*Question 9*)

Question 9: Competing Values and Limited Resources. How can the Forest Service work effectively with individuals and groups with strongly competing views, values, and beliefs in evaluating and managing public lands and resources, recognizing that the Agency cannot meet all of the desires of all of the parties?

This section includes one subsection: Managing Competing Interests.

Managing Competing Interests

Summary

General Comments – Managing competing interests is a topic of comment to a number of respondents. Some suggest that before the Forest Service can manage competing interests, it must first clarify its purpose and mission; others say that it must first restore public trust. Additional suggestions include complying with current and applicable laws and legislation; understanding political, management and leadership issues; ensuring a fair and open process; using scientific studies; evaluating relative impacts of competing uses; considering who is most affected by the decision; and ignoring extreme viewpoints. Aside from suggestions for how to manage competing interests, some state that consensus is an unrealistic goal and that it must be acknowledged that some parties will not be satisfied with management decisions.

Administrative/Agency Guidance – Some respondents assert that the Forest Service can best manage competing interests by taking a more proactive role in making decisions. One respondent states that it is “crucial” that the Agency remains the lead on decisionmaking and forest management issues and is worried that other agencies will unduly influence the process and decisions. These respondents assert that the Forest Service is a professional agency, that its purpose is to manage federal lands, and that it should take responsibility for decisionmaking. Likewise, some state that the Forest Service should allow trained foresters to make decisions rather than relying on public comment.

Local Forest Planning Process – A number of respondents assert that the local forest planning process provides the best way to work with different groups. They believe that there are so many different viewpoints in the nation, that maybe at the local level is where the Agency will be able consensus. Writers state that local decisionmaking is also more effective in managing competing interests because issues relating to specific areas can be discussed and there is more knowledge of ecological conditions.

Enhanced Collaborative Efforts – Some suggest that competing interests can be managed effectively through enhanced collaborative efforts. People suggest this can be achieved by making every effort to meet everyone’s needs, using conflict resolution strategies, using professional negotiators, or by forming advisory planning groups. Others suggest that the Forest Service should collaborate with special interest groups, although some state that special interest

groups won't compromise without an incentive to do so. In general, however, many assert that the fairest way of resolving differences among groups is through compromise. (See also Chapter 3: Working Together (Question 2): Public Involvement in Decisionmaking: *Collaboration Processes, Collaboration with States and Local Governments, Collaboration with Agencies, and Collaboration with Other Groups.*)

Public Education/Information Efforts – Several respondents advise using public education to resolve conflicts. This may be attempted through forest rangers, seminar programs, or by establishing a department of information. Some comment that it seems like the Forest Service's only way to address a problem is by closing access to the forest and suggests education to mitigate problems instead.

Forest Service Staff Training/Education – Some suggest that management of competing interests requires proper Forest Service staff education and training. Respondents suggest that Forest Service employees should be unbiased, should be able to work with a diverse constituency, and should understand political, management, and leadership issues. Others suggest the Forest Service should employ a diverse staff by hiring conservation biologists, naturalists, and people from all backgrounds.

Will of the Public/Elected Representatives – Many respondents assert that the Forest Service can best manage competing interests by abiding by the wishes of the majority. These people state that National Forest System lands are owned by the majority and therefore the "Forest Service should give weight to the overall opinions of all Americans" rather than just the presidential administration, private interests, or special interest groups (see also Chapter 1: National Roadless Protection – General Remarks: Need for the Roadless Area Conservation Rule: *Implement the Roadless Area Conservation Rule* and Chapter 3: Informed Decisionmaking (Question 1): Local vs. National Decisionmaking: *National Decisionmaking*). However, some state that conflicts can best be resolved by allowing elected officials to make decisions, because in a republican form of government it is elected officials who represent the public.

Ecosystem or Preservation Values – Some suggest that the best way to resolve competing interests is to place the highest value on ecosystem preservation. One individual remarks that the Forest Service should be a steward of the forest and an advocate for wild lands, before trying to resolve diverse opinion. Some assert that the destruction of a roadless area is irreversible but the preservation of a roadless area is not, and therefore the Forest Service should "err on the side of caution" by holding preservation as the highest priority when seeking to resolve conflicts.

Managing Competing Interests General

406. Public Concern: The Forest Service should clarify its purpose and mission in order to manage competing interests.

Clearly define purpose and goals. If all interests can be met within the guidelines, great, if not at least all parties will be aware of the constraints. The forest service should not have to satisfy private interests. The forest service should only work to protect the public resource and maintain the current roadless wilderness areas. There is enough development. (Individual, Beverly Hills, MI - #A4756.15161)

BY APPOINTING A COMMISSION TO ADDRESS THE ISSUE

At the local level the Forest Service can bring the competing values and desires together. It takes dedication, time and perseverance but it seems to be the only way consensus can be reached.

It would be beneficial to have a National consensus regarding the overall mission and purpose for the National Forest System. This is real fuzzy now. A good start was made with the points of agreement from the 7th Forest Congress but there was very little follow-up. Maybe there could be a blue-ribbon commission appointed to address this issue. (Individual, Salt Lake City, UT - #A22628.15160)

BY DEVELOPING A MISSION STATEMENT

The roadless plan should be scrapped. It is time to put the stench of the last administration behind us. The forest service needs to develop a mission statement that all people can live, especially those most affected by agency decisions. It needs to stop pandering to the environmental community. (Individual, Emmett, ID - #A110.10130)

[Question 9] It would be beneficial to have a National consensus regarding the overall mission and purpose for the National Forest System. This is real fuzzy now. A good start was made with the points of agreement from the 7th Forest Congress but there was very little follow-up. Maybe there could be a blue-ribbon commission appointed to address this issue. (Organization, Wenatchee, WA - #A22628.15160)

407. Public Concern: The Forest Service should restore the trust of the public before attempting to manage competing interests.

Be open and honest with the public. The travesty that was the previous public meetings regarding this issue was downright insulting. The members of the public who attend deserve to be treated with at least some modicum of respect that has been sorely lacking from the agency in recent years, at least above the individual districts. I believe the agency will have a monumental task simply restoring the confidence and trust of the public before there is any hope of effective compromise between competing interests. (Individual, Los Alamos, NM - #A3720.15110)

First and foremost, be open and honest with the public. The travesty that was the previous public meetings regarding this issue was downright insulting. The members of the public who attend deserve to be treated with at least some modicum of respect that has been sorely lacking from the agency in recent years, at least above the individual districts. I believe the agency will have a monumental task simply restoring the confidence and trust of the public before there is any hope of effective compromise between competing interests. (Individual, Denver, Co - #A5433.12230)

408. Public Concern: The Forest Service should manage competing interests.

BY IMPLEMENTING THE ROADLESS AREA CONSERVATION RULE

On the website you asked how to deal with competing values and limited resources - the policy enacted on January 12, 2001 deals with this problem in the best way possible. It created the idea of compromise—in 51% of the forests, logging, drilling, and mining will continue to be allowed, while it will be prevented in the remaining 49%. Even here, some leeway is provided, as all contracts already in effect in those areas may be seen through to the end. A more balanced compromise could not be asked for. It is time for people to learn to live within their means and to limit their demands on the environment.

For these reasons I urge you to let the rule stand as it is written in the January Record of Decision. It is an admirable move to protect our national forest roadless areas—without loopholes, waivers, or additional exceptions. Once these forests are gone, they're gone forever, and with them goes an important source of the human spirit. (Individual, Riverside, CA - #A4971.10150)

BY COMPLYING WITH CURRENT LEGISLATION, USING THE BEST AVAILABLE INFORMATION, ENCOURAGING LOCAL INPUT, AND PROVIDING SUFFICIENT STAFF

There will never be consensus on the management of national forests. Therefore, the Forest Service must anticipate dealing with conflicting values. If the Forest Service bases the forest planning and decision making process on the following elements, there will be a higher likelihood of acceptance and successful implementation.

Compliance with current legislation including the National Forest Management Act, use accurate site-specific information, seek and encourage local community involvement, authorize and support local decision making, use the best available science as a foundation for any analytical review and resulting recommendations, provide sufficient staff and other resources so that local forest plans can be successfully implemented. (Business or Association, Boise, ID - #A17232.13000)

BY COMPLYING WITH ALL APPLICABLE LAWS

As previously mentioned, the Forest Service is mandated to follow the NFMA, NEPA, as well as the ESA, APA, CWA, as well as other established federal laws. If the Forest Service would obey the law, many of the problems of “competing views” would be solved. (Organization, Salt Lake City, UT - #A17170.20200)

BY IDENTIFYING WHAT IS REQUIRED BY LAW AND WHAT IS DISCRETIONARY

The Forest Service must act consistently with its statutory and treaty obligations. The Service must first act to protect endangered species, clean water, and treaty reserved resources. The Service cannot back out of these obligations or create compromises for the purposes of reducing political pressure. Thus, an important step that the Forest Service could take to deal with many of its competing interests is to identify what is required by law and what is discretionary. This will narrow debates, protect property rights, and clarify whether a remedy can be had via Forest Service policy change or whether it must be through changes in state or federal law. (Columbia River Inter-Tribal Fish Commission, Portland, OR - #A20331.20000)

BY COMPLYING WITH THE NATIONAL FOREST MANAGEMENT ACT

Competing Values and Limited Resources: There will likely never be full agreement between all the parties interested in the national forests. With a lack of political consensus to change the statutory mission of the national forests, the Forest Service must adhere to the current body of legislation, most importantly to the National Forest Management Act. (Business or Association, Rockville, MD - #A13306.15160)

BY COMPLYING WITH THE NATIONAL ENVIRONMENTAL POLICY ACT

The Forest Service has a proven tool for working with the public to make sure that all views are heard—NEPA. It is true that the Forest Service cannot ever meet all the desires of all interested parties but the Forest Service can ensure an open process, build an adequate record for decisions and provide reasoned explanations to avoid or minimize conflicts and litigation. In addition, even if it makes some groups unhappy, the Forest Service must be sure to work within the current statutory framework. However, consistent with legal and regulatory constraints, are opportunities for consensus building. Constructive dialogues at the Forest level of community involvement can help bridge differences and narrow the range of disagreement through mutual education. This is a proven approach, but the USFS must encourage line officers to engage in such processes, as many avoid it due to the intensity of the issue and staff resources that must be committed. (Business or Association, Spokane, WA - #A17351.15161)

BY PREPARING ENVIRONMENTAL ANALYSES IN CONFORMANCE WITH THE NATIONAL ENVIRONMENTAL POLICY ACT

The best way to work with the variety of interests concerned with management of inventoried roadless areas is through the procedural regulations suggested in Question 1 The Forest Service can best work with a variety of interests by preparing environmental analyses in conformance with NEPA. (Individual, Long Beach, CA - #A25664.20203)

BY CONSIDERING THE RESULTS OF THE UNITED STATES INSTITUTE FOR ENVIRONMENTAL CONFLICT RESOLUTION

Results of the United States Institute for Environmental Conflict Resolution, NEPA Pilot Projects [FR Doc. 01-11898-Filed 5-10-01] might be useful [in resolving competing interests] if all else fails. Many participants attending a meeting concerning the above on June 8, 2001 in Denver, Colorado considered litigation the surest and least expensive way to put their point of view on the table of competing values.

If the Forest Service would have an independent constitutional overview of their new planning process, some of the competing social views would be minimized. (Individual, Rock Springs, WY - #A15658.15152)

BY CONSULTING THE VOLUMES OF LITERATURE IT HAS PUBLISHED IN RESPONSE TO PUBLIC CONCERNS

This is far too broad a question to be answered in one rulemaking process, but I would advise the Forest Service to look at the immense volumes of literature that it has published on the subject in response to concerns the public has raised. (Individual, Logan, UT - #A939.15150)

BY ADEQUATELY UNDERSTANDING POLITICAL, MANAGEMENT, AND LEADERSHIP ISSUES AND PUTTING ASIDE ITS OWN SELF-INTERESTS

The Forest Service must better understand political, management, and leadership issues of working “effectively with individuals and groups with strongly competing views, values and beliefs.” There is little evidence that that agency has given much thought to these complexities, hence most agency engagement tends away from collaboration and engagement and toward older forms of command and control behavior—often thinly camouflaged with language hinting at collaboration and positive interaction in search of public interest. The Forest Service must also put aside its own vested self-interest if it is to have any chance at working effectively with all parties. (Individual, Corvallis, OR - #A8027.15162)

BY RECOGNIZING ITS OWN VESTED INTERESTS

The agency must first begin by recognizing its own vested interests in certain kinds of organizational systems, management structures, and management methods. The agency is not a neutral arbiter amongst competing interests, but rather, has its own interests that are too often allied with private industrial users at the expense of all other citizens, interests and values. To date, despite glowing rhetoric about the need for greater collaboration and partnerships in planning and decision-making, the agency’s actions betray a continued interest in asserting technocratic power and control over the land and people. The RACR is not the proper venue for managers to relearn how to “care for the land and serve people.” The problems of Forest Service management extend far beyond the roadless area issue. We recommend that as a first step all Forest Service employees should read Dr. Paul Hirt’s excellent critique of Forest Service management, “A Conspiracy of Optimism.” (Organization, Eugene, OR - #A30352.15100)

BY USING SCIENTIFIC STUDIES

[Question 9] Get representatives of the competing views in a single room with USFS management and design a specific study that will prove or disprove the contentious issue. The Canadian Lynx is a good example here in Colorado. Environmentalists said the snowmobile tracks would harm the Lynx reintroduction by allowing a competing animal, the coyote, to walk on top of the hardened snow track and out-compete the Lynx. There was no scientific basis for this view but yet many snowmobile trails were closed. Over time the assumption was found not to be true but the trails are still closed. (Individual, Palmer Lake, CO - #A23361.14500)

BY FOLLOWING THE EXAMPLE OF THE QUINCY LIBRARY GROUP

The Quincy Library Group is one example of how diverse groups and competing interests can work together. (Permit Holder, Boise, ID - #A29589.15160)

BY USING THE ADAPTIVE ENVIRONMENTAL MANAGEMENT PROCESS

The Forest Service would do well to evaluate use of the Adaptive Environmental Management process. Now used by the BLM in the Pinedale Anticline Natural Gas Project in southwest Wyoming, AEM brings all user groups to the table, and allows local participants to construct management plans that specifically address local issues. The result is a plan that all participants can accept. Compromise, while not completely satisfactory to everyone, is at least a viable solution that everyone has a hand in. AEM has the added benefit of helping to prevent litigation and a lengthy and costly decision-making process. (Individual, Pinedale, WY - #A26289.15162)

BY USING AN EARTH GOVERNING SOCIAL SYSTEM

An Earth Governing Social System . . . would facilitate collaborative analysis, planning and coordination of activities effecting Earth systems. Such a system may be used on varying scales, from local communities to global ones. (Individual, Curtain Act, Australia - #A29708.15162)

BY ENSURING A FAIR AND OPEN PROCESS

The Forest Service must provide an open and fair process for the competing views, values and beliefs to be aired. The Forest Service cannot, as it did with the pending Roadless Actions, impose a preordained outcome on the decisions that it must make. The only way for the competing interests to be fully and fairly assessed is to ensure that local management remains paramount. While the Forest Service cannot meet all desires of all of the parties, it can ensure that the process that it uses is fair and open. (State Agency, Cheyenne, WY - #A22608.15160)

BY PRESENTING BOTH SIDES OF THE ISSUE IN A BALANCED, HONEST, AND FAIR MANNER

The last roadless effort had a very pronounced propaganda campaign pushing its roadless agenda, to the point of almost lying about the real situation, at least refusing to release any critical facts that didn't prove the absolute need to protect every last scrap of roadless ground in the US. I definitely agree that some areas need to be set aside, but there needs to be a balance. Without presenting both sides of the issue in an honest and fair manner, you're not going to get folks with differing viewpoints to agree on how to manage these areas. You will also not get a true picture of how the American public wants to see these areas managed if they don't understand the true issues and ramifications on both sides of the fence. (Individual, Wrangell, AK - #A30478.10135)

BY APPLYING ITS POLICIES TO ALL INTERESTS CONSISTENTLY

I am also a motorcyclist but stand in firm opposition to the motorcycle industry's supposedly representative voicing of what they present as unilateral rider desire that these protective laws be neutered. Despite this press to the contrary, I believe that most of us agree that there is need for strong protection. I, and many like-minded others, will gladly surrender the privilege to ride in or otherwise use protected areas in order to avert any risk to these resources, but ONLY if the law holds true for all—big business interests included. (Individual, South Bend, IN - #A1226.15120)

A policy that is inconsistent leads to a lack of National precedence, creating a policy with no teeth. Also it allows for too much influence from powerful lobbying organizations. Who exactly will have the "forest-to-forest" decision making ability? There is plenty of open land available to destroy with these operations. (Individual, Las Vegas, NV - #A1239.15120)

BY BALANCING COMPETING VALUES

Competing values and limited resources. As I have repeatedly suggested . . . the USFS should look at the system as a whole and come up with a comprehensive landscape-scale management plan that balances extractive and wilderness values. We already have over 400,000 miles of roads in the system to provide for extractive uses, and roaded lands constitute the majority of land cover. Protecting remaining roadless habitats merely lends balance (and barely, at that!) to the system as a whole by providing for both extractive/motorized and non extractive/non-motorized forest values. (Individual, Davis, CA - #A30523.15162)

The Forest Service needs to be a balancing practitioner of uses within the forest. One forest activity should not prevail over another, and in most situations not everyone is going to be satisfied with a particular decision that the Forest Service makes.

In the Tongass National Forest it is a fact that the logging industry takes precedence over other forest activities. Citizens of Wrangell, a Southeast Alaska town that lies within the Tongass National Forest, and others concerned would like to see more recreational opportunities available to them and prospective tourists. Bike trails, skiing, cabins, shelters, campgrounds and interpretive and educational opportunities are just some of the activities that could be pursued instead of logging. (Union, No Address - #A17699.15168)

BY CULTIVATING RELATIONSHIPS WITH ALL DIFFERENT INTEREST GROUPS

The Forest Service also needs to cultivate cordial and permanent relationships with more than the livestock, hunting, timber and mining interests. It needs to spend just as much time with environmental organizations, urbanites, backpackers, birdwatchers, tree huggers, and women. You don't develop an understanding of all segments of society if you don't communicate with all segments of society on an equal basis. (Individual, Waterbury, VT - #A15433.15164)

BY CONSIDERING WHO IS MOST AFFECTED BY THE DECISION

In regard to dealing with competing values on the subject of public lands management, the forest service should look at who the decision affects the most. A greater consideration, regardless of the numbers, should be given to local residents, governments and communities when making a decision that affects public lands and resources. A very minimal consideration should be given to the view of those who do not live in the area affected, regardless of the number of comments. (Individual, Manti, UT - #A25532.15111)

BY MAKING LAND USE DECISIONS BASED ON THE RELATIVE VALUE OF DIFFERENT USES TO SOCIETY

Each competing use must be evaluated for its contributions to society and the local economy. The natural resources of each area ultimately will generally dictate the "highest and best use", i.e. forest product production, mineral production, grazing, recreation (both developed and undeveloped), etc. Look for the highest and best benefit to society as a whole—not just the selfish demands of a small vocal minority. NEPA, ESA, CEA, etc. will dictate limits of uses and protect the environment. These NF lands and natural resources must help support the demands of our growing society. Everything we depend upon must be derived from the earth. If it can't be grown—it must be mined. (Individual, Tucson, AZ - #A5625.15160)

Although competing interests for National Forest resources have intensified in recent years, there have always been competing interests in the use and management of the National Forests. In the Secretary of Agriculture's February 1, 1905 letter to the Forester (first Chief of the Forest Service), Secretary James Wilson outlines the general policy laid down for the Forest Service "in the administration of the forest reserves". This extraordinary letter has stood the test of time—particularly the closing phrase: "where conflicting interests must be reconciled the question will always be decided from the standpoint of the greatest good of the greatest number in the long run."

The United States is very fortunate in having an organization like the U.S. Forest Service; with its historic delegated authorities to manage the National Forests for the greatest good for the greatest number in the long run. Although numerous statutes have been passed to deal with more intensified and competing uses, Forest Service personnel, political appointees and competing forest users would benefit by reconciling conflicting interests and reaching consensus "from the standpoint of the greatest good of the greatest number in the long run." (Business, Juneau, AK - #A5440.15160)

The agency of course cannot "meet all of the desires of all parties" on all acres of a National Forest. The key is to identify the highest values and appropriate uses on all forest areas. In many instances, this requires segregating uses. There currently is an overabundance of roaded national forest landscape, to the detriment of other values. Currently unroaded areas can best be managed by retaining that roadless condition and emphasizing the variety of values associated with roadlessness. (Individual, West Glacier, MT - #A5946.15160)

BY EVALUATING THE RELATIVE IMPACTS OF COMPETING USES

It also is important to consider the impact of any use. Will use A by 10 people compromise the use of the forest by 100? Will use B by 100 compromise only the use of 10 people? Clearly the second scenario is preferable. (Individual, Seattle, WA - #A17999.15168)

BY TAKING A LONG TERM VIEW

[Question #9] Always take a long term view. Kill the goose today no eggs later. (Individual, Ellijay, GA - #A8020.15000)

The Forest Service should take the longest view possible. Forget about the current stakeholders and think of the next generation. Most Forest Service land is open to resource extraction. Practically all private land is open to resource extraction. Globally, the pressure to extract resources from natural areas mounts daily. Natural ecosystems are being lost and changed in ways that we don't yet understand. Clearly, a hundred years from now a protected natural area will be of more value than another tree farm.

The Forest Service should maintain a long term view in its dealings with people with differing viewpoints, and should request that participants in these discussions maintain a long term view. (Individual, Portland, OR - #A13436.50300)

BY CONSIDERING EACH ROADLESS AREA FOR ITS CONTRIBUTION TO A LARGER CAUSE

If you consider each roadless area for its potential contribution to a larger cause, I believe you can get people enthused about how best to combine and group the IRAs into something more meaningful. With this technique you will illustrate how a National Forest is stratified into two separate categories of land: that which will be used for the production of goods and services (more intensively managed) and that which will be managed for more intangible benefits (less intensively managed).

When the Forests complete their roadless reevaluation, I believe three types of land arrangements will become apparent. They are: (1) roadless lands which are widely dispersed; (2) roadless lands which are more closely grouped; and (3) some combination of both of these situations.

When a Forest has a widely dispersed IRA situation, it is destined to manage its roadless "islands" as "protectorates." It can highlight these few areas for their uniqueness and their contrast to the rest of the Forest (which is already dedicated to goods and services) and celebrate that they took charge in the "nick of time" to save what was left.

When a Forest has the IRAs in close proximity or groups, it can manage for a larger inter-connectedness. A line can be drawn around the outside boundary of the grouped IRAs within which a less intensive form of land management could occur. . . . This can be used to contrast with the remainder of the Forest that is more visibly dedicated to the production of goods and services (more intensive management).

I believe this approach would give both industry and the environmentalists the feeling that they have determined something useful and meaningful. They would be providing something visible for their causes plus resolving the current gridlock for future generations. They would, in fact, be delineating the portion(s) of the Forest that will be managed to produce the intangible benefits such as roadless, etc., while also defining the portion(s) of the Forest that will produce the goods and services. (Individual, Libby, MT - #A2301.15120)

BY MAKING A DISTINCTION BETWEEN ROADED AND ROADLESS AREA VALUES.

The USFS can easily and effectively manage competitive values, views and beliefs by distinguishing between the values and goals of NF roaded and roadless lands. Roaded lands are where development activities based on roads like intensive resource management, and motorized use should occur. Roadless lands area where low development, dispersed resource extraction like livestock grazing could occur. Roadless lands are where non-motorized recreation should be given priority. (Individual, Bozeman, MT - #A8818.15160)

BY DISCOUNTING THE COMMENTS OF EXCLUSIONARY GROUPS

In specific response to the question about conflicting uses, I propose any one group who proposes/supports the exclusion of any other person/group/activity be discounted and not given credit for comments. These folks/groups never learned the sharing rule/lesson in Kindergarten and don't have standing to comment.

While this may seem lighthearted I'm serious. Those who propose exclusion are not good citizens, but rather selfish and narrow minded. These are Public lands and as such are "for" the public to benefit from and use. Responsible multiple use policies are the proper direction to go. Thus, only those who are willing to share have a valid voice in this discussion. (Individual, No Address - #A21170.15110)

BY IGNORING EXTREME VIEWPOINTS

All sides must share information freely. Those with viewpoints at the extremes should be politely ignored. There is room only in the middle for resolution to these issues. (Individual, Hayden, ID - #A30279.15160)

BY INCREASING DIRECT CONTACT BETWEEN REGIONS AND THE WASHINGTON OFFICE

The role of the Regions would be greatly reduced by more efficient use of computers, more direct contact between the Washington Office and the (fewer) Forests and the increased authority of the Ranger Districts.

These changes would make the Forest Service more responsive to the social, political, economic and technical factors at work in policy development. They would increase the Forest Service's "doing" ability. They would strengthen the balance between national and local needs and desires and have a chance to promote harmony rather than acrimony.

Region One has been one of the most contentious areas in the country in dealing with roadless and Wilderness allocation. Please consider trying this approach to organization and planning in Region One and see if it helps get resolution to the roadless issues. (Individual, No Address - #A26264.15160)

BEFORE ENGAGING THE PUBLIC

The Forest Service should work harder at the beginning by developing a mission, and goals. If you stay within this mission to accomplish the goals, then you have done what needs to be done on the public's behalf. Remember that the most vocal people represent a small minority of the "public". Most people don't have time to go to meetings and read hundreds of pages of Federal Registers unless it directly affects them or their property. (Individual, Miami, FL - #A1110.12120)

409. Public Concern: The Forest Service should not attempt to change the beliefs of citizens.

There will always be individuals and groups with strongly competing views, values and beliefs in evaluating and managing our public lands and resources. The USFS will not, and should not attempt to change these strongly held beliefs. Even if they did, it wouldn't work. (Individual, Grangeville, ID - #A830.15163)

410. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule has magnified conflict between groups.

Damage to Forest Service public relations

Obviously, the Roadless Area Initiative is very controversial, both inside and outside the Forest Service. **It has greatly magnified the conflict between the urban environmental community and other National Forest users.** The battle lines are drawn. On one side is the Administration and every environmental organization; on the other, every rural state and its governor, every county board, hunters, ORVers, libertarians, and logging and mining associations. (Union, No Address - #A13245.15120)

411. Public Concern: The Forest Service should recognize that consensus is an unrealistic goal.

You will rarely find all sides agreeing on some middle-ground compromise; consensus is an unrealistic goal. As one environmental organization representative put it recently, "If I don't win I'll lose my job." People whose jobs depend on winning cannot be expected to reach any accommodations with the other side of an issue. (Organization, Cocolalla, ID - #A13511.15120)

412. Public Concern: The Forest Service should recognize that not all parties will be satisfied with management decisions.

All that can be done is to listen carefully to what they are saying and try to ascertain their reasons for their views. Their views are not wrong. We have to acknowledge that there will be some dissatisfied people and some who will be very happy over the same decisions. (Individual, Olympia, WA - #A278.15110)

Working effectively with individuals and groups with strongly competing views is difficult. I do not believe that organized development and preservation groups represent the silent majority. Intense public involvement with local service organizations might educate these people and vocalize the silent

majority. Integrating public input, both local and national, with capability of the land in an honest and forthright manner during the planning process is the best way to do this. If everyone is a little unhappy and the land does not suffer you probably have it right. (Individual, Dayton, WY - #A5074.15110)

413. Public Concern: The Forest Service should recognize that most competing values arise from radical groups.

Most of the “competing values” arise when you get unbending radical groups on one side and virtually everyone else on the other. Remember, there is no compromise when you are dealing with these groups. When was the last time you heard an environmental group offer to “give” anything except less of what they want and don’t have? Any time anyone else is asked to compromise, they have to give something such as access to their favorite area or another 5 acres of what they used to have access to. (Organization, Richfield, UT - #A20428.15121)

Administrative/Agency Guidance

414. Public Concern: The Forest Service should implement the desires of the current President.

What is the best way for the Forest Service to work with the variety of States, tribes, local communities, other organizations, and individuals in a collaborative manner to ensure that concerns about roadless values are heard and addressed through a fair and open process?

The best way to be fair is to let the leader elected by 280 million Americans decide. Whatever Bush would like is the will of the American people. (Individual, Silver Spring, MD - #A4593.15165)

415. Public Concern: The Forest Service should take a leadership role and finalize its decision.

The Forest Service needs to take a strong leadership position in managing forests and natural resources and be willing to make decisions, knowing that their decisions will almost always be unpopular with one or more interests. The agency has, in recent years, stepped back from its leadership role and attempted to be a convener or facilitator, often unwilling to make decisions where groups with competing views are simply unable to reach consensus. (Permit Holder, Denver, CO - #A15385.15160)

Follow a good process involving all parties, examine all options, listen to the public, make a good decision, and stick to it. The Forest Service has done all but the last. (Organization, Seattle, WA - #A21694.15160)

The inventory of the roadless area has taken over a decade and cost the taxpayers millions of dollars. It is time that the rules are followed through and enforced. The forest service needs to stop asking questions on how they should function and start protecting our forests. All sides have been heard and now it is time for action. As a taxpaying voting citizen I am very frustrated with the amount of procrastination the roadless act has seen. Money should stop being wasted and work should start getting done. (Individual, Helena, MT - #A17696.15161)

From the ski industry’s perspective, it is crucial that the Forest Service function as leader and decisionmaker on forest management issues, whether it be at the planning or site-specific level. The agency has a statutory duty to manage forest resources to provide outdoor recreation opportunities to the public under NFMA and under the National Forest Ski Area Permit Act, and, moreover, brings recreation experience and expertise to the table. As other agencies, federal and state, get more involved and express more vocal opinions about management of forest resources, the need for leadership at the Forest Service becomes paramount. (Permit Holder, Denver, CO - #A15385.15162)

416. Public Concern: The Forest Service should allow trained foresters to make decisions.

The most important concern for “roadless” area management is to get the East vs West to make the determinations truly necessary to maintain our forests and wildlife. We can do this best by cutting the funding these environmentalists have tapped and end the ceaseless court cases. There are no roadless areas on the east coast . . . polls and press should not be managing our forests. Trained foresters are the ones we should be listening to. (Individual, Three Forks, MT - #A697.15100)

RATHER THAN RELYING ON PUBLIC COMMENT

The Forest Service’s decision-making process needs a substantial overhaul. There will always be disagreement about natural resource management. The current “consensus” system gives veto power to extremists, who want to prevent all management activities. The current system of public involvement has largely turned technical decisions over to laymen, who do not have adequate backgrounds to make these decision. We don’t actively seek public involvement in complex technical decisions, like how to treat cancer or how to design the space shuttle. Why would the public be any better at making complex technical decisions about how to manage National Forests? Setting long-term goals for forest conditions and management programs is an appropriate role for the public. The role of technical professionals in advising the public regarding resource potential, management alternatives, and management effects and in determining how best to achieve long-term, public goals for the National Forest needs to be strengthened. (Individual, Bend, OR - #A702.15110)

The USFS is charged with managing our federal lands as professionals and is paid to do so, despite its trend towards shaking off responsibility and putting it on the shoulders of the “public.” Thank God the Military does not do this or other large federal agencies. Do your jobs and manage the lands as defined. If they are considered suitable for multiple use management, then do so and stop trying to find ways to take them out of production. Put all lands considered as roadless into the Wilderness system and lock it up. Reduce your staffs and concentrate on those lands the public has said can be managed and saved. You cannot waste time trying to appease all the public. It’s impossible. You are still land managers, not arbitrators. (Individual, Montrose, CO - #A370.15100)

417. Public Concern: The Forest Service should comply with the law and use professional judgment.

You should, honestly and with an open mind, listen to all of us, analyze our comments and act on our good ideas. You must comply with the letter and spirit of the law and make the best, unbiased and professional decision you can for the land, its resources and the American people. That’s why we pay for your professional services. We have an appeal process and courts to deal with our objections. (Organization, Boise, ID - #A17677.10131)

Local Forest Planning Process

418. Public Concern: The Forest Service should recognize that the local forest planning process provides the best way to work with different groups.

As in all instances involving limited resources and multiple channels of demand, there will never be a full agreement between all parties with an interest in the National Forest System. Therefore, CCA asserts that the USFS re-emphasize the local forest decision making process as the best possible means of achieving desired resource conditions. Furthermore, the solution to the problems inherent in the Roadless Area Conservation Rules lies in a healthy compromise between land use and environmental protection. The two can co-exist, with proper management and cooperation between the managing agencies and users of the land. (Business or Association, Sacramento, CA - #A3681.15160)

Sifting through competing values and limited resources is the price of living in a 21st Century democracy. When forest management issues are debated through national ruelmaking, the ideology

becomes more important than consideration of actual landscapes. Consequently, more decision-making at local levels allows Forest Service employees to consider competing ideologies measured against actual effects on the ground. Local decision-making offers more opportunity for consensus where stakeholders can find management alternatives that do not necessarily compromise their beliefs. Therefore, forest management issues such as managing inventoried roadless areas should, for the most part, be considered at the local level. (Business or Association, Washington, DC - #A17887.13110)

There will likely never be full agreement between all the parties interested in the national forests. The Forest Service should re-emphasize local forest-level decision making as the best possible means of achieving desired resource conditions. (Business, Rapid City, SD - #A30145.15160)

There will never be full agreement between all the parties interested in the national forest. **The national forests are multiple use lands and with effort and professionalism can be managed as such.** The Forest service should reemphasize local forest-level decision-making as the best possible means of achieving desired resource conditions. In addition, the Agency and Congress should ensure that there are enough staff and resource **in the field** so that forest plans are implemented and objectives are achieved. (Individual, Moose, WY - #A20339.15162)

BY ALLOWING COMPETING VALUES TO BE IDENTIFIED LOCALLY ON EACH FOREST

Competing Values and Limited Resources. Competing values must be identified on each forest and must be locally determined. The KNF should be forest specific, not regionally specific, as would be the case of the consolidation of the Kootenai and the Panhandle. Once competing values are identified, they must be prioritized. Local input is invaluable in this process. (Elected Official, Lincoln County, MT - #A18119.13110)

BY ESTABLISHING LOCAL BOARDS TO MAKE DECISIONS

The problem is not with establishing federal policy that will please all but in establishing local boards with authority to make decisions after hearings and public input. Then when they are properly taught, educated, and informed by the citizens and foresters, those boards can make the decisions that will build and strengthen the local forests and preserve the forest for future generations, and for the continuation of quality watersheds, recreation, grazing, mining, and the environment. (Individual, Gunnison, UT - #A25755.15162)

BECAUSE ISSUES RELATING TO SPECIFIC AREAS CAN BE DISCUSSED

The best way for the Forest Service to work with the variety of entities on the roadless issue is through the forest planning process. This way specific issues relating to specific landmasses can be discussed. Discussion of roadless areas, statewide or nationwide allows only broad emotional issues to be discussed. Generally these issues are not related to specific needs of the land or the people. (Individual, Dayton, WY - #A5074.13000)

Enhanced Collaborative Efforts

419. Public Concern: The Forest Service should manage conflicting interests.

BY EMPHASIZING COLLABORATION

Collaborative efforts should be stressed. Individuals, organizations, and other affected parties must be able to discuss the management of local roadless areas through the existing forest planning process. . . Collaborative solutions should be developed even in the absence of complete "consensus." (Organization, Lake Isabella, CA - #A20945.15162)

BY MAKING EVERY EFFORT TO MEET EVERYONE'S NEEDS

The service must make every effort to meet everyone's needs. Certainly, not everyone will agree with every decision but, if all concerns/interests are addressed and efforts made to accommodate those interests are made, then the service has done its job. (Individual, No Address - #A50.15162)

BY USING CONFLICT RESOLUTION STRATEGIES

We recommend the use of conflict resolution strategies among stakeholders as one strategy to diminish conflicts. Persons used to resolve conflict should have the support of the affected parties before resolution strategies are employed.

Too often the agency accepts public comment in public meetings and allows for misinformation to build because inaccuracies are not corrected in public meetings. This passive approach allows the loudest and most prolific voices to prevail. After a period of public hearings and comment, if significant conflict remains, the agency should endeavor to resolve those conflicts through structured conflict resolution strategies among stakeholder representatives representing a balance of interests. (Permit Holder, Boise, ID - #A29589.15160)

The Forest Service should consider using arbitration or conflict resolution processes with representatives of diverse stakeholder groups, when appropriate, to resolve negotiable issues related to forest management. Also, lessons learned from local collaborative processes such as those being used with particular focuses/issues on the Nez Perce Forest in Region 1 should be examined for their levels of success. (Permit Holder, Boise, ID - #A29589.15162)

BY ESTABLISHING LOCAL MONITORING TEAMS COMPOSED OF DIVERSE STAKEHOLDERS DEDICATED TO SUSTAINING ROADLESS ECOSYSTEMS

Management innovations such as Reinvention should be encouraged to establish local Monitoring Teams comprised of diverse stakeholders beholden to the purpose and principle for sustaining roadless ecosystems. By clarifying and upholding clear purpose and principles, the strongly competing views will be superseded by these national scale values for roadless areas. These interests can have their way with the vastly more numerous roaded areas, where more diverse prescriptions and experimentation are warranted. (Individual, Cleveland, OH - #A26411.15160)

BY USING PROFESSIONAL NEGOTIATORS, PUBLIC RELATIONS CONSULTANTS, AND CONFLICT RESOLUTION SPECIALISTS

Employ professional negotiators, public relations consultants, and conflict resolvers. (Individual, Lolo, MT - #A111.15162)

To work with groups and people who want different things for/from the national forests (the key here being National, as in belonging to ALL citizens), the Forest Service should continue to educate the public on its goals and plans, and also should employ professional negotiators to work with groups of people EVERYDAY, not just when things come to a head. That encourages more communication, understanding, and learning across the entire community—even leading me on occasion to side with a lumber mill. (Individual, Bozeman, MT - #A285.15162)

BY FORMING ADVISORY PLANNING GROUPS

One way to assure that viewpoints be heard and recognized would be to format a hierarchy of the advisory planning groups, so that a number of the groups would yield a regional recommendation. The format would have to provide for dissenting opinions, possibly legitimizing the minority opinion by the regional body agreeing that it is a minority opinion, otherwise there could be any number of minority opinions which would not be helpful. (Individual, No Address - #A781.15100)

Advisory groups. The composition of said groups must consist of “all” interested parties. Balance of interests is mandatory. These advisory groups, operating on each forest, must be assured that their input is meaningful and not just window dressing. (Elected Official, Iron County, MI - #A3612.15120)

Each NF should have a Resource Advisory Council (like BLM’s RACs) to advise the S.O. and District Rangers on controversial natural resource management issues. 15 people, 5 each from 3 groups (commodity interest/environmental/local govt.-tribe). (Individual, Tucson, AZ - #A5625.15152)

Given the current lack of a political consensus to change the statutory framework, the Forest Service must adhere to the planning process mandated by NFMA. The potential to use forest level advisory committees, as envisioned by NGMA, may offer further opportunities to develop local community based solutions. (Organization, Chantilly, VA - #A3350.13200)

420. Public Concern: The Forest Service should collaborate with special interest groups.

BY MEETING WITH THEM INDIVIDUALLY AND COLLECTIVELY AND DEVELOPING AGENDA ITEMS EQUALLY IMPORTANT TO BOTH

Local Foresters should meet individually and collectively with the different interest groups that they work with. Foresters should develop agenda items that they would review with each group both individually and collectively. The agendas for each group must be exactly the same and not be tilted towards one special interest group or the other. Following individual meetings, a collective meeting, sharing all of the data openly with each interest group is also imperative. Preordained decisions and preconceived plans should not be allowed in this process. (Business, Haslett, MI - #A4861.15000)

BY DEALING WITH ONE REPRESENTATIVE FROM EACH INTEREST GROUP

The Forest Service should work with all groups by dealing with one representative of each “view”—not mass meetings where people are paid and bussed in to support a point of view. People simply have to be willing to listen to each other and compromise. The Forest Service should expect nothing less and should make this very clear from the onset. Representatives who are out of line should be asked to step down and a new representative should be requested from a group. Treat this like a meeting of foreign countries rather than a town meeting—it is probably closer to the first. (Individual, Holtville, CA - #A8729.15162)

421. Public Concern: The Forest Service should advise groups that the fairest way of resolving differences is through compromise.

Convince groups that compromise is the only way of being as fair as possible, and the only way of preventing bitter land use issues from becoming the source of future regional or localized civil unrest. A recognition of when extreme views demand an undue price from either the resources or those who most depend on them. MOST OF THE PUBLIC HAS LITTLE RESPECT FOR EXTREMISTS! THAT GOES FOR ENVIRONEMTALISTS OR RAPE THE LANDISTS. (Individual, Brimley, MI - #A3659.15160)

Simple compromise should prevail. Public input and small workgroups or task forces of interested parties may be the best resource for helping Forestry make its ultimate decisions. (Individual, Nashville, TN - #A874.15162)

422. Public Concern: The Forest Service should recognize that interest groups must have an incentive to compromise.

All of the diverse interests must have an incentive to resolve their beliefs. The preservation groups have no incentive to resolve their beliefs with other groups because as long as there is no decision on the roadless issue they win and the areas remain roadless. These groups will compromise only when they recognize the need for compromise. Industrial interests have more incentive to compromise at the local level because they have much more at stake. Congressional direction to resolve the issue through forest planning at the local level with judicial decisions backing up that direction may be the only method to arrive at a solution. Otherwise, this 30-year conflict will likely be around for a lot longer. (Individual, Moscow, ID - #A5380.15160)

If individuals and groups with diverse interests do not have an incentive to work together in a cooperative atmosphere, there is little the Forest Service can do to force cooperation. The Forest Service should proceed with planning efforts as specified in legislation. Until Congress acts and the judicial

branch recognized the validity of forest planning, the issue will remain. (Business or Association, Moscow, ID - #A5428.15160)

Public Education/Information Efforts

423. Public Concern: The Forest Service should use public education to resolve conflicts.

Managing forests for differing values is solely a matter of EDUCATION. It just so happens we folks who live in Rural Areas already value the forests for ALL THOSE DIFFERING VALUES, and understand fully HOW 'WE (all American) CAN ALL HAVE OUR CAKE AND EAT IT!' Education is the only thing that will ensure that has an opportunity to happen. (Individual, Forks, WA - #A877.15163)

THROUGH FOREST RANGERS

Having 'Forest Rangers' in the areas to assist in education would not only be helpful to the visitor but would help restore respect for the Forest Service. (Individual, Jarbidge, NV - #A8842.15163)

THROUGH CLASSROOMS AND SERVICE GROUPS

Education in the class rooms (fun elementary stuff) as well as a teenage service group within the agency (a quasi-scouting group from local high schools) would be a big help in introducing ideas to the young about the reason for certain decisions. By showing an interest in the youth, adults have a tendency to soften their stance. (Individual, Springfield, OH - #A12726.15163)

THROUGH SEMINAR PROGRAMS

There has been a surge of seminar programs by both government (state and federal) and by the private industry. This seminar type education seems to me a good idea because it is a very quick way to get various groups together with very little expense. One well educated man or woman that is educated in many fields can put on a program that has three or four (or more) to a group that other agencies are also interested in. (Individual, Celina, TN - #A11902.15163)

BY ESTABLISHING A DEPARTMENT OF INFORMATION

The NFMA must develop and employ a policy of public education so that states, organizations, individuals, tribes, etc. are aware of the status of these areas. They must be educated so that they know the reasons for the protected status. If an extensive public relations campaign, or a department of information is required, it should be established. This department, however, should have no decision making powers, but rather be in place to disseminate information to the public, and to gather public opinion. (Individual, Santa Barbara, CA - #A504.15163)

RATHER THAN CLOSING ACCESS TO FOREST LANDS

The management philosophy of the Forest Service seems to be that the only way to address a problem is by closing access to the forest. An approach that is more reasonable to the public including motorized visitors is to maintain recreation opportunities by addressing a problem through mitigation measures such as education, signing, seasonal restrictions, user fees, and structural improvements such as water bars, trail re-routing, and bridges. We encourage public agencies to support and use education as a means to address and mitigate problems rather than closures. Most user created problems can be addressed by education. Education should be the first line of action and all education measures should be exhausted before pursuing any other action. The elimination of much needed recreational opportunities is not reasonable without first exhausting all possible means of education to address the problem. Educational programs could include use of mailings, handouts, improved travel plan mapping, pamphlets, TV and radio spots, web pages, newspaper articles, signing, presentations, information kiosks with mapping, and trail rangers. Restrictions or closures are not always obvious to the public. Education can also be in the form of measures such as the use of jackleg fences with signs at the end of motorized trails in sensitive areas so that public is made aware of the end of the motorized trail and the surrounding area closure. The use of public education to address problems may require effort and time but it is more reasonable than closures and must be used fully utilized. Additionally, motorized visitors

can be called upon to help implement the educational process. (Organization, Helena, MT - #A13226.15163)

424. Public Concern: The Forest Service should inform the public that national forests are not national parks.

The USFS needs to undertake an educational campaign to inform the public that the National Forests are not National Parks and come under the concept of multiple use. The point needs to be made that the USFS is part of the Department of Agriculture because timber is an agricultural commodity. Timber production and the complementary goal of watershed protection, are the main reasons for the existence of a Forest Service. (Q9) (Individual, Ruidoso, NM - #A17775.15163)

Forest Service Staff Training/Education

425. Public Concern: The Forest Service should manage competing interests.

THROUGH THE USE OF SCIENCE AND UNBIASED EMPLOYEES

The most effective way to work with competing interests is to let sound science be the guide to decision-making that is made through public involvement. Unbiased USFS employees need to be sought for management. There has been too many USFS employees making a name for themselves as environmentally friendly and capitalizing on their biased decisionmaking when leaving public service. It ruins the agency's credibility and ability to make sound and reasonable decisions based on facts and public input. Our own Carson City office is deemed the "Headquarters for the Wilderness Society" by much of the general public in Nevada. (Individual, Sun Valley, NV - #A30102.15160)

A number of USFS personnel I've come in contact with over the years are clearly biased and are even anti-specific use. The Forest Service needs to determine who these individuals are and get rid of them or at least demote them to a position where they can do no harm. (Individual, Fraser, CO - #A30203.15152)

BY CONSULTING WITH PERSONNEL WHO HAVE WORKED UNDER THE NORTHWEST FOREST PLAN

You should consult with agency personnel who have been working under the Northwest Forest Plan. They have a lot of experience in dealing with various interest groups, one avenue being the PAC. (Organization, Port Townsend, WA - #A21695.15162)

BY HAVING ALL FOREST SERVICE EMPLOYEES READ "A CONSPIRACY OF OPTIMISM"

The agency must first begin by recognizing its own vested interests in certain kinds of organizational systems, management structures, and management methods. The agency is not a neutral arbiter amongst competing interest, but rather, has its own interests that are too often allied with private industrial users at the expense of all other citizens, interests and values. To date, despite glowing rhetoric about the need for greater collaboration and partnerships in planning and decision-making, the agency's actions betray a continuous interest in asserting technocratic power and control over the land and people. The RACR is not the proper avenue for managers to relearn how to "care for the land and serve people." The problems of Forest Service management extend far beyond the roadless area issue. We recommend that as a first step all forest Service employees should read Dr. Paul Hirt's excellent critique of Forest service management, "A Conspiracy of Optimism." (Organization, Eugene, OR - #A21798.12230)

426. Public Concern: The Forest Service should employ a diverse staff.

BY HAVING AS MANY CONSERVATION BIOLOGISTS AND EDUCATORS/NATURALISTS AS FORESTERS ON ITS STAFF

Develop more diversity within the ranks of the Forest Service and reach out to groups and individuals that you have not traditionally attempted to contact. Diversity can be created in the professional staff of the Forest Service. Every national forest should have as many conservation biologists and educators/naturalists as foresters on its staff. It should also attempt to recruit employees from all backgrounds and with all political beliefs. The Forest Service is still too much of a "good old boy"

organization and it needs to become more representative of the American public. (Individual, Waterbury, VT - #A15433.15164)

427. Public Concern: The Forest Service should educate personnel.

TO UNDERSTAND THAT COMPETING INTERESTS ARE NOTHING NEW

Reeducate the United States Forest Service employees that “competing values and limited resources” is NOTHING NEW. They act and manage as though it is. (Business or Association, Cody, WY - #A26503.15164)

TO ADEQUATELY UNDERSTAND POLITICAL, MANAGEMENT, AND LEADERSHIP ISSUES

The Forest Service must better understand political, management, and leadership issues of working “effectively with individuals and groups with strongly competing views, values and beliefs.” There is little evidence that that agency has given much thought to these complexities; hence most agency engagement tends away from collaboration and engagement and toward older forms of command and control behavior—often thinly camouflaged with language hinting at collaboration and positive interaction in search of public interest. The Forest Service must also put aside its own vested self-interest if it is to have any chance at working effectively with all parties. (Union, Eugene, OR - #A6245.15160)

TO WORK WITH A DIVERSE CONSTITUENCY

For future decisions, one must do extensive training for Forest Service personnel so they can begin to understand how to work effectively with a diverse constituency. (I apologize for picking on the Forest Service regarding public involvement—the agency does far better than other federal, state, county and city agencies—it is a truly tough job. (Individual, Olympia, WA - #A4503.15150)

Facilitation training should be increased within the Forest Service to improve the ability of Forest Service planners and line officers improve their effectiveness in leading meetings at which a diversity of interests and views are represented. The use of facilitators from outside the agency should also be considered in meetings that may become contentious. (Civic Group, Roanoke, VA - #A1713.15164)

TO FACILITATE COOPERATIVE MEETINGS

It is the job of the Forest Service to foster cooperative meetings where opposing needs and views can be expressed and respected. Expressing a willingness to hear all views and to accept proposals as potential solutions is a powerful way to encourage cooperation. Forest management is not just for trees.

There is training available in a class once called “Negotiating to Yes” that should be given to all Forest Service staff and used in this pursuit. Dale Carnegie classes are another good resource. (Individual, Salem, NH - #A8263.15160)

Will of the Public/Elected Representatives

428. Public Concern: The Forest Service should abide by the wishes of the majority.

The Forest Service should do what the majority of Americans want done with their federal wildlands. The USFS should question and poll the American public to find out what they do want. Limiting the breadth of such an outreach for comments at the city limits of local communities is a crime. Whatever Administration is in power should accept that. Clearly, the majority should rule. (Individual, Grangeville, ID - #A830.15100)

Last time I checked the United States was still a democracy. The people have spoken, and there is no compelling national interest of which they are unaware that could possibly justify ignoring them. Do so at your peril. (Individual, Nickelsville, VA - #A347.15110)

An opportunity for all people to voice their concerns should be met with decisions made based on the majority not by snowmobile or 4 wheelers spending money to be heard louder. (Individual, Livingston, MT - #A661.15110)

BY PRESERVING ROADLESS AREAS

The viewpoint of the majority, especially a clear majority, should be accepted. Thousands of citizens have indicated that they want our National Forest roadless areas preserved. (Individual, Fairhope, AL - #A13377.15165)

The ANPR specifically states that 9 million acres within IRAs are considered by the Service to be productive timberland and candidates for road construction. The point of a national standard is the recognition that the vast majority of American citizens recognize a value other than extractable resources in our public lands—let's leave the IRAs alone! (Individual, Seattle, WA - #A17840.15165)

BECAUSE NATIONAL FOREST SYSTEM LANDS ARE OWNED BY THE MAJORITY

We live in a democracy and the Forest Service should give weight to the overall opinions of all Americans. After all these lands belong to all individual citizens of the U.S. and the interests of a few special interest should not dominate over those of the majority. Splitting the baby in half (so to say) is not the way to go and will only lead to more degradation of these unique and limited lands. (Individual, Takoma Park, MD - #A16325.15165)

RATHER THAN THE PRESIDENTIAL ADMINISTRATION

The forest service can work most effectively to meet competing views by following the views, beliefs and guidance of the public majority. The public majority has spoken during the first USFS solicitation of public comment and that majority overwhelming favored roadless protection. Unfortunately, the forest service has bowed to the biased pressure of the new presidential administration and ignored the guidance of the public majority. (Individual, Petaluma, CA - #A17057.15110)

RATHER THAN PRIVATE INTERESTS

The Forest Service should step up to the plate and protect the public interest, as opposed to competing private interests in the forest. Had they been doing so, we would never have been at the point where we are, with so little native forest left in this nation. The Forest Service should abandon its proclivity to be a front for the timber barons and to return to the mission originally envisioned for the forests [by] Teddy Roosevelt and Gifford Pinchot. (Individual, No Address - #A16452.15165)

RATHER THAN SPECIAL INTEREST GROUPS

You need to allow the American public, not special interest groups dictate the policies of the Forest Service. Please allow us access to public property so long as we use it responsibly. (Individual, Las Vegas, NV - #A921.15100)

. . . “our” National Forests are truly the property of all our citizens. Not the property of extractive industry. I don't think that I would want someone digging around in “my” backyard. It would not be a good idea to do this on the part of the digger.

It is my understanding that Mr. Bush is making an attempt to open my “backyard” to the financial gain of private industry. I see that as theft. (Individual, Harmony, MN - #A43.15110)

This clearly indicates that changes being proposed may be in the interests of business and special interest groups, but that the will of the people as expressed in hearings has been demonstrated to support upholding of the present rule.

Please listen to and honor the will of the people and do not give in to profit-driven concessions which are being requested by business interests. The forests are a very precious national resource which should be managed in the interests of the people of the United States. (Individual, Concord, CA - #A238.15110)

What is NOT acceptable, is for powerful corporate and special interests to override the views of me and my neighbors with their own agendas, though this continues to be the disturbing political reality in many of these issues. (Individual, New Haven, CT - #A706.15120)

Extreme environmental groups, under the guise of conservation, will never let up pressuring land managers to comply with their hidden agenda. If they were to reach a compromise, they would not have a reason to secure and spend the incredible funding they routinely obtain. The average, forthright, accountable, American citizen relies on the FS to fairly and equitably administer public lands without bowing to the biased pressure of high volumes of post cards, form letters and e-mails, just because one group may be more organized or highly funded than typical Americans. (Association, Salt Lake City, UT - #A12009.15121)

RATHER THAN MERELY AVOIDING LITIGATION

I attended a public meeting where a USFS official indicated that one of the reasons the 'roadless' rule was under consideration was because the USFS was continually being sued over its decisions to allow certain activities. That is the weakest reason I've ever heard for instituting a public policy. Policy should be established by what is in the public best interest, not by willingness to litigate. (Individual, Anchorage, AK - #A22124.15165)

WHILE PROTECTING MINORITY RIGHTS

The Forest Service has a very tough job in working this out. Our tradition is majority rule while protecting minority rights. These are federal lands, so the majority involves the American people, not just one state. So the Forestry Service needs to understand what most Americans want, and do its best to implement those wishes without unjustly affecting the rights of the minority. (Individual, Saratoga, CA - #A22433.15165)

429. Public Concern: The Forest Service should allow elected officials to make decisions.

I feel a compromise must be made somehow. Let Jim Hansen decide for Utah . . . for the rest of the states . . . let their rep. figure it out. Special interest groups and lawyers don't belong in the process . . . elected/appointed officials do. Heaven help us with groups out there like the Sierra club, Utah wilderness Club, and Utah Wilderness Coalition. If they had their way, they'd drain lake Powell . . . what's next?? (Individual, Ogden, UT - #A590.15100)

Certainly we agree that reliable information and accurate mapping, and drawing on local expertise and experience through the local forest planning process is important. However, in the past federal agencies have failed to recognize the republican form of government in which we operate. Instead most decision making within the federal government says each person commenting equals one vote. In fact comments from local governments in our form of government says that those elected local officials should represent, for example, in a county of 10,000 people as a constituency and therefore their position represents 10,000 votes. Environmentalists have been appointed by no one, and they have no constitutional or elected power to represent anyone. They are accountable to no one. In that light then informed decision making must include the fact that when San Juan County speaks it is with the force of roughly 14,000 people. If that rule is not adhered to then there is no **informed decisionmaking**. (Elected Official, San Juan County, UT - #A4890.15111)

It is time for our elected and appointed officials to act as guardians of our land. This will take strong people because those interests who have exploited the lands for years are well entrenched, are very powerful lobbies, are willing to spend millions in order to ensure they can continue to exploit the lands so as to benefit financially. Ironically, some individuals and companies who have used but not abused the public lands in their pursuit of utilizing natural resources are forced to compete with the abusers and often, for survival, must themselves exploit the public lands. It is people such as yourself who must set the stage for conservation and allow the use of public lands but prohibit the abuse of these same lands.

At the same time, it is imperative to isolate some of these lands by designating them as roadless areas. (Individual, Laramie, WY - #A998.15120)

Ecosystem/Preservation Values

430. Public Concern: The Forest Service should place the highest value on ecosystem preservation when managing conflict.

Once a roadless area becomes roaded, it changes its identity and cannot be returned to its prior condition. The Forest Service should set its priority as preservation of the roadless condition and then reconcile the wants of different people to the first priority of preservation. (Individual, Bozeman, MT - #A282.15167)

Competing stakeholder interests - The U.S. Forest Service has a challenging, deeply political job. I would encourage it to manage its difficult stakeholder relations with the following guidance in mind: make decisions based upon the respect for the other living things with whom we share this planet; make decisions recognizing that scarcity warrants additional consideration (late seral habitat, disappearing species, quiet places), make moral not just economic choices, make decisions recognizing that man can make its living elsewhere but forest animals do not have that choice. (Individual, Lacey, WA - #A530.15167)

The forest service should err on the side of caution. If two parties are split as to whether a roadless area should be opened for roads, or left roadless, the choice which is ultimately made must be in favor of the "roadless" option.

The reason for this is clear: A roadless area which is exploited today cannot also be exploited tomorrow. ON the other hand, if a roadless area is left alone for a year, or for ten years, it can eventually be opened up for roadbuilding. By erring on the side of caution, you merely put off a decision until another day. By ignoring pleas to keep areas roadless, the roadless area is destroyed forever. (Individual, Columbus, OH - #A659.15162)

BY BEING A STEWARD OF THE FORESTS AND AN ADVOCATE FOR WILDLANDS

One comment point was how to work with diverse groups of differing opinions. First, what is the goal of the Forest Service? I believe that the Forest Service should be a steward of the forest and an advocate for wild lands. I believe that the native tribes, and the public should be included in the decisions concerning the public lands. Diverse opinion will always occur, State and Local communities should have a say, but they should not control or dominate the process. (Individual, Boise, ID - #A209.15160)

Chapter 4

Roadless Area Values (Question 6)

Question 6: Describing Values. What are the characteristics, environmental values, social and economic considerations, and other factors the Forest Service should consider as it evaluates inventoried roadless areas?

This chapter includes five main sections: Characteristics of Roadless Areas, Environmental Values, Social Environment and Values, Economic Environment and Values, and Heritage Resources.

Characteristics of Roadless Areas

This section includes three subsections: Characteristics of Roadless Areas General, Adequacy of Maps and Inventories, and Definitions.

Characteristics of Roadless Areas General

Summary

Evaluation of Roadless Areas – Roadless area values and characteristics are a topic of comment to many respondents. Numerous respondents offer lists of values and characteristics they personally associate with roadless areas. Several people advise the Forest Service to undertake a comprehensive evaluation to determine roadless area characteristics and values. Others propose that the Forest Service consider current physical and geographical characteristics when these areas are evaluated. The values mentioned in this section are mostly those of roadlessness, rareness, location, and values in conjunction with a full range of uses. Reference to other roadless area values and characteristics, such as environmental, social, and economic values, can be found throughout the document in those related sections. A number of people comment that roadless area values were considered during past public planning processes, including the RARE processes, and that reconsidering these values now is a waste of time and money. Additionally, some suggest that certain values should not be considered now or should be considered in a separate process from other inventories or assessments.

Adequacy of Analysis – Respondents question the definitions of roadless area “values” and the analysis that will follow based on those definitions. For example, one respondent advises the Forest Service to define roadless values in a context consistent with other aspects of land and resource management plans. Others allege that the Forest Service is deliberately misleading representation of the inherent values of roadless areas regardless of their wilderness potential, and in so doing fails to provide a balanced recital of ecological services. Others request the

Forest Service examine the definition of various values, including perceived value, social value, and ecological value.

Evaluation of Roadless Areas

431. Public Concern: The Forest Service should clearly state the benefits of having roadless areas.

If we are locking these areas away for some reason, it should be explained fully and the benefits to the nation should be obvious. Someone should state the benefits of having roadless areas at all. (Individual, Olympia, WA - #A444.10112)

432. Public Concern: The Forest Service should undertake a comprehensive evaluation of roadless areas.

TO DETERMINE THEIR CHARACTERISTICS, RESOURCE VALUES, AND EFFECTS OF VARIOUS ACTIVITIES

The following are some of the above categories you should address: 1. Inventory uses currently taking place that have not compromised the unit's roadless character. If their impacts have been acceptable in the past, there is no reason they shouldn't be acceptable in the future under managed conditions. 2. What activities take place on the roadless unit that are traditional and important to local culture; what role do these activities play in local economics? 2. What resources are present and how important are they to the local area and the nation? For example, the presence of important minerals might outweigh other concerns. Grazing might support local ranches. Wood harvest might stabilize raw material supplies for local mills. 4. What is the long-term effect of making resources on roadless lands essentially off limits, locally and nationally? Will more pressure be placed on commodity production from other countries without effective environmental protections? 5. Are the units identified as roadless in the inventories actually roadless? Some should be reviewed. Some units may be dropped and some might be added. 6. What recreation activities can be accommodated to given levels without unacceptable resource impacts? 7. What unique, sensitive, threatened or endangered species are present and how does the roadless area fit into its habitat picture? What activities can take place without causing harm to those species? 8. What is the relationship of the roadless unit to other lands, public and private; how might the roadless unit's management affect these lands and the uses they support? 9. What is the relationship of the roadless unit to adjacent special areas, including wilderness? 10. What is the relationship of the roadless unit to transportation systems, existing and planned, summer and winter? 11. What are the special environmental considerations, such as sensitive watersheds or unstable soils? 12. What is the best way to manage this unit of land in the public's interest? 12. Can the roadless unit be sustained in a healthy condition that doesn't pose threats to adjacent lands and resources? 14. What are the recreation opportunities the unit can provide under various management alternatives and how do these fit with the spectrum of opportunities in the region? 15. Does the unit have outstanding characteristics which make it suitable for addition to the wilderness system? 16. Does the unit have characteristics which make it outstanding as a place to conduct various recreation activities enhanced by a roadless setting, such as hunting, fishing, trail riding, sightseeing, rock climbing, etc. (Organization, Sandpoint, ID - #A6614.10110)

TO CONSIDER SIMILAR CHARACTERISTICS

In evaluating roadless areas, the Forest Service should always consider certain similar characteristics. These characteristics may be as minute as the space between varying species of trees and plants, or as inclusive as the overall appearance and health of the forest area. Regardless of scale, characteristics of the inventoried roadless areas should remain somewhat constant in representing the best interest of the forest.

Environmental values can play a bit more of a biased role in evaluating forest area. The main concern is the health of the ecosystem, yet it can be skewed as overprotection of resources. The concept is to keep roadless areas set aside for rare species, remote habitats, and free growth of the forest.

Representing different values, social and economic considerations can sometimes play against the greater interest for the forest. Social aspects of the situation might include accessibility, location, and natural appeal. Certain areas are more sought out than others due to natural beauty. Economic considerations might include the amount of timber in a certain area, or other resources. In order to better access the timber, more roads must be put in. Although, it seems that the best wood for timber surrounds the already existing roads, since those trees are younger and better kept.

Overall, the Forest Service should always look for certain factors while evaluating roadless areas. First, the area should be graded—so to speak—on the health of the forest. All species present should be taken into account. After assessing the health, areas should be checked for possible improvements. Most importantly, all plans for action in the forest should be aimed at sustaining the most ideal conditions. (Individual, Harrisonburg, VA - #A30138.45100)

433. Public Concern: The Forest Service should consider how roadless areas are characterized in evaluating roadless areas.

BY A WIDE RANGE OF FEATURES AND ATTRIBUTES

What are the characteristics, environmental values, social and economic considerations, and other factors the Forest Service should consider as it evaluates inventoried roadless areas?

This list might include; a. A complete inventory of renewable resources and production capability including forage, timber, fish and wildlife. b. An inventory of soil, water and geologic resources; an evaluation of their stability and suitability for various activities. c. An inventory of mineral resources. d. An inventory of sensitive, rare, threatened, or endangered species and their habitat. e. An evaluation of current activities and their impacts on the land and its resources. f. An evaluation of seasonal suitability for various activities, including motorized and non-motorized recreation. g. An evaluation of how potential recreation opportunities on the unit fit into or complement the regional spectrum of opportunities. h. An evaluation of forest health and fuel loading. i. Land ownership in and adjacent to the unit. j. A complete evaluation of the transportation system in and adjacent to the unit. k. Its proximity to designated wilderness and other roadless units. l. A thorough evaluation of renewable resources, productivity, sustainability and the importance of these at a sustainable level to local communities. m. Hazards to adjacent lands posed by various management alternatives. n. How is this unit of forest best managed in the public's interest, local and national? o. How important is this unit of forest to the long-term stability of local communities? p. What is the availability of roadless recreation opportunities in the region and are more needed? q. Can the roadless unit be managed in a healthy condition that doesn't pose threats to surrounding lands? r. What is its size and conformity; does it lie adjacent to designated wilderness; does it contain outstanding wilderness characteristics? (Individual, Boise, ID - #A5165.45100)

A more complete list might include: a) An evaluation of forest health and fuel loading, including forested areas at high risk from catastrophic wildfire. (Association, Coeur d'Alene, ID - #A22058.45100)

This list might include:

19. How will vegetative management options impact air and water resources?
20. What is the burning window for fuels treatment? (Association, Spokane, WA - #A21364.45100)

Relevant physical characteristics for the second-stage roadless area evaluations [following evaluation for wilderness designation] include, but are not limited to: ecological type, topography, soils, vegetation type and structure, wildlife, existing trails and other facilities; existing classified and unclassified roads, existing or potential old growth stands; streams and watersheds, TandE and sensitive species or communities, fire hazard rating, insect hazard rating, disease hazard rating, and proximity to private developments. (Civic Group, Roanoke, VA - #A1713.45100)

BY THEIR INACCESSIBILITY

There is very little private property adjacent to the roadless areas; the roadless areas are characterized by their relative inaccessibility. (Individual, Troy, MT - #A895.45100)

BY BARREN LANDSCAPE, SCRUB-BRUSH, ROCK, AND ICE

It should be pointed out that a minimal amount of productive old growth, low elevation forest was included in the Tongass Designated Wilderness areas. The vast majority of the "protected" lands in these units are barren landscape, scrub-brush, rock and ice in spite of the large appearing areas on the map. This mix is true in Region 1. As an ex-smokejumper I have had a birds-eye view of the composition of Wilderness Areas throughout Idaho and Montana. (Individual, Sitka, AK - #A1056.45100)

Also, these areas are not the pristine, remote, untouched back country that some imply that they are. Many are readily accessible to the general public by vehicle, etc., and have been for years; they are not all forested - many are front country scrub lands with few if any trees on them anywhere. If the general public really knew the truth about these areas, they wouldn't be so eager to blindly support any special classification for them. (Individual, East Kingston, NH - #A4893.45000)

434. Public Concern: The Forest Service should consider various values when evaluating roadless areas.**THE VALUE OF ROADLESSNESS**

Roadlessness is a value in itself that should be conserved. Administrative costs for roadless areas will be lower than on more intensively-managed lands. (Individual, Lexington, VA - #A16989.45100)

The primary characteristic should be roadlessness, for reasons mentioned in the May 2000 DEIS. Roadlessness by itself is rare enough that no additional characteristics are needed to make an area special. (Individual, Oberlin, OH - #A16281.45100)

The ultimate consideration, to me, is the fact that no matter what values you associate with a roadless area, once a road incurs upon that area, the values are lost forever. This should be the cautionary guide you use to help you protect roadless values. (Individual, Lewiston, ID - #A29569.45100)

THE VALUE OF RARENESS

I believe these intact areas should be preserved in their natural state precisely because so few areas in the world remain intact. I believe this is their most valuable use to mankind, in both an aesthetic and economic sense. Rareness creates economic value, and an economy, based on those who come to see, live close to, study, or otherwise benefit from that rareness. (Individual, Sitka, AK - #A15506.45100)

The value of roadless areas lies in the very fact that they are unroaded. Some are more aesthetically pleasing than others but we have so few roadless areas left that they should all be left intact. Near me in the Eastern Hiawatha National Forest is the only roadless area here. It is not valuable because of its unusual beauty but because it is roadless [and] relatively rare. (Individual, Brimley, MI - #A15719.45100)

THE VALUE OF REMOTENESS

When evaluating Roadless Areas, the Forest Service should consider:

The remoteness of the roadless area (is it located near large cities, how many miles is it from the nearest metropolitan area with a population larger than 30,000). (Individual, Des Moines, IA - #A12587.45100)

THE VALUE OF PROXIMITY TO COMMUNITIES

Location. If an IRA is close (within eyesight) to a community, it has a higher value because it provides a backdrop or otherwise helps to physically define the community. It becomes part of the character of the community, and people identify with it and value its presence.

If an IRA is located on a Forest boundary (or a county, state, or international boundary), it has a higher value because it serves multiple publics. This recognizes that more people identify with a “shared” IRA and take pride that it’s “in their back yard.” (Individual, Libby, MT - #A2301.45100)

THE VALUE OF THE OVERALL LANDSCAPE

Roadless values should also be described in terms of the overall landscape. The present RACR views roadless areas as “islands,” and imposes a management prescription on those islands without any reference to how that management prescription connected with the broader landscape.

A much more sustainable approach to forest management would be to recognize that roadless areas are not “islands” valuable solely for their lack of roads, but instead are an integral part of a larger management scheme. In many areas, a landscape approach may determine that overall road density, rather than the presence of roadless area “islands,” is a better indicator of overall forest health and ecological sustainability. (Governor, State of Idaho - #A20141. 45100)

THE VALUES ASSOCIATED WITH WILDERNESS AREAS

What are the characteristics, environmental values, social and economic considerations, and other factors the Forest Service should consider as it evaluates roadless areas?

Is it truly a wilderness with very limited access or is it an area with other than wilderness values. (Individual, Sparks, NV - #A4805.45100)

When evaluating Roadless Areas, the Forest Service should consider:

The management prescriptions of areas contiguous with the Inventoried Roadless Area (is there a designated Wilderness contiguous with the area, etc.). (Individual, Des Moines, IA - #A12587.45331)

THE VALUES ASSOCIATED WITH ROADLESS AREAS CONTIGUOUS TO AREAS WITH SPECIAL CONGRESSIONAL DESIGNATIONS

Wherever a roadless area contains or is contiguous to a Congressionally designated feature (such as a national scenic trail, a wild or scenic river, or wilderness), the particular values associated with such areas should be emphasized. The presumption in all such cases should be that the roadless area at issue must be retained in roadless status. (Organization, Baltimore, MD - #A892.45000)

INTANGIBLE AND TANGIBLE VALUES

It is difficult to compare intangible values (such as wilderness) with tangible ones (timber value) but the forest service must in all of their decisions. Not only must it consider the present value of the intangibles but the future value as well which will only increase exponentially with population growth. The intangibles not only include wildlife habitat, clean water, clean air, but view-shed, sound-shed, and the ability of a person to escape into wilderness. (Individual, Glide, OR - #A22303.45100)

IN CONJUNCTION WITH CONSIDERATION OF A FULL RANGE OF USES

I feel that the full range of values normally associated with any tract of forest land should be evaluated. Roadless areas have opportunities for roadless recreation, specialized wildlife habitat, and other values that may not be available in roaded areas. These values should be evaluated but the roadless character should not preclude consideration of a full range of uses, including uses that would require development of roads or other access. The evaluation must be site specific and must be based on an updated mapping of National Forest roadless areas based on national criteria direction for delineation of an area as roadless. Delineation criteria must be open to public involvement and all future mapping must be “ground proofed”, again through an open process. (Individual, Colfax, WA - #A5421.45100)

The full range of values normally associated with any tract of forestland should be evaluated. Roadless areas have opportunities for roadless recreation, specialized wildlife habitat, and other values that may not be available in roaded areas. These potential uses deserve special evaluation, but the roadless character should not preclude consideration of a full range of uses, including uses that would require development of roads or other access. The evaluation needs to be site specific in the context of the value and use of the adjacent areas. In context with questions 3 and 4, above, the evaluation should include full

disclosure of the consequences of various management strategies on forest health and the susceptibility to fire damage. There should be specific identification of the potential impacts on adjacent private and public lands and communities. (Individual, Lawrenceville, GA - #A6196.45100)

Inventoried roadless areas have been subject to in-depth analysis and evaluation since the first Roadless Area Review (RARE I) in 1972. During development of the forest plans, the presence or absence of a road did not exclusively drive the decisions on land allocations, but more appropriately, decisions were based on examinations of the full range of values on these lands. This should be the same for future amendments and revisions of the plans. (Association, Augusta, ME - #A13312.45500)

The full range of values normally associated with the evaluation of any area of national forest land should be considered during planning for roadless areas. The mere fact piece of land contains no roads does not automatically mean it possesses inherent values that demand special protection. In an open process the Service should consider such things as existing and potential uses of roadless area, potential and actual impacts of roadless designation on both forest users and the local communities, proclivity to fire, insect and disease and impacts to surrounding tracts of land, whether public ally or privately owned, just to name a few. The evaluation needs to be site specific and include a full range of uses, among them full development To undertake this process up-to-date information is needed along with new criteria for defining a roadless area. Areas that are currently roaded (Not just by the new definition of a road) should be removed from the roadless area designation. (Business, Alturas, CA - #A17770.45100)

435. Public Concern: The Forest Service should document the other major values and opportunities provided by roadless areas.

We advocate consideration not only of roadless values in hearings and comment period. In addition there should be full documentation of the other major values and opportunities provided by these areas. These include groundwater recharge; erosion reduction and control; headwaters fisheries benefits; extensive outdoor recreation; visual amenities; wild animal resources; wild plant resources; select areas for endangered plant and animal resources; satisfaction of over twenty laws relating to biodiversity; and historical and spiritual values. (Civic Group, Roanoke, VA - #A1713.45100)

436. Public Concern: The Forest Service should not allow the presence or absence of roads in an area to overshadow the appropriate consideration of other values.

SUCH AS HEALTHY FORESTS AND WILDLIFE HABITAT

We are concerned that the presence or absence of roads in an area will overshadow the appropriate consideration of other values such as healthy forests and wildlife habitat. As an example, if an area is inaccessible for management, there may be a significant loss of important wildlife habitat through canopy closure. At the forest plan level, the analysis must consider these changes in wildlife habitat versus the need or desire to keep the area inaccessible. We do not feel that such analysis and consideration of site specific impacts can be done at the national level. In addition, forest plan analysis must consider other factors such as, water quality, scenic values, access to non-federal land, reliable and consistent supply of fiber, and a variety of recreation opportunities. Economic and social relationships should also be evaluated, including those that directly impact working families and local communities. (Association, Rockville, MD - #A13306.45100)

437. Public Concern: The Forest Service should publish a compendium of submitted roadless values.

WITHOUT COMPILING ANY SCOREKEEPING STATISTICS

First, invite public comment, asking individuals and other interested entities to list any number of different attributes and inherencies of roadless areas that are of interest/importance to them. Then compile a probably very lengthy inclusive list of these, which are in effect "roadless values". Then

publish the list for public review. Everyone will no doubt be surprised at some of the things that others favor as “roadless values”. For example, a prospector might highly value the generally less explored nature of inventoried roadless areas (IRA). A marriage counselor might have found that encouraging troubled couples to go hiking/camping in roadless areas has been productive. A published compendium of all submitted “roadless values,” presented without any scorekeeping statistics as to which were more often mentioned, could be useful in many ways, not all of which are predictable. Unanticipated benefits to any rulemaking process may occur from this proposed approach to saying what “roadless values” are. (Individual, Kalispell, MT - #A19139.15100)

438. Public Concern: The Forest Service should periodically reevaluate roadless areas.

TO ASSESS CHANGE AND POTENTIAL IMPACTS TO ADJACENT NONFEDERAL LANDS

Many factors need to be addressed before the Forest Service evaluates inventoried roadless areas. While those factors need to be consistently applied, local values and community social and economic considerations need to be made. These factors include past management activities, current land use, wildlife habitat and endangered species, cultural resources, accessibility, juxtaposition to development, timber production potential, water quality and quantity, fire hazard, potential for epidemic insect or disease outbreak, economic impacts, invasive plants, and recreational opportunities. These characteristics should be reevaluated periodically to assess change and potential impacts to adjacent nonfederal lands. (Governor, State of South Dakota - #A23354.45100)

439. Public Concern: The Forest Service should consider that roadless area values were already identified.

DURING THE RARE PROCESS

The characteristics, environmental values, social and economic considerations and other factors the FS should consider as it evaluates inventoried roadless areas were identified starting with RARE in 1972 and during the 27 years that transpired between the initiation of that process and the publication of the Roadless Area Conservation DEIS and FEIS. The answers to Question 6 are found in those documents. (Individual, Klamath Falls, OR - #A4970.45100)

IN PREVIOUS PUBLIC COMMENT PERIODS FOR THE ROADLESS AREA CONSERVATION RULE

The public process for the Roadless rule, conducted by the Forest Service, already identified roadless area values, including, large undisturbed landscapes, safe drinking water, recreation, rare wildlife habitat, weed and pest control, scientific study, and Native American observances. (Individual, Johnstown, PA - #A4762.45000)

The Forest Service has already adequately identified roadless area values through the public involvement process for the Roadless Area Conservation Rule. I believe roadless areas should:

- Provide sources of clean drinking water;
- Protect water quality for fishing and swimming;
- Function as biological strongholds for rare and native wildlife;
- Provide large, undisturbed landscapes important for protecting the web of life;
- Present quiet, back-to-nature opportunities for stepping outside of the hustle and bustle of daily life;
- Serve as barriers against the spread of weeds and pests into pristine areas;
- Offer opportunities for scientific study and research;
- Provide open space, clean air, biological diversity, and unspoiled vistas;
- Be free from logging, mining, gas and oil development or exploration, or other resource extractive activities;
- Preserve areas needed for traditional Native American religious and cultural observances.

Monetary values for such things are difficult to measure in today's financial definitions. These things listed above mean far more to me than resource extractive activities would. Yes, I use wood, oil, and gas, but there are already designated areas in the country for these activities to be undertaken which minimize the impact on nature, health, and the ecological system. There needs to be a balance, and the Roadless Area Conservation Rule moves to achieve that. Pristine, roadless, natural areas are hard to come by, especially around where we live, and I place a very high value on them. Once they are disturbed, they never fully recover. Ecosystems are unbalanced and the web of life is disturbed. (Elected Official, Urbana, IL - #A4881.45100)

The Forest Service has already adequately identified roadless area valued through the public involvement process for the Roadless Area Conservation Rule. Roadless areas include the economic benefits associated with:

- 1) recreational opportunities and tourism;
 - 2) commercial and recreational fisheries within the boundaries of National Forests and downstream and offshore;
 - 3) habitat for important game species and hunting both within and outside of the National Forests;
 - 4) water for cities, industries, businesses, and individual households downstream from the National Forests;
 - 5) the regulation of water flowing through rivers and streams, including flood control;
 - 6) non-timber forest products such as wild mushrooms, herbs, and medicinal plants;
 - 7) mitigation of global climate change through absorption and storage of vast amounts of carbon;
 - 8) enhancing the quality of life of neighboring communities;
 - 9) harboring biological resources that either have value now or have as yet unknown but potentially large economic and social value;
 - 10) harboring biological and genetic resources that can improve the long-term productivities of all forest land;
 - 11) pest-control services provided by species that prey on agriculture and forest pests, and;
 - 12) pollination services provided by species that pollinate important forest and agricultural crops.
- (Individual, Santa Fe, NM - #A22971.45100)

With one exception, there is no reason for further evaluation of inventoried roadless areas; the current rule already has taken these considerations into account. The single exception is if we want to expand the roadless areas. Otherwise, implementation of the rule as it is currently written is the best way to accommodate these considerations. (Individual, Denver, CO - #A12861.45000)

What were the values used to formulate the policy that you are trying to gut? It would take pages to adequately answer this question. The bottom line is that detailed values were laid down after 600 public meetings and the initiative as it stands now was a logical outcome given those values. Those values should be adhered to and not replaced by values skewed to favor those who would benefit economically from more roads. (Individual, Bozeman, MT - #A15299.45000)

The values that must be followed are the ones outlined in the original roadless area proposal. Get a clue—over a million people spoke up in support of a vast roadless area, this should be proof enough that millions more Americans favor and embrace environmental ethics that applaud natural beauty, abundance, and variety. The world we live work in should be respected and protected, not exploited and destroyed. (Individual, Colorado Springs, CO - #A17259.45000)

AND IT IS A WASTE OF TAXPAYER MONEY TO UNDERGO ANOTHER PROCESS TO CONSIDER EXACTLY THE SAME VALUES

The Forest Service has already extensively analyzed the values of roadless areas and weighed the benefits of protecting them in the process of promulgating the Roadless Rule. It is a waste of taxpayer

money to undergo yet another process to consider exactly the same values considered the last go round. (Organization, Boise, ID - #A8240.45000)

ROADLESS AREA EVALUATION IN WYOMING WAS CONCLUDED WITH THE PASSAGE OF THE WYOMING WILDERNESS ACT

The advance notice of proposed rulemaking dated July 3, 2001 states “The Forest Service has been evaluating roadless areas for nearly 30 years”. While this may be true Service-wide, this effort was concluded in Wyoming with the passage of the Wyoming Wilderness Act of 1984 (Public Law 98-550).

This public law states in Title II, the Congress has made its own review and examination of the National Forest Roadless Areas in Wyoming and the environmental impacts associated with alternative allocation of such areas. (Association, Cody, WY - #A26503.20206)

440. Public Concern: The Forest Service should not consider environmental, social, and economic values when evaluating roadless areas.

The Forest Service should not consider environmental values and social and economic considerations. It would only use them to reduce the area, to road it, or to log it. (Individual, Salem, OR - #A13948.45100)

Social and economic issues need not be considered for management of all portions of National Forest Lands. A significant portion of these lands should be maintained in a pristine state for preservation of existing ecosystems and support of alternative uses. (Individual, Seldovia, AK - #A23513.45000)

441. Public Concern: The Forest Service should not evaluate roadless areas separate from its regular, on-going natural resource inventories and assessments.

UNTIL THE FOREST SERVICE PROPOSES AN ACTION THAT MAY AFFECT ROADLESS AREAS

The Forest Service should not evaluate roadless areas separate from its regular, on-going natural resource inventories and assessments. The time to consider the unique characteristics of a roadless area in decision-making is when the Forest Service proposes an action that may affect a roadless area. Until that time, any evaluation of roadless areas is purely academic and of no utility to land managers or the public. (Union, Eugene, OR - #A6245.45100)

Adequacy of Analysis

442. Public Concern: The Forest Service should define roadless values in a context consistent with other aspects of land and resource management plans.

The same criteria that are considered in other aspects of a land and resource management plan should be considered in the evaluation of inventoried roadless areas (i.e. watershed condition, wildlife, recreation, etc.). Additionally, “roadless values” must be defined in a context which is consistent with other aspects of the land and resource management plan. (County Department, Emery County, UT - #A30434.45100)

443. Public Concern: The Forest Service should recognize that the Advance Notice of Proposed Rulemaking misrepresents the value of roadless areas.

The ANPR implies that local decision-making is needed because protection is warranted for some roadless areas but not others yet never substantiates this. It states that most roadless areas previously were not recommended for wilderness designation due to low wilderness values or inadequate public support, and “other resource potentials.” This is a deliberately misleading representation of the inherent value of roadless areas (of which there is a huge body of literature left uncited by the ANPR) regardless of their wilderness potential. While evoking roadless resource potentials, the ANPR fails to provide a balanced recital of the ecological services provided by roadless areas. Instead, it observes that the

resource values of roadless areas “vary in importance,” specifically pointing out that roadless areas contain 9 million acres of “productive timberland.” (Organization, Aspen, CO - #A29614.11100)

444. Public Concern: The Forest Service should assign value to actual scientific measured valuation, not “perceived” value.

BECAUSE YOU CAN'T PLACE A MONETARY VALUE ON ETHEREAL ITEMS

I feel that a trend started in this area in the last few years attempt to place monetary value to ethereal items. The DEIS and FEIS both did this and attempted to show values for items that in reality are subjective. Value should be assigned on actual scientific measured valuation, not “perceived” value. Perceived value should carry some weight, however it should not outweigh hard physical values. (Organization, Huntsville, AL - #A13542.45000)

445. Public Concern: The Forest Service should define social value and ecological value.

The terms “social value” and “ecological values” need to be fully defined. Such terms are potentially explosive if they are subject to undefined individual interpretation and should not be used to make decisions on how to manage our National Forests. (Organization, Naperville, IL - #A20342.20202)

Adequacy of Maps and Inventories

Summary

Maps – In connection with the general evaluation of roadless areas, a number of respondents question the accuracy of maps and inventories. Several comment on the distribution of Forest Service maps. Others urge the Forest Service to provide and distribute more accurate maps; although some state that adequate maps were distributed. Many comment on mapping inadequacies, including the mapping of roads. A number of citizens offer suggestions for roadless area boundary adjustments. An organization and elected official urge the Forest Service to follow the guidelines required by 40 Code of Federal Regulations 1502.8 for document mapping in the use of plain language and appropriate graphics. One individual suggests roadless areas should not be delineated on a map because once these lands are designated it will be difficult to use those resources if they are needed in the future.

Additionally, numerous respondents question the accuracy of the maps used in the roadless area designation process. Many state that the maps were inaccurate. Many assert that specific roadless areas omitted from maps should be included and that the maps should be updated. Others request that roads be mapped accurately. Some people offer suggestions for improving the mapping process such as correcting past inaccuracies, ensuring maps are consistent with forest plans, and using Geographic Information System (GIS) technology.

Inventories – Roadless area inventories are a topic of comment to a number of respondents. They request the Forest Service complete or update the inventories in roadless areas. This includes inventorying infrastructure, developments, roads, and biological features and conditions. Others suggest areas they say should or should not be included after the inventories take place. Several ask that areas with roads be excluded from inventories; however, some suggest the opposite.

Many who comment about the accuracy of roadless area inventories state that these inventories are presently inaccurate and should be updated. Suggestions for updating inventories range from using uniform criteria to including other groups in the inventorying process.

Maps General

446. Public Concern: The Forest Service should provide adequate maps.

The boundaries do not meet the test of a legal boundary in that they do not give any distances and directions from known land features or survey points. And finally they are generally not readily available to the public. A version at too large a scale to specifically determine whether an existing road is in or out of the roadless area is the only version generally available to the public. Detailed small scale maps are available only at Forest Service headquarters (with the exception of a limited number of forests that have put their GIS information on the internet). (Individual, Gold Bar, WA - #A28501.14120)

TO FOSTER INFORMED DECISIONMAKING

My husband and I are trail motorcyclists. We know many of the forests in Region One well, yet, none of the open houses or hearings we attended, nor any of the literature we could seek out either via the internet or in person, could even provide a single map at less than a very gross scale so we could determine how our interests might be affected. I know many people who did not comment at the time, and still can't because we never have seen site-specific information. (Individual, Bozeman, MT - #A19102.10135)

Roadless areas must be accurately mapped at the forest level, including an inventory of classified roads, in order that informed decisions can be made. (Elected Official, State of New Hampshire - #A18105.10135)

The Forest Service must analyze potential impacts on communities and private property and must give these national forest neighbors meaningful opportunities to comment on decisions about roadless areas and the wildland/urban interface that might place them at increased risk. Therefore, it will be essential that the Forest Service produce accurate maps of the location of communities and private lands within and adjacent to high-risk roadless areas and the interface. We note that the GIS database for the roadless areas did not have a complete inventory of private and state lands, so the public did not have an adequate opportunity to assess the proposed decision. (Association, Fernandina Beach, FL - #A15466.14500)

447. Public Concern: The Forest Service should distribute copies of the detailed maps of inventoried roadless areas that are currently on file in the Washington Office.

SEND MAPS TO REGIONAL OFFICES AND EACH NATIONAL FOREST FOR CITIZEN REVIEW AND BOUNDARY ADJUSTMENTS

Some opponents of the Roadless Rule complain that roadless areas are not sufficiently delineated on maps or otherwise described, so that the public does not know what exactly is protected under the Roadless Rule. The maps may not be perfect, but Colorado Wild believes they sufficiently describe the inventoried roadless areas.

Some updating and adjusting of boundaries may need to be done. The Forest Service should make this a priority in forest plan revisions and as part of each national forest's program of work. Also, copies of the appropriate detailed maps of inventoried roadless areas now in the Washington Office should be sent to at least every Regional office, and preferably also to each national forest containing roadless areas. That way, citizens could view maps of roadless areas in their state, national forest, or surrounding area. (Organization, Denver, CO - #A12008.10155)

448. Public Concern: The Forest Service should acknowledge that adequate maps were made available to the public.

It is disingenuous for the states, particularly Idaho, to claim that they were shut out of the decision making process because maps of the roadless area were not available to them. Maps of these areas have been available since the forest plans were signed in the mid to late 1980s. In addition, the EIS team did a tremendous job of making maps available by state and forest to the public and anyone else. If the final

decision had involved uninventoried roadless areas as well as inventoried roadless areas this would not have been true. (Individual, Grangeville, ID - #A798.10155)

In the past, during RARE I, RARE II, and the first round of forest planning, roads and logging were the principle issues in contention. This is no longer true. The most contentious decisions today are how to allocate unclassified roadless lands among fiercely competing, often incompatible, recreation interests.

Secretary Veneman's first "principle" implies that "accurate mapping" of roadless lands does not exist. Not true. Inventoried roadless lands have been mapped and catalogued for the past sixteen years in every Montana forest plan. They were posted at each roadless hearing and available on the web as well.

While mapping can always be fine-tuned with new technology, the fact is that the long-standing inventory was prepared at the local forest level, incorporating "local expertise and experience." Veneman is simply repeating another "common allegation" without factual merit. (Organization, Helena, MT- #A21370.45440)

449. Public Concern: The Forest Service should recognize the inadequacy of maps in the Roadless Area Conservation Rule Final EIS.

A key component of the Final Environmental Impact Statement (FEIS) is that portion of Volume 2 containing the maps. There existed confusion and misinformation pertaining to the maps that were part of the DEIS and remained in the FEIS, such that the public is not fully informed regarding the nature, extent, and scope of the Roadless Initiative, especially as it pertains to affected areas within the INF, including SSA. Unless and until there are specific delineated, detailed, and discernable maps attached to and made a part of a revised or supplemented circulated DEIS, the public will never have the appropriate and ample opportunity to analyze the decision documentation and comment thereon.

Even after issuance and circulation of the DEIS, maps were continuously being modified, newly published, and circulated. The mere effect of such an occurrence compels amending or supplementing the FEIS, recirculating it, and giving the public ample and appropriate opportunity to review and comment in accordance with NEPA and its implementing regulations. In the FEIS, the Forest Service never cured the deficiencies of the maps. (Business, Mammoth Lakes, CA - #A30296.14100)

450. Public Concern: The Forest Service should adjust roadless area boundary lines where needed.

Despite the burn in substantial portions of French Creek and Patrick Butte Roadless areas they deserve full protection of their timber, wildlife, and non-motorized resources. The Elkhorn Creek areas, which was recently cut, should be closed to the roaded area so as to keep wildlife migration viable. The Elkhorn Creek area is still hard to gain access to and should not be made easier. Lake and Partridge Creeks are the most pristine drainages aside from French creek, and all three should remain roadless in perpetuity. The boundary should be extended to include the BLM property to the Salmon River. Hazard creek and Hard Creek should be protected for anadromous fish and thus should not be logged along their length or be roaded. Their headwaters should also be protected where they are above the anadromous habitat. Granite Mountain, at the south end of Patrick Butte, is threatened by a ski area and further random skiing but should remain roadless at least through the next planning period. The boundary of the roadless area is adequate up past Grassey Lakes and by Scribner Lake, Lave Butte, and Hershey Point. Beyond that point the boundary in the hydrogeologic boundary of Partridge Creek.

In the French Creek drainage the roadless areas boundaries should follow Little French Creek as close as possible, skirting clearcuts and the road down to include the BLM property. From there the boundary following the French Creek road up to Burgdorf property. From there the boundary following the French Creek road on up to Burgdorf then to Nethger and Josephine lakes and Cloochman Saddle, following the paved road to near Copet Creek, missing Granite Reservoir and Fisher Creek Saddle then dipping south again to past Slab Butte and following along Brundage Mountain Road to near Hard Creek Lake and Upper hazard Lake and back to Little French Creek. The clearcuts along Little French and French Creeks should be managed to favor habitat management. The utmost concern should be taken to include the hydrogeologic boundary of French Creek, especially along Klip Creek, where no timber management should be undertaken. The Slab Butte, Bruin Mountain, and Little French Creek country

should not be managed for recreation, timber, or sheep, but rather for their plants and alpine habitat; it is fragile and in some cases burned. The management of wolves is problematic in this area; the wolves should not be relocated when they occur. (Individual, Boise, ID - #A21369.45624)

TO FACILITATE THE ECONOMICAL MANAGEMENT OF ROADLESS AREAS AND ADJACENT LANDS

The Forest Service should allow local forest-level decisions for forest health treatments, including timber removal to reduce the risks of wildfire, where such activities will not impair roadless values. Boundary lines should be adjusted where needed to facilitate economical management of the roadless area and adjacent lands. Mid-slope boundaries are expensive to locate and create impossible boundaries for prescribed burning and other management projects. (Professional Society, Missoula, MT - #A15793.30100)

The allocation process should provide for the adjusting the boundaries of the IRAs either smaller or larger to facilitate more logical, efficient, effective boundaries. (Individual, Missoula, MT - #A28297.30120)

TO MANAGE AREAS THAT MAY HAVE BEEN ROADED AFTER RARE II

The Forest Service should provide a process by which consideration could be given for the boundary of the Roadless Area to be modified to meet current conditions. In this instance, the boundary (which is derived from the 1979 RARE II Final Environmental Impact Statement) includes lands that are roaded and have been managed as such for many years. (Elected Official, Gunnison County, CO - #A22061.45100)

TO SERVE ALL NEEDS

Severability. The boundary of an IRA can be adjusted sometimes to serve both sides' needs. For example: a 30,000 acre IRA has an intact portion or "lobe" containing 5,000 acres of productive timberland. This productive portion could be "severed off," if needed, and allocated to the adjacent development. The remaining 25,000 acres could be protected for its roadless values. (Individual, Libby, MT - #A2301.45300)

BY USING RELEVANT AND CREDIBLE INFORMATION

Use all relevant and credible information on which to base the boundary of the Roadless Area—not just taking the 1979 RARE II boundary and considering it done. While the comments are relatively extensive for the West Elk Mine in Colorado, they are not for mines located on Forest Service lands located in Utah. Input on these operations should also be developed and considered. (Business, Wright, WY - #A23085.45400)

BASED ON HISTORIC FACTORS INCLUDING OPERATING PRACTICES AND LAND MANAGEMENT

Create a mechanism whereby any proposed Roadless Area boundary can be modified and revised based upon historic factors including operating practices and land management. (Business, Wright, WY - #A23085.45400)

Today, there are two active coal mines operating in this area, justifying the need to adjust the Roadless Area boundary in this area. (Business, Wright, WY - #A23085.45440)

451. Public Concern: The Forest Service should not arbitrarily adjust roadless area boundaries to accommodate current or future uses.

IN THE INVENTORYING PROCESS

Having witnessed the White River National Forest roadless areas inventory, serious flaws in the inventory process have become quite apparent. Roadless area boundaries have been arbitrarily and capriciously drawn to accommodate current or future uses, despite the absence of any system roads. We have seen roadless area boundaries in the WRNF inventory exclude lands containing no roads because the Forest Service has its eye on the timber contained therein. Particularly alarming is the practice of allowing non-system, illegally created roads to disqualify areas as roadless. Furthermore, the current roadless inventory process is not an end-in-itself but rather an intermediate step in the process of

nominating land to Congress for wilderness designation. This structure encourages Forest managers to inappropriately combine capability and suitability in the process of mapping roadless areas. We have seen roadless inventories with boundaries drawn to exclude mountain bike trails because this use would be non-conforming with a wilderness management. Mountain bike trails are not roads and the lands around them had no roads either, yet, they were drawn out of the boundary. The Roadless Area Inventory process must be uniform nationwide and must be conducted as an end itself, not as a step in the process of wilderness designation. (Organization, Aspen, CO - #A29614.45000)

452. Public Concern: The Forest Service should make roadless area boundaries obvious.

TO PREVENT LITIGATION AND DISPUTES OVER DIFFERING INTERPRETATIONS

The area affected by a road seem to have all kinds of definitions depending on which whine factor the various groups seem to want to use. If the area is wanted for Wilderness there is one set of influence standards and there is one for wildlife, the list continues, but yet another if you want to lock up an area. It would seem appropriate that in areas with any sort of clearly defined topographic watershed features, such as creeks or ridgelines, those roads, once present, influence that entire area. It also seems apparent that as a road proceeds through watershed drainage the progress of the road's influence ends somewhere at the next obvious watershed divide defined element. I make this point because obvious boundaries are a must if litigation and disputes over interpretations are to be avoided. The Forest Service already spends far too much time in legal disputes without adding more. That means that areas with numerous four-wheel drive undesignated roads throughout the drainage area should not be declared roadless simply because the current roads don't meet the Forest Service test for vehicle passage. Vehicles had influenced these areas and the major action should not be [to] displace the users of these areas unless the resource impacts are very significant. (Individual, Cambridge, ID - #A11714.45513)

Loud moneyed local interests with schemes for destructive use of our forests are difficult for local planners to resist. For this reason boundaries are needed on the local planning that is necessary to implement and tidy up the roadless rule. For example, if some scrap of roadless forest is too viable, require an internal land swap of uncut roaded forest in which the roads can be abandoned. If the spirit of the roadless rule is maintained it is possible to be a little flexible about the details. (Individual, Pasadena, MD - #A17237.13210)

453. Public Concern: The Forest Service should follow the guidelines required by 40 Code of Federal Regulations 1502.8 for document mapping.

IN THE USE OF PLAIN LANGUAGE AND APPROPRIATE GRAPHICS

The maps used in the environmental document must be familiar and easily interpreted by the public. The public is most familiar with the Forest Visitors Map. The environmental document mapping must follow the guidelines required by 40 CFR 1502.8 which states that "Environmental impact statements shall be written in plain language and may use appropriate graphics so that decision-makers and the public can readily understand them". The maps must identify streams, road numbers, trail numbers, landmarks and key topographic features so that the public can easily interpret them. (Organization, Helena, MT - #A13226.10135)

In addition, the maps were at an insufficient scale to accurately assess the impacts of the proposed rule - additional maps and definitions contained in local forest plans had to be consulted. We highlighted that the Code of Federal Regulation (40 CFR 1502.8) direct that decision makers can readily understand them." We request that the maps and definitions be expanded and clarified. Upcoming local forest plans updates would provide an appropriate forum for clarifying local roadless rule applications and associated maps. (Elected Official, Mono, CA - #A18107.14100)

454. Public Concern: The Forest Service should not delineate roadless areas on a map.**BECAUSE ONCE THESE LANDS ARE DESIGNATED, IT WILL BE DIFFICULT TO USE RESOURCES THAT MAY BE NEEDED IN THE FUTURE**

My recommendation for these so-called "roadless" lands:

Simply maintain the status quo; do not put a line on the map. There **will** come a day when the political pendulum **will** swing. There **will** come a day when we no longer depend on other countries to meet our needs. There **will** come a day when other countries will no longer allow us to treat them as mere colonies. Once lines are drawn on a map, options will have been taken away. It will be extremely difficult to erase those lines when we someday need to use those lands. (Individual, No Address - #A25635.45000)

455. Public Concern: The Forest Service should adequately mark roads on maps and on the ground.

We are concerned to know if the roads, once they are inventoried, will be properly marked on maps? Will the maps be readily available and circulated in the marketplace? Finally, will the roadways/trails have any type of marking designation on the ground? How can volunteers and other groups assist the forest Service in marking and maintaining these roadways/trails throughout the forests? We believe that once a proper inventory is done, that the inventory needs to be documented, properly annotated and updated on ALL maps throughout the forests. Roads and trails; once inventoried and designated, must be marked and signed. (Business, Haslett, MI - #AA4861.14000)

*Accuracy of Maps***456. Public Concern: The Forest Service should accurately map roadless areas.****TO ACCURATELY IDENTIFY ROADLESS AREAS**

Imposing a one-size-fits-all regulation on roadless area management will inhibit the Forest Service's ability to participate in landscape restoration and risk-reduction efforts on our National Forests. To more effectively comment on how the roadless policy affects the State of Colorado, we request detailed maps from the U.S. Forest Service as to what is, and what is not, considered roadless by the agency. Once received, we will prepare more detailed comments. Clearly, there are many areas in Colorado that are roadless and deserving of such protection. Without clear maps the Forest Service cannot possibly identify them. With adequate maps, Colorado could help. (State Agency, Denver, CO - #A2332.14140)

TO ENSURE THAT ELIMINATION OF FUTURE ROADS DOES NOT PUT FEDERAL AND PRIVATE TIMBER RESOURCES AT RISK

Roadless areas should be mapped to assure that elimination of future roads is not putting federal and private timberlands at risk from uncontrollable wildfires, disease and insect infestation. (Elected Official, Plumas County, CA - #A4846.45000)

TO ENSURE ADEQUATE ASSESSMENT OF THE PRESENT AND FUTURE IMPACTS OF ROADLESS AREAS

In the past, the Forest Service has argued that those forests with plans in the final stages of the revision process should also be exempted from the roadless area policy. But upon closer analysis of forest plans, it is clear the revision process has not proven adequate in assessing either the present problems or future impacts of roadless areas. Under ideal circumstances, a National Forest would conduct an on-the-ground inventory of roadless areas and evaluate any potential impacts of proposed management activities within or adjacent to these pristine areas. However, many of these reassessments have been sloppy and inadequate. Cases in point:

The Targhee National Forest is adjacent to Yellowstone National Park and encompasses one of the most scenic and ecologically important areas in Idaho. In the required analysis of roadless areas, the Targhee National Forest simply photocopied old inventories, made marginal notes, and added just five pages of update to an inventory over a decade old. In addition, the forest plan revision failed to link the

importance of roadless areas with aquatic species such as the imperiled Yellowstone cutthroat trout. As a result, hundreds of thousands of acres of roadless lands will now be open to development based on an analysis completed almost fifteen years ago. Experience in the Targhee and other forests indicate that attempts at planning to protect roadless areas have failed.

Boulder Mountain on the Dixie National Forest in Utah is a 150,000+ acres uninventoried roadless area. Areas adjacent to Boulder Mountain comprise 60,000-80,000 acres of roadless lands that were not included in the Dixie inventory. All these areas should receive immediate protection and should not have to wait for the forest planning process.

In a 1999 citizens' inventory of the Manti-La Sal National Forest in Utah, 30 percent more roadless areas were found in the La Sal Mountains and 50 percent more were found in the Abajos than what is currently in the Forest Service's inventories. In a 1998 citizens' inventory of the Uinta National Forest 123,500 more acres of roadless lands were found than the Uinta's own 1999 inventory. These areas also deserve immediate protection.

Fishlake National Forest's Strategic Communication Director Linda Jackson, recently confirmed that the inventories from Utah's four National Forests not going through the revision process (Fishlake, Ashley, Dixie, and Manti-LaSal) are seriously flawed. Utah's National Forests are relying on roadless area inventories from 1979. More reliable inventories were conducted in 1983 but never completed due to the passage of the Utah wilderness bill. The timing was not coincidental. Utah's congressional delegation purposefully halted these inventories. (Organization, Nevada City, CA - #A4941.45400)

TO ENSURE THAT MANAGEMENT OPTIONS CAN BE ACCURATELY ASSESSED

It is absolutely essential that accurate maps of roadless areas and areas at risk of insects, disease and wildfires be completed so that management options can be properly assessed. (Individual, Irvine, CA - #A15580.30100)

AS PART OF THE PUBLIC INVOLVEMENT PROGRAM FOR FOREST PLANNING

The Forest Service needs to provide accurate, up-to-date maps of inventoried roadless areas as part of the public involvement program for forest planning. (Permit Holder, McCall, ID - #A15317.14100)

BY GROUND VALIDATION

National direction on the criteria for delineation of roadless areas must be provided to the field. This criteria should include standards for mapping classified and unclassified roads, mapping of forest health, fire and insect/disease risks, wildlife habitat, water quality, scenic values, access needs, recreational opportunities, timber values, wilderness attributes, etc. Using the above information, national forest should be remapped to accurately reflect their roadless areas with all mapping being ground validated. (Association, Colville, WA - #A3091.10135)

INVENTORY AND MAP THE GEOGRAPHIC LOCATION OF ROADLESS AREAS IN RELATION TO THE OTHER SIMILAR AND DISSIMILAR AREAS AND ANY CULTURAL DEVELOPMENT

The geographic location in relation to the other similar and dissimilar areas and any cultural development must be inventoried and mapped. (Individual, Evergreen, CO - #A19178.45330)

MAP CLASSIFIED, UNCLASSIFIED, AND OBLITERATED ROADS IN AREAS THAT QUALIFY AS ROADLESS

Each National Forest's Plan must, as a part of its next scheduled revision, include assessments that would "qualify" or "disqualify" each inventoried roadless area for such status. Those qualifying inventoried roadless areas would then be explicitly depicted on maps. Strict attention must be paid to road classifications in and around roadless areas by means of lists and maps of classified, unclassified and old obliterated roads. Based on local citizen input, establish a spectrum of active forest management methods and protection/preservation guidelines and, when applicable, assign them to each "qualifying" inventoried roadless area. (Organization, Moscow, ID - #A15318.45500)

INVENTORY AND MAP CLASSIFIED ROADS FOR THE COLVILLE, OKANOGAN, AND IDAHO PANHANDLE NATIONAL FORESTS

We would like to see the schedule to complete the inventory and mapping of classified roads for the Colville, Okanogan, and Idaho Panhandle National Forests. (Business, Colville, WA - #A2593.12400)

457. Public Concern: The Forest Service should use updated maps.

The Forest Service must first define up-to-date criteria for the delineation of roadless areas and not use maps that are outdated. The maps should be updated with current data as land management plans are revised. (Association, Ketchikan, AK - #A20443.13212)

TO GIVE THE PROPOSAL CREDIBILITY AND TO ALLOW THE PUBLIC TO MAKE SPECIFIC COMMENTS

KARE believes the areas within this proposal include many that are roaded, and in which the road access is being used for many multiple use activities. By changing the definition of a road, the Forest Service proposal identified many roaded areas as unroaded. The RARE II inventories are more than 20 years old, and many NFs have updated maps that clearly indicate new roads. By failing to use updated maps, the entire proposal lacks credibility, and prevents the public from being able to make specific comments. (Organization, Yreka, CA - #A8381.45400)

458. Public Concern: The Forest Service should correct mapping errors.**TO INCLUDE ELIGIBLE ROADLESS AREAS**

As for any Forest Service mapping errors that resulted in leaving 1.5 million, currently roadless acres open to clear-cut logging and road building in the January 2001 roadless rule we suggest that these mapping areas be fixed if they have not already been fixed in order to provide protection for Neka Mountain near Hoonah as well as Little Seal Creek, Saltery Bay and Crab Bay in Tenakee Inlet and other affected areas.

These areas are traditional territories of the Huna Tlingit. Their use of these lands can be traced back thousands of years. They continue to rely on the resources of the land and sea for their subsistence and survival. What is happening on the part of the Bush Administration, The National Forest Service, and for the for-profit Corporations is shameful. We must have protection for roadless watersheds on the Tongass. Keep the Tongass in the roadless rule. (Director Tribal Resources, Hoonah, AK - #A3024.45623)

Forest Service mapping errors failed to include eligible roadless areas such as: Broad Finger, Broad Creel, Saook Bay, Poison Bay, Deep Bay, and Ushk Bay; and a recent court decision removed protections of important community use areas provided by the 1999 Tongass Land Management Plan, thereby increasing the importance of the Roadless Policy on the Tongass, with mapping error corrections. (Elected Official, Tenakee Springs, AK - #A3358.45623)

As a result of a FS mapping error, the January 2001 roadless rule mistakenly left open 1.5 million currently roadless acres to clearcut logging and road building -- areas traditionally used by local communities. The FS should fix these mapping errors and provide long term protection for Neka Mountain near Hoonah; Little Seal Creek, Saltery Bay and Crab Bay in Tenakee Inlet; Broad Finger, Broad Creek and Saook Bay in Peril Strait; Poison Cove, Deep Bay, and Ushk Bay near Sitka; and East Kuiu Island, including Reid, Alvin and No Name Bays, and Seclusion Harbor. (Individual, Worthington, MA - #A10381.45621)

The reason Texas National Forests do not have many Roadless Areas is due to excessive road construction, including phantom roads and fire lanes, and an unfair Revised Land and Resource Management Plan (RLRMP) in 1996 which used tactics that kept potential Wilderness Areas (RARE II) from being considered.

For instance, fewer roads were shown on the maps in the RLRMP for Roadless Areas than in the maps handed out at the June 2000 informational meetings. The impacts of all FS roads were supposed to be considered in the RLRMP. Apparently, someone miscounted the number of roads. The roads shown on the maps handed out at the June 2000 informational meetings were found to be overgrown and barely discernable in the Big Creek Scenic Area, one of the Roadless Areas designated in Sam Houston National Forest. These so-called roads reduced the acreage of Roadless Area in the Big Creek Scenic Area Roadless Area. (Organization, Bellaire, TX - #A883.10155)

TO CORRECT AREAS ON THE TONGASS NATIONAL FOREST SHOWN AS “APPROVED FOR DEVELOPMENT”

Accurately map roadless areas on the Tongass: Include those areas such as Poison Cove and Ushk Bay that on current roadless area GIS plots are shown as “approved for development.” They are not. Review all court decisions concerning individual sales on the Tongass made since the date of the first Roadless Rule and include those areas where logging has been enjoined or prohibited. (Individual, Tenakee Springs, AR - #A1758.45623)

TO INCLUDE ADDITIONAL TERRITORY THE INVENTORIES EXCLUDED

The first principle for protection and management of roadless values stated by the Secretary of Agriculture on May 4, 2001 says that decision making should be based on “reliable mapping” and “local expertise and experience”. The New Mexico Wilderness Alliance has recently performed new mapping of roadless areas and found much more territory than the inventories include. These areas should be added to the inventory in order to abide by the Secretary’s principles. Also, some of the inventoried roadless areas now contain roads. (Individual, Albuquerque, NM - #A4864.45440)

Identify roadless areas omitted from Forest Service inventories. (Individual, Paluose, WA - #A6756.45400)

CORRECT THE MAP OF THE SANTA ROSA RANGER DISTRICT THAT SHOWS THE DISTRICT AS ROADLESS

I live in Humboldt County, Nevada, and I am concerned about the Santa Rosa Ranger District map showing the district being virtually roadless. (Individual, No Address - #A29078.45621)

IDENTIFY THE TRAIL IN THE THREE PRONG AREA THAT ENTERS THE MEADOW CREEK ROADLESS AREA ON THE NEZ PERCE NATIONAL FOREST AS A TRAIL RATHER THAN A ROAD

The Nez Perce National Forest map available at the hearings and open houses shows a road in the Three Prong area that enters the Meadow Creek roadless area although none appears on the map we received from the Nez Perce Forest showing recent development. This route was previously not considered a road for purposes of the roadless inventory (either RARE II or the Forest Plan) as it was (is) permanently closed, the area is revegetating, and it is not a significant impact or maintained (used for “experimental” purposes?). This, it should not be considered as a road even though it has been assigned a number. It should more appropriately be listed as a trail. (Organization, Moscow, ID - #A22654.45524)

459. Public Concern: The Forest Service should consider that past inaccuracies in determining roadless area boundaries may cause problems in the future.

Let me start with #A10: and more specifically with the issue of roadless area boundaries. The current boundaries were derived from a process designed to inventory roadless areas and determine approximate areas involved. They were never intended to become legal boundaries. The boundaries are highly inaccurate (Individual, Gold Bar, WA - #A28501.10135)

BECAUSE MAPPING ERRORS MAY PROHIBIT IMPROVEMENTS TO AREAS THAT SHOULD NOT HAVE BEEN INCLUDED IN A ROADLESS DESIGNATION IN THE FIRST PLACE

These inaccurate boundaries have the potential to create problems in the future when usage dictates an improvement to an existing road that was not intended to be in a roadless area but was partially included due to mapping errors. My original comments noted a portion of US 12 in a roadless area. Rather than correct the boundary, the Forest Service added some additional language mitigating the problem with US highways. That begs the question of why it is in the roadless area to begin with and does nothing to resolve the problem with FS roads that are inadvertently in the roadless area. (Individual, Gold Bar, WA - #A28501.10135)

460. Public Concern: The Forest Service should coordinate with adjoining Bureau of Land Management lands when making maps.

There needs to be better coordination between adjoining National Forest and BLM lands when making maps, laying out trails, and establishing travel plans. Many times a trail is open in one jurisdiction but

becomes closed when crossing over the boundary to another jurisdiction resulting in an overall loss of motorized recreation opportunity. (Organization, Helena, MT - #A13226.15162)

461. Public Concern: The Forest Service should ensure that Forest Visitors Maps are consistent with the Forest Travel Plan.

TO DECREASE VISITOR CONFUSION

Conflict of uses is aggravated by Forest Visitors Maps that are not consistent with the Forest Travel Plan. All forest visitors need to clearly understand what areas, roads or trails are open for motorized travel and what areas, roads, or trails are closed to motorized travel. We have experienced a number of misunderstandings from both non-motorized and motorized visitors. The Travel Plan Map and Forest Visitors Map should be the same. Also, this combination map should include additional detail such as contour information so that the public can better determine the location of roads and trails that are open or closed. (Organization, Helena, MT - #A13226.15163)

462. Public Concern: The Forest Service should use Geographic Information System technology to document and map the location of uninventoried roadless areas larger than 1,000 acres.

GIS maps generated by conservationists document location of uninventoried roadless areas larger than 1,000 acres. They have been provided to the Forest Service. The agency has the same technology and, with the push of a button, could also generate such maps. (Organization, Moscow, ID - #A22654.45320)

463. Public Concern: The Forest Service should consider that forests have not been accurately described or represented to the public.

OLD GROWTH AND SECOND GROWTH HAVE NOT BEEN ACCURATELY DESCRIBED

The amount of second growth on National Forests including pre-Forest Service logging and fire events is generally under reported. There are much larger areas of logged over forests that are not represented as timber areas in Forest Planning Revisions. In mapping these areas are not represented as areas that have been already been altered a great deal by man. In reality, these areas do not possess many of the attributes that are so valuable in older mature forests, such as many dead snags per acre, and larger amounts of carbon sequestered in dead woody material. For example, on my districts on the White River NF, the designated timber areas in the new forest plan revision are only a few thousand acres. However, the areas that have been actively logged since the turn of the century and do not contain old growth forest attributes because of the past logging number in the tens of thousands of acres. Therefore, if someone looks at the forest plan revision map for 2001 one may conclude that the timber operations on the forest are a very small percentage of the Forest operations as a whole. However, if one looks at the total amount of logging and road building that has occurred and still has a cumulative ecological effect on the watersheds, the percentage would be much, much higher. Roadless designation is acting to protect many areas that still possess these older forest attributes and are allowing some areas to continue to acquire those attributes. (Individual, Penrose, CO - #A21448.45500)

It is quite clear by the comments supporting the maintenance of these areas in their "pristine roadless condition" that most of the people commenting have never seen the areas covered under this plan. If they had, they would know that these areas have been logged, mined and in some cases have roads, still in use, predating the formation of the Forest Service. . . . Over 30% of the Payette National Forest has burned over the past 10 years. Trees will not begin growing in much of the areas for 50 to 100 years because of the intensity of the fires. Almost none of these areas have had any trees planted following the fires. There is no plan to plant these areas because they are steep, have few roads and the Payette National Forest doesn't have the funds to plant new trees. They remain at high risk for repeat fires in the current condition. A second burn in these areas will further sterilize these soils so that trees may not grow for an even longer period of time.

The Roadless Area Initiative has been one of the biggest hoaxes carried off by the Clinton administration. By labeling these areas “roadless” and “pristine”, support has been gathered from people who have not and will never see these areas. Many of these areas do not have the types of “old growth” that the public is being lead to believe they support. (Individual, McCall, ID - #A29305.45100)

TRAVELWAYS HAVE NOT BEEN ACCURATELY DESCRIBED

The current data being collected by the evaluation team does not fully show the roaded nature of these areas as it does not include the many well established and utilized motorized travel ways.

In addition Non-FS Federal along with State and County Roads are not included in the Forest Service classified road system, so much of the areas considered as roadless now and in the future local Forests and communities will have to go through extensive studies to eliminate obviously roaded areas set aside by mindless beltway bureaucrats and politicians who don't have a clue of what conditions occur on the ground. (Individual, Alturas, CA - #A28581.10135)

Inventories General

464. Public Concern: The Forest Service should inventory certain features in roadless areas.

INVENTORY AND EVALUATE ALL NATURAL RESOURCES AND THEIR POTENTIAL VALUE, INCLUDING EXTRACTIVE MINERALS

Describing Values: In evaluating and inventorying “roadless” areas the USFS must inventory and evaluate ALL natural resources and their potential value, including extractive minerals. Our nation is rapidly running out of the strategic mineral resources vital to sustaining our society. The U.S. is becoming more dependent on foreign suppliers of these critical mineral resources. The USFS must evaluate the real cost to society of closing off potential mineral areas with “roadless” designations. (Individual, Tucson, AZ - #A5625.45000)

INVENTORY ALL INFRASTRUCTURE AND DEVELOPMENTS

Require an inventory of all developments including: roads, routes, travelways, trails, cabins, or other human caused development or disturbance.

In order to make informed planning decisions on the future management of roadless areas, it is essential that all information be available to the decision makers. For this reason, it is essential that all evidence of human use or development should be identified and mapped. This proposal would require that a complete inventory be conducted before a management plan is developed. (Organization, Salt Lake City, UT - #A12009.45400)

INVENTORY AND GROUND VALIDATE EACH ROAD AND TRAIL TO DETERMINE ITS RECREATIONAL VALUE AND ANY PROBLEMS REQUIRING MITIGATION

Each road and trail should be inventoried and viewed on the ground to determine its recreational value and any significant problem areas that require mitigation measures. Each road and trail should be evaluated for its value as a motorized loop or connected route. Each road and trail should be evaluated for its value as a dispersed campsite or as access for all multiple-use visitors. Every problem has a solution. Every impact has a mitigation measure. Roadless Rule alternatives should be developed with the objective of including as many roads and trails as possible and addressing as many problems as possible by using every mitigation measure possible. (Organization, Helena, MT - #A13226.45400)

INVENTORY TOPOGRAPHIC AND PHYSICAL CHARACTERISTICS

What are the characteristics of the land to be considered? All the topographic, and other physical characteristics. The existing and potential flora and fauna must be inventoried and mapped, the geographic location in relation to the other similar and dissimilar areas and any cultural developments must be inventoried and accurately mapped and described, the size of the area is very important. (Individual, Manhattan, MT - #A21848.45100)

The roadless areas identified by the final rule cover 58.5 million acres. This large expanse of area covers broad ranges of ecosystems and forest types. Each individual unit of forest needs to be fully examined and analyzed to gain a complete understanding of the characteristics that define that forest. Specific characteristics include: tree types, other vegetative cover, wildlife present, soils, hydrology, topography, and climate. However, other characteristics not related to the environment should be considered also. These include the specific uses of the forest, the users, and how the land and resource management plan addresses those concerns now.

Specific environmental values to be considered are the value of the ecosystem for wildlife protection, recreation, aesthetics, watershed protection, and overall health of the ecosystem. Each individual unit of forest has different environmental values that should be taken into consideration when making individual decisions about that specific forest and how it should be managed. (Association, Washington, DC - #A28689.45000)

INVENTORY FOREST HEALTH CONDITIONS

Prior planning for immediate access into inventoried roadless areas is imperative. Additionally, the current status of Forest conditions must be inventoried and mapped, e.g., dense stands in need of thinning; areas of heavy fuel build-up and in need of controlled burning. (Individual, Fort Collins, CO - #A17987.30410)

INVENTORY VALUES, SOCIAL AND ECONOMIC IMPACTS, AND LONG-TERM USES

Delineation: Before any decisions can be made one must know what your decision is about. Any areas proposed for roadless designation must first be delineated on maps and then inventoried for the values they have, what social and economic impacts they may affect, and determine what is best in the long term for the land. Has this process been done for any, all, or some of the lands involved in the roadless rule? (Association, Columbia Falls, MT - #A18043.45100)

INVENTORY ROADLESS AREAS, ROADED AREAS, CLASSIFICATIONS OF ROADS, AND PRIVATE ACCESS ROADS

Before any proposal goes forward, the agency must fully inventory roadless areas, roaded areas, classifications of roads and private access roads. Additionally, the inventory must be accurate down to the forest level so that decisionmakers and the public can be fully informed. Most importantly, the agency must consider the economic and social impacts when considering any final action. (Organization, No Address - #A29917.45400)

465. Public Concern: The Forest Service should specify when the uninventoried roadless areas are to be inventoried and clarify that existing management will not change prior to completion of the inventory.

The Forest Service should clearly specify when the “uninventoried roadless areas” are to be inventoried and clarify that existing management is not changed prior to completion of the inventory. Absent a clear and strict time line, the failure to act could create additional gridlock in management of the National Forests. (Elected Official, Douglas County, OR - #A11811.45420)

466. Public Concern: The Forest Service should delete roaded portions of inventoried roadless areas from the inventory.

Roaded portions of inventoried roadless areas should be deleted from the inventory. (Association, Conroe, TX - #A8076.45400)

If an area is currently or previously roaded, it should be dropped from the Roadless inventory. (Organization, Maryville, TN - #A8754.45400)

Roaded portions of inventoried roadless areas should be deleted from the inventory. If these areas are not removed, existing roads should be maintained to provide access for fire mitigation and fire fighting activities. (Elected Official, State of Minnesota - #A15541.45512)

467. Public Concern: The Forest Service should include previously inventoried trails in the present inventory.

Return trails that used to be on the Forest Service trail inventory to the present inventory. (Organization, Helena, MT - #A13226.45400)

468. Public Concern: The Forest Service should clarify that the existence of user-created routes is not an appropriate reason for removing a roadless area from the inventory.

Prohibit Illegally Created Unclassified Routes In Roadless Areas.

The final rule should make it clear that the existence of user-created and other unclassified routes are not an appropriate reason to remove a roadless area from the inventory. (Organization, Missoula, MT - #A21359.90420)

469. Public Concern: The Forest Service should consider a road that has appeared on a forest map for more than ten years to be a road.

FOR THE PURPOSES OF DEFINING ROADLESS AREAS

Fifty-two percent of the designated “Inventoried Roadless Areas that do not allow road construction or reconstruction” in the State of Colorado are within the Rio Grande National Forest. This seems to be disproportionate for a single National Forest. In addition, until the definition of “Roadless” is clarified, designating areas is difficult. Saguache County Commissioners contend that if a road has been shown on a Forest map for more than ten years, it is a road for the purposes of defining roadless areas. (Elected Official, Saguache County, CO - #A28774.45500)

470. Public Concern: The Forest Service should clarify the present status of lands classified as inventoried roadless areas—roaded or unroaded—since RARE II.

The resort I work at, Sierra-at-Tahoe Snowsport Resort, has on its western boundary an Inventoried Roadless Area. Even though it is listed as IRA where road construction and reconstruction is allowed, there is also a section of IRA where roads are not permitted. There is no question that our resort has influenced the improved access to this land and thus has changed the character of the land since it was reviewed under RARE II in 1979. To that end, we are very interested to find out if any reclassification of land is anticipated in the near future. To assume that the land and its qualities have not changed in over 20 years is not logically understood. We would respectfully like to have access to all review documents completed on all land adjacent to Sierra-at-Tahoe permit area that was placed in either IRA roaded or unroaded since the RARE II work was completed. (Business, Twin Bridges, CA - #A8808.45440)

In 25 years, the RARE II areas have obviously changed. But RARE II was not updated for the Roadless Initiative. Rather, the RARE II areas were used as they were originally defined.

To address the changes that have occurred in 25 years, the DEIS had to define very confusing terms like “roaded roadless areas”, “unroaded roaded areas” and “unroaded roadless areas”. To make matters more confusing, the DEIS Alternative 2 has that the next round of Forest Plans will look at all National Forest areas outside the RARE II areas to see if more are suitable for inclusion into IRAs under this proposal. Thus, there may be millions of acres included that aren’t on the map. The DEIS is asking the public to comment on impacts on land which does not have a defined boundary. And this is not an insignificant amount of land that may eventually be included—this may more than double the amount of land included in some States, particularly in the east. The DEIS does not even attempt to explain this or estimate the increased areas that will be impacted.

The DEIS addresses this serious flaw by simply saying that local managers will define these areas at the next round of the local Forest Plan. How can the public be asked to comment on impacts on the lands that have not even been defined or identified? (Union, No Address - #A28881.45000)

What are your intensions in regards to the lands, which have been roaded since the last survey?
(Individual, Walla Walla, WA - #A17698.45400)

471. Public Concern: The Forest Service should not change current inventory information.

BECAUSE IT WOULD BE A VIOLATION OF THE NATIONAL ENVIRONMENTAL POLICY ACT

The areas depicted on the roadless FEIS volume II are accurate and complete. These areas were inventoried through a complete public involvement process conducted through each Forest Plan. You can not legally change these inventories without violating NEPA. (Individual, Salt Lake City, UT - #A26984.45400)

472. Public Concern: The Forest Service should require forests to survey areas not included in the Roadless Area Conservation Rule.

THROUGH THE NATIONAL FOREST MANAGEMENT ACT PROCESS

The NFMA process can fill in whatever details are left over, but it should not be used to countermand the national policy set forth in the rule. One area in which the NFMA process would be especially valuable, however, would be in surveying the lands ignored by this rule (such as roadless areas below 5,000 acres in size, and formerly roadless lands that have been degraded by logging) for the purpose of identifying areas to be added to the roadless inventory, or to be rehabilitated to roadless status. Local forests should be mandated to conduct such reviews, using the NFMA process. (Individual, Pendleton, OR - #A30482.20201)

473. Public Concern: The Forest Service should identify all roadless areas created or enlarged by road closures.

Under the NEPA regulations an agency can not commit resources prejudicing selection of alternatives or otherwise limiting the choice of alternatives before making a final decision. We note that the Forest Service has been closing and obliterating roads with the stated intent to create larger unroaded areas. To ensure that the agency allows for proper review and comment by the public, we suggest that all roadless areas created or enlarged by road closures be identified. (County Attorney, Grant County, OR - #A17667.45510)

474. Public Concern: The Forest Service should state who did the roadless inventory, and explain the methodology and criteria used to determine whether an area is roadless.

Who did the inventory, how, what methodology was used, what criteria was used to determine "roadless"??? (Individual, Tucson, AZ - #A5625.10135)

Accuracy of Inventories

475. Public Concern: The Forest Service should update the roadless area inventory.

BY USING CURRENT INFORMATION

Forest lands should be re-inventoried for roadless values. The inventory upon which the roadless rule was based is outdated. The last inventory of roadless areas—RARE II—was completed in 1979. Circumstances and conditions within those areas have changed. Any roadless policy should be based on sound science, which, in this case, requires that forest lands be reinventoried prior to its adoption. (Individual, Eagle, ID - #A17754.45400)

As a 37 year veteran of the Forest Service, I served as a district ranger during both Rare 1 and Rare 11. The inventory then was flawed. Its main purpose was to inventory for potential wilderness. The Endangered Species Act did not weigh into the evaluation at that time. We were asked to inventory large areas that met certain lack of roads criteria. The productivity of the forest in the inventoried areas was not put into the equation. (Individual, No Address - #A20465.45410)

Our objection is based on two key points; 1. That the study conducted by the Clinton Administration failed to update the physical land conditions recorded in an inventory that was conducted in the late 1970's, and 2. Those conducting the study failed to inform the public that some of the areas they were asking the public to comment on were no longer roadless areas. Ignoring obvious facts in the study process resulted in misrepresentation of existing land conditions to the public, and a public response that was distorted because of this omission. This whole study became a centralized planning process that produced bad public policy due to inaccurate data, misrepresentation of factual information to the public, and conclusions that were based on factual and process errors.

In our opinion, response to the ten questions listed in the advanced notice of proposed rule making is meaningless as long as the two errors noted above stand. We urge the Forest Service to start the process over, correct an old inventory, and then conduct the study based on local conditions using the local National Forest planning process as the venue for local decisions. (Organization, Rhinelander, WI - #A19070.45400)

The previous "roadless" rule making was just a facade for a decision that was already made. Without any analysis someone got a burr up his butt and decided roadless should be roadless. The lines were drawn over two decades ago! That's at least a generation different. A road back then was something you could drive your father's Oldsmobile on. Today we have an abundance of four-wheel drives, SUV's, ATV's and motorcycles. What wasn't considered a road two decades ago, is now a major access to folks with these improved motor vehicles. We should not, and cannot use these old inventories as current best science. The "roadless" areas need to be re-evaluated with forest plan revisions. (Professional Society, Sheridan, WY - #A28276.45440)

Fishlake National Forest's Strategic Communication Director Linda Jackson, recently confirmed that the inventories from Utah's four National Forests not going through the revision process (Fishlake, Ashley, Dixie, and Manti-La Sal) are seriously flawed. Utah's National Forests are relying on roadless area inventories from 1979. More reliable inventories were conducted in 1983 but never completed due to the passage of the Utah wilderness bill. The timing was not coincidental. Utah's congressional delegation purposefully halted these inventories. (Organization, Missoula, MT - #A21359.45622)

BY ALLOCATING MONEY TO IDENTIFY ROADLESS AREAS NOT CURRENTLY IN THE INVENTORY

I am very interested in seeing that off-road vehicles be prevented from going into roadless areas, while monies should be allocated to identify roadless areas not currently in the Forest Service's inventories. (Individual, Fort Thomas, KY - #A11699.91221)

BY INVENTORING ALL RESOURCES

All resources should be inventoried. The historic range should be evaluated, and current solid objectives considered to develop an adjusted desired future condition. There should be an analysis of current activities, and the resource impacts. Forest health conditions, fuel loadings, and burn windows must be reviewed. Historical motorized recreational use and impact should be analyzed. The possibility of road access, considering cost and environmental impacts, must be considered. Possible timber harvest systems should be studied. How will decisions impact local communities, and what job expertise is available in the area is a consideration. And last, how will vegetative management options impact air and water resources in the area. (Association, Kamiah, ID - #A3685.45400)

The other concerns we have are that the roads that were inventoried under Rare I and Rare II during the sixties and seventies need to be looked at to determine if they should have roadless designation. The areas on the Manti have presently used RS 2477 roads. We don't need more roads except to harvest

infested timber and manage the forest properly. (Elected Official, Sanpete County, UT - #A15546.45400)

All the topographic, and other physical characteristics: The existing and potential flora and fauna must be inventoried and mapped; the geographic location in relation to the other similar and dissimilar areas and any cultural developments must be inventoried and accurately mapped and described, the size of the area is very important. (Individual, Paradise, MT - #A11753.45000)

BY INVENTORYING ROADLESS ACREAGE

It has also been observed that entire roadless areas have been left out of the official list of inventoried roadless areas. There are quite a few environmental groups that have studied the actual roadless areas and have found evidence of gross underreporting of roadless acreage. Please solicit these groups for much more complete inventories. (Individual, Painted Post, NY - #A357.45400)

First the Forest Service needs to start with an accurate inventory of true roadless areas. For years the Forest Service has been barricading existing roads, intentionally leaving these roads off of maps and calling the area roadless. (Individual, Lewiston, ID - #A835.45400)

The inventory of roadless areas that the January rule relied on was completed in 1979. Since that time there has been over twenty years of activity, including forest planning. You are working with dynamic systems not static, plastic Forests. Many things have changed during the years since RARE II including fires, road building, campground development, watershed protection, and the list goes on and on.

Any consideration of conservation of roadless areas must begin with an accurate inventory of what is in reality roadless and undeveloped. Without an accurate inventory the whole exercise will again be a farce, and a violation of plain English. It will not have the respect of the stakeholders, only the small-minded special interest groups. So please start the re-examination with an accurate inventory that you can defend to the American public. (Individual, Ogden, UT - #A878.45400)

BY INVENTORYING PREVIOUSLY UNIDENTIFIED ROADLESS AREAS

I support protecting inventoried roadless areas from any development while dedicating resources to inventory unidentified roadless areas. (Individual, Asheville, NC - #A911.10150)

I would like to encourage the forest service to identify all the de facto roadless areas that were missed in this most recent inventory and add them to the protected areas. (Individual, Painted Post, NY - #A5297.10157)

Implement the rule as written. Then begin . . . evaluating other roadless areas which the Forest Service missed in their inventories and come up with a plan to protect them, too. (Individual, Olympia, WA - #A4503.10157)

Forest planning should identify uninventoried roadless areas per a consistent and inclusive criteria. Roadless areas should be mapped as starting at the edge of road corridors. Narrow strips of roadless and should be included, if they provide the only unmanaged habitat in the vicinity or the only connectivity between other areas. They should allow inclusion of stumps, logging units, and old roads no longer in use by normal highway vehicles. The guidelines need not be as strict as those for designated wilderness areas. Even with these signs of prior human disturbance, the ecological and recreational values are significant. (Individual, Chelan, WA - #A22174.45400)

BY INVENTORYING AND MAPPING ROADS

My husband and I regularly use a road in the "roadless" area in the Siskiyou National Forest. We use the road to access our mining claims. The road was built by miners in the early 1950s and since then has been used by miners and recreationalists of all kinds. It is a shame this road doesn't seem to count. It is not a super-highway, but works well even for two wheel drive vehicles. This road should be inventoried

and accurately mapped. There are many roads in the Siskiyou National Forest that are used which should not be closed or considered to be in roadless areas. The radical environmentalists in this area have already been quoted in the local newspaper saying these roads do not exist since they are in the "roadless area." (Individual, Grants Pass, OR - #A5305.45400)

Inventory all roads currently in existence. Reevaluate whether or not these areas should really be designated "roadless". Determine what sort of a road system is necessary for fire protection. Do not eliminate any of the existing roads. Take local needs into consideration before removing any roads or restricting travel in the IRAs. (Individual, McCall, ID - #A29305.45400)

In order to evaluate protection and management of inventoried roadless areas you must insure that all pre existing routes in the area have been inventoried and provisions are made in the management process to include routes that may have been excluded. What specific threat is exclusive/inclusive to the roadless areas? Best Conservation Management practices are mandated and applicable to all public lands. The special roadless designation itself segregates the American Public. (Individual, Santa Ysabel, CA - #A26392.45400)

In preparation for our ground-truthing fieldwork, we prepare field maps that show the known coverage of roads from the Forest Service's digital and mylar layers. When we encounter a motorized route that is not on this field map, we label it as a ghost route. Of the 537 miles of road we traveled this summer, 73.6 miles were ghost routes.* [Footnote* all figures tabulated using Geographic Information System software, USFS and HCCA data.]

This example of incomplete information raises a question: How can we effectively manage what we do not fully understand? Before any sweeping decisions about the roadless areas remaining on our National Forests are made, it seems wise to first assess their locations, area, connectivity and dispersal. (Individual, Silverthorne, CO - #A22049.45440)

BY INVENTORYING CLASSIFIED AND UNCLASSIFIED ROADS

Roadless areas must be properly and accurately mapped at the forest level in order that informed decisions can be made. In addition, a complete inventory of existing roads both classified and unclassified must be completed. (Individual, Grants Pass, OR - #A5305.10135)

You cannot manage land without a proper inventory of roads (classified and unclassified), the location of other ownerships whose access must be guaranteed. (Individual, Oroville, CA - #A17888.45400)

BY COMPLETING A COMPREHENSIVE BIOLOGICAL INVENTORY

Please do not rescind the Forest Service's Roadless Area Conservation Rule and mandate that the agency do the comprehensive biological inventory which has never been fully done on public lands, insisting that Congress fund this baseline data before any further multi-use activities destroy something irreplaceable in the forest's biological web. (Elected Official, San Miguel County, CO - #A4549.45400)

The best way to manage roadless areas is as follows:

. . . (6) Conduct a complete biological inventory of the public lands system, and make the results public. (Individual, Dallas, TX - #A18002.30200)

BY USING UNIFORM CRITERIA

In the forthcoming Forest Plan amendments and/or revisions, it is critical that all the inventoried roadless areas (and other unroaded areas greater than 5,000 acres) be accurately mapped using uniform criteria. At a minimum, this mapping should include all existing roads, both classified and unclassified, and those areas at risk of wildfire, insects and disease infestations. Given accurate information, including mapping, we feel that future management options can be developed and assessed for the total National Forest on a local basis. These decisions will determine what the long-term use of the roadless areas should be, from multiple-use to future wilderness. (Business, Colville, WA - #A3362.45400)

The Forest Service must first provide up-to-date criteria for the delineation of roadless areas. The criteria should be consistently applied to all forests and should include such factors as forest health, wildlife habitat, water quality, scenic values, access to non-federal land, and a variety of recreational opportunities. Roadless portions of inventoried roadless areas should be deleted from the inventory. (Business, Alexandria, VA - #A11684.10135)

NFMA provides sufficient direction for evaluation of roadless areas at 36 CFR 219. The Forest Service should utilize the existing NFMA planning regulations to determine what specific issues need to be addressed on a forest-by-forest basis.

The Forest Service must first provide up-to-date criteria for the delineation of roadless areas. The criteria should be consistently applied on all forests and should include such factors as forest health, wildlife habitat, water quality, scenic values, access to non-federal land, and a variety of recreation opportunities. Economic and social relationships should also be evaluated, including those that directly impact working families and local communities. (Tribal Corporation, Anchorage, AK - #A20340.45000)

The agency should provide up-to-date criteria for the delineation of roadless areas. The criteria should be consistently applied on all forests and should include such factors as forest health, wildlife habitat, water quality, scenic values, access to non-federal lands and a variety of recreational opportunities.

IRA's have opportunities for roadless recreation (motorized and non-motorized), specialized wildlife habitat, and other values that may not be available in roadless areas. These potential uses deserve equal consideration in the evaluation process, but the roadless character should not preclude consideration of a full range of uses, including uses that would require development of roads or other access. The evaluation needs to be site specific in the context of the value and use of the adjacent areas. The analysis should include full disclosure of the consequences of various management strategies on forest health, use opportunities, susceptibility to fire and impacts on adjacent private and public lands and communities.

The agency should also consider:

The nation's need for Timber

The existing recreational uses should be preserved

The opportunity to provide for motorized and mechanized recreation

The management prescriptions in areas contiguous to each IRA

The current and historic uses of the area

Any management decisions that are necessary to improve or maintain existing conditions. (Individual, Richfield, UT - #A30413.50200)

BY USING A SCALE APPROPRIATE FOR PLANNING

Informed decision-making — To ensure the rule is implemented with more reliable information and accurate mapping. This includes drawing on local expertise and experience through the local forest planning process.

The identification of the roadless area should include mapping of the area at a scale appropriate for planning (normally 1:24,000). The roadless areas identified and mapped should be used to update the list of roadless areas identified and listed in the FEIS of the roadless conservation rule. (Civic Group, Roanoke, VA - #A1713.45400)

BY HAVING AN INDEPENDENT THIRD PARTY COMPLETE A SCIENCE BASED INVENTORY OF ROADLESS AREAS AND FEATURES

I recommend that the US Forest Service does not act in haste to implement a "Roadless Area Conservation" plan that is improperly developed and inappropriate to the needs of the specific forest being considered as well as the needs of the nation at-large. Complete, instead, a third-party review of "roadless" areas, and develop conservation of these areas using NFMA and NEPA. The Forest Service will undoubtedly receive many comments on this proposed action. (Individual, Reno, NV - #A21755.10130)

Much work has been completed since the 1970s toward inventorying Forest Service lands. The results of this work can be used as the basis of an expanding inventory; supplemented with additional necessary work. The Forest Service should specifically describe and inventory the physical areas that are proposed for "roadless designation. Subsequent to this the agency should carefully inventory and describe the legal (in-holdings and other designated areas), man-made structures and/or features (roads, buildings, dams, canals, etc), natural resource potential, environmental, social and cultural values or characteristics within the areas designated. This needs to be completed by an objective, science-based third-party review. (Individual, Reno, NV - #A21755.10137)

There appears to have been little objective study of the areas that have been designated as roadless. I know there was an effort by special interest groups to have field volunteers do on-the-ground surveys of areas that were included in the roadless area designations.

As most of the area under proposed roadless designation probably has air photo coverage, a systematic examination should be conducted by independent professionals before the discussion even proceeds.

Please contact me if there have been such studies conducted, so I and other interested parties can examine the results of such systematic surveys. (Individual, Aurora, CO - #A773.10135)

BY INCLUDING LOCAL, STATE, AND FEDERALLY ELECTED OFFICIALS IN THE PROCESS

Accurate mapping and inventory processes must be completed so informed decisions can be made. Local and state and federal elected officials must be included in this process. (Association, No Address - #A25990.45400)

BY USING THE CRITERIA LISTED IN THE FOREST SERVICE PLANNING HANDBOOK

One of the early steps in the revision of Forest plans is to update the inventory of roadless areas. The inventory should be conducted according to criteria listed in the Forest Service Planning Handbook. In many cases the Forest inventory of roadless areas conducted in accord with these criteria will be changed substantially from the inventory that was conducted during RARE II, which is the most current inventory for many Forests at this time. (Civic Group, Roanoke, VA - #A1713.45400)

THROUGH STAND EXAMINATIONS

Existing Roadless areas may be in desperate need of active management to reduce forest insect and disease incidence and fuels, improve forest tree vigor, provide for desirable flora and fauna species from both the ecological and from mankind's perspectives, and to support local recreational and forest product utilization activities.

Obviously a complete inventory of forest stands and conditions must be made through the stand examination system and other inventory measures. Recreation potential evaluation must utilize accurate maps indicating cultural improvements as well as topographic features on a small drainage-by-drainage basis. The existing forest planning procedure is quite capable of this necessarily intensive inventory and analysis. (Individual, Paradise, MT - #A11753.45000)

Stand examination and other inventories must be made, and all existing and predicted future conditions must be accurately described and mapped. Only then can officials bring forth the data and provide necessary analysis to the interdisciplinary team and the public. (Individual, Paradise, MT - #A11753.30110)

WITH CITIZEN INVENTORIES

Another flaw in the Clinton rule was that it only addressed RARE II areas. As you know RARE II was litigated and the Ninth Circuit Court of Appeals found that the inventory was insufficiently site-specific and did not consider a sufficient range of alternatives. The UEC, as well as other environmental groups in the west, have been conducting roadless area surveys of National Forest lands. The UEC has surveyed all six of Utah's National Forests and has found and documented an additional 70 roadless areas that meet all of the criteria for roadless designation. These 70 areas provide at a minimum (some areas are larger than the 5,000 acre minimum requirement) at least 350,000 additional acres of roadless lands that were not included in the RARE II inventory, and deserve protection under any roadless policy the Forest

Service implements. The Forest Service should make a concerted effort to obtain all citizen inventories, verify the documentation and add these areas to the RARE II inventory so they are all afforded the protection under any roadless policy. (Organization, Salt Lake City, UT - #A17170.10157)

The 1979 RARE II EIS did an extensive review of roadless areas in National Forests. The EIS noted that “The public was asked to suggest additions to or deletions from an inventory of roadless areas, and to suggest which should be used to evaluate those areas for wilderness or nonwilderness use”, (page iv). This same opportunity to suggest boundary revisions was NOT afforded in the rulemaking that culminated on January 12, 2001. Any future rulemaking must make that a clear directive. (Business, Wright, WY - #A23085.15100)

Another flaw in the Clinton rule was that it only addressed RARE II areas. As you know RARE II was litigated and the Ninth Circuit Court of Appeals found that the inventory was insufficiently site-specific and did not consider a sufficient range of alternatives. WildLaw, as well as other environmental groups, have been conducting roadless area surveys of National Forest lands. WildLaw has surveyed all of Alabama’s National Forests and has found and documented additional roadless areas that meet all of the criteria for roadless designation. The Forest Service should make a concerted effort to obtain all citizen inventories, verify the documentation and add these areas to the RARE II inventory so they are all afforded the protection under any roadless policy. (Organization, Montgomery, AL - #A27512.45300)

Inventoried Roadless Areas in Utah are woefully short of the actual acreage to be found. Every forest in Utah failed to identify all roadless areas. Historically the last round of FS planning took place at about the time of the 1984 Utah Wilderness Act. The forests in Utah believed that act eliminated their obligation to identify roadless areas in Utah during the last round of Forest Plans.

In the past we have submitted maps which identify roadless areas in the Moab and Monticello Ranger Districts in the Manti-La Sal National Forest. Field work completed by Red Rock Forests indicates there is much more roadless acreage than the FS identified with RARE II. We believe this is typical of all national forests in Utah with the possible exception of the Wasatch-Cache NF. That forest accomplished a good inventory in its last analysis of the current situation. We would be glad to share our maps with the Forest Service again if you wish. Shortly we will have the maps available in a GIS format which to local ranger district could use in planning. (Organization, Moab, UT - #A30528.45622)

I attended two of the National Forest Service Roadless Area Open Houses, the Sweet Home of WNF and the Suislaw NF in Corvallis, Oregon. **Neither of these informational meetings had maps detailing the “other smaller Roadless Areas” of less than 5,000 acres that were not inventoried or included in Appendix C of the NW Forest Plan.** Many of the public kept asking to see maps delineating “just what are the 1,000+ to 5,000 acre, non-RARE I or II Roadless Areas”? Some districts do have in their database, or even mapped in pilot studies the boundaries of the smaller RA’s. **This was a frustrating and bad omission on the part of the Forest Service to hold these informational RA open houses without public access to these maps.** Some FS staff claim that these areas are not inventoried, hence no maps available. If that is the case, district by district, I strongly suggest/propose that **all of these significant RA’s are updated with *current* inventories and mapped for consideration in this proposal. Much of the data for this already exists.** (Organization, Albany, OR - #A19057.10152)

476. Public Concern: The Forest Service should integrate the best available information from its own road inventories.

BY USING CURRENT GEOGRAPHIC INFORMATION SYSTEM DATA

In addition to maintaining the integrity of inventoried roadless areas, the rule should immediately integrate the best available information from its own road inventories. This can be done from existing information in most areas and should not be delayed. The Forest Service should use current Geographic Information System road inventory coverage’s to identify the many roadless areas over 5,000 acres that were not identified during past RARE and Forest Plan inventories. By simply taking a look, the Boise

National Forest recently identified three roadless areas over 5,000 acres (totaling 26,000 acres) that it had overlooked during earlier inventories. The new information for each National Forest nationwide should not be limited to identifying roadless areas over 5,000 acres however, but should also identify roadless areas between 1,000 and 5,000 acres that were never before considered important. These smaller areas are important for ecological reasons (see below for more details).

According to Interior Columbia Basin Ecosystem Management Project (ICBEMP) data, Idaho roadless areas have much greater ecological integrity than other Forest Service lands in the state. Of 12 million acres in Idaho that ICBEMP identified as having high ecological integrity, nearly 8 million of those are in roadless and Wilderness areas. These areas also protect 25 percent of habitat for Chinook salmon, steelhead, bull trout, and westslope cutthroat trout in Idaho, and provide 75 percent of the strongholds for all salmonid species in Idaho according to the ICBEMP. Roadless areas are also the most risky areas for development and subsequent erosion, containing nearly 30 percent of all of Idaho's steep slopes. (Organization, Nevada City, CA - #A4941.45440)

477. Public Concern: The Forest Service should consider that there was an inconsistent application of data entry standards when roadless areas were inventoried.

According to the Forest Service's own data, there are over 421,000 acres of private lands and 43,000 acres of State lands within inventoried roadless areas in parcels ranging in size from five acres to hundreds of acres. As noted above however, this database may or may not have been entirely accurate since we understand that there was inconsistent application of the data entry standards. Therefore, an accurate analysis of lands potentially affected by the roadless area regulation was impossible. (Organization, Rapid City, SD - #A17011.45400)

478. Public Concern: The Forest Service should provide a physical description of the areas proposed for roadless designation.

The Forest Service should specifically describe the physical area that is proposed for "roadless" designation. Subsequent to clearly defining the proposed "roadless" areas, the agency should carefully inventory those areas and describe the legal inholdings and other designated areas, man made structures and/or features (roads, buildings, dams, canals, etc.), the natural resource potential of the area (as described in ANPR Question 5 above), environmental characteristics, and social and cultural areas of value within those areas proposed for designation. Such descriptions should be as objective as possible and should not attempt to rate or prioritize the items described. Much work has been done since the 1970s in inventorying Forest Service lands. The results of this work can be used as the basis of this inventory, supplemented where necessary with additional work. (Association, Novato, CA - #A17652.45400)

Definitions

Summary

Both those who ask that the Roadless Area Conservation Rule be implemented and those who ask that it not be implemented ask the Forest Service to clearly define terms used throughout the rulemaking process. These include such terms as road, road building, roadless, and unroaded. Not only do respondents say these terms are problematic, they also request the Forest Service clarify the relationship between them. Another point of confusion mentioned is whether roadless areas contain roads or not.

479. Public Concern: The Forest Service should define certain terms.

ROAD

The definition of a road must be broadened to reflect the reality of what is on the ground. It is unacceptable to define a road such that only mechanically maintained/constructed roads qualify. Lots of

traffic passes through our national forests on roads that were not mechanically constructed. These roads should not be defined out of existence. (Individual, No Address - #A50.45200)

Your first question is not fair because you asked for the role of the forest service in “roadless” areas. The statement of roadless and your definition of a road in itself makes your task easier. I define a road as a two track road and that is where the debate begins. My definition of a road and your definition of a road is as different as the number of acres the forest service is looking at to change or enact your roadless management plan. (Individual, Elko, NV - #A4853.45200)

If the agency decides at this time to adopt “roadless protection” guidance or directives to be applied by agency personnel in the local forest planning process, those directives should address the following:

The definition of “road” should be clear. In deciding at the forest plan level what activities can take place within protected roadless areas, it should be clear what does and does not constitute a “road”. Consistent with the Clinton Administration’s approach in the January 12 Roadless Conservation Rule, ski trails and ski ways should not be considered roads. Likewise, temporary roads and/or roads used on a seasonal basis for maintenance purposes should not be considered “roads”. These are typically service roads with no public access for vehicle transport. (Permit Holder, No Address - #A5285.45200)

I would like to see the definition of a road changed to include all existing roads including all unmaintained roads such as two tracks. These roads have been used by hunters and anglers for generations and provide important access to most people as they can not walk or ride horseback into the “Roadless Areas”. This has been my biggest objection to the “Roadless Plan” from day one. (Individual, Casper, WY - #A5080.45514)

My first concern is for the appropriate identification and definition of what a roadless area really is. The current inventory has many roads in many of the areas. The current roadless inventory is based on some antiquated standards and it makes the procedural aspects inconsistent. The process of a consistently applied roadless determination has been tried several times but each time the process was based on a sort of predetermined agenda. I was involved in both RARE’s. Both had considerable variation in the interpretation of direction information and the application of definitions. Correction of inconsistencies and appropriate definitions of roads and their influence would be a place to start. That makes the footing more equal in the mapping and the terms must be consistently and sensibly applied and defined. I am aware that 3 Forests in the Intermountain Region have not handled the map corrections, interpretations and applications similarly. Above all, the definition about what constitutes a road must be looked at in a more practical way, as well as what is the extent of influence by a road. For example much of the western United States is traversed by roads referred to as “four-wheel drive roads”. These “roads” access numerous kinds of developments essential to the management and/or enjoyment of these lands. The “greens” (preservation organizations such as the Sierra Club/ Earth Justice/Earth First!, etc.) in their lawsuits and appeals recognize them and often refer to them as “ghost roads”. Many people of the West identify these areas and say that the roads are present. They correctly point out the areas are not unroaded and vehicle traffic is not uncommon. Many of these areas have, or until recently, had no vehicle restrictions in the management plans or traffic plans for the area. Many of these areas contain numerous roads of this type and are now in the areas mapped and inventoried as roadless. Timber sale areas with an extensive net work of closed logging roads are defined as roadless. Several areas with RS 2477 roads or poorly maintained access roads to private in-holdings or mineral rights exist. In-action by the agency to deal with such roads requires that they be determined as a road, regardless of definition. Your recent unilateral Roads Policy has not settled the issue of these roads. In fact your dogmatic use of the definitions has increased the public perception of ineptness. (Individual, Cambridge, ID - #A11714.45200)

Definition and consequent classification of a road should be *strictly* held to full circumstantial, contextual framework and historical origins of the road: I.e., roads constructed in part or in full to circumvent (intentionally or not) some ecological/biological considerations that would prevent, say,

timber harvest, roadless definition, inappropriate recreation developments, etc. should not be considered roads that would prevent serious roadless inventory considerations. In fact, such circumspect activities should be considered with appropriate penalty of the law. Looking at another but related area for just one moment, is not the spirit and letter of the Endangered Species Act (ESA) designed to prevent a trend toward listing??? Is not the roadless rule to accommodate similar processes (i.e., *reduce the trend* in road increase)??? (Individual, Ewen, MI - #A17662.45200)

ROAD BUILDING

“Road building” is repair/maintenance of existing roads “building”? or is building in a new road where none existed before “road building”???? (Individual, Tucson, AZ - #A5625.10135)

UNROADED

What is the meaning of the term “unroaded”? Roadless means there are no roads within a specific area and roaded means that there are indeed roads within a specific area. The term “unroaded” is not in the NFMA, nor in any approved regulation. This term is used for no other reason than to circumvent legal descriptions . . . of what constitutes a road that has been handed down in Federal Courts.

Under RS-2477 Rights-of-Ways, the definition of a road in part states that “the mere passing of people and goods constitutes a road”. There are at this time over 90 such Rights-of-Ways legally filed and recorded in the courthouses of Shoshone, Clearwater and Idaho Counties. There are nationwide conservatively probably over a thousand of such rights-of-ways filed and recorded that have not been addressed, other than the invention of what constitutes a road ignoring legal law. These have not been addressed anywhere in this proposal. (Organization, Orofino, ID - #A8393.45200)

The Agency needs to clearly define “unroaded characteristics.” (Association, Salem, OR - #A21754.45200)

Additionally, unroaded areas should be defined as tracts with more than 1,000 acres of contiguous land that is generally free of roads suitable for standard (2-wheel-drive/low-clearance) highway vehicles. Consistent with current Forest Service roadless area inventory policy, both categories should provide greater leeway for roads and other development features in eastern national forests. (Organization, Denver, CO - #A21367.45100)

ROADLESS AREA

My concern with the entire concept of roadless areas is that they are not scientifically defined. One has only to look at the United States Department of Interior Geological Survey maps of Elko County to realize that the area is not roadless. In my experience in traveling these roads, I have never found one that does not have a reason for existence. None are there for any purpose. Those that once were necessary, and now are no longer needed, have disappeared and been obliterated by time and nature. Wheeled access to Elko County is necessary for all the citizens. Even backpackers use these roads to reach wilderness areas. (Individual, Elko, NV - #A4868.45100)

It is clear that existing roads (classified, unclassified and temporary) are present in “Inventoried Roadless Areas,” but there is no guidance for “responsible officials” to use in determining the maximum threshold amount of roads that can be present in an area below which the area can still be considered for inclusion in the Inventoried Roadless Areas. This decision appears to be left to the discretion of the responsible officials and is, therefore, arbitrary in its nature. To promote uniformity and consistency through the National Forest System, what constitutes “roadless” relative to the presence of previously existing roads must be more clearly defined in the regulations. Item (5) under “Roadless Area Characteristics,” for example, could lead to the conclusion that the presence of any classified, unclassified or temporary roads would exclude an area from the “Inventoried Roadless Areas.” Yet, this is clearly not the case. The definitions of Inventoried Roadless Area lack clarity. (Organization, Fullerton, CA - #A3705.45513)

The starting point of my comment is that the condition of being roadless is an artificial and an unscientific basis for classifying land for the uses that will be allowed. After all, two-hundred years ago the entire western area was roadless, but that did not deter its settlement and use according to its suitability. The process was not perfect, but a vibrant and productive economy arose from decisions that were correct more often than not. (Individual, Missoula, MT - #A4987.45500)

Let us dispense with the rhetoric and cut to the meat of the issue. Let's give the hackneyed phrase "Roadless Areas" a rest. Because Roadless Areas represent the only inviolate remnants of unprotected public land, let's use "inviolable remnants" when addressing RARE II Inventoried Roadless Areas, if only for the purpose of this correspondence. (Organization, Republic, WA - #A6302.45100)

We advocate that the broadest possible definition of "roadless" be used and require a definition that is at least as broad as that used in the RARE II process. Some evidence of past human disturbance should not disqualify an area from being designated as a roadless area. (Organization, Cave Junction, OR - #A17235.45200)

Clearly, the Forest Service needs to reiterate and clarify the definition of "roadless area" and require individual forests to abide by it. We strongly urge the agency to clarify the roadless area definition to include:

All previously inventoried roadless areas except those that have subsequently been deliberately roaded by the Forest Service through a NEPA process; and

Similarly undeveloped lands (including small areas adjacent to designated wilderness and inventoried roadless areas) that were passed over in prior inventories or have subsequently been added to the National Forest System. (Organization, Denver, CO - #A21367.45100)

480. Public Concern: The Forest Service should clarify the relationship between inventoried roadless areas, unroaded areas, and classified roads.

Definitions

The Forest Service needs to clear up the confusion over the relationship between inventoried roadless areas, unroaded areas, and classified roads. Roadless areas should be defined to include:

all previously inventoried roadless areas except those that have subsequently been deliberately roaded by the Forest Service through a NEPA process; and similarly undeveloped lands (including small areas adjacent to designated wilderness and inventoried roadless areas) that were passed over in prior inventories or have subsequently been added to the National Forest System.

Additionally, unroaded areas should be defined as tracts with more than 1,000 acres of contiguous land that is generally free of roads suitable for standard (2-wheel-drive/low-clearance) highway vehicles. Consistent with current Forest Service roadless area inventory policy, both categories should provide greater leeway for roads and other development features in eastern national forests. (Organization, Missoula, MT - #A21359.45100)

The Forest Service Should Consistently Use Historic Definitions of Roadless Areas.

The Forest Service needs to clear up the confusion over the relationship between inventoried roadless areas, unroaded areas, and classified roads. We are concerned that the Forest Service underestimated the total roadless acreage in Region 2 by using an unsupported and inappropriate definition of a road. Both the Arapaho-Roosevelt and White River National Forests based roadless area inventories prepared during the forest plan revision process on a definition that conflicts with the RARE II definition of a road and the definition in the Forest Service Handbook. We suspect that this inappropriate definition may have been applied to inventories elsewhere in Region 2 and perhaps in other regions, and strongly urge the Forest Service to ensure that roadless area inventories are based on the appropriate definition in the final rule.

To the best of our knowledge, the Forest Service has for decades interpreted the term “improved road” to mean a route constructed and maintained for use by two-wheel drive, low-clearance vehicles. Despite these historic definitions, the White River National Forest recently completed an inventory as part of its plan revision using an overly restrictive standard that excluded from its roadless area inventory, areas that the Forest Service found were not capable and suitable for wilderness designation. This extremely restrictive standard included -- visual and auditory impacts from developed areas, defensibility of the area against prohibited uses, future planned timber sales, and existing motorized off-road vehicle use. None of these standards is relevant to any of the prohibitions or procedures in the proposed roadless areas conservation rule; therefore lands excluded from the roadless area inventory through the application of these irrelevant standards should be included in the rule making. For example, the Forest Service discounted all acreage within Copper Mountain Ski Resort’s master development plan boundary even though it is completely roadless. It also appears that the Forest Service did not include Independence Mountain adjacent to the Keystone Ski Area as roadless even though it is clearly roadless. (Organization, Denver, CO - #A21367.45200)

There is a distinct difference between “unroaded” and “roadless” areas. The rule does not clearly differentiate and keep those two categories separate. The roadless rule *should not* include unroaded areas. (Elected Official, Crook County, WY - #A15545.45200)

481. Public Concern: The Forest Service should accurately label unroaded and roadless areas.

SO THAT OPPOSING INTERESTS CAN UNDERSTAND THE ACTUAL SITUATION ON THE GROUND

My biggest other concern is the fact that the inventoried roadless areas are an absolute fraud being pulled over on the unsuspecting public and political representatives; this is because these areas can and often do have roads within them. And further many historical roads, truck roads, and abandoned railroad beds, particularly in the eastern Weeks Act Forests, are not even considered ‘roads’ under the inventoried roadless definition. Because of this, many well intentioned citizens and elected officials believe that by supporting the “roadless initiative” they are supporting the protection of pristine areas untouched by humans; that is false. The reality is far different and varies from National Forest to National Forest. The effect of the “roadless initiative” in many cases is an anti-history campaign based on the misinterpretation of the roadless inventory. This is a lexicological disaster that could be partly remedied by relabeling the “roadless”, “unroaded”, and other forest transportation based categories with accurate terms more in keeping with common usage. The result of accurate labels would be a discussion in which those on different sides of the issue at least understand the actual situation on the ground. (Individual, Center Sandwich, NH - #A5698.45000)

482. Public Concern: The Forest Service should not define areas covered by special use permits or mineral leases as roadless or unroaded lands.

We suggest that areas covered by special use permits or mineral leases be defined [not as] roadless or unroaded lands. Among these areas are those covered by grazing permits, water diversion facilities and ditches and canals, telecommunication sites, mining claims, road and water easements, and recreation developments. (Elected Official, Douglas County, OR - #A11811.45000)

We suggest that areas covered by special use permits or mineral leases be defined as not roadless or unroaded lands. Among these areas are those covered by grazing permits, water diversion facilities and ditches and canals, telecommunication sites, mining claims, road and water easements, and recreational developments. (County Attorney, Grant County, OR - #A17667.90100)

483. Public Concern: The Forest Service should refer to areas with roads or motorized trails as unroaded, not roadless.

The regulations should not use the word roadless (except in reference to Inventoried Roadless Areas). The connotation of the generic term “roadless” has been a great source of confusion to the general public

throughout the prior rulemaking. An area should not be referenced in any agency documentation in the general sense of roadless or roadlessness. Areas without the presence of roads or motorized trails should be referred to as “unroaded”, not roadless. Unroaded should be defined as any area which does not contain any roads (whether such roads are categorized as classified, unclassified, or uninventoried) or motorized trails. (Organization, Chesapeake, VA - #A11804.45200)

484. Public Concern: The Forest Service should not use the term roadless to describe areas containing forest products necessary for the future operation of the timber industry and community recreational roads and trails

It is our understanding that the Clinton-directed review process will establish criteria and procedures that may negatively impact public access to forestlands. Consider discontinuing use of the term “Roadless” to describe areas that contain forest products necessary for the future operation of our industry as well as our community’s recreational roads and trails. (Association, East Lansing, MI - #A23868.45000)

485. Public Concern: The Forest Service should not use the term non-road.

I value having access to our national forest land. I know that there are many possible uses for the land and that there is obviously conflicting opinion about what should or should not be done.

I think the whole term “non-road” is ridiculous. (Individual, Cincinnati, OH - #A4027.45200)

486. Public Concern: The Forest Service should clearly differentiate between a road and a trail.

. . . as off-road vehicles continue to grow in size, the Forest Service continues to increase the width of what they consider to be a trail versus a road. The definition of “road” must clearly differentiate a road from a motorized route or non-motorized trail “on-the-ground,” and not depend on the language “unless classified and managed as a trail.” In other words, anyone should be able to look at a route and know if it is a road, a motorized route or a non-motorized trail. The old definition of a road was: “a general term denoting a way for purposes of travel by vehicles greater than 50 inches in width.” This definition comes from FSH 7709.54 and does not refer to trails, which are defined separately. It is intended for identifying roads on the ground.

The new definition is: “a motor vehicle travelway over 50 inches wide, unless classified and managed as a trail. A road may be classified or unclassified.” The key difference here is that in the new definition, the Forest Service has changed from a travelway for VEHICLES greater than 50 inches, to a TRAVELWAY greater than 50 inches.

The old definition was tied to the fact that most ORVs were 50 inches or less in size, even though ORV routes are usually greater than 50 inches in order to accommodate the vehicles. The new definition simply says that the travelway has to be more than 50 inches wide.

We ask that the following be included as part of the Roadless Area Conservation Rule:

A) we propose dropping the classified/unclassified road distinction and simply defining a “road” as:

“a general term denoting a travelway that is legally and intentionally constructed and regularly maintained by mechanical means, for purposes of regular and continuous travel by standard passenger vehicles.”

B) Unclassified roads would no longer be termed roads, but instead termed “unauthorized motorized routes.” (Organization, Missoula, MT - #A21359.45200)

Environmental Values

This section includes 11 subsections: Environmental Values General, Evaluation of Roadless Areas, Management, Water Quality, Air Quality, Soils, Scenery, Wildlife, Wildlife Habitat, Threatened and Endangered Species, and Vegetation and Botanical Resources.

Environmental Values General

Summary

General Comments – A number of respondents comment on environmental values. The most general comment on this topic is that the Forest Service should preserve the environment. Suggested reasons for this include the need to protect global ecosystems, to help stop deforestation, and to preserve unique climates. Respondents suggest that preserving the environment can be done by monitoring traffic, encouraging the establishment of conservation associations, and encouraging the signing of the Kyoto Treaty. Others suggest that the Forest Service should hold the Administration accountable for maintaining environmental safeguards. Some state that the Forest Service should revise forest plans to address environmental concerns. Others advise the Agency to avoid relying on planned mitigation to offset environmental effects. Conversely, some say that pre-settlement conditions are not attainable and should not be held as a goal.

Roadless Area Environmental Values – Respondents offer a number of comments requesting the protection of roadless areas for environmental reasons. These writers assert that the Forest Service should consider ecological values when evaluating roadless areas. According to respondents, roadless areas should be protected to preserve ecological values, to increase representative ecosystem types, to preserve biodiversity, to restore surrounding areas, and to set an example for other countries. In order to protect these roadless area values, some people recommend that the Forest Service implement the Roadless Area Conservation Rule, while others comment that the protection of roadless areas should not result in increased damage to roaded areas.

Adequacy of Analysis – Some respondents comment about the adequacy of the analysis of environmental values. These people advise the Forest Service to make decisions based on science in order to allow ecosystem management to be the prime objective and to ensure sustainability. Some suggest that the Forest Service should adequately evaluate environmental impacts, particularly the environmental impacts of modern problems such as acid rain and global warming. Similarly, some ask that the Forest Service take into consideration the effects that environmental destruction will have on a global level. Others believe the Forest Service to protect roadless areas in order to enable the study of the long-term effects of timber removal; and others add that there is a need to “identify native biological communities that are poorly represented in current roadless areas and restore roadless areas that could support these rare communities.” On the other hand, some assert that the concept of biodiversity is a fraud. According to one individual, biodiversity does not acknowledge evolution and seems to replace it with an unchanging environment. This person claims that recent studies have proven that a healthy environment is reflected in fewer species.

Funding – In comment on roadless area environmental values, some focus specifically on the matter of funding for the desired actions or resulting impacts. Some respondents assert that the Forest Service should use money allocated for roads to fund ecosystem management and protection of wildlife, or they request funding for the study of ecology. Respondents also ask that the Forest Service identify funding necessary to relocate, reconstruct, or maintain the existing routes to ensure compliance with existing environmental requirements. Others mention funding for the prevention or restoration of environmental damage. One individual suggests that the Forest Service require those who ask that road construction be allowed to bear the costs of damage to affected ecosystems while others request funding for reclamation projects, including research on the effects of habitat degradation.

Education – Several respondents suggest that the Forest Service educate the public. Suggested topics of education include the environment and ecology, the costs of environmental degradation, conservation goals, and the need to make productive use of forests.

487. Public Concern: The Forest Service should hold the Administration accountable for maintaining environmental safeguards.

President Bush's administration needs to remain representative and respond to the environmental concerns of his constituency and the legacy of future Americans. Supporting technologies and industries that undermine our country's legacy rather than training workers in those fields, for new environmentally sound industries, is the height of hubris. I call on you to hold the administration accountable for its efforts to weaken the environmental safeguards and public participation opportunities in the forest planning regulations. (Individual, Northridge, CA - #A21249.12111)

BY DEMANDING AN EXPLANATION OF HOW IT INTENDS TO FURTHER PROTECT NATURAL RESOURCES

I demand a response detailing what the Bush Administration intends to do about further protecting our national resources like the Tongass National Forest. (Individual, Ithaca, NY - #A16541.12111)

488. Public Concern: The Forest Service should adequately identify forest environmental values.

The environmental values of the forest should be identified. For example, many forests have the potential for the overgrowth of trees. As the ranger at Hone Quarry indicated, some areas of forest can become too dense or matured. In such cases, they allow for the timber extraction of these trees. The ranger added that when the national forest permits local timber companies to come in and remove these trees, they usually only need minimal roads to do the task.

Other environmental values to consider are the species in the forest. Again, the ranger commented that even within a small cubic region, a huge number of species of organisms and plants probably exist. Obviously, if these areas are not designated as roadless, construction in these areas will endanger the survival of these species. In George Washington National Forest, black bear and wild turkey populations in the area are in direct competition with increasing public use and development. Hence, in order to protect all the living entities in a forest, most areas should remain roadless. (Individual, No Address - #A30370.50000)

489. Public Concern: The Forest Service should recognize that preservation values have already been adequately addressed.

Rather than preserving a long, extensive list, I will refer the reader once again to the Roadless Area conservation FEIS (on which the current Rule is based), Chapter 3, which covers topics ranging from physical resources to American Indian issues. It should be clear that the issues covered in Chapter 3 are exhaustive and in no need of enhancement. Of prime importance to me are the values of watershed protection, wildlife habitat, and low-impact recreation. It is important to note that all of the stated concerns behind the current efforts to amend the Rule (forest health, fire management, access issues,

local input, etc.) have already been painstakingly and adequately addressed and resolved by the Rule itself. This is clear to anyone who has taken the time, as I have, to actually review the final document. The Rule has provisions for fuels-reduction thinning and habitat improvements for endangered species among other concerns. This fact compels me to, once again, suggest that the original Rule be implemented as written and published. (Individual, Sedona, AZ - #A17217.50000)

These factors were considered thoroughly in the Environmental Impact Statement. First and foremost should be consideration of the ecological values that these areas will provide, including value as intact habitat for plants and wildlife, as a corridor between key habitats, and as fully functional, healthy ecosystems. (Individual, Olympia, WA - #A20847.50100)

490. Public Concern: The Forest Service should preserve the environment.

TO PROTECT GLOBAL ECOSYSTEMS

Protecting forests implies the protection of biodiversity, the atmosphere, soils, the Earth and its inhabitants. A forest is not something separate from the whole. It should not be viewed that way. Instead it is part of an entire planetary system, which can cause significant alterations to the Earth's atmospheric dynamics. We have reached a fulcrum, it is time we protected all remaining forests. This means no mechanical intrusions and no intentional burning other than those created by lightning strikes. Existing forest covers should be extended through the encouragement of natural extension systems. (Individual, Curtin Act, Australia - #A29708.50100)

TO HELP STOP DEFORESTATION

There is widespread publicity about worldwide deforestation, and public uproar about it. Can't we protect our own forests? It is so much easier to say that other people cause the problems. In reality, we must all act responsibly. (Individual, Spokane, WA - #A26820.50420)

TO PROTECT ECOLOGICAL SYSTEMS

In the case of forests, tampering any further with already too-diminished wild forest acreage will endanger the ecological services these forests provide—air and water purification, spawning fish and game, maintaining a reservoir of biological richness and diversity (both as a good in itself and as the seed stock for rehabilitating and restoring forest land degraded by past logging, mining, etc.). (Individual, Pasadena, CA - #A11735.30100)

TO PRESERVE UNIQUE CLIMATES/ECOSYSTEMS

The United States of America is home to many ecosystems/climates that are present NO OTHER PLACE ON EARTH but in our country. These ecosystems will not be able to sustain themselves without the presence of established trees and the niches they fulfill! For example, Washington and Oregon contain the ONLY mild climate, temperate rainforest on the planet. Without the native Redwood trees, which sustain that ecosystem, those two states wouldn't have the same climate, wildlife or beauty. Removing these Redwoods would also lead to soil erosion and exhaustion. THESE FACTS ARE SCIENTIFICALLY PROVEN!!! So why then would the President, who has been elected to make decisions that better our country, want to deplete the land and ecosystems contained within its borders? (Individual, Harper Woods, MI - #A40537.50510)

BY TAKING A LONG-TERM VIEW

The principal responsibility of the forest service is to be guardians of the lands they manage. Emphasis must be put on the soils, the waters, the wildlife, and the vegetation in any management plan. The Forest service must always see the big picture as their primary responsibility and think of the consequences of any actions in a 25, 50, or 100 year time frame. National Forest lands belong to all the citizens of the United States, most of whom cherish these lands. Although any individual has the right to express his opinion, this opinion should not be allowed to outweigh the importance of protecting the land. (Individual, Reno, NV - #A23545.50100)

BY PROTECTING LOW-ELEVATION ECOSYSTEMS

In the Southern Rockies and throughout the nation, many ecosystems are not adequately represented in our current system of protected areas, such as national parks, wilderness areas, and research natural areas (Scott et al. 2001). For instance, here in the Southern Rockies, SREP discovered that roughly 70% of the region's protected areas lies above 10,000 feet, thus capturing mainly high-elevation ecosystems, such as subalpine forests and alpine tundra, as well as hundreds of thousands of acres of bare rock and snowfields. As a result, numerous natural communities are either poorly represented or missing entirely in the current system of protected areas. This finding is mirrored by the Forest Service's analysis of the plant ecosystems represented within designated wilderness in Region 2: over 90% of these lands are found within three ecosystem types—rock and ice, alpine tundra, and high-elevation Engelmann Spruce-subalpine fir. (See Appendix 3: Plant Series—Rocky Mountain Region: Wilderness and Management Areas). In contrast, 60% of the roadless land area in the Southern Rockies lies below 10,000 feet in elevation and contain significant amounts of low- and mid-elevation ecosystems that are not well represented in the current system of protected areas. (Organization, Denver, CO - #A21367.60400)

BY MONITORING TRAFFIC

After the roads are built, will the government have the ability to adequately monitor the "health" of the local environment to ensure that the traffic on the roads is not proving to be too detrimental to the local flora, fauna, watershed, etc.? If the government finds that unexpected damage is occurring, will the government have the ability to close the roads and allow the area to become 'roadless' once again? (Individual, Columbus, OH - #A659.50000)

BY REWARDING FOREST SERVICE PERSONNEL FOR MAINTAINING AND IMPROVING HEALTHY ECOSYSTEMS

Reward USFS managers and staffers for maintaining and improving indicators of healthy ecosystems and overall biodiversity levels. (Individual, Dallas, TX - #A18002.30200)

BY ENCOURAGING THE ESTABLISHMENT OF CONSERVATION ASSOCIATIONS TO HELP PROTECT ECOLOGICAL FOREST VALUES

I expect that if the Forest Service were to preserve some fraction of their lands in a pristine state, it would find that non-profit organizations similar to the National Parks Conservation Association (NPCA) could be set up to support this effort. Why not a National Forest Roadless-Area Conservation Association to help tap into private resources for protection of the ecological values of the forests? (Individual, State College, PA - #A28680.15121)

BY ENCOURAGING THE SIGNING OF THE KYOTO TREATY

Personally I'd like to comment that the world belongs to us ALL. Logging of forests has been done all over the world for many centuries. The devastating effects are also C L E A R. Have a look at Ireland: there used to be lots of forests, but now less than 10% of the country is forest. If you plan to let the world go down, we cannot accept that. Your plans are like plans made in the 60s, where environment didn't matter as much as it does nowadays. Maybe I'm not making it clear, but I'm pretty much angry to see how (at distance, I'm from the Netherlands) things are being . . . up at the other end of the ocean!!!! Instead of reducing energy consumption, you just want to mine for more (fossil) energy! As reason you're telling that it's good for the American economy. Let me tell you this: if you keep on executing actions and plans like this, there will be no future. There will be no American Economy anymore. There will be no more, a world in which people, plants and animals can live because of all the polluting and molestation actions. I highly suggest you take a 2nd look at your conservation rule, and have a 2nd opinion in other (European) countries. And last but not least: SIGN THE KYOTO COMMITMENT!!!!!!!!!! (Individual, No Address - #A3752.50400)

491. Public Concern: The Forest Service should revise forest plans to address environmental concerns.**THE NORTHWEST FOREST PLAN**

The Northwest Forest Plan must be revised. The old growth cannot be saved. LSR is not favorable to water production. Snag retention must be eliminated. Heavy fuel retention must be eliminated. The

recreation of wetlands must be monitored so that something is not created that will do more harm than good. Fire will not eliminate the medium to heavy ladder fuels. (Individual, Klamath Falls, OR - #A8809.20000)

492. Public Concern: The Forest Service should avoid relying on planned mitigation to offset environmental effects.

The project should not be mitigated in order to continue. We should not rely on planned mitigation. This is simply attempting to fix things after a planned resource failure. In so many cases these so-called projects are referred to as timber, road, mining or grazing “opportunities”. The strategy of messing up the ecology for someone’s (usually a local citizen) monetary gain, and then attempting to fix the mess makes no sense at all. (Individual, Grangeville, ID - #A830.50000)

493. Public Concern: The Forest Service should consider that the Roadless Area Conservation Rule will promote the use of less environmentally friendly products.

Contrary to the implied conclusions of the analysis, the preferred alternative(s) will . . . promote the use of less environmentally friendly products . . . (Professional Society, Anchorage, AK - #A21707.20201)

494. Public Concern: The Forest Service should recognize that pre-settlement conditions are not attainable.

It seems to me that the organizations or special interest groups that are backing the implementation of this rule assume that if there are no roads to provide access into those designated areas, then they will return to their pre-settle conditions. Nothing could be further from the truth! We will never again have pre-settle conditions in this country. #1 because of past land use (over farming, strip mining, high grading, etc.) #2 because of fire suppression, you cannot have pre-settlement conditions by altering natural occurrences. #3 because of the introduction of exotic diseases and pests into both our terrestrial and aquatic ecosystems (pest which our native species cannot handle), and #4 because of overpopulation, which everyone knows causes a whole host of problems in itself. (Individual, Ellenboro, NC - #A10509.15121)

495. Public Concern: The Forest Service should recognize that the Wyoming Wilderness Act does not adequately protect the environment and wildlife habitat.

The Wyoming Wilderness Act protected high altitude habitat and did not garner protection for complete ecosystems and watersheds, or the lower mountain regions that would protect large herds of wintering and migrating elk, deer, and moose. The Bridger-Teton and Shoshone National Forests should protect the wild integrity of the remaining roadless areas in the impending Forest Plan Revision process. (Individual, Jelm, WY - #A27247.20000)

Environmental Values General – Roadless Areas

496. Public Concern: The Forest Service should protect roadless areas.

TO PRESERVE THEIR ECOLOGICAL VALUES

These Areas are roadless because they were not appropriate areas for logging, mining, or grazing, the uneconomical places. The extractors have not gotten there yet, and as a result these areas have become the last vestiges of the pre-settlement American forests. These forests now have far more value than their extractive, consumptive values - values such as biodiversity, watershed protection, ecosystem services such as cleaning up water and air, generating oxygen, making soil, and recreation (including hunting and fishing). (Individual, Cedar Mountain, NC - #A45.50000)

Give no value whatsoever to commercial or economic considerations, only ecological and preservation values should matter. (Individual, No Address - #A25.50000)

The values that the Forest Service should consider as it evaluates and plans for roadless areas are the interests and circumstances of the nation as a whole and the potential for these areas to contribute to the national well being. In this regard three facts seem especially relevant: 1.) The United States has the largest and most useful road system on the face of the earth that has ever existed in human history. 2.) The United States has obliterated 97 percent of its primary forest. 3.) Inventoried roadless areas of National Forests have unusually high potential to exhibit natural characteristics. Since our needs for moving stuff around have been extensively met and our needs for ecological well being have been grievously compromised it is obvious that environmental health should be the overwhelming concern with regard to these lands. (Individual, West Lebanon, NH - #A4836.45100)

Present and future ecological value should be considered when examining roadless areas. Is it pristine? Was it once pristine and could be again, if roadbuilding and logging were ceased? Is the forest otherwise heavily fragmented? How is the water quality? Has erosion from other roads affected water quality elsewhere? Could it happen here? What are noise considerations? Is the area near a wilderness? Can it provide an important buffer to the wilderness and visitors to the wilderness? Is the area important wildlife habitat, especially for rare, threatened or endangered species? Is the area valuable for scientific research? Is the area important to Native American history, culture or religion? How is the view? Is it part of a stunning vista that would be destroyed if it were logged? (Individual, Minneapolis, MN - #A30387.45000)

In evaluating inventoried roadless areas, the Forest Service should consider the nature of the ecosystem in each roadless area. This includes the identification of habitat for threatened and endangered species, the existence of invasive exotics, and other characteristics. Recreational values of the roadless areas and the economic value of recreational activities in those areas should also be considered. The economic value of the timber should be a minor consideration, although timber harvesting to remove invasive species, improve habitat for threatened or endangered species, or to reduce fuel loads should continue to be available as a management tool in the inventoried roadless areas. (Individual, Marietta, GA - #A4827.45000)

TO INCREASE REPRESENTATIVE ECOSYSTEM TYPES

Roadless areas will increase representation of ecosystem types in protected areas. In the Southern Rockies and throughout the nation, many ecosystems are not adequately represented in our current system of protected areas, which includes public lands such as National Parks, Wilderness Areas, and Research Natural Areas (Scott et al. 2001). For instance, here in the Southern Rockies SREP discovered that roughly 70% of the region's protected area lies above 10,000 feet in elevation, thus capturing mainly high-elevation ecosystems, such as subalpine forests and alpine tundra, as well as hundreds of thousands of acres of bare rock and snowfields. As a result, numerous natural communities are either poorly represented or missing entirely in the current system of protected areas. In contrast, more than 60% of the roadless lands that are in the Southern Rockies lie below 10,000 feet and contains significant amounts of low- and mid- elevation ecosystems that are now well represented in the current system of protected areas. If these roadless areas were protected in the Southern Rockies, 10 of 12 major terrestrial ecosystems (e.g., ponderosa pine forest, mountain shrublands) would have at least 10% of their total area within protected areas. De Velice and Martin (2001) determined that, of the land-cover classes they examined for the U.S. as a whole (a coarser classification than what Shinneman et al. used), all of the western U.S. land cover types would achieve at least 12% representation if roadless areas were protected.

Better representation of all ecosystem types in protected areas means better protection for the myriad species they support. Higher numbers of species are associated with the low- and mid- elevation ecosystems found in roadless areas when compared to high-elevation ecosystem types. For instance, in the Southern Rockies, alpine tundra has roughly 50 associated vertebrate species while lower elevation sagebrush and semi-desert shrublands have around 160 associated vertebrate species. Thus, protecting

roadless areas will also protect more species-rich ecosystems. This could potentially prevent many plant and animal species from becoming imperiled and eventually listed as Threatened and Endangered under the U.S. Endangered Species Act. (Organization, Boulder, CO - #A22130.50510)

TO PRESERVE BIODIVERSITY

I love our National Forests. I hike in the nearest ones regularly, and look forward to visiting others whenever I can. My favorite activities are hiking, birding, and photography. The roadless areas are very important to me, whether I am able to access them or not. Even if they are too remote for access by day hikes, they play a very important role in conservation of species. As you know, the smaller a piece of land is that is undisturbed, the poorer it gets in species diversity. So for that reason alone, we should keep as much of the forests roadless as we possibly can. (Individual, Reno, NV - #A82.50000)

The most important value to consider in evaluating roadless areas is the fact that these few remnants of our nation's great forests are invaluable as islands of biodiversity from which species might hope to re-colonize the surrounding areas that have been logged or otherwise degraded. Additionally, these areas are of inestimable value as legacy for future generations. These two things alone would justify the need to protect them from further development and environmental degradation and far outweigh any short-term economic benefits that might be derived from their development. These remaining roadless areas represent such a minute fragment of what were once our great National Forests that this must be the overriding consideration in managing these areas. (Individual, Tenakee Springs, AK - #A5083.50000)

Conserving wild forests affords the protection of those areas needed to preserve species and ecosystems that is America's heritage. Extensive scientific literature (Noss and Soule, 1998) has recognized the need to protect large areas of "core reserves"—absolutely protected areas to facilitate the survival and recovery of wide ranging species. By protecting forests, society maintains the biological legacy that supports a diversity of life, including humans, and provides goods and services necessary to sustain a viable economic future. (Organization, Minneapolis, MN - #A28927.50520)

The principal value offered by National Forest roadless areas is as a reservoir of undeveloped land and biodiversity. This is the key value to which others—whether timber extraction or recreation (for example)—are second. With respect to timber extraction, this is simply because roaded public and private lands can grow trees just as well or better than most roadless areas, while providing cheaper access due to existing roads. With respect to recreation, this is likewise because such roaded lands already offer many developed-recreation opportunities. The ecological and hence societal benefits of large tracts of undeveloped land have been amply and scientifically documented; only roadless areas by definition (whether designated Wilderness Areas, Wilderness Study Areas, inventoried roadless areas, etc.) can then provide these benefits to our nation. (Individual, Granite Bay, CA - #A5166.50100)

I would like to make some outlines of recommendations for a heightened awareness, as you proceed with the rule making process decision and choosing the most appropriate alternative with accompanying consequent intentional actions:

Process of examining for roadless areas -->assist in Plan Revision--> RARE III.

Assume that areas now not inventoried roadless areas are not properly classified i.e. reexamine the totality of the system for roadless potential with the new criteria hereupon derived.

An increased weight for a *top priority* for the Value of Biodiversity (VOB) in and of itself.

Priority of *Ecological values* (i.e., including potential for old growth characteristics).

As Humans, the only *really* provable produced biodiversity in terms of *perpetuity* is seen from the perspective of geological-evolutionary spatial-temporal lenses.

Economic value as a consideration only as viewed through a *curtain* of the Value of Biodiversity, i.e., the increase of species as created by clear cutting most probably does not contribute, or is comparable to *evolutionary produced biodiversity and therefore has not provable economic value, for the long term.* (Individual, Ewen, MI - #A17662.45100)

The value of the area in question should be considered in terms of its ability to contribute to or to sustain the biodiversity of the larger area within which the roadless area exists. For example, if the roadless area has been or can be shown to provide the range, protection and habitat needed for sustaining a healthy population of grizzly bears or for that matter, any essential or endangered or even at risk, flora or fauna, large or small, that is either listed as threatened or endangered or even at risk, then by all means, protect that value. Once these types of inherent forest values have been identified and noted, the remaining values are the protection of our own cultural and spiritual values. A place for a native American to obtain the natural objects that are part of their ceremonies and heritage; a place for us to show and teach people about the natural resource values within a roaded area and their importance in maintaining a healthy ecosystem, untrammled, except by foot or hoof or paddle. (Individual, Olympia, WA - #A28646.45100)

TO PRESERVE THE FOOD CHAIN

I am scared to death of losing any more forests, because our trees are living organisms placed on this earth for many purposes. Their natural beauty, which brings peace to those of us who walk among them, is the least of the reasons for their existence. As you know, forests are a major part of the ecosystem which provide food and shelter for other plants and the animals in our food chain. When we disrupt the food chain, WE suffer the consequences along with the living organisms we've allowed to die. (Individual, Gainesville, FL - #A222.50000)

TO USE AS MODELS OF ECOSYSTEM MANAGEMENT

I fully sympathize with the difficulty of the mandate of multiple use. However, I urge that decisions regarding the future management of roadless areas consider primarily **the long-term ramifications to habitat and wildlife**. The 58 million acres in question are a small portion of federally managed lands. I urge the Forest Service to use them as models of ecosystem-friendly management. These are not vague or unrealistic goals. If systematic and scientific investigation demonstrates a road or cut is eroding into a stream, close or improve the road and stop the cut. If a road or cut is fragmenting habitat, take measures to resolve the problem or cease the activity. (Individual, Baton Rouge, LA - #A21876.50100)

TO RESTORE SURROUNDING AREAS

The Roadless Area Conservation Rule emphasizes ecological sustainability as the first priority for management plans. These ecologically intact areas can serve as nuclei for restoration of ecological functions in the surrounding forest areas. (Organization, Mariposa, CA - #A28552.50100)

TO SET AN EXAMPLE FOR OTHER COUNTRIES

As a citizen of the U.S.A. trying to stem the tide of tropical forest destruction, I cannot often say that developing countries should follow our example, given that we deforested most of eastern North America and have done a pretty bad job in the west as well. But at least I could use the designation of roadless areas as evidence of our commitment to protecting the environment. If these areas are once again opened up, we will all lose substantial credibility in the battle against deforestation worldwide. As the richest nation in the world, can't we curb some of our greed and leave what is left in wilderness? (Professional Society, Gainesville, FL - #A26736.50400)

497. Public Concern: The Forest Service should ensure that protection of roadless areas does not result in increased damage to roaded areas.

PROTECT ROADED AREAS THROUGH THE NATIONAL FOREST MANAGEMENT ACT

Protecting these areas should not allow free-license to decimate the remaining roaded areas. The NFMA must protect the remaining resources in a suitable, ecosystem-oriented manner. (Individual, Kemmerer, WY - #A8383.50100)

498. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule.

The best way for roadless areas to be managed for healthy forests is to allow the Roadless Conservation Policy to stand as implemented on January 12, 2001. The Roadless Area Conservation FEIS states on p.

3-5, “Unroaded areas are more likely than roaded areas to support greater ecosystem health, including the diversity of native and desired nonnative plant and animal communities, due to the absence of disturbances caused by roads and accompanying activities. Inventoried roadless areas also conserve native biodiversity, by providing areas where nonnative invasive species are rare, uncommon, or absent.” Also on p. 3-5, “Habitat for threatened, endangered, proposed, candidate, and sensitive species and for those species dependent on large, undisturbed areas of land—inventoried roadless areas function as biological strongholds and refuges for many species.” This is particularly true in the Yaak Valley where roadless areas such as Roderick IRA provide some of the highest concentrations of grizzly bears in the Yaak ecosystem. (Individual, Post Falls, ID - #A29936.50500)

BECAUSE WATERSHEDS AND WILD HABITAT EXTEND BEYOND LOCAL ADMINISTRATIVE BOUNDARIES

Watersheds and wild habitat extend beyond local administrative boundaries. So their maintenance should be guided by larger policy. The National Forest Management Act undervalues wild habitat and watersheds (because they have been steadily cut and consumed over the last 40 years under its process). Local planners should focus the Conservation Rule, not override it. (Individual, Langley, WA - #A17924.13110)

Adequacy of Analysis

499. Public Concern: The Forest Service should make decisions based on science.

When law-makers and law-shapers begin to use our best available science and technology as their guide, environmental policy and law will inevitably begin to parallel natural law. Again, natural law truly governs the long-term physical well-being of the human race. (Individual, Metropolis, IL - #A3877.50300)

Use science, not politics to make sound decisions. (Individual, Lexington, KY - #A6036.50000)

IN ORDER TO ALLOW ECOSYSTEM MANAGEMENT TO BE THE PRIME OBJECTIVE

Best available science and wide-ranging public input should be the basis for decisionmaking. Special interest, single-issue groups certainly have a right to be heard but in the end sustainability and ecosystem health should be the prime management objectives. (Individual, Las Vegas, NV - #A28178.14000)

Protecting the forest: The idea of protecting the forest by cutting it down is a way for the timber industry to sound reasonable while getting more land to clearcut. Sound scientific data and methods should be used when protecting against wildfire and disease. Decisions should be made by scientists with the forests’ ecosystems’ best interests in mind. Not by the resource extraction industries or politicians. (Individual, Snohomish, WA - #A30084.15100)

TO ENSURE SUSTAINABILITY

There is much more to be discovered in the future. The role of local forest management is important, as it always has been, insofar as it is consistent with the recent rulings, emphasizing sustainability, collaboration, and science. These are national lands that we all have an interest in, now and into the future. In order to guarantee sustainability, good science must be used. We know much more now than we did even twenty years ago about forest ecology and how ecological systems work. (Individual, Salt Lake City, UT - #A19069.14500)

500. Public Concern: The Forest Service should adequately evaluate environmental impacts.

TO AVOID ARBITRARY AND CAPRICIOUS DECISIONMAKING

The cumulative effect of not considering all relevant factors such as the studies and finding discussed above will lead to a clear error in judgment. According to case law, an agency’s decision would be

arbitrary and capricious “if the agency relied on factors which congress had not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency or is so implausible that it could not be ascribed to a difference in view of the product of agency expertise.” (Motor Vehicle Mfrs. v. State Farm Mutual Auto. Ins. Co., 463 U.S. 29, 43 (1983)).

Therefore, an agency’s decision can be found arbitrary and capricious if one or more of the following characterizations are met: (1) the decision ignores material factors, (2) the decision places great weight on irrelevant factors, (3) the decision is contrary to the agency’s explanation for the choice, and (4) the decision is so outrageous that it was a “product of agency expertise.” We encourage the Forest Service to avoid this characterization and adopt a Rulemaking alternative built around a fair evaluation of environmental impacts including mitigation measures and all reasonable and existing motorized roads and trails. (Organization, Helena, MT - #A13226.10141)

501. Public Concern: The Forest Service should address the environmental impacts of modern problems on forests.

ACID RAIN AND GLOBAL WARMING

Your questions fail to address critical modern day problems, such as the environmental impact of acid rain on our forests. In Understanding Forests, John A. Berger maintains: “Forest damage from acid rain costs the world tens of billions of dollars a year. . .” (16-17). Similarly, you refuse to pose any questions about the environmental impact on our forests and oceans brought about by global warming, a phenomenon recently affirmed by scientists around the globe. (Individual, Melvindale, MI - #A30286.50400)

502. Public Concern: The Forest Service should recognize the global ramifications of environmental destruction.

Can’t the people in charge of our country see the damage already done and still worse, being done more quickly than before? Have you seen any scientific predictions of what the pollution and destruction we are doing to this earth is going to produce? It is happening already: The weather—the disasters and droughts; hurricanes, global warming, more tornados, more severe heat waves in record breaking lengths of YEARS and the unusual natural disasters like never EVER before. And all this is killing people and making record numbers of entire nations of people suffer so horribly. All of these things, even just in the last decade, have increased in intensity at an alarming rate. We are destroying our own planet! What about our grandchildren’s futures, or their children’s futures, if any at all? Who should try to stop this insane course we have been on (and continue to increase) in our blindness and denial. We must ALL take responsibility now, today, THIS MINUTE, to stop what more destruction of this earth will do to it, do it forever. We must each and every one of us, stop the money-importance only attitudes and look around. How blind and how stupid we as humans and inhabitants of this planet have been. When will we finally STOP all this? After its completely too late, and we all are dying off due to destruction of our own world? If there are other planets with intelligent life, how must they think of us, as destructive, so ignorantly intent on killing ourselves? (Individual, Ogden, UT - #A27782.50400)

503. Public Concern: The Forest Service should protect roadless areas.

TO ENABLE THE STUDY OF THE LONG-TERM EFFECTS OF TIMBER REMOVAL

Since more than 90% of the original, virgin forests that once covered the continental US have been cut at least once, I think it unwise to allow additional virgin, roadless forest to be prepared for cutting by allowing roads to be constructed. If anything we need the few remaining large tracts of virgin, roadless forest to be left alone to serve as benchmarks for further scientific study to determine just what long-term effects modern, mechanized timber harvest has had on our forests that have already been cut. (Professional Society, Hixson, TN - #A26223.52200)

504. Public Concern: The Forest Service should compare the negative impacts of decreased access against the environmental benefits.

The environmental document must objectively compare the significant negative impacts of closing roads and motorized trails to motorized visitors versus the positive benefits to wildlife habitat, sediment production, water quality, noxious weeds, and fisheries. The real measurable benefits to wildlife habitat, sediment production, water quality, noxious weeds and fisheries from the closing of these travel ways to motorized visitors are all too often relatively small in magnitude and do not justify the significant cumulative impact of the motorized closure on thousands of visitors seeking motorized access and recreation. The document must evaluate how the goal of environmental perfectionism is affecting the human environment. The document must also evaluate the cumulative impact that using environmental perfectionism as a goal for decision-making is having on the human environment. (Organization, Great Falls, MT - #A15315.50000)

505. Public Concern: The Forest Service should identify underrepresented biological communities.

The FS needs to identify native biological communities that are poorly represented in current roadless areas and restore roadless areas that could support these rare communities. (Professional Society, Missoula, MT - #A17054.45000)

506. Public Concern: The Forest Service should evaluate the status of non-National Forest System lands in the coastal rainforests of southeast Alaska and British Columbia.

TO DETERMINE WHETHER ADDITIONAL CONSERVATION EFFORTS ON THE TONGASS ARE NEEDED TO PROVIDE A BUFFER FOR REGION-WIDE CUMULATIVE EFFECTS

The Forest Service should evaluate the status of non-Forest lands in the coastal rainforests of Southeast Alaska and British Columbia, to determine whether additional conservation efforts on the Tongass are warranted, to provide a buffer for region-wide cumulative effects. Private, state, and borough-held lands in Alaska are all subjects to intense logging, with few exceptions. A similar situation appears to exist in British Columbia, where comparatively few lands have been reserved for conservation purposes. It seems unlikely that non-Forest System lands in the region will adequately protect the ecological values of the temperate rainforest. (Permit Holder, Juneau, AK - #A23220.45613)

507. Public Concern: The Forest Service should provide an analysis of geologic hazard mitigation opportunities that will be lost as a result of roadless area designations.

IN WYOMING

We believe it is important that the following issues must be addressed in the underlying EIS, on a Wyoming-specific scale.

A detailed analysis of geologic hazard mitigation opportunities that will be lost as a result of this proposed action. (State Agency, Cheyenne, WY - #A22609.10135)

508. Public Concern: The Forest Service should recognize that the concept of biodiversity is a fraud.

The concept of Biodiversity is a fraud! It ignores Evolution and replaces it with a "static" unchanging environment. As every scientific person worth his "salt" knows, the Earth is dynamic and ever changing. Over 99% of all species that have existed on the face of the Earth are now extinct, and they became extinct before man ever existed! Recent university studies have shown that a healthy environment is reflected in fewer species. (Individual, Sedona, AZ - #A1566.20222)

Funding

509. Public Concern: The Forest Service should use money allocated for roads to fund ecosystem management and protection of wildlife

Forest Service studies and congressional hearings have established that the Forest Service loses hundreds of millions of dollars every year on its road system. Opening up the roadless areas for additional road building and logging will increase the deficit in the Forest Service budget. From a strictly economic standpoint, the government would be better served to leave these roadless areas intact and use the road money on other Forest Service programs, such as ecosystem management and protection of wildlife. (Individual, Seattle, WA - #A4885.17100)

510. Public Concern: The Forest Service should fund the study of landscape ecology, conservation biology, and fire ecology.

IN AND NEXT TO ROADLESS AREAS

I want full funding of the evolving study of landscape ecology and conservation biology and fire ecology in and next to the roadless wilderness areas. (Individual, Talent, OR - #A23553.30000)

511. Public Concern: The Forest Service should identify the funding required to comply with environmental requirements.

Identify the funding required to relocate, reconstruct or maintain the existing routes to ensure compliance with existing environmental requirements.

The work required to bring all areas into compliance with environmental regulations will require additional funding. While this proposal does not contain any request for additional funding, it is essential that the funding needs to be identified so that Congress can make better-informed budget decisions and so that the agencies can make better allocations of appropriated funding. This information will also provide a basis on which the agencies can form public-private partnerships to help resolve the issues. (Organization, Salt Lake City, UT - #A12009.17100)

512. Public Concern: The Forest Service should require that proponents of road construction bear the costs of damage to affected ecosystems.

I propose that the proponents of any roads, and cost necessarily associated therewith (including, but not limited to, construction, re-construction, maintenance, signs, etc. and **decommissioning** cost if the road proves ecologically harmful or at such time as the road's proponents no longer desire or have approval for it, as well as also including all the indirect costs of negative environmental impacts produced by or resulting from such roads) bear all such costs in full, with none of those costs ending up being reimbursed and/or born by the peoples of the United States as a whole. These "costs", as the term is used here, must include all direct costs (as well as all indirect costs), such as damage to affected ecosystems resulting from the construction, maintenance, and use by proponents of such roads, e.g. sedimentation into watersheds, air pollution, loss of fragmentation of wildlife habitat, corridors, or habitat connectivity, entry of invasive non-native species, increased fire risks, etc. (Individual, Bishop, CA - #A20954.90130)

513. Public Concern: The Forest Service should allow expansion of current access only if a bond is posted sufficient to repair any accompanying damage.

Existing access should be continued as long as it is in continuous use, retired if it is not, and subject to stringent review of any expansion that could damage the surrounding resources. Expansion of current access should require posting of a reasonable bond sufficient to repair any damage. Any development should be held financially responsible for damage and privately owned land condemned if damage is not remedied. (Individual, Santa Fe, NM - #A25545.40000)

514. Public Concern: The Forest Service should provide funding to research the effects of habitat degradation.

More funding is needed to provide for a better understanding of the effects of habitat degradation and to minimize the damages to forest/watershed ecosystems. This research would be linked with the authority to approve timber harvest and road construction and reconstruction in inventoried roadless areas as long as the least adverse impact is selected for a forest harvest plan. Build flexibility into the timber sale plans so managers can be responsive to disease and insect outbreaks. (Individual, Pelican, AK - #A26552.75600)

515. Public Concern: The Forest Service should provide funding for reclamation projects.

It has been my experience that there seems to be ample budget and agency motivation to cut more mature and old growth forest. Yet there seems to never be enough money available for some of the pending reclamation projects that are waiting in the wings. Some of these projects are relics of damage done by previous logging and road building. An example in my area is the effects of high altitude logging of Engelmann spruce and sub alpine fir forests. There are a number of areas that were logged at relatively high elevations and have never fully recovered and will not unless large-scale tree planting projects occur in the area. This type of reclamation would add to long-term benefits both locally and globally, yet are not an agency priority. Funding for projects such as this many times has to be acquired through grants from other entities. Meanwhile the Forest Service still spends many thousands of dollars in the NEPA process trying to justify logging and road construction in new areas. Environmental reclamation projects that help restore ecosystem functionality are the wave of the future. I hope the Forest Service eventually realizes this and begins to make this type of project activity the priority over outdated consumptive use projects. (Individual, Penrose, CO - #A21448.17100)

516. Public Concern: The Forest Service should provide more environmental research funding.

AS LONG AS THE RESEARCH IS LINKED TO AUTHORITY TO APPROVE TIMBER HARVEST AND ROAD CONSTRUCTION IN ROADLESS AREAS.

More funding is needed to provide for a better understanding of the effects of habitat degradation and to minimize the damages to forest/watershed ecosystem. This research would be linked with the authority to approve timber harvest and road construction and reconstruction in inventoried roadless areas as long as the least adverse impact is selected for a forest harvest plan. (Individual, Pelican, AK - #A26552.75600)

Education

517. Public Concern: The Forest Service should educate the public.

ABOUT THE ENVIRONMENT AND ECOLOGY

The best way for the Forest Service to work with a variety of interests such as; state, tribes and local interests is the help to educate them, the public about forest health and wild land. With a strong emphasis on environmental education and ecology. (Individual, No Address - #A17268.15163)

ABOUT THE COSTS OF ENVIRONMENTAL DEGRADATION

We can't have unlimited use of fossil fuels and dependence on potentially enemy, oil producing nations without some losses. We need to turn up the education of the general public about what those costs may be, which may include a permanent loss of long ago designated forest refuges. "Progress", including increases of fuel use, will eventually cause great harm to almost everything that this world has to offer, both under the soil and over it. Without informing the general global public (including the largest users, The American Public) I believe it may be a losing battle. (Individual, Knoxville, TN - #A19730.15163)

ABOUT CONSERVATION GOALS

Achieving the goals of conservation, wildlife protection, and sustainability of natural resources should be the highest priorities. Education of the public regarding these goals is needed. (Individual, Gallatin Gateway, MT - #A19100.50100)

ABOUT THE NEED TO MAKE PRODUCTIVE USE OF FORESTS

We appreciate this administration's work toward correcting the problems relating to imported Canadian lumber. But I am sure that most urban Americans do not even realize what has been happening to our timber industry. They do know that new housing costs have sky-rocketed. What they do hear is that loggers, miners, recreationists and cattle are destroying the forests. And they hear FS accused of "killing" endangered species every time they offer a timber sale or grazing lease. The urban public must be told the truth and educated on the real problems facing us and the necessity of using our public lands. We have worked in this type of education on a grassroots level but we do not have the financial resources or government accreditation to be accepted in schools or other public venues. It seems counter-productive that the federal government offers a multitude of funding grants to "conservation" groups, many times as partners with agencies, to provide "educational" materials promoting non-use of national forests, but there are no opportunities for wise-use and "multiple use" groups to present the production/use side of the debate. The FS has the resources and should use them as outreach programs to educate urban America. (Organization, Three Rivers, CA - #A28739.15163)

The FS should continue to manage national forests pursuant to Acts of Congress, which all mandate multiple use. The public must be educated on how our nation's economic independence is directly linked to natural resource production, which is largely derived from public lands. Natural resource production can be, and is being, done in an environmentally sensitive manner. Without natural resource production our nation's economy will suffer which is already evident in the current economic downturn and rising unemployment rate. (Organization, Three Rivers, CA - #A28739.15166)

Evaluation of Roadless Areas

Summary

Some people state that when evaluating roadless areas and making decisions, the Forest Service should only consider environmental factors. These respondents assert that national forests cannot accommodate every use and that claims that roadless areas need to be opened for economic reasons are false. Many other suggestions are offered regarding what the Forest Service should consider when evaluating roadless areas. Suggestions include the evaluation of ecosystems, watersheds, native biodiversity, sustainability, habitat requirements, and current conditions. One individual advises the Forest Service to determine how much land is required to assure the preservation, health, and limited growth of species whose population are declining.

518. Public Concern: The Forest Service should only consider environmental factors when making decisions.

BECAUSE NATIONAL FORESTS CANNOT ACCOMMODATE EVERY USE

The Forest Service needs to adopt a philosophy that protection of the forest comes first, above all other interests. They need to be able to tell some people “NO that is not an appropriate use for the forest”. The National Forest can not accommodate every use, and it shouldn’t. For example—Just because someone comes up with a new type of off-road vehicle the FS has no responsibility to provide a place to use it. (Individual, Merion Station, PA - #A17478.50200)

BECAUSE CLAIMS THAT THESE AREAS NEED TO BE OPENED FOR ECONOMIC REASONS ARE FALSE

The only “characteristics, environmental values, social and economic considerations, and other factors” that should be considered in this decision are environmental ones. I do not believe there are any economic factors. The claims being made that these areas need to be opened up for economic exploitation are simply false. It is nothing more than the greed of powerful interests trying to disguise itself in the sentimentality of a rural life that does not and never did exist. (Individual, No Address - #A49.50000)

519. Public Concern: The Forest Service should evaluate roadless areas with respect to general environmental considerations.

EVALUATE ECOSYSTEMS

In evaluating roadless areas eco-systems should be considered. Do the areas fit into protection of an eco-system or are they fragmented? Is the timber of great-value or marginal? What is the highest and best use of the land? Consider the wildlife. (Individual, Missoula, MT - #A113.50100)

At this time deforestation and the slow erosion of natural capital such as the declining species diversity and the loss of intact ecosystems compels us to protect what we have for future generations and especially to prevent predatory financial interests from taking that which belongs to all U.S. citizens and their progeny. The true value of the U.S. forest system is not being measured properly due to a limited economic view that sees our forests in board-feet measurements for timber sales, rather than as a priceless natural resource that provides invaluable services as an intact ecosystem. Those include but are not limited to: filtering pollutants out of the air and water, sequestering carbon to fight climate change, maintaining rainfall and local climate conditions, protecting the habitat of endangered species as mandated by law, providing recreation areas necessary for maintaining a superior quality of life, and finally are an essential part of the scenic beauty that forms the character and backbone of the United States. (Individual, New York, NY - #A395.50100)

The primary concern of the forest service in managing Roadless Areas ought to be protecting ecosystem integrity and creating wildlife corridors. The patchwork logging of the last 90 years has seriously impaired forest ecosystem integrity. A GIS analysis of logging in the Gifford Pinchot National Forest confirms this assertion. It is high time that the Forest Service start taking into account ecosystem function, rather than logging as fast as possible, in its planning. (Individual, Olympia, WA - #A614.50100)

EVALUATE WATERSHEDS

The local and national values of unburned watersheds and wildlife habitat must be incorporated into the equation. Though the tragedy of losing homes to wildfires is common in the media, the agency must publicly promote the social and economic value of a watershed that is not yet destroyed by a catastrophic forest fire. Until this evaluation is made public, the other concerns are secondary. (Professional Society, Chico, CA - #A29719.51310)

EVALUATE NATIVE BIODIVERSITY

The USFS must look at a wide array of values when evaluating roadless areas. Native biological diversity values must be taken into consideration. Many of our remaining roadless areas are home to some of the most endangered or rare species in North America. These areas are often headwater and are sensitive to the impacts of roads, such as sedimentation and simplification of channel structure. (Individual, Sandpoint, ID - #A28585.50100)

EVALUATE SUSTAINABILITY

Sustainability is the primary value to be considered when evaluating inventoried roadless areas. This means that decisions must be based on environmental, economic and social considerations for the local communities. The society of American Forests recently took a position on sustainability. I suggest you use this statement as guidance as you deliberate any action on a roadless directive. If the Forest Service maintains sustainability of the local community, it will also preserve sustainability for the region and the nation. (Business, Colbert, WA - #A17500.50000)

EVALUATE HABITAT REQUIREMENTS

The Forest Service should consider the wildlife and plant species, their habitat requirements, water quality, air quality, diversity of all species (mammal, plant, bird, fish, reptile, amphibian, etc.), and the interconnected parts of a functioning natural ecosystem in evaluating roadless areas. (Organization, Salt Lake City, UT - #A17170.50000)

EVALUATE ROADLESS AREAS UNDER THE CURRENT CLIMATIC PERIOD AND RANGE OF VARIABILITY

Current climatic period – the period of time since establishment of the modern major vegetation types, which typically encompass the late Holocene Epoch including the present, including likely climatic conditions within the planning period. The climatic period is typically centuries to millennia in length, a period of time that is long enough to encompass the variability that species and ecosystems have experienced. Range of variability – the expected range of variation in ecosystem composition, and structure that would be expected under natural disturbance regimes in the current climatic period. These regimes include the type, frequency, severity, and magnitude of disturbance in the absence of fire suppression and extensive commodity extraction. The above definitions do not meld with what you are presently trying to do in light of future evaluations of “roadless” areas during forest revision plans; in particular, areas that are prone to catastrophic fire. The present \$1.9 billion fire budget the forest service has for 2001 should be testament to failed policy over the last decade. The largest asset that forests provide communities (animals and human), is fresh water—the context of the above two definitions as used in the 2000 forest management plan in relation to roadless are not always conducive to this, either on private or federal administered lands. As used throughout the forest management plan, 219.36 is unworkable with environmental health at the urban/rural interface as demonstrated in the Bitterroot National Forests over the last two fire years. (Individual, Rock Springs, WY - #A15658.50000)

520. Public Concern: The Forest Service should determine how much land is needed for ecosystem integrity.

The emphasis needs to be put on exactly how much land is required to assure the preservation, health, and even limited growth of species that are experiencing dwindling numbers or are endangered. Once the proper amount of lands can be set aside to assure the preservation of these species, of which no person or government has the right to destroy, then we can use what other lands we have available more responsibly and effectively to appease purely human concerns. We need to have these plans made by intelligence and the input of the expert opinion of university scientists who have studied and know the best course of action as it relates to what is best for the survival of the forest ecosystem, not its destruction. It is essential that the Forest Service recognizes that its prime concern is the health of the forests, of which each one might be designated differently for use, but all of which should be properly and carefully maintained as complete forest ecosystems. Views that are harmful to the long-term survival of the entire forest should not be seen as real participants in the forest management. (Individual, Lexington, KY - #A1077.15167)

521. Public Concern: The Forest Service should conduct an inventory of soil, water, and geologic resources.

This list might include: An inventory of soil, water and geologic resources; an evaluation of their stability and suitability for various activities. (Business, Lewiston, ID - #A7991.50000)

Management

Summary

General Comments – General comments regarding management vis-à-vis the environment are highly varied. Some comment that the Forest Service should protect roadless areas to encourage energy conservation. Others suggest that certain land types be protected, ranging from the most ecologically important roadless areas to areas not designated as roadless. Writers also suggest management strategies—including connecting protected areas, managing forests through their entire life cycle, and combining the technical advances and experience of forest managers with the best available science to determine appropriate management.

Ecosystem/Restoration Management – A number of respondents suggest that the Forest Service should manage lands under an ecosystem management philosophy, but ideas vary on how to carry this out. Suggestions include managing roadless areas in an ecosystem based framework, managing with the principles of conservation biology, allowing natural processes to manage fish and wildlife species, and restoring natural disturbance regimes. Another respondent suggests that roadless areas be retained as scientific control areas. Some add that the Forest Service should engage the public in protecting the environment. One organization advises the Forest Service to focus on restoring degraded areas, while others state that the Agency should ensure the reclamation of developed lands.

Multiple Use Management – Some respondents assert that the Roadless Area Conservation Rule does not threaten the tradition of multiple use, while others believe the Rule implies preservation, not conservation, of which this person does not think follows the intent of multiple use management. Another respondent is of the opinion that the multiple use mandate is fulfilled by active management in roaded areas.

A number of respondents state that the Forest Service should allow multiple use and sustained yield management. These writers suggest attaining this objective by allowing the exercise of existing rights, by including recreational and economic uses, and by rotating roadless area

inventories. Some people claim there are already enough protected areas and by allowing any single use preference, such as ‘nonuse,’ to dominate unfair and in violation of the multiple-use mandate.

Other respondents assert that the Forest Service should not manage National Forest System lands under the multiple use philosophy because some uses should be strictly limited, because it is not realistic, and because there are limited areas that should not be jeopardized.

Other Management Philosophies – Several respondents provide other suggestions regarding management philosophies. One individual asserts that the Agency should look to our past and recognize that wilderness once lost, cannot be retrieved. Others maintain that Roosevelt’s conservation ethic stressed active management of forest lands, and thus the Roadless Rule stands in fundamental opposition to Roosevelt’s philosophy of conservation. Some also suggest developing policies for protecting and using forest lands which do not entail excluding people, and eliminating biodiversity and ecosystem management as management principles.

Effects of Activities/Disturbance on the Environment – A number of respondents comment that the Forest Service should consider the effects of certain activities and disturbances on the environment. Some suggest that fire results in greater environmental impact than other uses such as timber removal and road construction, while others advise the Forest Service to consider forms of damage to forests other than that of fire. Several respondents request that the Forest Service allow certain activities including environmental clean up, the use of all-terrain vehicles for managing habitat, and the commercial use of surplus plant and animal species.

Some respondents advise the Forest Service to consider the positive environmental effects of roads, fire, insects and disease, and downed timber. Some suggest that ecosystems need disturbance to exist and that the absence of timber management and fire control would cause a detrimental volume of additional stream sedimentation. Others suggest that, while these activities may not be beneficial, road construction and off-road vehicles do not endanger the environment.

Other respondents advise the Forest Service to address the negative environmental impacts of resource removal, mechanical forest health treatments, off-road vehicles, roads, mines, drilling, fire, and prescribed fire. According to one individual, erosion from large, stand replacing fires, that often seem to start from prescribed fires are relatively large, compared to similar sized tree removal areas.

Management General

522. Public Concern: The Forest Service should protect roadless areas.

TO ENCOURAGE ENERGY CONSERVATION

Keeping them roadless keeps heavy equipment from using fossil fuels to build roads, and keeps road users from using fossil fuels on the roads. Retaining roadless areas reduces greenhouse gas emissions . . . from destroying ecosystems through roading and associated uses, and from pulling up coal and oil from the ground and burning them, too. (Individual, Zephyr Cove, NV - #A27169.45100)

Another consideration is energy consumption. The more roads you provide for back road access, the more energy use that will encourage. Our future generations already face enough energy problems without creating more for them. (Individual, Lindsong, KS - #A13426.50000)

523. Public Concern: The Forest Service should concentrate protection efforts on the most ecologically important roadless areas.

The FS needs to take seriously the recommendations of environmental experts as far as what roadless areas are most important to protect from species and ecosystem standpoints. Need to make sure that the most important areas are protected, then let some of the other interests have their access if it conflicts with protection of biodiversity. Most other interests are not limited to roadless, wilderness areas like preservation of biodiversity is. Logging, mining, snowmobiles and dirt bikes can all use areas with existing roads. Grizzlies, wolves and cougars need large roadless protected areas to survive. (Individual, Seattle, WA - #A27495.50100)

524. Public Concern: The Forest Service should protect areas not designated as roadless.

If roadless areas do become protected, the Forest Service should not then ignore proper management of roaded, multiple-use areas. In other words, do not turn roaded portions of Forest Service lands into tree farms or ATV playgrounds because the "environmentalists" got the unroaded portion. (Individual, No Address - #A29377.50200)

525. Public Concern: The Forest Service should protect areas adjacent to roadless areas.

TO PRESERVE THE ECOLOGICAL VALUE OF THE AREA

Access to private inholdings and other properties is still guaranteed under the Conservation Rule. In fact, the forest service is required to provide access where demanded by such inholdings. In areas with heavily fragmented ownerships, such as in Chippewa and Superior National Forests, this is actually a flaw, because managers of our STATE forests can demand access to go in and cut wood adjacent to a roadless area. In an ideal world, those state entities would examine such areas and strive to make them contiguous roadless tracts, instead of insisting on harvesting timber there. My guess is if it is adjacent to national roadless areas, it would be of the same ecological value and ought to be preserved. (Individual, Minneapolis, MN - #A30387.40100)

526. Public Concern: The Forest Service should combine the technical advances and experience of forest managers with the best available science to determine appropriate management.

TO MAINTAIN A HEALTHY ECOLOGY IN ROADLESS AREAS

The technical advances and experiences of those engaged in tree management should be combined with the findings and conclusions of other scientists to determine the most appropriate actions, if any, that are needed to maintain a healthy ecology in the roadless areas. Again, nothing can replace reproducible experimental data and analysis as a guide in making management decisions. An important fact [often ignored by users of ecosystems] is that there is a minimal size and makeup of such a system if it is to be sustainable in the face of unusual climatic events. The degree of human pressure that can cause the ecosystem to live on the edge of survival may lead to sustainability only until a natural disaster occurs. (Individual, Cottonwood, AZ - #A26396.30100)

527. Public Concern: The Forest Service should manage forests primarily for natural habitats.

The PRIMARY use of national forests should be preservation of wildlife and natural habitats, as REPUBLICAN President and national forest founder Theodore Roosevelt intended. I would not expect wealthy oil men and oil-rich politicians to understand that, but that's how we who live and work near and in the national forests every day feel. (Individual, Black Hawk, CO - #A25654.50100)

528. Public Concern: The Forest Service should connect protected areas.

It is also important to note that to teach effectively and minimize costs, these backcountry areas need to be contiguous or connected in such a way as to provide seamless transitions. Islands of wilderness are not the answer. This has been illustrated in the ongoing White River National Forest planning process where one proposed alternative would designate more acres of Wilderness but provide for developed recreation across the remainder of the forests. Islands of Wilderness do not meet the needs of wilderness, wilderness managers, wilderness users or the flora and fauna inhabiting these areas. (Permit Holder, Golden, CO - #A29630.50520)

529. Public Concern: The Forest Service should manage forests through their entire life cycle.

Forests need to be managed through their entire life cycle. Some defined roadless areas have been harvested once or twice, regrew naturally or by replanting, provide habitat for wildlife, and at some point are ready to reharvest. As the forest matures, it happens to be generally roadless for awhile. That does not mean, at all, that it has to become a quasi-wilderness forever, which is the biggest problem with the RAC Rule. (Individual, Minneapolis, MN - #A18054.45100)

530. Public Concern: The Forest Service should document the risks and impacts of management and non-management.

It is imperative that the Forest Service requires that the risks and impacts of “doing nothing” be documented as well as an analysis of the risks or impacts of roading or other management activities. In the final decision, the standards for no management on federal forest lands should be as stringent as any standard for management activities. (Association, Augusta, ME - #A13312.30110)

531. Public Concern: The Forest Service should return environmental policies to their status before the Clinton Administration.

I am writing to encourage you to rescind the Forest Service’s Roadless Area Conservation Rule as it now stands. This policy is the product of the most extensive federal encroachment in history. It flies in the face of responsible conservation practices. The rule represents an over-balanced approach to environmental extremism, and makes the American people servants to the land instead of stewards over it. As written, it is patently unfair. This kind of bureaucratic regulation is not even constitutional law.

The best way to protect what you term roadless values is to return environmental policies to their status before the Clinton administration hijacked the land from the American people. (Individual, Carthage, MO - #A1102.10130)

*Ecosystem/Restoration Management***532. Public Concern: The Forest Service should emphasize long-term protection over short-term profits.**

The roots of our government go back to daring foresight, deep intelligence and wisdom. I urge you, at this critical moment, to draw from these roots and raise the standard of our government’s values of our pristine forests to a more long-term, relevant and wise view than that of reaping short-term profits with devastating, lasting effects. We need the Wild Forest Protection Plan as finalized at the beginning of this year, not a policy that facilitates the bull-doing and consumption of these forests—at huge taxpayer expense—for short-term gain and resulting in, at best, after replanting, a Douglas Fir farm destined for future clearcutting and seriously lacking in flora and fauna, instead of the real thing. That is not the way to treat what remains of a national treasure teeming with life and that is not what we should leave behind for future generations. (Individual, Alexandria, VA - #A13348.30520)

533. Public Concern: The Forest Service should recognize that short-term solutions will not fix long-term problems.

I have faxed, emailed, and written many letters about the Roadless Area Conservation Rule, ANPR. I am very concerned about short term solutions to long term problems. These short term solutions will have long term effects on our planet, not just for us, but for generations to come. Please, please in your heart do what is right, as a Christian I don't see how God could understand how we are destroying His world . . . for money. (Individual, Brazoria, TX - #A4158.50300)

I feel like our national policies are too short term and should have a longer vision. (Individual, No Address - #A4753.50300)

534. Public Concern: The Forest Service should manage roadless areas in an ecosystem based framework.

Local forest planning is essential to management of roadless areas and was given that responsibility by the NRAC Final EIS Rulemaking process. The EIS/policy/rulemaking provided important management exception after exception to guide management of roadless areas (range management, forest health, fire management, public safety, endangered species and wildlife management, travel planning and management, etc.) An expansive national roadless policy detailing management principles—no road building or activities which inherently produce roads for commercial purposes (timber harvesting, some kinds of mineral development)—was developed because roadless areas have great national value and have literally driven broad, national forest policy for decade after decade of conflict and contention. It must be clear now, even to the “new” Forest Service, at this point in time, that protecting these roadless areas is crucial to initiating an ecosystem based framework for managing forest lands. Inherently, forest-by-forest planning fails at this landscape or ecosystem level, thus the need for a wide-ranging roadless area policy. (Organization, Hyrum, UT - #A13496.50100)

The notice proposed five principles on which “protection and management” of roadless values should be based. Yet curiously, not one of the principles mentions protection of the ecological values of roadless areas. The guiding principle of protecting roadless areas must actually be protecting roadless areas. The goal of these principles appears to be to provide a balance between roadless protection and other interests. However, the lack of principles relating to actual protection of roadless areas makes this much less than a balanced approach. Further, these principles are redundant. While protecting certain overriding public interests that may conflict with roadless protection is appropriate in some instances, the roadless rule as promulgated already provides for that balance. (Organization, Boise, ID - #A8240.50000)

BY MANAGING WITHIN HISTORIC RANGES OF ECOLOGICAL VARIABILITY

DESCRIBING VALUES. AOC supports national forest management policies that permit and encourage: **management** of resources within historical ranges of ecological variability. (Elected Official, Union County, OR - #A8707.50100)

535. Public Concern: The Forest Service should manage roadless areas using the principles of conservation biology.

The value of a forest lies in life itself for its own sake. The roadless areas should be managed to conserve plant and animal life in as nearly natural a state as possible. This should be accomplished by prohibiting most human disturbance, and by strictly regulating permitted activities (See Question 7). Some of the dimensions to be considered include: a) species diversity, b) relative species abundance, c) intact functional relationships within and between species, d) genetic variability. In other words, the roadless areas should be managed using the principles of conservation biology. (Individual, Dallas, OR - #A3697.50000)

536. Public Concern: The Forest Service should allow natural processes to manage fish and wildlife species.

Focus should be on preserving the existing national forests, not trying to create more. Our government needs to stop trying to play God, by reintroducing wolves, ferrets, or poisoning lakes to rid it of one species of fish just to plant a 'native' species. Let nature take its course, it really doesn't need our help. (Individual, Whitefish, MT - #A8765.30100)

537. Public Concern: The Forest Service should restore natural disturbance regimes.**TO ALLOW THE BUILDUP OF COARSE WOODY DEBRIS AND LARGE WOODY DEBRIS**

Roadless area protection is needed to protect and restore the integrity of natural disturbance regimes (a hallmark of healthy forests)—small site canopy gaps as well as rare catastrophic disturbance (the spectrum of spatial and temporal scales). A variety of natural processes promote forest regeneration and create canopy openings and early successional habitat; logging is not necessary for these to occur. Coarse woody debris (CWD), large woody debris (LWD), and snags from dead and dying trees are a vital component of healthy forests, essential for sustaining the health of a multitude of terrestrial and aquatic populations and food webs. These materials gradually accumulate as a forest ages and becomes old growth. At present there is a paucity of CWD, LWD, and snags at most sites due to past logging that greatly reduced these inputs by removing the trees. (Individual, Staunton, VA - #A30027.30110)

TO ALLOW REGENERATION OF THE FOREST FLOOR

The forests should be protected and managed the same as they have been for centuries. Hasn't less intrusive management worked for wildlife and habitat? Wildfire burns (with contributing fuels) in remote areas do contribute to healthy forests, right? The regeneration of the forest floor after a burn from potash and nitrogen is incredible. (Individual, Hayfield, CO - #A13395.30100)

538. Public Concern: The Forest Service should focus on restoring degraded areas.

[Question 9] Focus on questions that can be resolved. Too much time is wasted on conundrums. There is a huge amount of work to be done in roaded areas, restoring and repairing past damage. Instead of an endless debate on whether to build a mile of road in a sensitive area, change the question. Focus on stewardship projects, restoration of damaged habitats, thinning and preventing further extirpation of threatened and endangered species. (Organization, Helena, MT - #A20598.50100)

539. Public Concern: The Forest Service should ensure the reclamation of developed lands.**THROUGH TECHNOLOGY**

What are the characteristics, environmental values, social and economic considerations and other factors the Forest Service should consider as it evaluates IRAs?. The existence of technology to effectively reclaim the land, should development be determined appropriate. (Organization, Fairfax, VA - #A8036.50000)

540. Public Concern: The Forest Service should engage the public in protecting the environment.**ENCOURAGE NON-PROFIT ORGANIZATIONS TO SUPPORT THE PRESERVATION OF PRISTINE AREAS**

I expect that if the Forest Service were to preserve some fraction of their lands in a pristine state, it would find that non-profit organizations similar to the National Parks Conservation Association (NPCA) could be set up to support this effort. Why not a National Forest Roadless Area Conservation

Association to help tap into private resources for protection of the ecological values of the forests? (Individual, State College, PA - #A15450.17130)

ALLOW THE PUBLIC TO SPONSOR/ADOPT AN AREA OF THE FOREST

How about getting a family, organization, business, etc, person, to sponsor a piece of forest like they do for medians and various areas in and around cities or along stretches of road? I could try to help sponsor the beauty of 20 acres somewhere. What a great idea. (Individual, No Address - #A5360.30200)

541. Public Concern: The Forest Service should organize public/private partnerships to maintain and protect areas most in need of repair.

Good stewardship of the forests requires a hands-on approach by the stakeholders of the forests. Much more can be done in organizing public/private partnerships to accomplish the goals of maintaining and protecting those national forest lands that are most in need of repair. These partnerships would also provide a way of educating the public about forest care and respect. Of course those who don't believe that people should be allowed in the forests will try to disrupt these kinds of efforts, but their ideology doesn't allow for good management and protection of the forests. (Individual, Denver, CO - #A26037.30100)

542. Public Concern: The Forest Service should retain roadless areas as scientific control areas.

Roadless areas provide a baseline for judging the impacts of more intense land-use activities on multiple-use lands. Because roadless areas in the Southern Rockies and elsewhere provide examples of ecologically healthy landscapes, they provide important opportunities to gauge the health of lands being managed primarily for resource extraction and more intense levels of use. Without roadless areas, there is no reliable ecological baseline to compare the relative health of our more intensely used lands. Thus, roadless areas are an invaluable tool for land and resource managers, helping to ensure the health of all our public lands. This requires substantial amounts of roadless lands in all ecosystem types found on the National Forest, as multiple-use lands occur on all ecosystem types. (Organization, Boulder, CO - #A22130.45100)

If naturally caused forest fires, insect outbreaks, etc. occur, they occur. We are in desperate need of some very large areas that are allowed to live truly naturally, dealing with whatever happens naturally. To assume that present management practices, however carefully devised, are perfect is a serious mistake. In fact, in my opinion, it is a frightening form of intellectual arrogance. I hope we can agree there is much we do not know about forest ecosystems. That is why it is so critically important to leave some very large ones—across the nation—*alone*. Present management practices may be causing harmful effects of which we are utterly unaware at this time. How can we possibly know what the effects of present or future management practices are if we have nothing against which to compare? (Individual, West Swanzey, NH - #A15665.30100)

GRAVINA, SOUTHEAST ALASKA

I've suggested Gravina should be retained as a scientific control area from which to compare the already extensively roaded and clear cut regions of SE Alaska. The cumulative impacts of non-USFS lands must be considered as well. There are numerous options for both consumptive and non-consumptive uses of these areas that do not require roads. (Individual, Ketchikan, AK - #A13522.50000)

543. Public Concern: The Forest Service should recognize that timber interests have marginalized ecological forestry.

We have been, ostensibly, discussing ecology and conservation for at least thirty years in relationship to management of our National Forests, and of course these concerns were supposedly originally present when Mr. Roosevelt created the USFS a hundred years ago. The problem—especially since the end of WWII—is that the raw financial and political power of the timber industry has marginalized these discussions and any sweeping, meaningful, practically effective implementation of ecological science in

the management of these forests. “Forestry” has been defined by the industry, not ecologists, and only in the past ten years has there even been flirtation with ecological concepts and actualizing them at a management level. (Individual, Williams, OR - #A17130.15122)

Multiple Use Management

544. Public Concern: The Forest Service should clarify the meaning of multiple use.

What is the meaning of Multiple Use? I could ask 10 Agency employees and would get 10 different answers. A myriad of activities occur on National Park managed lands. Yet, National Parks (even with commercial activities) are not considered multiple use lands. Why? Why is the USFS considered multiple use and the NPS is not? Does multiple use mean that logging and mining may occur? If so, lets say so. We continually get requests to implement various projects on NFS managed lands by proponents. Most are money-making opportunities on Federal lands. There is nothing inherently evil about that. However, many of these projects are inconsistent with the long-term goals of the streams and the land. In these instances, time after time, the proponents vehemently argue that their project must be moved forward regardless of impacts because the USFS is a ‘multiple use’ agency. What is the difference between the NPS and the USFS as it relates to ‘multiple use.’ (Individual, Grangeville, ID - #A1578.15161)

545. Public Concern: The Forest Service should base multiple use management on local citizen needs.

To illustrate the importance of decision making at the local level, all stakeholders present for a planning meeting for the Burro Mountains in the Gila National Forest in southern New Mexico stated, “the Burro Mountains need to be managed for multiple use.” In other words, access needs to be provided for all activities in the National Forest System. As such, NMDA [New Mexico Department of Agriculture] requests the FS base national forest management decisions on a rigorous analysis of multiple use needs of the local citizenry. (State Agency, Las Cruces, NM - #A18061.50200)

546. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule does not threaten the tradition of multiple use.

As an Eastern Washington resident, I understand the value of having our National Forests managed for multiple use.

Already the vast majority of National Forests support diverse activities such as grazing, logging, mining, and recreation. The roadless rule does not impact these activities at all and as such does not threaten the tradition of multiple use. (Individual, Ellensburg, WA - #A1895.10110)

547. Public Concern: The Forest Service should recognize that maintaining forested areas without roads is an appropriate measure in the context of multiple use management.

The Roadless Rule is a good example of progressive land management based on science and a recognition of all forest values. The February 2000 issue of Conservation Biology included a special section (9 papers) on “Ecological Effects of Roads.” An article by Trombulak and Frissell concluded: “We reviewed the scientific literature . . . and found support for the general conclusion that they [roads] are associated with negative effects on biotic integrity in both terrestrial and aquatic ecosystems . . . Our review underscores the importance to conservation of avoiding the construction of new roads in roadless or sparsely roaded areas . . . [and] it is critical to retain remaining roadless or near roadless portions of the landscape in their natural state . . .”

Maintaining forested areas without roads is an appropriate measure in the context of multiple-use management. Multiple use of national forests has never implied building roads and authorizing extractive use and high-tech recreation on all areas outside of Wilderness. We, and future generations,

will benefit from national forest landscapes that have not been roaded. (Individual, West Glacier, MT - #A5946.45100)

For the Forest Service to attribute to roadless areas values beyond traditional multiple use values leads to a legal trap that the Forest Service should avoid. In theory, the “release” language in the 1980s Wilderness acts was intended to help solve this problem, it didn’t. Multiple use management certainly includes values that require that some areas not be roaded. The NFMA forest planning process is the mandated, appropriate and adequate way to handle this. (Individual, Spokane, WA - #A17819.50200)

548. Public Concern: The Forest Service should recognize that preservation is in opposition to multiple use.

When the term Roadless Area Conservation is claimed by the Forest Service, in my mind it is not conservation; rather they are saying PRESERVATION and I object to that. The whole premise of “protecting” our forests is a false one and is in direct opposition to the Forest Service foundation of multiple use. (Individual, Bellvue, CO - #A13383.50200)

549. Public Concern: The Forest Service should recognize that roadless area values are attainable through multiple use management of roaded areas.

I recommend that you carefully and clearly identify those products, services, and conditions of national forest lands that can be provided under responsible multiple-use management and do not require the restrictions inherent in roadless/Wilderness area designation. Many of the benefits claimed for roadless areas in former President Clinton’s speech announcing this initiative, in Forest Service press releases, and in the Forest Service’s background statement in the NOI were fully attainable though the multiple-use management of roaded areas. (Professional Society, Orono, ME - #A17644.50200)

Allow Multiple Use Management

550. Public Concern: The Forest Service should allow multiple use and sustained yield management.

Multiple-use of our national forests makes healthier forests, healthier local economies, better wildlife habitat, helps our schools and county roads, and makes more recreational opportunities such as huckleberry-picking, photography, and good-panning. The availability of small fast-and-pole and firewood permits are also beneficial to local citizens. (Individual, Stevensville, MT - #A2357.50200)

BY ALLOWING THE EXERCISE OF EXISTING RIGHTS

North Dakota Farm Bureau believes the most effective utilization of public lands is the multiple-use concept, including agriculture, mineral development and recreation. Any land management decisions should be site specific at the local level. Existing rights should be allowed, such as water rights, grazing permits, right of access, etc. (Association, Bismarck, ND - #A30187.50200)

BY INCLUDING RECREATIONAL AND ECONOMIC USES

We continue to be a strong supporter of the concept of multiple use for public lands within the State of Nevada. These uses include recreational (hiking, camping, bicycling, horse backing, hunting, fishing, cross-country skiing, snow-shoeing and off-road vehicle use), and economic uses such as mining, livestock grazing, timber harvest and guided tours (i.e. snowmobile and off-road vehicle use). (Elected Official, Douglas County, NV - #A22071.50200)

BY ROTATING ROADLESS AREA INVENTORIES

The forest is a renewable economic resource. Dynamic natural forces as well as man’s activities have an impact on current forest conditions and are important factors in making management decisions. Harvesting forest products such as timber, forage and wildlife should be managed in a way to provide ongoing multiple use and sustained yield. To accomplish this, it may be necessary to rotate roadless inventories from one section of the forest to another. We believe that the roadless inventory should be

periodically updated in order to keep the database current. Expansion of roadless acreage is not necessary. (Association, Sandy, UT - #A15818.30200)

BECAUSE IT BEST MEETS THE NEEDS OF THE PEOPLE

Multiple use management will best meet the needs of the public and provide an equal and equitable management plan. We encourage reinstatement of these goals. (Organization, Great Falls, MT - #A17098.50200)

I think this question can largely be answered by recommending that the forest service follow the tenets of multiple use management. These areas are the public's domain, and all the interests of the public should be able to be potentially accommodated. This cannot happen if large chunks of forest are declared "off-limits". (Individual, No Address - #A27249.50200)

BECAUSE THERE ARE ALREADY ENOUGH PROTECTED AREAS

There are many inventories roadless areas, wilderness study areas, and designated Wilderness areas within our backyard. We value all these areas for their beauty, the wildlife, the solitude, and the peace of mind they bring to us. But enough is enough. There are designated areas where each of us can enjoy our very own "special" values. Montana does not need more designated wilderness. We have participated in volunteer work with the local Forest Service for many years. We have created a feeling of ownership by protecting the environment with erosion control, weed abatement and improved public safety. Multiple use values should be returned to the process. (Organization, Great Falls, MT - #A17098.50200)

The National Forest system contains 192 million acres. Of this, 42 million acres, or 22%, are currently preserved in special designated areas (wilderness or other naturally managed areas) where road building, timber management, and other types of permitted uses are not permitted. The IRAs consist of another 54.3 million acres, or 28% of the lands managed by the Forest Service, of which some acreage (the reader of the decision is hard pressed to determine how many) is going to be recommended for additional wilderness designation. In addition, there is a large inventory of parcels "less than 5,000 acres in size"; depending on the outcome of the Roadless Initiative, these parcels could be withdrawn from multiple use. Thus, at a minimum, 50% of the National Forest lands will be withdrawn from the majority of the users. At the same time, user numbers for National Forest lands increase yearly. Where are all of the users going to go? The decision alludes to the fact that other federal and private lands have future opportunities for the additional users, but then falls short of any sort of evaluation of how this is going to be accomplished or how the public is going to be informed of this new "Don't Use the National Forest" strategy. Such a significant change in policy, more than doubling the amount of land area that will no longer be available for multiple use, deserves more careful consideration than the process employed at this point. (Permit Holder, Mammoth Lakes, CA - #A21901.50200)

BECAUSE ALLOWING ANY SINGLE USE TO DOMINATE THE PUBLIC LANDSCAPE WOULD BE UNFAIR

The Forest Service should be protecting this land FOR the public, not FROM the public. In its efforts to meet its multiple-use mandate the Forest Service will undoubtedly have to balance the use preferences of a variety of users. Allowing any single use preference, such as "nonuse", to dominate the public landscape would be unfair and in violation of the multiple-use mandate. (Individual, Canyon Lake, TX - #A3666.50200)

AS REQUIRED BY LAW

We cannot make decisions about resources we have failed to identify. Any modifications to the Roadless Area Conservation Policy must take into consideration the need to access the national forests to provide for Congressionally-mandated multiple uses. (Individual, Laramie, WY - #A949.50200)

The plans must provide for multiple use as provided in The Multiple Use Sustained Yield Act of 1960, taking into account the "coordination of outdoor recreation, range, timber watershed, wildlife and fish, and wilderness". (Individual, Anaheim, CA - #A953.50200)

The management for multiple use works when it's allowed to, when forest professionals are allowed to make their best professional decisions and then implement them. If fuel levels are high, allow for fire wood removal or select timbering, allow for primitive recreation, both motorized and non-motorized, encourage the public to enjoy the solitude that their public lands can afford them. The prescription works when it's allowed to, otherwise the anti-recreation lobby couldn't continue to find millions and millions of acres managed under the multiple use mandate every year that now qualifies for Wilderness designation. (Individual, Los Alamos, NM - #A3720.50200)

551. Public Concern: The Forest Service should reexamine forest plans to ensure that multiple use requirements are being met.

It is notable that during the LRMP process the Forest Service noted that a 10% reduction in timber sale outputs would be a significant change that would trigger a revision or amendment. The significant nature of the reduction warrants a reexamination of the forest plans to determine whether the multiple use requirements are still being met, and if not steps should be taken to revise land use allocations to restore multiple use management. (County Attorney, Grant County, OR - #A17667.50200)

552. Public Concern: The Forest Service should manage national forests for sustainable use.

I strongly oppose any weakening of the Roadless Area Conservation Rule. I am a passionate supporter of preserving the remaining tracts of unroaded areas. They represent a small portion of the productive forest acreage available to us. We have put vast tracts of the forest into wood products production. If we are any kind of stewards of the land, and if we have any skill and knowledge about achieving sustained yield, we can maintain an adequate flow of material (and jobs) from the huge areas of forest already in commercial use. (Individual, Eugene, OR - #A276.75400)

BY IMPLEMENTING RESTRICTIONS ON TIMBER REMOVAL METHODS AND PRACTICES

Unlike most other "tree huggers", I would like to see some of the trees in our forest lands harvested. HOWEVER, I don't want to see roads nor clear-cutting as being a part of that harvest. I feel that:

1. The Forest Service should select the trees that may be harvested;
2. Commercial loggers must pay a fair price on all trees harvested;
3. No roads can be constructed into any part of our National Forests for logging purposes;
4. Loggers will have to do all of the cutting and trimming;
5. Helicopters will have to pick up the logs and remove them from the forest.

Will it be expensive? Yes, it will be for the loggers, but not for the taxpayers. Will it cost the taxpayers anything? No, it should put money into our treasury if loggers pay a good price for our logs. Will it cost consumers more for lumber? Certainly, it may even cause industry to conserve wood products more effectively (wood pallets, for example, are often used once, then tossed). (Individual, Random Lake, WI - #A4620.75400)

Do Not Allow/Reconsider Multiple Use Management

553. Public Concern: The Forest Service should not manage National Forest System lands under the multiple use philosophy.

Perhaps it is time to reconsider our 19th century economic model based on extraction. Why doesn't the Forest Service lead the way by changing the management approach and the ill-advised Multiple Use concept to one that protects, restores, and celebrates our heritage of wildness? (Individual, Florence, MT - #A7.50000)

BECAUSE SOME USES SHOULD BE STRICTLY LIMITED

The idea of multiple use is not really workable when the numbers and demands become mutually exclusive. Perhaps it is time to scrap MUSY in favor of more realistic management policy—one that gives precedence to maintaining the forests' ecological integrity rather than its utility for extraction

industries. Short of scrapping MUSY, the Forest Service should recognize that some uses are much harder on the forest and even other types of uses, and should therefore be more strictly limited. Logging, mining, and drilling obviously destroy forest resources and preclude other uses. Motorized users are not mutually compatible with simultaneous quiet uses; they also harm the forest. These types of uses should be strictly regulated and possibly curtailed. (Individual, Crested Butte, CO - #A21816.50100)

BECAUSE IT IS NOT REALISTIC

The idea of multiple use management on all public lands is an admirable goal but not a realistic one. (Permit Holder, Rifle, CO - #A29619.50200)

BECAUSE THERE ARE TOO FEW FORESTS LEFT TO JEOPARDIZE THEM ANY FURTHER

At one time, the mandate of the Forest Service called for “multiple use”: preservation, recreation, logging and mining. At one time, this policy may have made sense. Certainly today, it no longer does. For a variety of interlocking reasons, both economic and environmental, multiple use is no longer the correct way to manage our national forests. Our country has too few forests left to jeopardize them any further. (Individual, Candler, NC - #A160.50200)

We have despoiled way too much of our public lands through the concept of multiple use. This is a polite term for theft cloaked as necessity. (Individual, Harmony, MN - #A43.50200)

Other Management Philosophies

554. Public Concern: The Forest Service should manage roadless areas according to the philosophy of Theodore Roosevelt.

We need to look at these issues as one of our greatest presidents, Theodore Roosevelt, would have us do. Wilderness lost is wilderness never to be regained. Logical, intelligent land use is an imperative. (Individual, Centre Hall, PA - #A3965.50000)

555. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule opposes the Roosevelt philosophy of conservation.

Even more ironic was the feeble attempt by President Clinton to claim the conservation mantle of Roosevelt and Gifford Pinchot. Clinton invoked Teddy Roosevelt nine times in his speech announcing this initiative. But this initiative stands in fundamental opposition to Roosevelt’s philosophy of conservation and to his record of accomplishment.

Roosevelt’s conservation ethic was summed up in a speech at Osawatomie, Kansas on August 21, 1910, when he said, “**Conservation means development as much as it does protection**”. And what did he mean by development? His autobiography boasts of the “roads, trail, and telephone lines” that began “to be provided on a large scale” on National Forest lands under his Administration. Roosevelt emphasizes that, once he had Pinchot and professional foresters in charge of the National Forests, they proceeded without delay to “open all the resources of the National Forests to regulated use”. He further points with pride to increasing timber sale income from National Forest lands by more than fourteen-fold in three years.

The Clinton Administration, by way of contrast, boasted of eliminating 2/3 of the timber sale program since taking office, and hoped to make this non-use-non-management philosophy permanent. In point of fact, based on the words and actions of both men, Clinton had an approach to National Forest management that was roughly opposite to that of Roosevelt. Those of us who believe in the philosophy of multiple use are the true philosophical heirs of Teddy Roosevelt. (Organization, Missoula, MT - #A28141.50200)

556. Public Concern: The Forest Service should develop policies for protecting and using forest lands without excluding people.

Western governors, congressional leaders, recreation groups, resource businesses, property owners and citizens are working together to support our rural communities, and to advance new ways to protect the environment while simultaneously providing the public with the important natural renewable resources these lands provide. It's time, through your leadership, to advance policies for protecting and using forest environments without excluding people. (Individual, Scotts Valley, CA - #A2876.50200)

557. Public Concern: The Forest Service should eliminate biodiversity and ecosystem management as management principles.

Eliminate "biodiversity" as a management concept, goal, or operational principle.

Eliminate "eco-system management" as a management concept, goal, or operational principle.

No more interpreting multiple-use to put people's activities last. (Individual, Greeley, CO - #A28995.50200)

Effects of Activities/Disturbance on the Environment

558. Public Concern: The Forest Service should consider forms of large-scale damage to forests other than that of fire.

INCLUDING HUMAN CAUSED DAMAGE

Protecting forests from the negative effects of severe wildfires and insect and disease outbreaks.

How does the Secretary propose to expose the forest to the positive effects of severe wildfires while protecting them from the negative effects of the same? One process usually results in a host of effects and these effects usually show some distribution over whatever range of parameters you choose.

Protecting forests from catastrophic [fire] is fine, but there are other forms of large-scale damage to forests that are not mentioned in this statement, especially those caused by mankind: changes in atmospheric composition (for example introduction of copious quantities of sulfur which leads to acid), demands for access (leading to fragmentation of forest tracts, reduction of water quality, and loss of habitat by the building of roads), and demands that value be measured in dollars only (there are many ways to make money, many ways to obtain energy, many way to build structure, but there is no way to make a forest—to date, people have demonstrated only that they can destroy forests en mass via clearcutting or destroy forests slowly, piece by piece, as we are dong right now with this letter, this discussion, and this entire issue. (Individual, Nederland, CO - #A19016.11130)

559. Public Concern: The Forest Service should recognize that fire results in greater environmental impact than other uses.

TIMBER REMOVAL

One last thought, doesn't it seem rather hypocritical that the same environmental groups who protest a 40 acre logging job stand silently by, as millions of acres burn, causing air pollution, destroying wildlife, wildlife habitat and with no vegetation soil erodes into steams and rivers. The 40 acres will normally be replanted within a year. In 4 to 5 years there is a new healthy stand. A forest fire, if not enough will sterilize the soil and any regeneration will be a long time coming. (Individual, Olympia, WA - #A11810.50000)

ROAD AND FIRE LINE CONSTRUCTION

The huge Yellowstone National Park fire demonstrated that active road building and fire line construction results in much greater stream sedimentation and adverse impacts to aquatic resources than the fire itself. (Individual, Juneau, AK - #A23242.30100)

560. Public Concern: The Forest Service should recognize that some activities do not endanger the environment.**ROAD CONSTRUCTION**

The mountains are still there, the creeks are still there, wildlife is still there, sagebrush is still there, etc., etc. The premise that roads destroy an area is pure nonsense. They allow all of us to enjoy and access our back yards. (Individual, Ketchum, ID - #A388.50000)

OFF-ROAD VEHICLES

All too often it seems we in the ORV community are automatically considered scofflaws and anti-environmental neanderthals simply because we enjoy the natural wonders of our great nation from the seat of a motorized vehicle. From my perspective, this could not be further from the truth. From my childhood days growing up in the backwoods of Maine to my current middle aged radial on the great circle of life, I have always enjoyed the natural wonders of our United States and have tried hard to make sure the impact of my adventures have been minimal. I was taught the basic tenets of the Tread Lightly philosophy by my parents long before the Tread Lightly, Inc. program was organized into the form as it exists today. I and all of the other ORV users I know adhere to these same tenets as we partake in the enjoyment of our public lands. To automatically label us as anti-environmental and/or dangerous to the environment simply because we drive an ORV is to ignore the simple truth. (Individual, Saint Louis, MO - #A629.50000)

561. Public Concern: The Forest Service should use all-terrain vehicles for managing the habitat of all the forests and grasslands in the United States.

I suggest that the use of other ALL Terrain Vehicles are cheaper and better to use for managing the habitat of all the forests and grasslands of the U.S.A. All the forests are being deteriorated by wildfires because of negligence of people getting too close that are not responsible for their actions and it will only get worse when there are more roads going to and through them. (Individual, Jamestown, IN - #A10964.30200)

562. Public Concern: The Forest Service should permit environmental clean-up activities.

Allow for an environmental cleanup, when there are existing statutory or treaty rights, or when there will be irreparable resources damage, or there are hazardous road conditions, development of Federal Aid Highway projects, or the continuation or renewal of mineral leases on current leased lands. (Tribal Government, Lapwai, ID - #A11821.90110)

563. Public Concern: The Forest Service should prohibit the collection of animal and plant specimens.

In order for the process to reach its full environmental and scientific potential human activities within those designated areas should be kept to an absolute minimum.

The following activity shall be expressly prohibited: Collecting animal and/or plant specimens. Permits could be issued for bona fide scientific purposes. (Individual, No Address - #A26840.90000)

564. Public Concern: The Forest Service should require a permit for destructive sampling of the forest biosystem.

Non-destructive data-collection should also be allowed, to assess the biodiversity and "health" of the roadless area. Destructive sampling of the forest biosystem should require a permit from the forest service. (Individual, Olympia, WA - #A25533.90110)

565. Public Concern: The Forest Service should allow the commercial use of surplus plant and animal species.

AS DETERMINED BY MONITORING TEAMS

Allow exploitation of all surplus plant and animal species, as determined by interdisciplinary roadless areas monitoring teams. (Individual, Cleveland, OH - #A26411.90000)

Positive Effects

566. Public Concern: The Forest Service should consider the positive environmental effects of activities/disturbance.

ROADS

I wonder, after a road is built does it not become a natural fire break? The natural grasses and foliage that fill the sides of the road creates feed for wildlife, and mankind has a chance to use the road for pleasure and economic benefit. I'm sure there was some erosion when the road was built but it diminishes with time. By rebuilding and removing the road twice, how much silt and erosion does this cause? Now there will be the concern of erosion after the fire is out. I bet you a Montana T-Bone steak it is a heck of a lot more. (Individual, Kalispell, MT - #A13362.52210)

In my experience as a fire watch for a logging company, all species of wild life travel the logging roads rather than through the brush or rugged terrain. (Individual, Cottage Grove, OR - #A11071.53000)

FIRE

Forest fires should not be thought of in a negative way. Forest fires can be compared to sharks in that they both get a bad reputation because the public is not informed on the issue. Fires are a very good thing for the environment and can actually improve conditions in the forests. We as a nation have almost been too good at preventing forest fires because according to the U.S. forest service about 110 million acres of woods are in poor health ("Playing"). Poor health of trees can be contributed to dead trees and the fact that forest floors are cluttered with dead wood and debris that prevent new, healthy trees from sprouting. Trees need sunlight to grow and if the ground is covered with underbrush it is very difficult for new seedlings to develop. Controlled burnings would remove the clutter and the ash would provide nutrients for the next generation of trees. As well, trees that die as a result of a fire will eventually topple over and disintegrate, nourishing the soil and insects. As well, the fire will melt pinecones and release their seeds, which could become the next generation of trees (Hyman). When snow melts in the spring, the water will carry nutrients from dead trees and plants into the surrounding waters, which will be a boost to insects and fish that prey on insects. As a result of the fire cleaning out the forest floor, this will open up space that will allow plants to grow back quickly. (Individual, No Address - #A30364.30310)

Most natural events that might be considered catastrophes actually have beneficial consequences for the long-term health of ecosystems. Fires for instance are necessary to burn-off dead vegetation and germinate the seeds of some species. (Individual, Albuquerque, NM - #A23820.30100)

Federal restrictions on road development on the surface also seem environmentally friendly from a standpoint of specie preservation. But in fact, it could be the opposite. Wildfire threatens the safety of many rare and endangered plant species throughout the national forest system. Without small-scale road development in fire prone areas of the forests, fires could spread quickly with no hope of containing the flames. Intervention is necessary on the part of local forest rangers, and without it many species could perish. Local fire prone areas are well known by the forest rangers, and a federal restriction that prohibits access to these specific areas could endanger many species. (Individual, No Address - #A29623.30200)

INSECTS AND DISEASE

Much of the managed forests of the sierra cascade region are lacking in wildlife habitat trees (snags) because of the removal of “decadent” trees and management decisions that target dwarf mistletoe and insect infestation. These two processes are integral to the dynamic functioning of natural forests. Dwarf mistletoe “infestation” of stands and individual trees creates irreplaceable habitat for a wide variety of birds according to a study published by Robert Bennetts (The Influence of Dwarf Mistletoe Infestation on Bird Communities in Colorado Ponderosa Pine Forest, Colorado State University, 1991). Dwarf mistletoe traditionally has been viewed as a forest pest because of reductions in timber volume. Bennetts’ data suggest that dwarf mistletoe has a positive influence on abundance and richness of bird communities. An alternative view of dwarf mistletoe is warranted in the context of an ecological disturbance process and its influence on wildlife and forest structure. The ecological role of dwarf mistletoe is certainly not limited to snag recruitment in that it provides nesting and forage habitat for sensitive species as well as their prey base (Pgs. 22-23 Bennetts). The silvicultural goal of thinning trees to improve vigor and reduce mortality needs to be assessed in terms of eliminating opportunity for snag recruitment and other habitat requirements. This is particularly true in designating High Value Habitat Areas such as roadless areas. (Organization, Chico, CA - #A25114.31210)

The agency asserts or implies that natural diseases and insects that may kill trees are automatically harmful to forest health (DEIS 3-109). This not only unreasonably presumes that cutting and removing trees cures or prevents diseases or insects, but also concludes that not logging roadless areas is undesirable. The positive aspects of insect and disease outbreaks are omitted from the discussion. Ignored are such beneficial affects as resultant increases in CWD and habitat/niche complexity, thinning of overstocked stands, desirable alterations in stand species diversity and composition, creation or facilitation of early successional habitat, and greater age class diversity. (Individual, Staunton, VA - #A29325.30100)

A common example from Virginia of the agency’s improper presumptions as regards “forest health” underscores the need for tightened proscriptions and improved analysis. It is often simply assumed that widespread gypsy moth mortality will be severe in the long-term (GWNF Panhandle timber sale EA-3). However, this is not consistent with information in the tiered-to GWNF FEIS. The agency found that they cannot predict which stands will be damaged severely by gypsy moths (GWNF FEIS at 3-49). And the agency found that silvicultural practices will not control gypsy moth populations. See FEIS, Response at I-404. The agency also found that most of the oaks are not being destroyed in gypsy moth impacted areas. See FEIS, Response at I-396-397. Also ignored is the recent substantiated collapse of gypsy moth populations (see, e.g., GW-JNFs 1997 and 1998 Monitoring Report at page 84). Importantly, it has been established that a reduction in the proportion of oaks resulting from insects or other natural factors is beneficial as it reduces the subsequent susceptibility of the sites to gypsy moths. As regards gypsy moth or other insect and disease impacts, the affects and substantial benefits to forest health from not logging have not been fully and fairly considered. Scientific information on this relevant factor comes from the agency’s own research scientists. (Individual, Staunton, VA - #A29325.31200)

DOWNED TIMBER

Bark beetle infestations are as natural to the forests as the trees themselves. Given that old growth is most susceptible to attack, it is important to remember large down wood benefits wildlife and helps prevent catastrophic wildfires by holding large quantities of water on the forest floor (See enclosure referenced above). (Individual, Penn Valley, CA - #A12007.31200)

Healthy coniferous forests are a mix of early, mid and late seral live trees up to 500-600 years of age. Included are shrubs and grasses along with many dead and dying trees. The most important factor for wildlife is a reliable, year-around, food source. Shelter and unfragmented habitats are next. Actual forest health hinges on the number of large softwoods present, such as snags and large down logs. Large down logs are essential to forest health, sometimes called the “foundation of the ecosystem.” They hold massive amounts of water on the forest floor, enrich soils and support myriad wildlife species. Remembering that the cellular structure of large dead woody material can hold up to three times its dry

weight in water is important because it is this kind of wood that helps maintain dampish and cool forest floors. These wet, fire resistant microclimates are further enhanced by the cooling effects of natural forest shading as measured through canopy closure. The key points are that as summer begins, a completely saturated tree branch 2 inch in diameter has only a four-day timelag between wet and air-dry while a 30-inch log has a 180-day timelag. The major problem here, is logging removes the larger wood that would ordinarily grow old and die. Thus, logging interrupts the forests' natural resistance to catastrophic wildfires in several ways: 1) the cooling effects of uncut forest canopies (shading) are lost; 2) moisture 'reservoirs' or the 'holding-tank' qualities inherent to large down wood is lost over the short and long term; and 3) the logged over areas are typically knee deep with small limbs and other discarded logging slash. This highly flammable material dries quickly in the increased sunlight caused by the logging. Worse, more small diameter fine fuels sprout rapidly and grow up among the dry slash. (Individual, Penn Valley, CA - #A12007.60000)

567. Public Concern: The Forest Service should assess the volume of additional stream sedimentation that will occur because of the absence of timber management and fire control.

ASSESS THE DAMAGE THIS WILL CAUSE TO THREATENED AND ENDANGERED SPECIES

Since logging will be banned or nearly banned from this 50 million acres, built up fuels will make the forest susceptible to devastating wildfires. So the first question for the EIS should be, how much particulate will be released into the atmosphere from these fires? How much CO₂? When land is logged, the riparian zones can be segregated out and left alone. Wildfires have no such discrimination. How much damage will this initiative cause to riparian zones from the inevitable, uncontrolled wildfires? Many of us have seen the spectacular stream sedimentation that can occur after wildfire, such as the mud flows currently occurring in the Bitterroot. So we would like an assessment of the volume of additional stream sedimentation that will occur because of the absence of timber management and fire control. We want to see an assessment of the damage this will cause to threatened and endangered species, particularly salmon and bull trout. We want to see an accounting for effects such as the Tanner Gulch fire in Oregon, the consequences of which wiped out salmon in that drainage. (Organization, Missoula, MT - #A28141.50000)

568. Public Concern: The Forest Service should allow stewardship timber removal.

TO INCREASE THE ABUNDANCE OF DEAD WOOD ON FOREST FLOORS

Road construction or reconstruction is unnecessary for the management of healthy forests in roadless areas. Where healthy, native forests persist, natural fire outbreaks and windstorms are natural disturbances to which the forest is well adapted. In fact, these processes are important for the maintenance of biocomplexity in forested landscapes. Where logging has already occurred in roadless areas, or inventoried roadless area where road construction is permitted by management prescriptions, some stewardship logging will be required to alleviate the overcrowding and homogenous characteristics of biological simple, even-aged managed forests. Logging for stewardship logging. Since dead woody debris is a vital component of forest ecosystems, is often lacking in managed forests (due to 'salvage' operations), a further benefit of stewardship logging would be to increase the abundance of dead wood on forest floors. (Individual, Seattle, WA - #A29812.30100)

569. Public Concern: The Forest Service should consider that some ecosystems and threatened species need disturbance and roadways to exist.

I think that by trying to protect everything with blanket laws, more damage will be done to ecosystems in the long run. There are certain ecosystems and threatened species that need disturbance and roadways to exist. I would hate to see policies swing to such an extreme that we endanger more ecosystems. (Individual, Gulliver, MI - #A8362.30000)

Negative Effects

570. Public Concern: The Forest Service should address the negative environmental impacts of activities/disturbance.

RESOURCE USE

Resource extraction proposals threaten to undermine ecosystem health. Presently the Chugach Alaska Corporation is pursuing two major projects that stand to compromise the health of the Delta—the road to their timber inholdings in the Bering Coal Fields and plans to explore oil and gas with Cassandra Energy Corporation in the Katalla region. Both projects will have substantial long-term impacts, especially a road system that would incur more access to fish, wildlife and habitat in the wild eastern part of the Delta wetlands. (Organization, Anchorage, AK - #A23038.50100)

Local citizens who reside close to National forest lands have long been influential in supporting extractive uses of Federal lands because of the local economic benefits (in the form of jobs) resulting from such uses. Historically the environmental consequences of such uses were often inadequately considered or ignored outright. (Individual, Columbus, OH - #A41.15111)

MECHANICAL FOREST HEALTH TREATMENTS

DellaSala and Frost document the best available science that determines that even when they are carefully conducted, mechanical thinning treatments can result in numerous adverse environmental impacts, including:

Soil damage through increased erosion, compaction, and loss of duff/litter layer (Harvey et al. 1994, Meurisse and Geist 1994).

Increased tree mortality of residual/retained trees due to pathogens and mechanical damage to boles and roots (Hagle and Schmitz 1993, Filip 1994).

Increased sediment and siltation that is harmful to fish habitat and other aquatic species (Beschta 1978, Grant and Wolff 1991).

Increased levels of fine fuels and short-term fire hazard (Fahnestock 1968, Weatherspoon 1996, Wilson and Dell 1971, Huff et al. 1995).

Dependence on roads, which result in numerous long-term adverse effects (Henjum et al. 1994, Megahan et al. 1994).

Reduced habitat quality for sensitive, rare, threatened and endangered species associated with cool, moist microsites or closed canopy forests (FEMAT 1993, Thomas et al. 1993).

Given the potential for serious adverse impacts from mechanical thinning treatments in addition to the adverse effects of roads, such treatments should be restricted to previously roaded areas that are also the sites most degraded and in need of restoration. It just makes no sense to build roads to facilitate road-dependent fuels treatments in the name of “conservation,” “restoration,” or “protection.” (Organization, Eugene, OR - #A21798.50000)

OFF-ROAD VEHICLES AND LOGGING EQUIPMENT

Areas adjacent to roads also tend to receive more off-road use (camping, firewood gathering) which in heavily used areas can compact soil or damage root systems causing physiological stress. Chemical and road salt can also damage trees. In dry forests with lots of traffic and dirt roads, excessive dust can also stress trees and other vegetation. Soil compaction decreases water absorption and can damage roots of grasses, forbs, shrubs and trees. Off-road vehicles, or heavy logging equipment use, during wet conditions is especially damaging and compaction and loss of soil structure can occur with a single vehicle. (Individual, Las Vegas, NV - #A5694.30100)

ROADS AND MINES

I have seen the beauty, the diversity of plant life and the wonder of the animal life in these areas. I have also seen the damage and destruction caused by roads (intended or not) and by mines (often created by a few individuals). The destruction is not just to the immediate area, but surrounding areas as it affects

water in the area—both its purity and the way it flows. It affects the plants destroying many and often allowing non-native plants to get a foot hold. It affects the animals by creating artificial separations of the lands and always the danger of maiming and death by being hit by vehicles and also by poisoning the soil and water that provides food and water for the animals. (Individual, Fillmore, UT - #A7847.30100)

DRILLING

Considering the continued leaching of oil from the Katalla fields into Delta waters, no doubt leaving toxic impacts that will only be exacerbated by proposals of renewed drilling and heavy logging in the Delta's uplands, this plan should be declined on the basis of impacts to the adjacent public lands. It is ACE's understanding that the Forest Service has never taken an inventory of "orphan" wells at Katalla, much less tested for the presence of toxins in anadromous streams in the area (conversations with Forest Service staff). (Organization, Anchorage, AK - #A23038.51300)

EFFECTS OF ROAD BUILDING ON AREAS ADJACENT TO ROADLESS AREAS

The Forest Service should consider the natural resources adjacent to their roadless areas and how road building might adversely impact them—i.e. protecting salmon spawning reaches from road accidents (tanker spills) and weather phenomena such as floods and fires. It should also consider the steepness of terrain—and in the case of a roaded system already underway to facilitate logging, which despite their best science in the planning process, begins to fail (landslide). (Individual, Craig, AK - #A778.50000)

FIRE

In **THE BIG BURN, The Northwest's Great Forest Fire of 1910** an account based on letters, newspaper accounts of the day and actual photographs, by Don Miller and Stan Cohen (Library of Congress catalog card no. 78-51507, ISBN 0-933126-04-2) there is this first hand account in a letter:

"Men who quenched their thirst from small streams immediately became deathly sick. The clear, pure water running through miles of ashes had become a strong, alkaline solution, polluted by dead fish, killed by the lye". (pg. 18)

History has probably repeated that many times. In the 1992 the Tanner Gulch Fire in northeastern Oregon, a sluice-out in the upper tributary of the Grande Ronde River resulted in total fish kill for 36 miles downstream in this prime salmon spawning river.

Fire does not protect watersheds, and much of the road destruction (called obliteration) puts tons of silt into streams, both destructive to fisheries and water quality. Modern silviculture can protect watersheds by reducing fire intensity, provide money, machines and expertise to maintain roads and thus reduce the potential for culvert failures, timber for jobs and the local and national economy. (Business, Kalispell, MT - #A29034.30300)

Some of these environmentalists are concerned about the "protection" from erosion from these areas, as well as from road in the forest. From 39 years of flying the Helena National Forest and its surroundings, I can tell you that erosion from our large stand replacing fires, including the let-burn fires advocated by environmental groups, is comparatively like a dump truck load compared to a shovelful of erosion from a similar sized harvest areas. (Individual, East Helena, MT - #A20422.15121)

Years of federal mismanagement to appease environmental interests (mainly, refusing to cut or clear any trees at all) has left the national forests in a state where overcrowded and dead and dying trees have created a disastrous and precarious situation. Trees and debris have created fuel ladders that threaten even healthy trees (that is, an older, healthy forest can withstand and survive a fire if the fire merely clears low-lying brush and grasses but leaves the crowns of larger trees intact.) But the same is not true when dead and dying trees are not cleared. Fire that would normally stay close to the ground can "climb" up these trees and reach the crowns of healthy trees, consuming them. Second, fires that burn too hot can leave land barren by destroying the organic materials necessary for forest regeneration. Finally, when the fuel loads are too high, fires are hard or impossible to control. These fires don't just burn out they rage so hot and so large that they can leap across vast expanses of land and burn whole landscapes. For all the direct costs of such fires, (lost forests, evacuated communities, lost houses,) there is a tremendous cost on our environment. Burning trees release tremendous amounts of toxins and

particulate matter into the air, and the smoke and quality of communities hundreds of miles away. The fires destroy habitat of wildlife, including the habitats of threatened and endangered species. Forest fires can create unstable soil conditions, leading to mudslides and other sediment runoff that affect our streams and rivers, and, ultimately the coast. (Individual, West Point, UT - #A5415.30430)

PREScribed FIRE

Prescribed Natural Fires—Good or Bad?

Environmentalists within and outside of the Forest Service are intensifying their efforts to increase the amounts of prescribed natural fire on public lands.

Environmental groups believe that fires started by lightning should be allowed to burn. Present policy permits this wilderness areas, national parks, and other areas including a large portion of the Elkhorn Mountains included in such categories as Wildlife Management Areas.

Experience over the past twelve years has shown that this “let burn policy” is a disaster for the environment, for receptionists, and for the general public.

The Canyon Creek Fire northwest of Lincoln in 1988, burned 246,000 acres, including 40,574 acres of private land, and 9,166 acres of state land. Pasture land, power and telephone lines, fence lines and some outbuildings were destroyed. The Forest Service disclaimed any responsibility, and it was left to Congress to reimburse the private owners for their losses. This same scenario occurred in Yellowstone Park in 1988, and has been replayed in many other areas since. As more time passes, the public memory of these destructive fires fades, and re-introduction of these policies becomes more easily accepted.

The environmentalists want to commit even more of our dwindling outdoors to additional acreage to these let-burn areas. Unfortunately, wildfires have a nasty habit of straying outside the boundaries prescribed for them by the Forest Service. If you have a home in the woods, how would you feel if one of these fires refused to stay inside the Forest Service boundary and burned your buildings and property? You could also expect the federal agency to disclaim any liability for your losses.

Contrary to what the Forest Service would like you to believe, the effects of uncontrolled wildfires on the natural environment are not entirely beneficial. Erosion associated with these super hot fires is unparalleled with other means of eliminating these excess fuels. Organic material which would aid in regrowth of new forests is mostly destroyed, and the ashes blown away by the wind. The carnage of small animals burned in these fires is beyond belief. And of course, huge wildfires certainly contribute their fair share of carbon dioxide and other pollutants to the greenhouse effect and global warming. (Individual, East Helena, MT - #A20422.30400)

Water Quality

Summary

General Comments – A number of respondents comment on water quality. People ask the Forest Service to protect roadless areas in order to protect water quality, to protect against flooding and landslides, and to act as biological defenses against pollution. Some comment particularly that roaded access be maintained to water resources. Some respondents assert that access to water sources is necessary for food resources or to protect the sources from sedimentation. Others state that road access should not be closed because roads and trails can be hydrologically disconnected from streams. Others comment on the effects of wilderness designations and timber removal practices on water quality. One individual suggests that good logging practices can ensure good water quality. On the other hand, some suggest that further land protections, such as roadless or wilderness designations or buffer zones, should be considered by the Forest Service to protect water quality.

Watershed Health – A number of respondents comment on watershed health. Some suggest that the Forest Service should adequately address watershed protection and ask that the effects of certain activities, such as road construction and timber removal, also be addressed. Others

request that the Forest Service protect roadless areas to preserve watershed health and to provide for irrigation. One individual asks that the Forest Service assess watershed health from a ridgetop-to-ridgetop perspective in order for “aquatic and vegetative values [to] be applied in a balanced manner.” Others comment that land designations may have a negative impact on watershed management access. Some state, further, that seems to be no inherent watershed benefit associated with roadless conservation.

Water Quantity – Respondents offer a variety of different comments on water quantity. Some comment that the Forest Service should increase logging to increase water quantity and state that roadless designations would “limit treatment to increase water production in the future.” Others assert that increased logging will not increase water quantity. These respondents believe that undue timber removal is detrimental to the environment, with no redeeming benefits.

Water Quality General

571. Public Concern: The Forest Service should protect roadless areas.

TO PROTECT WATER QUALITY

If we do not pass this Rule, we will be destroying Water quality—for drinking and for swimming and for wildlife . . . etc. If we log the forests, we have less clean water, and we destroy living area and water for (rarer everyday) wildlife. There are a million other reasons for not destroying the forests. I think this (water and wildlife) is the most crucial. (Individual, Austin, TX - #A21704.51340)

TO PROTECT AGAINST FLOODING AND LANDSLIDES

These unlogged and unroaded areas protect private property from landslides and flood damage. (Individual, Santa Monica, CA - #A1715.45000)

Millions of dollars in damages can be caused by severe flooding. Roadless and unlogged watersheds could help to mitigate the severity of the floods and thus save millions of dollars and a lot of human suffering. This may be especially important if we experience climate change. (Individual, Las Vegas, NV - #A5694.51330)

TO PROVIDE BASELINE AQUATIC DATA

I am a professional aquatic ecologist, involved in a quantitative assessment of all the rivers and streams in the 12 conterminous western states. Preliminary results indicate that most western waters are impaired and that few catchments or reaches remain that can serve for determining reference conditions against which to compare the others. We often must use historical data. Similar conclusions have been reached in qualitative assessments by federal ecologists and independent scientists. Therefore, based on the best available science, it seems foolish to continue to destroy forests for short term, small scale economic gains to a few in the face of long term and broad scale ecological deterioration with impacts on many current and future citizens. (Individual, Corvallis, OR - #A7998.50300)

TO ACT AS BIOLOGICAL DEFENSES AGAINST POLLUTION

I believe that full and immediate protection for all roadless areas is important because it reduces human impacts on vital ecological areas and protects our drinking water sources from the risks associated with human contact. There are risks now that we did not know about fifteen years ago, like cryptosporidium, and although treatment plants are highly efficient, we know they cannot remove everything. With the continuing growth in Colorado, the risks to our drinking water are only going to increase unless we have the vision now to protect our water sources. (Individual, Longmont, CO - #A7167.51342)

572. Public Concern: The Forest Service should adequately assess the true value of water on National Forest System lands.

An assessment of the marginal value of water on National Forest lands is more than \$3.7 billion per year. This does not include the value of maintaining fish species, many other recreation values, nor the savings to municipalities that have reduced filtration costs because water from National Forests is so clean. It also does not account for the aesthetic rewards to visitors of a day spent by a cold, clear stream. (Organization, Missoula, MT - #A21359.51000)

573. Public Concern: The Forest Service should recognize that water is necessary for food resources.

What do these “enviros” eat? Grass? Worms? I guess they don’t eat regular meat because they don’t want the farmers to have water for crops that feed the beef, hogs, and chickens; also, there goes the fruit trees and the bread for the table . . . and what about the displaced MINORITY workers from Mexico? (Individual, Mazama, WA - #A757.51310)

Our Wenatchee Valley is the apple Capitol of the World. All of the irrigation water for this multi-billion dollar industry comes out of Wilderness and roadless Areas. Our local economy depends on these naturally functioning wild forest watersheds. The Wenatchee River Watershed watered by the above named Roadless Areas is one of the few remaining unharmed septums where wild salmon spawn. The White River, whose sole watershed is Wilderness and roadless area, produces half the wild Sockeye Salmon in the Pacific Northwest. (Individual, Peshastin, WA - #A22973.51300)

574. Public Concern: The Forest Service should address the effects of wilderness designation on water quality.

The enclosed letter that accompanied the 3 page EPA letter included starts with general comments, under which is 1. Water quality. The following paragraph is taken from page 1 of the enclosure. “The 1700 watersheds of the National Forests provide the preponderance of high quality water supplies for the western states, and many eastern areas as well. Undisturbed forest areas are vitally important in maintaining adequate oxygen and nutrient balances in aquatic systems, and also provide pristine streams of low natural turbidity for the enhancement of aquatic life. EPA is concerned that supplies of high quality water be available throughout the Nation. Our responsibilities under the Federal Water Pollution Control Act Amendments of 1972 further stress the goal that the Nation’s waters be available for the full range of **beneficial uses**, including recreation and the maintenance and enhancement of all forms of aquatic life.” (Emphasis added) On page 2 of the enclosure letter EPA also had the following concerns. “All evaluations of areas that are qualified under the Wilderness Act of 1964 should be conducted with full regard to the potential impacts on water quality. The draft environmental statement for the Roadless and Undeveloped areas contain severe shortcomings, in these areas, and we feel there exists the potential for extensive water quality degradation if Roadless Areas are not allowed the benefit of more detailed study prior to selection as candidates for the Wilderness System. (Organization, Coeur d’Alene, ID - #A13314.51340)

575. Public Concern: The Forest Service should allow roaded access to water resources.**TO PROTECT WATER RESOURCES FROM NATURALLY OCCURRING SEDIMENTATION**

While roads may and do contribute to sedimentation of aquatic resources, design can minimize and even eliminate this concern. Roads can also allow access to water resources that require protection from naturally-occurring forms of sedimentation, and from catastrophic sedimentation sources such as fire and landslides. (Individual, Tendoy, ID - #A27508.30200)

576. Public Concern: The Forest Service should not use the risk of sedimentation as justification for motorized recreation and access closures.

BECAUSE ROADS AND TRAILS CAN EASILY BE HYDROLOGICALLY DISCONNECTED FROM STREAMS

The Forest Service Stream Systems Technology Center has found, in a paper published in the July 2000 issue of Stream Notes, that roads and trails can easily be hydrologically disconnected from streams. Therefore, the sedimentation concerns can be easily mitigated and must not be used as a reason to justify motorized recreation and access closures except in significant cases that cannot be adequately mitigated. (Organization, Helena, MT - #A13226.51340)

577. Public Concern: The Forest Service should recognize that good timber removal practices can ensure good water quality.

Water quality: good logging practices can ensure good water quality. Large wildfires tend to follow drainages and can lead to catastrophic destruction of water quality. (Individual, McCall, ID - #A29305.51000)

578. Public Concern: The Forest Service should use buffer zones to protect water quality.

The use of forests as watersheds should be elevated in importance. Logging, when done, should be accompanied by a large deposit to compensate and clean-up streams that silt-up after logging. Buffers should be sufficiently wide to guarantee no increase in water temperature from the loss of shade, as well as to guarantee no silting after the first heavy rain. (Individual, Olympia, WA - #A441.51300)

579. Public Concern: The Forest Service should explain the reason grazing and timber removal are believed to pollute water more than wild fire.

I read in the local newspaper that the runoff from the burned areas were polluting the streams and required the removal of endangered Gila trout. This occurred while logging and grazing are being restricted because they pollute. Why is pollution from forest fires good while any other use of the forest that may result in pollution bad? (Individual, Silver City, NM - #A1139.30100)

Watershed Health

580. Public Concern: The Forest Service should adequately address watershed protection.

I find it strange that you ask no questions on the issue of watershed protection, which the earlier Congressional records clearly addressed. As late as 1990, scientists were still discussing the numerous benefits from our old growth ecosystems on America's soils and waterways. For example, Time Magazine observed, "The ancient growth acts as a giant filtration system, preventing run off of water and soil that would swell streams and rivers and threaten fish spawning areas and water quality with excessive sedimentation" (n. p., June, 25, 1990). (Individual, Melvindale, MI - #A30286.51300)

AS MANDATED BY THE ORGANIC ACT

As provided by the Roadless Rule, the appropriate role for local forest planning on National Forests is to provide Watershed Protection (Organic Act of 1897) [It is] THE SINGLE MOST IMPORTANT CALLING OF THE US FOREST SERVICE. (Individual, No Address - #A3079.20204)

581. Public Concern: The Forest Service should assess watershed health from a ridgetop-to-ridgetop perspective.

Aquatic and vegetative values must be applied in a balanced manner. The health of forest watersheds and ecosystems must be assessed and treated from a "ridgetop to ridgetop" perspective. The "ridgetop to ridgetop" perspective should apply to a forest's overall health status and any necessary restoration.

Inventoried roadless area creation should not interfere with the restoration of watershed or ecosystem health. (Organization, Moscow, ID - #A15318.50000)

582. Public Concern: The Forest Service should address the effects of certain activities on watersheds.

ROADS

Environmental characteristics that should have the highest level of attention when evaluating roadless areas should be related to watershed areas and possible erosion that could occur if a road is developed or not maintained. If roads do exist in sensitive areas, careful consideration should be given to either improving those roads or alleviate the negative environmental impacts and or to remove the road and relocate it elsewhere if necessary. (Business, Haslett, MI - #A4861.50000)

Roads interfere with the movement of organisms and energy across the landscape. One of the most severe impacts is to riparian areas: Culverts and roadfills bisect stream corridors, isolating communities of fish, amphibians and mammals, they block storm flows, create dam-break floods, and prevent the movement of wood debris. These impacts are huge and we have way too many roads already. Let us keep some areas intact. The Forest Service cannot keep up with the maintenance and abandonment of the roads it already has, why build more? (Individual, Olympia, WA - #A510.51000)

Roads often have devastating impacts on water quality and fish habitat by increasing landslides, erosion, and siltation of streams. Roads also fragment forests and degrade or eliminate habitat for species that depend on remote landscapes, such as grizzly bears, wolves, and other large, wide-ranging predators (Trombulak and Frissel 2000). The habitat fragmentation, erosion, and sediment transport associated with roads is a major threat to the integrity of our forest ecosystems. The impacts on watersheds of "pulse" events created by wildfire and naturally occurring erosion are very limited in duration and are the very conditions with which aquatic organisms evolved. Forest road networks, in contrast, are a chronic source of sediment pollution to the watersheds. They also cause, along with all the forest canopy openings created by logging, high peak flow events from spring runoff and rain-on-snow events that destabilize the streambeds and streambanks, fill pool habitat with bedload sediments, and increase fine sediment input - all further damaging the aquatic environment. (Organization, Missoula, MT - #A613.54000)

SELECTIVE TIMBER REMOVAL

This rapacious, greedy appetite must be stopped. We know that it is in loggers interest to cut the best trees in a given watershed and move on. They take the largest trees that are easiest to reach to maximize profits. Unfortunately, the harmful effects to the watersheds are spread throughout a much broader area than raw numbers would indicate. The best trees are located in lower areas that are next to streams that define major watersheds. Streams, therefore, take the brunt of this industry and although areas are only partially logged the harmful effects are felt on a disproportionate amount of the watersheds. Why will you not acknowledge this? (Director, Tribal Resources, Hoonah, AK - #A3024.51340)

583. Public Concern: The Forest Service should manage vegetation for watershed health.

All forestland should be managed as a watershed. The spacing of all vegetation must favor water production. This vegetation must be healthy, vigorous and all age classes must be in balance. The over-mature must be removed so that the balance is maintained. This spacing must be maintained from the top of the mountain to the valley and from the ridge top to the swale. (Individual, Klamath Falls, OR - #A8809.51000)

584. Public Concern: The Forest Service should protect roadless areas.**TO PRESERVE WATERSHED HEALTH**

Undeveloped areas have been spared the increased erosion associated with roadbuilding, logging, and other forms of development, which causes damaging sedimentation of streams and rivers. Roadless areas harbor some of the country's most intact aquatic ecosystems and contribute to the recovery of degraded aquatic populations. The clean flows they provide are important not only to aquatic organisms, but also as sources of drinking water (42 million acres of national forest land are classified as municipal watersheds). Roadless areas help regulate stream flows and reduce flood threats, absorbing excess waters during storm events and releasing them slowly over time. (Organization, Missoula, MT - #A613.51000)

Roadless areas help recharge aquifers and are often in the headwaters of municipal watersheds, providing the cleanest water and resulting in lower water treatment costs for local residents. In fact, 80% of our nation's water supply comes from national forests, with roadless areas producing the purest of that water. (Individual, Santa Monica, CA - #A1715.51000)

We need protected, untouched forest areas to help retain and purify our water supply. Undisturbed forest acts like a sponge, releasing water slowly into rivers. Logging roads cause horrible erosion which ruins fisheries, and clogs waterways with silt. (Individual, Roswell, GA - #A1467.51200)

The Forest Service did a thorough job of identifying the characteristics, environmental values, social and economic concerns when it evaluated IRA's in 1972 (RARE I), 1979 (RARE II), and additional reviews conducted since then. Watershed protection is arguably the most important value in social and economic terms, but is inextricably woven with overall ecosystem health. Although IRAs comprise less than 2% of land in the continental US, they provide about 14% of the nation's total water flow, and 33% of water in the West. (Individual, Vista, CA - #A4838.45100)

TO PROTECT WATERSHEDS IN CALIFORNIA

The last 30% of our wild national forests - with almost 4.5 million acres in California - provides a quality water source. This is especially critical in a state that has undergone water rationing several times in the last thirty years. (Individual, San Pablo, CA - #A5005.51320)

Here in California, WATERSHED PROTECTION is a very important issue and we must protect our water supply. It does not rain here in the summer, as I am sure you know, and we must not log in the roadless areas. (Individual, Santa Cruz, CA - #A908.51310)

TO PROVIDE FOR IRRIGATION

The Forest Service role in working with the states, tribes and communities should be in protecting the watershed for clean drinking water, wildlife, recreation, and irrigation. (Individual, Boise, ID - #A5731.50000)

Where I live we need the watershed to feed the streams, brooks, springs, and rivers which is for the various sports, hydro electric, and irrigation as well as drinking water and other commercial endeavors. (Individual, Great Falls, MT - #A5914.50000)

TO PROTECT COMMUNITY WATER SOURCES

Every community of any size that is adjacent to National Forest lands depends on surface water from those lands for its drinking water. Any ground disturbance, and particularly roadbuilding, loads sediment into the water, making it vulnerable to contamination from pathogens and more difficult to purify for potable use. As a 20-year water treatment engineer I can testify to the very substantial public health benefit of clean water from roadless lands. (Individual, Bozeman, MT - #A6189.51342)

585. Public Concern: The Wilderness Act should be revised to protect drinking water.

The Wilderness Act must be revised if we are going to have enough drinking water—2030 and beyond. (Individual, Klamath Falls, OR - #A8809.20206)

586. Public Concern: The Forest Service should ensure that land designations do not interfere with management access to watersheds.

Roadless areas by and large are key watersheds, which provide snowpack retention and habitat and protect water quality. Nevertheless, to designate these areas as wilderness would foreclose critical management activities that may be needed to protect the most important roles key watersheds serve. If specific designation of a roadless area is appropriate, it should be made under the local forest plan. (Association, No Address - #A21242.51300)

In the west, much of our local watershed is in our National Forests. It is imperative that roads be maintained, and access be allowed to these vital areas. Our very lives could depend on it. (Individual, Manti, UT - #A27830.51300)

587. Public Concern: The Forest Service should recognize that there is no inherent watershed benefit associated with roadless area conservation.

Watershed protection values have been misstated. The Weeks Law established eastern National Forests to produce wood and water. These are compatible uses. While all human uses have a risk of pollution, research has repeatedly shown normal harvesting does not impair water uses. Forestry is consistently ranked as one of the lowest sources of pollution by the US EPA.

There were many inaccurate statements in the May Draft EIS. Roadless conservation does not guarantee high quality water. Many natural conditions such as wetlands and acid geologic formations lower water quality. Nationally, grazing probably causes more pollution than roads. Based on my monitoring, recreation causes the most pollution in the White Mountain national Forest. The pathogens associated with backcountry waste disposal are a greater risk than timber harvesting. Roadless conservation does not prevent landslides. A study inventoried over 500 landslides in the White Mountain National Forest and concluded they were all due to natural events. Normal harvesting does not cause floods. On the other hand, studies show long term forest preservation reduces stream flow and increases nutrient release. It should be made clear there is no inherent watershed benefit associated with roadless conservation. (Individual, No Address - #A17292.45000)

588. Public Concern: The Forest Service should identify critical areas of key watersheds.

Critical areas of key watersheds also need to be identified and restored through road removal and other restoration efforts. (Professional Society, Missoula, MT - #A17054.45000)

Water Quantity

589. Public Concern: The Forest Service should increase logging to increase water quantity.

Not enough emphasis has been placed on the importance of water in discussions of roadless areas. Whether or not to build roads or log has been front and center, but the importance of water, especially here in the West, has been ignored. The quantity of water delivered at the Forest boundary can be increased by certain silvicultural practices, including building roads and removing trees. (As in the Dead Horse Experiment on the Caribou National Forest, which demonstrates water yield could be increased tremendously.) National Forest lands that should be treated to increase water production are the areas that receive the most snow. These generally are the same areas currently designated as roadless. Setting

these aside would limit treatment to increase water production in the future. (Individual, Mapleton, UT - #A6978.51000)

In our region, it is evident by the overgrown condition of the forests that a controlled and environmentally sound timber harvest program is needed to accomplish the two main purposes of the USFS. In recent years, timber production in the region has virtually ceased resulting in deteriorating watersheds due to transpiration of water from too many trees. In some places, there are in excess of 1000 stems per acre. The Gila Wilderness provides a good example of the degradation of watersheds due to a policy of no timber harvest. Excessive tree density in this area has resulted in the diminution of grasses resulting in the accelerated runoff of rain and snowmelt with accompanying erosion. Creek beds that were small and had water in them much of the year are now fifty feet wide due to excessive runoff and only contain water during a storm. Does the Roadless Initiative seek to extend this kind of non-management that has resulted in an ecological disaster? (Individual, Ruidoso, NM - #A17775.51300)

590. Public Concern: The Forest Service should recognize that increasing logging will not increase water quantity.

It is obvious that undue timbering, particularly on steep slopes that occur in the national forests, is very destructive of natural resources. It causes a loss of topsoil that took years to create and is difficult to replace. It silts up our streams with adverse effects on fish and other aquatic organisms, both by clogging their respiratory tracts and covering up the fertilized eggs needed for reproduction. It further silts up water used by around one-third of our citizens for their drinking water supplies, thus making water purification more expensive to a host of municipalities that do not have extra funds to spend. This is also disadvantageous to industries that use water from our watercourses. [Footnote 1: Strangely enough, it was recently contended, in litigation involving the Medicine Bow National Forest in Wyoming, that increased logging would “improve” a watershed by increasing water runoff. That claim was, however, rejected by the Tenth Circuit Court of Appeals, which sustained protection of the national forest against that attack.] (Organization, Birmingham, AL - #A21582.51300)

Air Quality

Summary

General Comments – Some respondents state there is a need to preserve and improve air quality. Common comments are that the Forest Service should protect air quality by strengthening the Clean Air Act (see also Chapter 2: Other Legal Concerns: Federal Laws, Acts, and Policies: *Clean Air Act*), prohibiting road construction, and protecting roadless areas.

Some assert that the preservation of forests is important in creating sinks for the absorption of greenhouse gas emissions, particularly carbon dioxide. One individual points out, though, that protecting roadless areas will not increase carbon sink or reduce fires.

Others suggest that protecting roadless areas will counteract global warming and reduce the threat of asthma. One respondent states healthy forests maintain current radiation balance, which if thrown off balance would effect the earth both meteorologically and biologically.

Adequacy of Analysis – A few individuals ask the Forest Service to provide data regarding airborne contaminants from wildfire. One comments that the Forest Service does not seem to provide data on human health hazards emanating from the airborne contaminants from these wildfires, “the degradation of air in Class 1 air zones from these and other fires that are left to burn “naturally,” the transformation of growing forests which are carbon sinks into eventual over mature forests which are carbon emitters.”

Effects of Activities/Disturbance on Air Quality – Some respondents suggest that the Forest Service should plant trees to counter the effects of greenhouse gases and to absorb industrial air pollution; and should consider the contribution of old, rotten trees to greenhouse gases. Several believe building and maintain dirt roads causes air pollution through the dust that occurs. Another respondent suggests that mature trees and trees at risk of falling should be removed in order to improve air quality because of the excess carbon put back into the atmosphere. Others ask the Forest Service to address the impacts of motorized activity on air quality, and to carry out controlled burns in order to reduce air pollution.

Air Quality General

591. Public Concern: The Forest Service should define air quality as a key objective.

Everyone will rally around the improved air quality theme, but it is your obligation to collect and disseminate the process to achieve this. Unless your request for input defines air quality as a key objective, the answers to your survey will be less than true. (Business, Vancouver, WA - #A670.52100)

592. Public Concern: The Forest Service should protect air quality.

BY STRENGTHENING THE CLEAN AIR ACT

One of the most important forest health problems is air pollution, which is greatly affecting the health and vigor of our eastern forests. I would encourage the FS to support strengthening the Clean Air Act and Clean Air Act regulations. A pro-active management approach to air pollution issues in roadless areas is needed. (Individual, Roanoke, VA - #A23081.30100)

BY PROHIBITING ROAD CONSTRUCTION

More roads add to more dust to create more air pollution. (Individual, Kalispell, MT - #A16734.52120)

593. Public Concern: The Forest Service should protect roadless areas.

TO PRESERVE AIR QUALITY

How are we going to breathe without the oxygen that the trees and other plants give off? If the world keeps on destroying our environment, pretty soon our planet will be an empty mass like Mars, with nothing but dust. (Individual, Allentown, PA - #A1468.50000)

Our heritage as Americans is more than our political system, more than our social environment, our civil liberties. The greatest heritage is the land itself, the beauty of Mother Nature all around us. What would life be like without forests and untainted streams and rivers? We are yet still animals, we are Mammals. Does the Bush administration feel that we can survive without our partners in respiration? Our very breath gives life to the trees in this world and they then in exchange give us ours. (Individual, Dewittville, NY - #A1500.50000)

TO CREATE SINKS FOR THE ABSORPTION OF GREENHOUSE GAS EMISSIONS

Forests contribute to the prevention of carbon dioxide build-up, a factor of major importance in our future. (Individual, Metuchan, NJ - #A507.52130)

The preservation of forests is especially important in creating sinks for the absorption of greenhouse gas emissions, particularly carbon dioxide. (Individual, Evanston, IL - #A991.52130)

TO COUNTERACT GLOBAL WARMING

Global Warming is in full-swing. I believe protecting these roadless areas is best for future generations of Americans and the world, and all of humanity. (Individual, Lafayette, CO - #A807.50400)

Integrity of our forests is vital to the well being of all the creatures on the globe. Roads will facilitate the increase of forest loss by epidemics caused by introduction of organisms lethal to the trees growing there brought by equipment, personnel, visitors from other places. There are hundreds of examples of loss of forests throughout the world due to introduction of exotic pests. Each time these forest deaths increase the atmospheric CO₂, and decrease atmospheric O₂. Biomass accumulation through forests killed by diseases where no resistance has been established is a significant cause of global warming. Opening roads in forests is the highway for introduction of exotic pests. Surely this must be also considered in the details of the Kyoto Accords. (Individual, Sausalito, CA - #A1344.50400)

Alaska is facing, perhaps more than any other state, the threats of global climate change. The residents of Shishmarof can testify to that truth, as well as scientists at the University of Fairbanks and around the world. Forests are valuable carbon dioxide recyclers and contribute to reductions of CO₂ in the atmosphere. (Individual, Chugiak, AK - #A261.50410)

TO REDUCE THE THREAT OF ASTHMA

Forests provide oxygen for the air we breathe. We are such hypocrites to bemoan the fact that the rain forests are being destroyed along with their capacity for producing breathable air, when we have little respect for the clean air our own trees provide. The percentage of increase for asthma in the United States in the last ten years is incredibly high. Could there be a correlation between our declining breathable air from fewer trees cleaning up the air pollution and the rampant rise in asthma? Asthma is a killer and is nothing to ignore! (Individual, Gainesville, FL - #A222.52130)

Trees provide oxygen. If we have no trees watch asthma cases rise. Where will nature go? (Individual, Bettendorf, IA - #A4356.52130)

594. Public Concern: The Forest Service should recognize that the Roadless Area Conservation Rule will not increase carbon sequestration.

Please revise the Rule!!! It will not protect the forest, increase carbon sink, reduce fires, or generally help forest health. (Individual, Piney View, WV - #A12597.10131)

595. Public Concern: The Forest Service should protect forests to maintain the current radiation.

Our forests are important [for] maintaining the current radiation balance and without them could upset the proper balance of incoming to outgoing radiation, which in turn will affect our Earth meteorologically and biologically. (Individual, Somerville, MA - #A42100.50400)

Adequacy of Analysis

596. Public Concern: The Forest Service should provide data regarding airborne contaminants from wildfire.

The Forest Service has never provided definitive data on the real human health hazards emanating from the airborne contaminants from these wildfires, the degradation of air in Class 1 air zones from these and other fires that are left to burn "naturally", the transformation of growing forests which are carbon sinks into eventual over mature forests which are carbon emitters. (Individual, Seeley Lake, MT - #A8075.14100)

As a member of the Governor's Clean Air Committee here in Vermont, I am very concerned with the serious threat to our air quality posed by the millions of acres burned last summer and again this summer. The majority of our air pollution comes from outside Vermont. The jet stream and prevailing winds bring significant ash and other pollutants from the west, southwest and south to Vermont. This is contributory to our higher than normal incidence of respiratory disease. Some scientists have calculated that the pollution from the fires last summer exceeded the pollution of fossil fuel power plants by a

factor of greater than ten for the entire year. This is not acceptable when poor air quality is a serious health issue. Moreover, it seems likely that western fires are contributing to the reported pollution-related forest degradation in Vermont. (Individual, South Royalton, VT - #A13393.52110)

Effects of Activities/Disturbance on Air Quality

597. Public Concern: The Forest Service should plant trees.

TO COUNTER THE EFFECTS OF GREENHOUSE GASES

It is not only the tropical rain forests that need to be protected for the ecological health of this planet, but the last wild, roadless areas of our now National Forests. Carl Sagan in his last book . . . states that we need to plant additional trees to counter the greenhouse gasses we currently produce, equal to the area of the United States, today! (Individual, Santa Barbara, CA - #A4860.50410)

TO ABSORB INDUSTRIAL AIR POLLUTION

This should now be part of any forest or energy plan. The Nation needs to engage in greater reforestation and planting of trees which, in turn, will support our industrial base by absorbing the CO₂ it generates. Without the added trees, we shall clearly have greater problems ahead. The government could invest more funds into programs for planting trees, but how much more cost-effective is it to preserve those that we already have in the national forests? That will not cause any cash outlays! (Organization, Birmingham, AL - #A21582.50410)

598. Public Concern: The Forest Service should consider the contribution of old, rotten trees to greenhouse gases.

When old trees fall over and start to rot, much of the absorbed carbon gets released back into the atmosphere. A well-managed growing forest is our best protection against greenhouse gases. (Association, South Hill, VA - #A17035.50410)

599. Public Concern: The Forest Service should remove mature trees and trees at risk of falling.

TO IMPROVE AIR QUALITY

We can unite all opinions if we concentrate on air quality - a universal need. Fifteen years ago, a group of us including Audubon and Sierra members, plus foresters and conservationist decided to make personal tests on improving air quality as well as improving fish and wild life habitat - yet maintaining the desirable forest environment for our square mile forest and lake home site area. We have been removing mature and risk trees that would fall down, opening the canopy so sunlight could increase growth. After fifteen years we enjoyed an increase in wood fiber from 6,000,000 board feet to 9,000,000 board feet - a 50% increase in sequestration - converting carbon dioxide into wood fiber and releasing two molecules of oxygen for each molecule of carbon removed from the atmosphere. An adjacent area with restrictions and no personal access, was cruised with very little additional increment of growth. Converted to pounds of carbon dioxide - our area took 30,000 tons of CO₂ out of the air. This is two or three times as much as a nearby restricted area. We have asked the Department of Natural Resources of the State of Washington as well as Bureau of Land Management to see how we have maintained the forest environment as well as provided for fire control. There are more than 3,000 similar private forest ownership's, each of whom could improve air quality and fire control with no government or state subsidy. We can factor this with the air pollution from last season's forest fires. If only a percentage of these private ownership followed a similar plan the entire added CO₂ from the fires would be consumed and converted to usable fiber. Forests are the most important element to improving air quality and planting trees is only a first step. We need to improve the efficiency of our forests to make up for the continuing use of fossil fuels. We proved it can be done, and your foresters know it can be done if all people know the facts of air quality improvement. (Association, Vancouver, WA - #A279.52130)

600. Public Concern: The Forest Service should address impacts of motorized activity on air quality.

VEHICLE EMISSIONS

I have seen it happen, moving to a pristine area full of wildlife and fruits. My Mom and I used to come out of the woods with gallons of wild berries, each day. Two years later, a highway is put through allowing access to diesel vehicles to another area. In one season, I have seen hundreds of thousands of frogs, toads, snakes, fox, wild berries, and fruit disappear, never to return. We are lucky to be able to pick a half cup of berries from the same bushes we had picked gallons from before. Diesel, snowmobile and auto fumes are bad to fragile systems. I have seen it myself. I don't need a study to tell me. (Individual, Antonito, CO - #A21454.60300)

CONSTRUCTION EQUIPMENT

I have not even mentioned the vast amount of noise and air pollution from the construction equipment used to build these roads. (Individual, Radford, VA - #A9397.52100)

601. Public Concern: The Forest Service should carry out controlled burns.

TO REDUCE AIR POLLUTION

This year as I was hiking with my wife, we saw an area that had burned just North of Troy, MT. The fires burned along the perimeter of an old blocked off logging road. I point that out to show that roads give us natural fire breaks that help prevent small fires from becoming big fires. We also saw evidence where fire fighters used the road to get to the fire quickly. Again, these roads are valuable in the effort to control wildfires. From a pollution standpoint, it is important to use every means necessary to keep wildfires small. The fires in Montana this year and last produced as much pollution for the environment as industry ever would in an entire year. I could only hope that all people would have to sit around breathing in the smoke from wildfires for a month or so every summer. Perhaps that would help change their minds. (Individual, Kalispell, MT - #A27110.30200)

Soils

Summary

Soils General – One individual urges the Forest Service to recognize the environmental importance of soil—”Man’s most important ‘natural resource’ is the soil!! The soil supports all lakes, rivers, vegetation (due to rainfall and weather), wildlife and man!”

Adequacy of Analysis – Another association suggests that the Forest Service develop a national interagency soil survey and inventory program with standardized monitoring methods in order to assess current and future health need, as well as impacts from various uses, including grazing. One respondent requests that the Forest Service address soil composition in individual forests rather than create blanket legislation for all areas.

Effects of Activities/Disturbance on Soils – Several respondents comment on the effects of activities on soil. They suggest that the Forest Service address the effects of timber removal on surface soils, the effects of logging and road building on erosion and landslides, and the effects of soil compaction. Others advise that biomass from habitat restoration work should be retained to provide nourishment for the soil.

Soils General

602. Public Concern: The Forest Service should recognize the environmental importance of soil.

Man's most important "natural resource" is the soil!! The soil supports all lakes, rivers, vegetation (due to rainfall and weather), wildlife and man! Let nature support itself, as it did before man tried to be the politically determining factor! (Individual, Coeur d'Alene, ID - #A16085.52200)

Adequacy of Analysis

603. Public Concern: The Forest Service should develop a national interagency soil survey and inventory program with standardized monitoring methods.

TO BETTER ASSESS THE CURRENT AND FUTURE HEALTH OF THESE LANDS, AS WELL AS IMPACTS FROM VARIOUS USES

With regard to roadless areas currently used for grazing, CCA supports a national interagency soil survey and inventory program and standardized monitoring methods to better assess the current and future health of these lands, as well as impacts from various uses, including grazing. (Association, Sacramento, CA - #A3681.30100)

604. Public Concern: The Forest Service should address soil composition in individual forests.

Forest health must be addressed by treating each forest area as unique. Soil composition is quite varied; why introduce a blanket legislation to cover soils and vegetations existing in a large variety of substrates, climates, and latitudes? This is not based on good science. (Individual, Jackson, WY - #A29552.52200)

Effects of Activities/Disturbance on Soils

605. Public Concern: The Forest Service should address the effects of activities on soil.

EFFECTS OF TIMBER REMOVAL ON SURFACE SOILS

My studies of the effect disturbance (e.g., clear-cutting and other forms of timber harvest) has on forest surface soils suggest, at least for the North American forest types studied, a high potential for lasting damage that could have ecosystem-level impacts as a result of the disturbance. My studies have indicated highly significant losses of organic maternal and nutrient cations (e.g., K and Mg) from surface soils within three years post clear-cut. Similar findings have also been described for other forests (North American, European, and others). Immediate detrimental effects (within three years post clear-cut) have been observed for soil microbial communities, which could have lasting effects on the abilities of these soils to recycle nutrients for these ecosystems. Similar findings, although not quite as dramatic, have been found in areas where selective harvest techniques have been used (using heavy equipment). Of course one of the critical factors required for either clear-cutting or selective harvest using heavy equipment is the necessity of building roads into the site. Therein lies my concern with the Bush Administration's request to revisit the Roadless Area Conservation Rule approved by the Clinton Administration. (Professional Society, Hixson, TN - #A26223.52200)

EFFECTS OF TIMBER LOGGING AND ROAD BUILDING ON EROSION AND LANDSLIDES

. . . Oregon, most of the mudslides in the last five years are a direct result of clear-cuts and placement of logging roads on slopes too steep to support such roads. Obstruction of vital watersheds as a result of erosion from clear-cutting and logging roads has already caused irreparable damage. (Individual, No Address - #A3863.51341)

I am also very aware of the effect of road-building and tree-harvesting on areas down-hill when heavy rains occur. Citizens of our state have suffered loss of all they have in part because of destruction of natural areas for commercial gain. (Individual, Morgantown, WV - #A4000.51341)

These unlogged and unroaded areas also protect private property from landslides and flood damage. (Individual, Santa Monica, CA - #A1715.45000)

EFFECTS OF SOIL COMPACTION

Logging and roadbuilding compact soils, disturb or destroy organic layers, and cause high rates of soil erosion. Trees' access to nutrients and water is reduced because of restricted root growth in compacted soils, reduced water infiltration rates, and decreased oxygen and water available to root systems. Soil compaction also adversely impacts microorganism communities such as mycorrhizal fungi, which are important to many tree species in accessing nutrients. (Individual, Anchorage, AK - #A20934.52200)

606. Public Concern: The Forest Service should retain biomass from habitat restoration.

Appropriate habitat restoration work should, of course, be allowed, but the biomass from that work should not be removed from the forest, to supply wood or pulp or fiber for commercial interests. Instead it should be allowed to decompose or be burned in piles where it will nourish the soil, in places. (Organization, San Francisco, CA - #A11992.52220)

Scenery

Summary

A few people comment that the Forest Service should place greater value on scenic resources. One Organization asserts that the Roadless Rule would be the best way to preserve the scenic beauty in roadless areas. While others comment that the implementation of a national roadless rule would provide relief from what they see as unsightly even age management.

607. Public Concern: The Forest Service should place greater value on scenic resources

BY COMPLETING VISUAL ASSESSMENTS OF ALL ROADLESS AREAS

In a recent policy study evaluating the impact of federal laws on scenic conservation, Scenic America pointed out that NFMA and its accompanying regulations undervalues scenic resources. We strongly urge the Forest Service to complete visual resource assessments of all existing roadless areas. Furthermore, we believe that the Roadless Rule would provide the greatest possible protection for the scenic beauty in roadless areas. (Organization, Washington, DC - #A22098.45100)

608. Public Concern: The Forest Service should implement a national roadless rule.

TO PROVIDE RELIEF FROM UNSIGHTLY CLEAR CUTS

We need scenic, unroaded forest landscapes for relief from mountains with their tops cut off or their trees stripped. (Individual, Soddy Daisy, TN - #A15286.70310)

Wildlife

Summary

General Comments – Wildlife is a major issue to a number of respondents. A number of people believe that the protection of roadless areas will be beneficial to wildlife, amphibians, and

subsistence species by ensuring reproductive capability and providing wildlife corridors. Other respondents provide a number of suggestions on how the Forest Service should protect wildlife. These suggestions include actively managing roadless areas, allowing state fish and wildlife agencies to manage populations, allowing field research in roadless areas, and implementing the Theodore Roosevelt Conservation Alliance Square Deal Initiatives. On the other hand, some respondents comment that some land designations may restrict wildlife management and request that the Forest Service avoid making those designations. Others suggest that managing for individual members of species will have negative impacts over the long term. At the same time, a few respondents suggest that some wildlife management activities and restrictions are carried out to the detriment of humans, and assert that the Forest Service should value human life over wildlife and plant life.

Species-Specific Considerations – Some respondents comment about specific species. Several people request the protection of roadless areas for the sake of certain species such as brown bears, yellow-legged frogs, lynx, cutthroat trout, and butterflies. Some comment as well about the reintroduction of predator populations. Specifically, some state that “PREDATOR reintroduction and protection should be a management objective,” while others assert that “the reintroduction of coyotes, wolves, and bears to certain areas is upsetting the balance that was established with the people population increase.”

Funding – Respondents offer several comments regarding funding related to wildlife. One individual requests that the Forest Service more effectively utilize funds earmarked for the protection of wild horses. An organization responds that building roads in the Skagit River watershed would route funds away from salmon recovery efforts.

Effects of Activities/Disturbance on Wildlife – Some general comments regarding the effects of activities/disturbance on wildlife suggest that wildlife is not adversely impacted by certain activities. For example, some respondents assert that roads do not harm wildlife, including fish and the desert tortoise, nor do roads impede wildlife movement. People also suggest that vehicles do not disturb wildlife.

A number of respondents suggest that positive effects result from certain activities or disturbances. Some activities suggested to be beneficial to wildlife include timber removal such as thinning, dams and fish passage ladders, and ranch management. Some suggest that fire, disease, and insects are beneficial to bird species. One individual suggests that the Forest Service should provide retaining pools when installing culverts for the benefit of wildlife during the dry season.

A greater number of respondents, however, suggest a wide array of negative effects of specific activities and disturbances on wildlife. Writers advise the Forest Service to address the negative effects of roads on wildlife. Some suggest specifically that roads have negative effects on fish, suggesting that roads cause sedimentation, loss of spawning habitat, and facilitate the stocking of non-native species, overfishing, and disease transmission. Respondents also ask the Forest Service to address the negative effects of off-road vehicles, inadequate stream culverts, timber removal, hiking, and fire on wildlife. Some comment that the Forest Service should protect wildlife by closing roads or prohibiting all active management and resource use.

Wildlife General

609. Public Concern: The Forest Service should protect roadless areas.

FOR WILDLIFE

I support the Roadless Area Conservation Rule JUST AS IT IS. Here are some reasons why:

Montana roadless lands provide some of the best hunting, camping, wildlife habitat, and trout waters left in our nation. These roadless areas sustain mountain streams that are the lifeblood of legendary trout waters and the source of drinking and irrigation water for many communities. In Montana traditional Western trails traverse areas without roads providing habitat for wolverine, mountain goat, bighorn sheep, elk, pine marten, lynx, and black and grizzly bear. These animals do not survive well when we build roads and interfere with their territory. When there are roads there is so much more human activity in their homes.

Only national protection will guarantee that Montana's wild national forest lands remain intact regardless of changing politics and personnel. The issues of inholdings, fire, floods, and forest health raised in the revision process are rightfully addressed by the existing policy. Montana's rugged roadless lands and traditions are a public land legacy, a priceless gift for our kids and all generations in an increasingly crowded and commercial world.

I live in the Gallatin Valley of Montana and it is becoming more and more crowded every year. The only places available to recreate are public lands unless one is wealthy enough to buy their own. The survival of the above mentioned wild animals is important to me. It gives me a big thrill to see some of this wild life occasionally. (Individual, Manhattan, MT - #A5633.10150)

FOR AMPHIBIANS

The Southern Appalachians, in particular, are home to a wide diversity of vascular and vertebrate species, some of which are endemic, some are found nowhere else on earth, and many are found nowhere else in North America in such concentration of species diversity. Many of these, especially amphibians, are dependent upon clean and clear-flowing water supplies which are provided by interior (roadless) area, but threatened by logging and roadbuilding and their associated siltation and stream degradation. (Organization, Bland, VA - #A17007.50500)

TO MAINTAIN HEALTHY FISHERIES

Protecting existing roadless areas makes sense both ecologically, economically and morally. As stewards of God's green earth, we have the duty to protect the natural environment for generations who are to come after us. Protecting the pristine, wild nature of these areas is economically beneficial as we allow sporting activities in these areas. Ecologically and biologically, roads should not be constructed in the existing roadless areas of our national forests and grasslands. These roads threaten vital trout and salmon which are a national treasure. (Individual, No Address - #A4575.10150)

Much of the remaining integrity of our fisheries relates directly to the absence of roadbuilding and management activities in our tiny percentage of remaining roadless areas. The Wild and Scenic Elk River, located in the Powers Ranger District of the Siskiyou National Forest, is a watershed of specific interest to me as a fisherman and frequent visitor. To maintain its exceptional water quality and its phenomenal Chinook salmon and steelhead fishery, it is absolutely crucial to fully protect the Copper Mountain Roadless Area, the proposed Copper Salmon Wilderness, and *all* presently unroaded areas of Elk River watershed. (Individual, No Address - #A27799.51000)

The Southern Appalachians, in particular, are home to a wide diversity of vascular and vertebrate species, some of which are endemic, some are found nowhere else on earth, and many are found nowhere else in North America in such concentration of species diversity. Many of these, especially amphibians, are dependant upon clean and clear-flowing water supplies which are provided by interior (roadless) areas, but threatened by logging and roadbuilding and their associated siltation and stream degradation. (Organization, Bland, VA - #A17007.50500)

Watershed purity here in the Tongass communities is essential for healthy salmon runs. The Salmon and other fisheries are essential to the economy of Southeast Alaska. Tree dumps, silt, runoff from logging roads and inadequate buffer zones to protect streams are in direct conflict with healthy ecosystems and healthy salmon runs. (Individual, Juneau, AK - #A30033.51000)

The general national road building prohibitions and limited exceptions contained in the Roadless Rule should be retained. At the local planning level, specific restrictions should apply to road-building, reconstruction, or off-road vehicle use in inventoried roadless areas that have watersheds containing aquatic diversity areas identified through regional, forest, or watershed assessments. (Organization, Eugene, OR - #A29717.51300)

TO ENSURE REPRODUCTIVE CAPABILITY

All of these creatures live in different ways, but all share at least one thing in common: they all live to produce. This is true for any organism. Every organism has means of reproduction. It was through the process of reproduction that organisms evolved into their present forms. Reproduction is vitally important. If a species as a whole were to lose its ability to reproduce, then that species would disappear from this earth NEVER TO APPEAR AGAIN! That is why reproduction is so important. In order for reproduction to occur, a number of things are necessary. Above all else, most important to reproduction is food and water; an organism can't reproduce if it is not adequately nourished and therefore unhealthy. Secondly and equally important to reproduction is the organism's ability to find a home. I define the word 'home' as the place where an organism finds food and water and also looks for a mate. In order for reproduction to occur, AN ORGANISM NEEDS A HOME . . . Extinction is the result when the members of a species lose their homes and cannot find a new home. The loss of homes is what causes extinction. . . . We (people) call these places where life finds homes in great numbers: forests. Forests are the homes of life. Gone are forests, gone is life. (Individual, Austin, TX - #A22389.53100)

It must be remembered that mere presence of a species is not the issue; it is reproductive success that matters. Throughout America, many species are dependant upon the habitat and security afforded by roadless areas for sustaining viable populations of themselves. National implementation of roadless area protection would give an immediate substantial boost to biodiversity. Even the Forest Service and State agencies, who generally favor intensive management regimes, admit that fragmentation of habitat should be guarded against for species like the Cow Knob Salamander (endemic to Shenandoah Mountain on the GWNF; the highest concentration of roadless areas on the Forest is found here). Ensuring protected status for roadless/unroaded areas, with the associated ecosystem recovery, could extend safeguards to other, perhaps as yet unknown, species that presently suffer from habitat fragmentation, alteration, and loss. For example, many species of neotropical migratory songbirds that depend on unfragmented mature deciduous forest are in decline. Intact habitat areas serve as a population "source" for the "sink" habitats that the developed landscape has become. Roadless areas now serve as biotic reservoirs in this era of advancing human development. (Individual, Staunton, VA - #A30027.53200)

FOR SUBSISTENCE SPECIES

Protecting roadless areas from roads and logging will also have benefits to subsistence uses of the Tongass. In particular, roadless area protections will help keep habitat intact and ensure forage for Sitka black-tailed deer, an especially important species for subsistence hunters in the region. (Organization, Sitka, AK - #A30486.53300)

TO PROVIDE WILDLIFE CORRIDORS

Wildlife corridors can be provided using roadless areas. Wildlife needs corridors to travel between safe havens. (Individual, Silverthorne, CO - #A28101.53100)

610. Public Concern: The Forest Service should protect wildlife.

BY ACTIVELY MANAGING ROADLESS AREAS

Being an avid hunter, I am very much aware the game animals survive better where the forest is managed than where it is not. (Individual, Okanogan, WA - #A791.30000)

Anyone who has taken Ecology 101 knows that the climax plant community in most of the mountainous West is a coniferous forest of some type, dependent largely on altitude and aspect. As a wildlife biologist, I believe timber needs to be managed. Coniferous forests do not typically support the greatest diversity of wildlife resources. I urge that timber management/wildlife management be woven into the final management plan for our national forests. (Individual, Salem, OR - #A4253.30100)

BY RETURNING TO ITS ORIGINAL ROLE OF PROTECTING THE LAND AND ITS WILDLIFE, AS IN THE DAYS OF GIFFORD PINCHOT

Question regarding describing values. The Forest Service should consider the fact that most of the land area of the United States is roaded and that the Forest Service's role should be returned to its original function of protecting the land and its wildlife as it was in the days of Gifford Pinchot. (Individual, Helena, MT - #A5394.12120)

BY MANAGING WILDLIFE AND WILDLIFE HABITAT IN COOPERATION WITH STATE DEPARTMENTS OF NATURAL RESOURCES

I believe the U.S. Forest Service with state D.N.R. cooperation can manage our wildlife and wildlife habitat. (Individual, Mosinee, WI - #A12172.30100)

BY ALLOWING STATE FISH AND WILDLIFE AGENCIES TO MANAGE POPULATIONS

The USFS should continue to allow the state fish and wildlife agencies to manage the fish and wildlife populations through carefully regulated hunting and trapping seasons on the USFS lands, because these are vitally important management tools that help balance wildlife populations with people's needs and desires, and provide many benefits to the public at large with no cost to taxpayers. (Individual, Columbia, MO - #A52517.15123)

BY ALLOWING FIELD RESEARCH IN ROADLESS AREAS

Observance of fish and wildlife populations and their natural processes should be allowed. Fish and wildlife biologists come to the Copper River Delta for field research because they can do something here that they cannot do in other places, observe these populations and their natural process. In other words, there are precious few other undisturbed areas for conducting such research. Research should be an encouraged activity in IRAs. (Organization, Cordova, AK - #A23229.90100)

BY ALLOWING WILDLIFE RESEARCH, TROUT STOCKING, AND WILDLIFE LAW ENFORCEMENT ACTIVITIES IN AREAS WHERE EXISTING ROADS ALREADY ALLOW MOTORIZED ACCESS

Wildlife research, trout stocking, wildlife law enforcement, and prescribed burning should be other expressly allowed activities where use of motorized equipment on existing roads is permitted. These activities are consistent with the existing Jefferson National Forest Land Management Plan. (State Agency, Richmond, VA - #A6048.90100)

BY SUPPORTING LEGISLATION TO PRECLUDE, PREVENT, OR OVERRULE LAWSUITS DESIGNED TO MITIGATE THE SCIENTIFIC MANAGEMENT OF WILDLIFE

Please consider legislation to preclude/prevent/overrule precocious lawsuits designed to mitigate the scientific management of all wildlife. (Individual, Petaluma, CA - #A16026.20000)

BY IMPLEMENTING THE THEODORE ROOSEVELT CONSERVATION ALLIANCE SQUARE DEAL INITIATIVES

I am an avid outdoor enthusiast who believes that you and your new Administration should embrace the Theodore Roosevelt Conservation Alliance's Square Deal Initiative. These initiatives will create a public lands legacy in the coming century that is synonymous with the vision of Theodore Roosevelt, America's greatest conservation president. Initiative #1 asks you to scientifically manage all fish and wildlife habitat in the National Forest System, whether roaded or unroaded, as valuable and unique lands that will remain open to hunters, anglers and other public users. I, along with the TRCA, urge you to balance accessibility to National Forest Lands, with the year round requirements of fish and wildlife such as habitat, clean water, food, shelter, open space and disturbance management, while maintaining a functioning forest road system. This includes keeping roadless areas roadless with science-based exceptions made for forest health, restoration and other national needs. And we also ask that you embrace Initiative #2 to dramatically increase funding and accountability for active fish and wildlife. Funding priorities should not be tied to any commodity production formulas, but rather to achieving

long-term, sustainable fish and wildlife populations. Funding should also include programs that involve all communities in promoting sound forest stewardship and restoration to enhance water quality and fish and wildlife habitat. Bob Munson, our TRCA Director has stated: "In honor of the 'Square Deal' that was TR's hallmark from 1901-1909, our country can settle for nothing less than the public's continued use and enjoyment of their public lands with a priority placed on maintaining healthy and vibrant fish and wildlife habitats." I agree with Bob. Let's use these initiatives to make fish and wildlife a priority on our National Forests. (Individual, Luverne, MN - #A4538.53100)

BY PROTECTING SOUTHERN APPALACHIAN ROADLESS AREAS

The Southern Appalachians support a world-class biological diversity of plants and animals, which can only be preserved by setting aside from logging and road building large tracts of unfrequented forests. The roadless areas on our public lands contribute significantly to the fact that the Southern Appalachians host one of the world's greatest diversities of mussels and fish and more than half of all tree, fern, and flowering plant species found on the North American continent. More than 3,000 species of flowering plants, 690 vertebrates, and over 120 species of trees all thrive in the roadless areas of this region. Scientific studies have shown that many of our region's species experience serious population declines when faced with habitat destruction caused by logging and road construction. Black bear populations are threatened by excessive road densities. Trout need streams free of sediment caused by erosion from roads and logging to flourish. Similarly, in the biologically rich Southern Appalachians, threatened and endangered species of other animal and plant life benefit from safe havens where logging and road building is not a threat.

As indicated by Dr. James Petranka in his letter to the Forest Service of July 12, 2000, salamanders provide "a compelling example of the need to prohibit logging in the roadless areas." See Attached statement. The Southern Appalachians have perhaps the greatest taxonomic diversity, density and biomass of salamanders in the world according to Petranka. And in order to preserve this biodiversity, roadless areas must be left relatively undisturbed. A recent study showed that clearcuts had a significantly lower abundance and fewer species of salamander compared to mature forest stands in the Southern Appalachians. *J. W. Petranka, M. E. Eldridge and K. E. Haley, Effects of timber harvesting on southern Appalachian salamanders, 7 Conservation Biology 363-370, (1993)*. Plethodon salamanders, common to our region, have especially high mortality after development activities, because they have small home ranges and are unlikely to relocate to intact forests from logged areas. *Id.* at 363. The relatively common land salamander *Plethodon jordani*, an important part of the food chain of our southern forests, completely disappears from clearcut sites in the Southern Appalachians. *A. N. Ash, Disappearance of salamanders from clearcut plots, 104 The Journal of the Elisha Mitchell Scientific Society 116-122, (1988)*. (Organization, Charlottesville, VA - #A15659.53100)

611. Public Concern: The Forest Service should avoid making land designations that restrict wildlife management.

The Department and other agencies and entities must have the ability to take necessary management actions to ensure the continued well-being of populations of wildlife on the National Forests. The Department does not support additional land designations (e.g., Wilderness designation) or regulations that have the potential to limit or restrict our ability to conduct necessary wildlife management activities on Forest Service lands. (State Agency, Phoenix, AZ - #A22073.53000)

612. Public Concern: The Forest Service should recognize the long-term negative impacts of managing for individual members of species.

You are presently managing for individuals of a species by halting or severely limiting all activities in an area. The long term impacts will be degrading to the site and eventually damage the species you claimed to be protecting. It is my contention we are managing strictly for the present with no thought to the future. (Individual, Carson City, NV - #A21959.53000)

613. Public Concern: The Forest Service should protect grassland species.

Administered by the Forest Service, the National Grasslands comprise nearly four million acres of sage steppe and prairie throughout the Great Plains and the intermountain West. National Grasslands are

found in every state from North Dakota south to Texas, as well as Idaho and Oregon. Comprising a critical but often neglected component of our National Forest System, National Grasslands are still home to a vast array of plants and animals. The imperiled black-tailed prairie dog, for example, is a keystone species of the grassland that provides food, shelter, and habitat benefits for numerous other declining species such as the burrowing owl, mountain plover, swift fox, ferruginous hawk, and America's most endangered mammal, the black-footed ferret. Some nine different prairie species are dependent on prairie dogs, and additional 20 species opportunistically take advantage of prairie dog colonies, and 117 more have a relationship with prairie dog towns. The grasslands of the United States, in fact, support some 7,500 species of wildlife, including pronghorn antelope, elk, mule deer, bighorn sheep, golden eagles, numerous kinds of hawks, sage grouse, prairie chickens, whooping cranes, badgers, and an abundant variety of grassland birds.

More than 50 prairie grassland species, however, are now either listed as endangered or threatened under the Endangered Species Act, and more than 700 are candidates for listing. Of the 435 bird species that breed in the United States, 330 of them breed in the grasslands of the Great Plains—and grassland bird species have consistently shown steeper population declines than any other North American birds. (Organization, Reston, VA - #A21625.53000)

614. Public Concern: The Forest Service should treat wildlife and domestic livestock equally.

Give wildlife equal right with domestic livestock you allow to graze on forest land. (Individual, Roswell, NM - #A11007.53000)

615. Public Concern: The Forest Service should value human life over wildlife and plantlife.

It seems to me that the main people who are aware of these comment periods are the tree-huggers who think that even weeds are more important than people. When a fish that is too stupid to survive takes precedence over people's lives and livelihoods, there is something really wrong with this picture. I have nothing against trying to save endangered species, most of them seem to be endangered because of loss of habitat, which is not a reason to close off areas completely. In California, the tree-huggers even managed to get loc-weed on the endangered list. They did this by using the scientific name. This is not an endangered plant! Western ranchers have been trying, without success, to get rid of this noxious weed as long as there have been ranches in the west. Another farce is the highly endangered Joshua Tree. There are many square miles of them in at least three states. (Individual, No Address - #A8252.15121)

Last month 4 brave true Americans lost their lives because of environmental red tape. A helicopter was not able to get water out of a stream because of endangered fish. Sad day for this country when fish in a stream have more rights than human life. (Individual, Jennings, KS - #A8874.53200)

People should come first, not a turtle or an owl or a rat . . . People need to be able to protect themselves from fire and flood. What good does it do to protect an owl's habitat from people if a fire comes along and destroys the forest because loggers can't come in and clean up an excessive fuel load. There needs to be a middle ground. (Individual, Centerfield, UT - #A27645.30400)

616. Public Concern: The Forest Service should manage wildlife under recommendations of local fish and game agencies.

The Forest Service should consider the following characteristics of each inventoried roadless area on each Forest separately (specific activities that should be allowed): **Wildlife**—Forest activities (i.e., timing and intensity) should be governed, in part, by recommendations of the local game and fish agencies, e.g., with regard to mating and nesting seasons. Additionally, as silvicultural practices permit, consideration should be given to effect on habitat of local wildlife and fish species. Special attention should be directed toward streamside activities which may impact fisheries ecology. (Individual, Fort Collins, CO - #A17987.53100)

Wildlife General – Species-Specific Considerations

617. Public Concern: The Forest Service should protect roadless areas.

FOR BROWN BEARS

In addition to recreation opportunities, roadless areas are essential for important species of wildlife, particularly brown bears (Suring et al 1997). “The Kenai peninsula has received some of the most significant human impacts in Alaska, to the detriment of some wildlife populations and habitat.” “Bear populations and their habitat are declining due to direct human-caused mortality and human encroachment.” (Organization, Anchorage, AK - #A17358.53200)

FOR YELLOW-LEGGED FROGS

I am concerned about the welfare of two of my favorite amphibian species that live in the Sierras, the Foothill Yellow-Legged Frog, and the Mountain Yellow-Legged Frog. Both species live in forested areas, and the Mountain Yellow-Legged Frog is the only frog that lives high up in the Sierra Nevada mountains. (Individual, Redding, CA - #A5690.53000)

FOR LYNX AND CUTTHROAT TROUT

The Wyoming Range is a spectacular forest with Canadian lynx and Bonneville cutthroat trout living there—two wildlife species that are very sensitive and imperiled. We need to protect the last remnants of unroaded country in Wyoming to maintain habitat for these unique species. (Organization, Sheridan, WY - #A17593.53000)

FOR BUTTERFLIES

I have urged for years that the Dark Divide area in the Gifford Pinchot Nat. Forest be included in Wilderness—it is an important butterfly habitat, and motorbikes are and will continue to destroy the vegetation upon which the butterflies depend. (Individual, Tacoma, WA - #A11709.60000)

FOR BEARS AND WOLVES IN THE COOPER RIVER DELTA

I encourage protection of Bears and wolves in the Cooper River Delta. (Individual, Anchorage, AK - #A25357.53000)

618. Public Concern: The Forest Service should determine the degree to which native trout are linked to undeveloped areas on public lands.

Despite the ecological significance of roadless areas, millions of public land roadless acres have been lost to development (such as logging roads) in the past 25 years. Therefore, it is critical to determine the degrees to which native trout are linked to undeveloped areas on lands managed for the American people by the United States Forest Service, Bureau of Land Management, and National Park Service. (Organization, Laramie, WY - #A30488.54110)

619. Public Concern: The Forest Service should reintroduce and protect predators.

PREDATOR reintroduction and protection should be a management objective. (Individual, San Jose, CA - #A6276.53200)

GRIZZLY BEARS

Please support the past efforts on saving roadless areas and the introduction of grizzlies into those areas suitable. (Individual, Plains, MT - #A5801.10150)

620. Public Concern: The Forest Service should make the black bear the national wild animal.

Proposal: Make our “Black Bear” our national wild animal, similar to our national bird the “Eagle.” This would be a start toward a civilized society in general. (Individual, Tacoma, WA - #A8589.53000)

621. Public Concern: The Forest Service should prohibit the killing of black bear.

I ask that our black bear “killing”, not “hunting” the natural animals of our forests, be eliminated!! Why? should we kill our innocent animals, except for meat! Yearly, like yearly having new cars? We are ridiculous inhabitants of this precious God Given Land, and need to change!! European countries have their 1500 years of faith of enlightenment of reason. What ages do we have or will have? (Individual, Tacoma, WA - #A8589.53000)

622. Public Concern: The Forest Service should prevent wolf populations from expanding.

With that in mind lets think about not letting the wolves get our of hand either. They do major destruction to wildlife as well as farm animals and endangerment of small kids recreating in outdoors when their numbers get too high and we are nearing that in the area I reside in. (Individual, Medford, WI - #A6035.53200)

Get rid of the wolves. Its a joke that they are listed as endangered. Alaska and Canada are over run with them and they have taken their toll on our big game herds here in Idaho. (Individual, Carmen, ID - #A7972.53000)

623. Public Concern: The Forest Service should consider that the reintroduction of coyotes, wolves and bears to certain areas is upsetting the balance between people and animals.

The reintroduction of coyotes, wolves and bears to certain areas is upsetting the balance that was established with the people population increase. (Individual, Klamath Falls, OR - #A8809.20000)

624. Public Concern: The Forest Service should use elk as a management indicator species.

The CERT [Clearwater Elk Recovery Team] believes that any resulting USFS roadless policy should be based upon a heavily weighed, local input process that develops recommendations to the cyclic revisions and infrequent amendments to individual National Forest Plans. In the Clearwater Basin, elk must continue to be a major indicator specie both in National Forest Plan and in the reality of accomplished, active forest management. (Organization, Moscow, ID - #A15318.53300)

Place a high priority for creating and rejuvenating elk forage in the Clearwater and Nez Perce National Forests and throughout Idaho. Put action in maintaining elk as a major indicator species in the Idaho National Forest Plan through active forest and rangeland management. Give your service the ability to manage its forests on a site-specific basis that is locally advised. (Organization, Viola, ID - #A23458.53300)

Funding

625. Public Concern: The Forest Service should more effectively utilize funds earmarked for protection of wild horses.

We feel the money being used to protect wild horses could be better utilized. (Individual, Troy, OH - #A10718.17100)

626. Public Concern: The Forest Service should recognize that building roads in the Skagit River watershed would route funds away from salmon recovery efforts.

In Washington, the Forest Service is working with the Skagit Watershed Council (of which The Nature Conservancy of Washington is a founding member) to procure state Salmon Recovery Funding Board monies to protect endangered salmon runs. The construction of additional roads in the Skagit River watershed would counter the positive work that the Forest Service is doing, and could route salmon recovery funds away from other critical salmon protection and restoration projects in order to mitigate the harmful effects of federal roads. (Organization, Seattle, WA - #A21904.17240)

*Effects of Activities/Disturbance on Wildlife***627. Public Concern: The Forest Service should recognize that wildlife is resilient to Active Management.**

In seeking to provide more habitat for wildlife, the motivations of the Forest Service are laudable. However, the strategy proposed for doing this is flawed. Wild creatures are more resilient than most people would like to admit. Peregrines inhabit the heights of office buildings in Detroit. Cranes, herons and hundreds of other species live in the Detroit River, surrounded by industry. (Individual, Palisade, CO - #A20897.53100)

628. Public Concern: The Forest Service should recognize that roads do not harm wildlife.

A common objection to roads is that they will negatively impact wildlife. Here are several examples to show that wildlife don't seem to care.

Several years ago I visited Glacier National Park and drove through the park on the Going To The Sun Highway like thousands of other tourists do every year. This is a road that could never be built in today's political climate since it goes through a wilderness. Yet near the highway were many mountain goats undisturbed by the tourists stopping to take their pictures.

In Jasper, Alberta, elk regularly wander through the town and eat the people's gardens, as deer do in many western Oregon towns.

I have a picture on my desk of three grizzly bears walking on the Alaska pipeline. Opponents of the construction of this pipeline cited harm to wildlife as a major reason not to build it. Apparently the bears were not solicited for input. (Individual, Springfield, OR - #A21815.53000)

Avoid all road and trail closures based on wildlife concerns except where negative wildlife impact can be specifically identified and documented. Motorized use on existing trails has little or no verified effect on game animal welfare. In fact, some of the areas more intensely visited by motorized visitors have experienced significant increases in wildlife populations; further substantiating the fact that motorized recreation does not in itself create a significant impact on wildlife. (Organization, Helena, MT - #A13226.91211)

FISH

The argument that dust from unpaved roads is settling in streams and causing difficulty for spawning fish, including salmon and steelhead is laughable. There was a preceding generation in Idaho's mountains and valleys that only had unpaved roads and trails, and may have been at times more numerous than now, the dust of which, (horses, wagons, larger than herds of cattle/bands of sheep) created clouds of dust, and yet 35 years ago Idahoans could catch plenty of salmon and steelhead and 15 trout per day, plus bag more than one deer in several areas. (Individual, Bellevue, ID - #A30175.54000)

THE DESERT TORTOISE

I've spent a good bit of time north of Barstow and, for awhile, this area was closed off because off-road drivers and prospectors posed a danger to the desert tortoise. Off-road drivers would run over them and

prospectors dug holes for them to fall into that they couldn't get out of. In at least six years of hunting for gold in this area, I have only seen one dead tortoise and its remains were under a bush. I've never seen one that was run over or trapped in a hole. In fact, the biggest tortoise that I've ever seen was going from tailing pile to tailing pile, eating new growth and ignoring the old growth between the piles. (Individual, No Address - #A8252.53200)

ROADS DO NOT IMPEDE WILDLIFE MOVEMENT

Grizzly bears do cross roads—even oiled ones, deer, elk and moose become suburbanites witnessed by the number of road kills. All these animals have four legs and can and do skip into the next draw or over the next ridge when a vehicle of any kind approaches. (Individual, Whitefish, MT - #A5102.53000)

629. Public Concern: The Forest Service should recognize that vehicles do not disturb wildlife.

As for the claim that vehicles of any type disturb the wildlife just doesn't hold water. I have [lived] in the foothills and mountains of Colorado for the last 35 years. In most areas there is more wildlife living among the people and homes than there ever was, I see foxes and deer on a daily basis, bears on occasion, have heard mountain lions (know many people who have seen them), bobcats, coyotes. When first moved here we almost never saw this wildlife (including the deer that we only saw occasionally), so that the wildlife has a problem with people again doesn't hold water. The only areas that I have seen a drop in the amount of wildlife that can be seen regularly is in some of the western slope areas that have been (in my opinion) over hunted (and yes I am a hunter but have quit hunting deer due to this problem and probably not even hunting elk this year). As for the argument that there are more sightings of wildlife due to more people, maybe but if the animals have a problem with people why haven't they moved to more remote areas (and there are still large areas without homes or people in Colorado, Wyoming, etc.)? (Individual, Boulder, CO - #A4480.53100)

630. Public Concern: The Forest Service should recognize that the impacts of road fragmentation are greater than the impacts of fire.

The vast majority of birds and small to mid-size animals that went extinct in the last 450 years lived on islands, and paving roads through an ecosystem slices and dices the entire system into islands. Slapping a road through an ecosystem is far more deadly than fire. In a few years, an ecosystem rebounds from fire. Fire is a natural part of the ecology of Earth but not so a concrete road. A paved road will always kill, and kill, and KILL. An ecosystem and biological diversity will rebound from fire, but a paved road will always be an EARTH-KILLER! Forever! **Every yard of ecosystem paved and slathered over is another yard of dead planet.**

EXTINCTION IS FOREVER and paving roads causes extinction! "THE MASS EXTINCTIONS WHICH THE EARTH IS CURRENTLY FACING IS A GREAT THREAT TO CIVILIZATION SECOND ONLY TO THE THREAT OF THERMONUCLEAR WAR." *NATIONAL ACADEMY OF SCIENCES. (Individual, No Address - #A18867.50100)

631. Public Concern: The Forest Service should not use elk forage enhancement as an excuse for timber removal.

No amendments to this **Roadless Area plan** should allow for **helicopter-entry logging or experimental thinning studies**, NO PATCH CLEARCUTS IN THE NAME OF ELK FORAGE ENHANCEMENT or salvage logging. We already have plenty of lands in which we can conduct these activities. (Organization, Albany, OR - #A19057.90520)

632. Public Concern: The Forest Service should address the effects of fire on fisheries.

The fires that burned in Montana in 2000 and now in 2001 have been devastating to fisheries, particularly bull trout and cutthroat trout spawning streams of the Bitterroot National Forest and the Big Creek drainage of the North Fork of the Flathead River. (Business, Kalispell, MT - #A29034.54100)

633. Public Concern: The Forest Service should allow trapping as a wildlife management tool.

I also support trapping on national forest lands as a wildlife management tool. (Individual, Fort Morgan, CO - #A19961.91410)

*Positive Effects***634. Public Concern: The Forest Service should allow timber removal.****FOR THE BENEFIT OF WILDLIFE**

My primary reason for opposition is that it creates a problem with the necessary timber management required for good wildlife management. A diversified forest benefits game management while providing economic development opportunities. As an avid outdoorsman I have seen firsthand the benefits to wildlife from timber harvesting. A timber harvest (i.e. clearcut) properly managed by wildlife biologists is probably the most important single factor beneficial to the greatest number of species of wildlife in a timbered region. This provides a year round food source and shelter/cover for nesting, protection from cold winds and severe weather, and escape from predators. The forest of varied age growth among hardwood mast producing trees will increase the likelihood of mast production in any given year as often the younger trees will produce even when the older larger trees do not. The new growth in a young (2 to 10 year old) clear cut area provides browse and diversity of plant life throughout the entire year that is very beneficial to deer, bear, turkey, grouse, squirrel, and many other species including those that prey on the former. In a mature forest mast producing trees generally bear mast only every few years. This is a bonanza for the wildlife that rely on this food source when it occurs, but when it is gone, often in a matter of several weeks, there is very little to eat for the next couple of years.

This is another point where the importance of a properly managed harvesting operation is necessary. A young forest will likely contain numerous species of mast producing trees and plants that produce annually and at different times within the same year providing a reliable food source for an extended period of time. Some of these additional species include grapes, dogwood trees, wild cherry trees, blackberry vines, sassafras, numerous weed species providing seeds and browse, etc. While these species of plant life will likely be eliminated as the young forest matures back to its original make-up, it is of great importance to allow this diversity to flourish for the few years that it can. Then hopefully there will have been other harvest areas close by that are in this age bracket that will then be providing for this necessary source of food and cover. Properly managed, we will have rotated throughout the forest region and will be ready to harvest this same area in another 100 years. (Individual, Roanoke, VA - #A11780.30100)

TO ENCOURAGE THE GROWTH OF HUCKLEBERRIES FOR GRIZZLY BEARS

Grizzly bears have become increasing problems in this area of northwest Montana. Their habitat management direction has become hands-off, de facto wilderness with no vegetation management even though the Forest Service acknowledges that logging is a tried and true method to improve grizzly habitat. Our Grizzlies are not and cannot eat security. Instead they have been relegated to putting on calories by eating garbage, dog food and birdseed in housing areas and towns because their normal food sources are being crowded out in dense, unhealthy forests.

Huckleberries, their normal food source, need sunlight and forest openings for regeneration and berry production. This valuable plan was the subject of a five-year study, *The Ecology and Culture of Montana Huckleberries: A Guide for Growers and Researchers* (by Dr. Nellie Stark and Stephen Baker at the Montana Forest and Conservation Experiment Station School of Forestry, University of Montana) funded in part by the U.S. Forest Service. It needs sunlight, does not survive fire well because of its shallow rhizomes that spread in woody debris, and the researcher estimates that conditions for germination from seed may only exist once every seventy years. Unlike most tree seedlings, huckleberries do not do well in a nursery setting either. There is a great tragedy playing out in the survival of bears and huckleberries because our forests are deteriorating with the lack of active management. (Business, Kalispell, MT - #A29034.53100)

635. Public Concern: The Forest Service should allow thinning.**TO PROMOTE PLANT GROWTH AND FEED FOR WILDLIFE AND BIRDS**

In regard to making more of our national forests roadless, I believe the 24.2 million acres on which new roads are already banned is enough of the 58.5 million roadless acres. With what you consider marketable timber on only 9 million of those 34.3 million acres, that small percentage should not have an adverse effect on the forests. Thinning would undoubtedly help promote plant growth for the animals and birds to feed on. (Individual, Big Timber, MT - #A5630.30530)

636. Public Concern: The Forest Service should provide retaining pools when installing culverts.**FOR WILDLIFE IN THE DRY SEASON**

When placing culvert pipes, consider building a reasonable size water retaining pool on the upper side, or lower, for pump chance and for the wildlife in the dry season. (Individual, Cottage Grove, OR - #A11071.53000)

637. Public Concern: The Forest Service should retain dams and fix fish passage ladders.

Keep all dams on all rivers. Just fix the ladders to help fish upstream. (Individual, Grants Pass, OR - #A11357.54100)

638. Public Concern: The Forest Service should recognize the beneficial impact of ranch management on wildlife.

Ranchers develop water ponds—provide salt and supplements that also help wildlife. (Individual, Decatur, IL - #A11051.53000)

639. Public Concern: The Forest Service should recognize the benefits of fire, disease, and insects to bird species.

Many bird species that are declining rely on fire, disease and insects. In particular, Lewis's Woodpeckers, Three-toed Woodpeckers, Black-backed Woodpeckers, Olive-sided Flycatchers and Townsend's Solitaires rely on fire to create their habitat. (Organization, Helena, MT - #A20874.53100)

*Negative Effects***640. Public Concern: The Forest Service should address the negative effects of roads on wildlife.**

Roadbuilding also adversely impacts forest health by:

Harming wildlife through the displacement of species sensitive to disturbance or dependent on forest interior habitat. For example, species such as grizzly bears, wolves, and elk avoid otherwise suitable habitat near roads.

Roads create barriers to the movement of many species. Small animals such as salamanders, frogs, and mice will rarely cross roads or are killed by vehicles when crossing.

Roads are barriers to dispersal, isolating populations on one side of the road from those on the other. This results in the loss of gene flow between populations and the potential vulnerability of some species to inbreeding or environmental catastrophes. (Individual, Anchorage, AK - #A20934.53110)

Keep the wild in the last remaining wildlands of this nation. We need to think of these places as interconnected units they need to remain protected fully so that the animals that call them home can continue to exist. It has been shown that roads no matter how rural have had a significant impact on the migration of wildlife and that conversely has an impact on their populations. The Canadian national

parks have already seen a decline in predator populations in wildlands where roads bisect the tremendous preserved acres. We cannot continue to make the same mistakes and we need to view all these areas and the surrounding areas as important areas for wildlife. (Individual, Wilmington, DE - #A4268.50520)

Roads are a specific type of disturbance that fragment the landscape for a range of sensitive species, and create zones of elevated mortality for others. The critical values protected in roadless areas are landscapes where near-natural disturbance regimes prevail: they provide an ecological benchmark for scientific research, an emergency backstop against catastrophic ecological change, and a critical source area for metapopulations, from which regenerating landscapes can be recolonized. (Individual, No Address - #A4777.50520)

As a biologist working in the Yellowstone-Teton Range area. I fully support protection of roadless areas. These areas are extremely important as a refugia for sensitive wildlife. Roadless lands provide many hazards for wildlife, including poaching, excessive hunting, illegal logging, litter, dumping and too much human use. (Individual, Victor, ID - #A5336.53000)

80% of all the wolves killed in one of our largest national parks are killed because of the railroad running through it. A moose or deer is struck and killed by the train. Subsequently, a wolf comes to eat the moose or deer and the wolf is killed. Roads running through our pristine wilderness areas would cause the same problem. It would be cruel to and unsafe for the wildlife in these now roadless areas. Please do not allow roads. (Individual, Holden, MA - #A6912.90130)

ON NON-NATIVE BIRDS AND PLANTS

Working in the Colorado and New York State Breeding Bird Atlases, I got to see first hand how destructive roads in our forest are on introducing new species of birds (cowbirds and starlings etc.) and foreign plant species (Russian Knap weed and thistles etc.). Also forest are fragmented, streams and air are polluted. (Individual, Franktown, CO - #A5142.50000)

DECREASED POPULATION VIABILITY

In the Interior Columbia Basin Ecosystem Management Plan, USFS, USFWS and BLM scientists found that roads directly impacted the current and future population viability of 28 of 78 (36%) high priority terrestrial vertebrate species and 17 of 31 (55%) of the very highest priority species brought forward for the Supplemental Draft EIS. The impacts of roads on these species were analyzed and are part of the ICBEMP record and publications. This undeniable impact of roads on wildlife can only be addressed by protecting roadless areas and removing a large percentage of existing roads. (Individual, Boise, ID - #A23621.53000)

641. Public Concern: The Forest Service should address the negative effects of roads on fish.

Roads can bring changes to water volume, speed, temperature, which can negatively affect a host of animals including trout and salmon. (Professional Society, No Address - #A26799.50000)

SEDIMENTATION

Yellowstone, Bonneville, Colorado and Snake River Cutthroat trout depend on clean streams that flow through roadless areas for their survival. Roads are the primary source of sedimentation in our national forests, causing the decline of fisheries and harm to other aquatic species. (Individual, Jelm, WY - #A27247.54000)

LOSS OF SPAWNING HABITAT

Other aspects of the effects of roads on salmon and trout streams remain to be studied—perhaps studies are underway. Important among these is the effect of erosion as the result of the construction and existence of roads. Nearly all of the Tongass consists of steep terrain. In combination with high rainfall, the inevitable effect is erosion, to the detriment of good salmon spawning gravel. Of course the logging

also adds to that erosion: since 1990, 100-ft. buffer strips have been required along major streams, but no such protection is required for upper tributary streams. These streams which send debris and mud onward into the lower fish-bearing streams, are becoming more at risk as the logging is more often forced into the upper elevations now that the lower elevations have been logged. Moreover, the lesson has been learned elsewhere that 100-ft. buffers are not sufficient. (Individual, Gustavus, AK - #A19067.54100)

Roads act as stream runoff collectors that direct high flows, sediment, and other non-point pollutants into streams, covering spawning habitat and reducing rearing capacity for salmonids. Most roads parallel valley floors, often with little or no stream buffer. When a stream naturally meanders towards a roadway, road engineers armor the eroding stream bank with rip-rap, channelizing the stream and further degrading fish habitat. (Individual, Juneau, AK - #A23242.54100)

STOCKING NON-NATIVE SPECIES, ACCESS BY LIVESTOCK, OVERFISHING, AND DISEASE TRANSMISSION

As part of the efforts to protect native trout and their habitat, the Campaign evaluated the relationship between public land roadless areas and existing native trout populations. Roads are a significant cause of trout habitat damage and water quality degradation. Roads also facilitate stocking of non-native trout and other fish species, access by livestock, overfishing, and disease transmission. Unfortunately, like native trout, roadless areas are a diminishing resource on the public lands. In many instances, roadless areas outside of wilderness and national parks have not been protected from on-going development. (Organization, Laramie, WY - #A30488.54100)

642. Public Concern: The Forest Service should close roads.

TO MAINTAIN UNFETTERED MIGRATION ROUTES FOR WILDLIFE

It is incredibly important that what little unfettered migration routes for animals are left be kept intact, or even improved upon by closing down existing roads and letting them go back to nature. (Individual, No Address - #A1692.53000)

TO INCREASE ELK POPULATIONS

I worked on the Kaibab National Forest which was one of the forerunners in closing roads and not making new ones. The benefits that we saw were innumerable and spanned across several interests, not just for “environmentalists”. The most notable effects known by people in the region was the quality of the wildlife, especially seen in the Trophy Elk taken from this area by hunters, which was due solely in part to the Kaibab’s policy on roads. (Individual, Glendale, AZ - #A1908.53300)

643. Public Concern: The Forest Service should address the negative effects of off-road vehicles on wildlife.

Motorized off-road vehicle travel should also be expressly prohibited. The negative impact of off-road vehicles (ORVs) on wildlife is becoming ever more apparent, particularly as off-road vehicles become faster, more common, and able to conquer more terrain. ORVs provide access for hunters, poachers, and others who might intentionally or unintentionally disturb wildlife. They can transport disease, fungi, and non-native species. They generate extreme noise and air pollution. Overuse of certain areas creates de facto roads that are often in inappropriate locations and can lead to severe erosion, wildlife impacts, and scars on the landscape. The roads and snowmobile trails used by ORVs can provide access, in the form of a trail or hard-packed snow, into previously inaccessible areas for not only humans but also for some wildlife. For example, coyotes and bobcats can follow hard packed snow into areas where they can compete with the lynx, which is otherwise better adapted to deep snow. (Organization, Washington, DC - #A18031.90110)

644. Public Concern: The Forest Service should address the negative effects of inadequate stream culverts on fish passage.

Many aspects of roads need to be considered. One of the most important impacts is on streams that are crossed by roads. Past road-building practices have left many culverts over anadromous fish streams

inadequate for fish passage. Attention to this aspect of road building is crucial for Southeast's commercial, sport, and subsistence fisheries. (Individual, Petersburg, AK #A21351.54100)

The roads that have been built at enormous cost have not been environmentally benign by any measure: the Forest Service and Alaska Department of Fish and Game report that as many as 66% of logging culverts over anadromous fish streams, and 85% of resident fish stream crossing are not adequate for fish passage. (Organization, Reston, VA - #A21625.54100)

The Forest Service has failed to adequately maintain the logging roads already constructed in the Tongass, thereby blocking salmon passage, fouling spawning areas and degrading water quality with sedimentation. (Elected Official, Tenakee Springs, AK - #A3358.54100)

STOP CONSTRUCTING NEW ROADS UNTIL EXISTING ROADS AND CULVERTS ARE REPAIRED

Tongass streams spawn 80% of all salmon in Southeast Alaska yet, you yourselves report that as many as 66% of logging road culverts over anadromous fish streams and 85% of resident fish stream crossings are not adequate for fish passage. The Alaska Dept. of Fish and Game agrees. We suggest that if the Forest Service cannot maintain existing roads and lacks funding to correct blocked culverts, it should stop building new roads. (Director, Tribal Resources, Hoonah, AK - #A3024.54100)

Commercial fishing, the area's largest private employer, requires the pristine Tongass streams for salmon to spawn and for young salmon to grow. But, most of the existing logging road culverts do not allow passage of resident salmon, due to blockages, lack of maintenance, or poor design. The Forest Service should fix these roads, not build more that will just block more fish and lead to the decimation of the Tongass salmon population. We need to learn from the mistakes made in the Pacific Northwest and protect the habitat needed for healthy salmon runs. (Individual, Everett, WA - #A4799.54100)

645. Public Concern: The Forest Service should prohibit all Active Management and Resource Use.

TO PROTECT WILDLIFE

These areas are our remaining wild unprotected areas of the United States; these areas especially in my region (northeastern Washington and northern Idaho) are home to some of the nations major endangered species, Mountain Caribou, Grizzly Bear, Bull Trout, Gray Wolf and Lynx. The only way I see any protection for these animals and for these remaining wild areas, is a roadless rule that does not allow for resource extraction of any kind. (Individual, Spokane, WA - #A820.53100)

646. Public Concern: The Forest Service should address the negative effects of timber removal on wildlife.

FOREST INTERIOR BIRDS

In his letter calling for inclusion of a prohibition on logging and road construction in the final rule, Dr. David S. Lee, ornithologist and Curator of Birds at the North Carolina State Museum of Natural Sciences, confirms that forest interior birds are particularly sensitive to disturbances created by logging. . . . In the southern forests, which are critical neotropical migratory songbird breeding habitat and migration flyway, timber activities create edges which, particularly in eastern forests, facilitate cowbird parasitism of the nests of other birds. M. D. Baker and M. J. Lacki, *Short-term changes in bird communities in response to silvicultural prescriptions*, 96 *Forest Ecology and Management* 27-36 (1997). Research has found that this cowbird behavior has contributed to the population declines of many neotropical migrant bird species. See *Id.* and *see also* K. V. Rosenberg, J. D. Lowe and A. A. Dhondt, *Effects of forest fragmentation on breeding tanagers: a continental perspective*, 13 *Conservation Biology* 568-583 (1999). General nest predation rates in Southern Appalachian forest fragments has also been found to increase as forest fragment size decreases. A.J. Keyser, G. E. Hill and E. C. Soehren, *Effects of forest fragment size, nest density, and proximity to edge on the risk of predation*

to ground-nesting passerine birds, 12 Conservation Biology 986-994 (1998). (Organization, Charlottesville, VA - #A25689.53200)

SALAMANDERS

As indicated by Dr. James Petranka in his letter to the Forest Service of July 12, 2000, salamanders provide “a compelling example of the need to prohibit logging in the roadless areas.” The Southern Appalachians have perhaps the greatest taxonomic diversity, density and biomass of salamanders in the world according to Petranka. And in order to preserve this biodiversity, roadless areas must be left relatively undisturbed. A recent study showed that clearcuts had a significantly lower abundance and fewer species of salamander compared to mature forest stands in the Southern Appalachians. J.W. Petranka, M.E. Eldridge and K.E. Haley, *Effects of timber harvesting on southern Appalachian salamanders*, 7 Conservation Biology 363-370, (1991). *Plethodon* salamanders, common to our region, have especially high mortality after development activities, because they have small home ranges and are unlikely to relocate to intact forests from logged areas. Id. At 363. The relatively common land salamander *Plethodon jordani*, an important part of the food chain of our southern forests, completely disappears from clearcut sites in the Southern Appalachians. A.N. Ash, *Disappearance of salamanders form clearcut plots*, 104 The Journal of the Elisha Mitchell Scientific Society 116-122, (1988). (Organization, Johnson City, TN - #A20341.53110)

647. Public Concern: The Forest Service should restrict hiking in roadless areas.

IN AREAS WHERE CALVING OCCURS

When determining what restrictions are necessary, the forest must set new guidelines based on good, undisputed data. Perhaps . . . hiking should be banned in some areas where calving occurs. (Individual, No Address - #A29334.90110)

648. Public Concern: The Forest Service should address the effects of fire on species extinction.

The loss of species to an agonizing death from fire is terrible. We do not know what unique species of life may be extinguished forever because of the fires. I recall that a unique tree in the Northwest is the source of Taxol, an important lifesaving drug. We have no assurance that a similar discovery may have escaped notice in the areas destroyed by fire. (Individual, South Royalton, VT - #A13393.50000)

Wildlife Habitat

Summary

General Comments – A number of respondents comment on wildlife habitat. Some assert that the Forest Service should protect roadless areas for habitat for various species, and that it should preserve fish and wildlife habitat as a priority. Some suggest types of habitat that would benefit from roadless area protection, such as wetlands, migratory bird habitat, interior species habitat, salmon and trout habitat, and wolf and fox habitat. Respondents also provide a wide variety of strategies for preserving habitat. Some of these strategies include reducing the effects of human encroachment, avoiding development of wetlands, retaining dead and downed trees, providing wildlife corridors between roadless areas, increasing elk forage, and allowing continued maintenance of wildlife habitat improvements.

Respondents also frequently discuss habitat fragmentation. Many request that the Forest Service address the negative effects of habitat fragmentation and also take steps to prevent it.

Respondents suggest prohibiting road building and protecting roadless areas to prevent fragmentation.

Effects of Activities/Disturbances on Wildlife Habitat – Some respondents believe that the Forest Service should allow various activities due to their positive effects on wildlife habitat. One organization asserts that some even age management should be occur in order to maintain habitat diversity and support the species of disturbance ecosystems. Some suggest allowing limited timber removal, the use of fire to clear out old growth, dredging, grazing, and road building to benefit wildlife habitat.

In contrast, other comments on this topic conclude that certain activities have negative effects on wildlife habitat. Respondents state that the Forest Service should prohibit mining, thinning, developed activities, and road construction in order to protect wildlife habitat. Some also add that the Forest Service should address the negative effects of roads on specific wildlife habitat such as American marten habitat and beaver habitat.

Wildlife Habitat General

649. Public Concern: The Forest Service should manage forests for habitat rather than for “values.”

If the water is clear enough for fish survival, the fuels discontinuous enough that fires can be limited within reason, there’s huntable game, and resource producers can still produce, that’s good enough for me.

I really don’t give a rat’s fanny about “values,” especially the sort of unquantifiable “non-use values” so popular with the preservationist crowd. I fail to see the “value” in an unmanaged forest that can go up in flame at any time, wrecking habitat from ridge to ridge at a time when there isn’t a hell of a lot of habitat to spare in some cases. I would rather have partly-functional habitat than no habitat at all. Of course, if the habitat goes up, then the species become MORE endangered and then the eco-lawyers can get LOTS of “value.” (Individual, Whitefish, MT - #A20672.50000)

650. Public Concern: The Forest Service should more adequately describe desired future conditions to reflect wildlife habitat.

The Forest Service has not adequately described the desired future condition (DFC) of Roadless Areas. We believe the future condition of Roadless Area should be characterized predominantly by remote (backcountry) landscapes where ample habitat exists to support a rich diversity of wildlife and other natural resources, as well as the type and quality of recreation that depends on serene, natural surroundings. The FS, however, must balance the demand for remote landscapes against the need to manage habitats for wildlife, water quality, and fire. Data clearly shows that mule deer and elk need the security provided by wild areas without much roading, but it is the shortage of managed habitats in these remote landscapes that limits population size, distribution, and health of these and many other species. (Organization, Washington, DC - #A21762.50000)

651. Public Concern: The Forest Service should consider the size of inventoried roadless areas.

TO MAKE SURE THEIR SIZE IS CONSISTENT WITH THE HABITAT REQUIREMENTS OF INTERIOR-DWELLING SPECIES

The sheer size of an IRA parcel should also be considered to make sure it is of a size consistent with the habitat requirements of interior-dwelling species which are being promoted. This is by no means an all inclusive list. A set of national criteria needs to be created for evaluating IRAs and those criteria should be applied through the local planning process. (State Agency, Madison, WI - #A28775.45330)

652. Public Concern: The Forest Service should address the negative effects of habitat fragmentation on wildlife.

In both the Tongass and elsewhere (Pacific Northwest, Amazon), forest fragmentation has been found to have detrimental effects on populations of individual species such as Sitka blacktailed deer and on overall species diversity and abundance. Road construction contributes to these effects by both directly increasing mortality (hunters, trappers, and drivers use roads whether or not you close them) and by facilitating further fragmentation of habitat (timber sales follow roads, roads themselves can pose significant barriers to dispersal in some organisms). Recent research in the Tongass indicates that the fragmented landscapes produced by logging and road-building cause a significant DECREASE in avian community diversity compared to continuous old growth forest. (Professional Society, No Address - #A26225.53100)

Habitat Fragmentation—Roads break up local populations of smaller animals and plants, potentially leading to local extinctions and disruption of behavior and movement patterns of large animals, such as elk and pronghorn antelope. (Professional Society, Lincoln, NE - #A19374.53110)

BEARS

My concern was and still is for wildlife habitat—especially Grizzly Bear Habitat. Rooding makes it difficult for the bears to move to new food sources and increases the likelihood of Bear/Human confrontations. Rooding definitely diminishes the Bear's habitat. (Individual, Riverton, WY - #A20861.53110)

653. Public Concern: The Forest Service should protect roadless areas.

FOR WETLAND SPECIES PROTECTION

Let's not forget that the eastern Delta is one of the world's most important wetlands (according to Ducks Unlimited and others) in terms of migratory and breeding birds; that this is the largest wetland on the Pacific coast of North America; and that still contains healthy populations of salmon. At a conference held in May 1999 in Cordova, USFS administrators and researchers, and researchers from academia, recommended that Cordova become the site of a major wetland research facility to study this intact, functioning wetland so that the research could be used to help restore damaged wetlands and Pacific salmon stocks in the northwest U.S. None of this proposed development and research depends on roads and, in fact, could be harmed by more roads into the region. (Individual, Cordova, AK - #A8044.53100)

FOR ELK REINTRODUCTION

The state is reintroducing elk into this area and has plans for introducing other species. These animals need huge expanses of roadless areas that are rare in this area. We should not destroy those that we currently have. (Individual, Soddy Daisy, TN - #A13508.53100)

FOR MIGRATORY BIRD HABITAT

Numerous bird species, particularly migratory birds, depend partly or entirely on roadless forests for breeding, feeding, and resting on their migratory journeys. Cerulean, Cape May and black-throated green warblers, wood thrushes, and ovenbirds are all birds that need interior woodlands to thrive. Edge species that impact interior birds through predation, competition, and parasitism include crows, jays, cowbirds, and raccoons. There is some indication that unroaded tracts of forests 1000 acres or less can provide enough interior habitat to suit at least some interior birds, which is one of the reasons parcels of this size should receive immediate protection under the roadless policy. (Organization, Washington, DC - #A18031.53100)

FOR INTERIOR SPECIES HABITAT

The characteristics that make roadless areas so important are largely a factor of their size. One of the most important roles roadless forests play is a barrier to predators and competitors better suited to the forest's edge. Roads provide access for these non-interior species to forests that were previously off-limits to them, where they can wreak havoc on susceptible plants and animals of forest interior. A resulting change in plant composition may reduce or eliminate the food or habitat relied on by forest-

interior animals. Diseases, fungi, non-native species, and pests can also be kept at bay by deep, unbroken forests. Roads, clearcuts, and other openings also change the climate of a forest, for as far as 500 feet or more into the adjacent forest. Openings in the trees allow more wind, light, and noise to enter. The result is often a warmer, drier forest that may be uninhabitable for interior species, suitable for edge species, or both. (Organization, Washington, DC - #A22129.50520)

The roadless areas provide abundant and diverse values, but first and foremost emphasis should be placed on preserving areas that provide a template and source of information for research regarding biological resources. Roadless areas are particularly important in this context because they are relatively unfragmented and can provide large amounts of interior habitat relative to edge, and this condition is becoming extremely rare in the landscape. In addition, these areas provide valuable wildlife habitat and water protection benefits that are challenging to restore or replace. (Association, Minneapolis, MN - #A19249.45100)

FOR KENAI PENINSULA HABITAT

While peninsula brown bear habitat effectiveness has been reduced by 70% on CNF lands, adjacent habitat on the Kenai National Wildlife Refuge (KNWR) been reduced by thirty percent (KNWR). Most management activities have occurred in the lower elevations, fragmenting valleys and wildlife travel routes. However, under the preferred alternative management activities will continue to change the distribution of certain species across the forest by continuing to concentrate activities in these valleys. The Kenai song sparrow and seven subspecies of mammals are restricted to the Kenai Peninsula (3-58). Ironically however, the preferred alternative places the most change, with the least amount of protections here.

Several telemetry studies give compelling evidence to the island-like geography of the Kenai. There is little to no genetic interchange between the Kenai and mainland Alaska for some wildlife populations, such as brown bears, lynx and wolves. All of these species are on Federally listed in the lower '48 due to isolation, habitat fragmentation, development and human disturbance, conditions not unlike those that exist on the Kenai. The geographic land bridge, which enable genetic interchange, was severed this summer with the Whittier access road. It took wolves nearly 50 years to naturally economize the peninsula after being eradicated in the early 1900s. Caribou had to be reintroduced after their decimation, never naturally colonizing (KNWR). Human impacts were much lower at the time of colonization than they are now. Future management of CNF lands will determine the outcome for some of these species. The preferred alternative must permanently protect habitat of critical importance, especially for those species, which may be isolated. WE strongly recommend coordination with federal landholders that share CNF boundaries, such as the Park Service and Fish and Wildlife. (Organization, Anchorage, AK - #A23038.53100)

FOR CLEARWATER BASIN HABITAT

Studies by Carroll, Noss, and Paquet (2000) show the Clearwater Basin wildlands to be the most important areas for carnivores in the US and Canadian Rockies. The roadless areas provide clean water and spawning grounds for native fish and the unfragmented, large tracts of forests for wildlife such as grizzly bear, wolf, goshawk and pine marten. Forest Service studies have found streams and rivers are healthier in roadless areas than in roaded, logged places. (Organization, Moscow, ID - #A22654.50000)

TO PRESERVE HABITAT FOR INDIGENOUS WILDLIFE

An emphasis should be made to assure that sizable habitats are provided for the indigenous wildlife of America, quite apart from its function to people. Once sufficient land has been permanently set aside to assure the continuation and development of these species in isolation, then there is more flexibility with remaining public lands. At this moment, more land, not less, needs to be kept and conserved in roadless areas. (Individual, Lexington, KY - #A1077.30200)

TO PRESERVE SALMON HABITAT

Healthy salmon runs are the backbone of the ecosystem and economy in Southeast Alaska. In contrast to the rest of the Pacific coast, millions of salmon still return to the rainforest streams each fall. Large trees along rainforest streams provide critical fish habitat. They help maintain steady water temperatures by

providing shade and maintain flow rates by controlling runoff. Woody debris from dead trees helps preserve stream structure and nutrient supplies important for juvenile salmon. High-quality, intact forest is essential for continued wild salmon runs. (Organization, Nevada City, CA - #A4941.54100)

The Tongass still has healthy salmon runs. More roads will jeopardize these salmon stocks which will result in ESA listings and ruin a sustainable way of life for many people in the SE Alaska. (Individual, McKinleyville, CA - #A1269.20222)

TO PRESERVE TROUT HABITAT

Many trout populations, like bull trout and most cutthroat trout populations, are severely fragmented and depressed. Much historic habitat is degraded, rendering all remaining habitat critical to native trout persistence. High quality habitat is rare. Any further degradation increases likelihood of trout extirpation. These conditions make roadless area protection essential to protecting and restoring trout. In a study of the role of Congressionally designated wilderness in conserving aquatic biointegrity, and sensitive species, researchers found that watersheds containing wilderness scored higher for aquatic biointegrity indicators. This study used road density among other factors as a measure of predictors of biointegrity; citing other studies that suggest that scientists can actually use roads as a catchall human disturbance indicator. Bull trout are exceptionally sensitive to direct, indirect, and cumulative road effects. Bull trout strongholds occur in areas with road density of about 0.4 miles per square mile of land area, but when road density increases to 1.7 miles per square mile bull trout are not found. The study found that wilderness areas are important areas of biointegrity in western Montana and given their importance and rarity, unprotected areas with good aquatic biointegrity merit permanent protection.

Further, recent studies have shown that the majority of isolated populations do not have adequate space for their long-term persistence. Scientists have estimated that, to maintain a cutthroat population in the long term, cutthroat might need two to twelve miles of occupied stream habitat. Few populations are left that occupy this much habitat. Existing populations are at short-term extinction risk from fires, floods, toxic spills, and non-native fish stocking.

High quality habitat for most trout populations is rare. High quality habitats in roadless areas are like islands in an ocean of degraded habitat. (Organization, Laramie, WY - #A30488.54110)

TO PRESERVE TROPHIC WEBS

The more habitats we destroy for all the animals living here the less chance they have to survive. Even small insects who get overlooked, if their habitat goes, then what will the birds, frogs and fish eat? We have the power and the obligation to help protect these ecosystems. (Individual, No Address - #A3887.50510)

Numerous studies in the rainforests of South America have shown the problems that occur when forests are fragmented. Intrusion of non-forest plant species and decreases in viability of animals at the top of the food chain are the two most obvious examples. (Individual, Tulsa, OK - #A1324.50520)

654. Public Concern: The Forest Service should preserve fish and wildlife habitat as a priority.

PRIORITY IS THAT WILDLIFE HABITAT BE PRESERVED! (Individual, No Address - #A584.50000)

BY REDUCING THE EFFECTS OF HUMAN ENCROACHMENT ON WILDLIFE HABITAT

In these times of massive land development for urban use, it is clearly becoming a problem for a vast amount of wildlife. If this is not controlled in some areas where the wildlife can remain in its own (not intruded upon and changed for human use) natural environment then they simply do not stand a chance. So many people are against hunting and fishing and the numbers grow day by day. There is so much energy spent on saving this or that species but only as long as it does not impede human interests i.e.: money, huge fancy houses that are just show pieces of the rich (who do not appreciate wildlife anyway), resorts or anything that revolves around making a lot of money. (Individual, Billings, MT - #A4210.53000)

Human development of land here is fast deteriorating terrestrial and aquatic wildlife habitat. (Individual, Eagle River, WI - #A844.53000)

BY AVOIDING DEVELOPMENT OF WETLAND SITES

. . . Stop developing on wetland sites. These have become bird and animal sanctuaries near our cities. (Individual, Fort Wayne, IN - #A479.10111)

BY RETAINING STANDING DEAD AND DOWNED TREES

Studies recognize the benefits from standing and downed dead trees left by insect infestations. These trees provide food and shelter for wildlife. They form fish-spawning filter water for downstream use, and fertilize soils for future generations of forest life. (Individual, Missoula, MT - #A17952.60200)

Woodpeckers thrive in snag trees, naturally occurring in forests. Salamanders like the cool, rotting logs often found throughout undisturbed forests. (Organization, Washington, DC - #A22129.60200)

BY ADDRESSING LANDSCAPE-SCALE HABITAT NEEDS FOR WILDLIFE

Maintaining the population viability of far-ranging forest carnivores (including the grizzly bear, gray wolf, wolverine, fisher, pine marten, lynx, goshawk, etc.), reveals the need to consider landscape scale habitat needs. Core areas of relatively undisturbed habitats must be maintained. Linkages with other core areas must be established, providing sufficient habitat components so the linkages, or corridors, are functional for genetic interchange. Both core areas and linkages must be the focus of watershed rehabilitation and recovery . . . (such as road removal). Buffer zones around core areas must also be recognized in their contribution to habitat needs for these wildlife species. (Organization, Missoula, MT - #A613.53100)

BY PROVIDING WILDLIFE CORRIDORS BETWEEN ROADLESS AREAS

The USFS and other federal departments should work at establishing corridors between roadless areas to allow for wildlife and plant species to migrate between protected areas. (Association, Bonners Ferry, ID - #A20858.50520)

BY PROVIDING WILDLIFE CORRIDORS IN EXURBAN AND SUBURBAN ZONES

I ask that wildlife corridors in exurban and suburban zones be actively promulgated by the Forest Service. (Individual, Valley Center, CA - #A4316.53100)

BY PROTECTING CRITICAL WINTER AND MIGRATORY RANGE

Please also work to increase and enhance critical wintering and migratory habitat for our game animals. Urban and suburban sprawl takes an increasing toll of these critical areas each year. (Individual, Monument, CO - #A5764.53100)

BY INCREASING ELK FORAGE

Elk related business is a major economic contributor to Idaho. Our significant decline in Clearwater Basin elk population levels is tied directly to a lack of active forest management in the Basin. The creation of elk forage must come through proactive forest management utilizing the full range of forest management tools (timber harvest and burning) across the full breadth of the lands. (Organization, Moscow, ID - #A15318.53300)

BY PROTECTING HIGH VOLUME CREEK HABITAT

It is common knowledge that high volume creek bottoms and valleys also provide the best habitat for deer, salmon and other wildlife. Remaining areas should be kept roadless to protect these wildlife habitats. (Individual, Sitka, AK - #A15246.53100)

BY IDENTIFYING AND MAPPING CRITICAL SALMON HABITAT

Fast track a watershed analysis system to identify salmon stream habitat, as fisheries in Alaska is a tantamount economic, subsistence, and recreational resource many of us utilize. Identify and map "critical habitat," the land essential for the survival of the species. Use this identification to design a

strategy plan for wildlife protections while using alternative logging practices to minimize impacts. (Individual, Pelican, AK - #A26552.50000)

BY DIVERTING FUNDING FROM STOCKING EFFORTS TO HABITAT RESTORATION AND ENVIRONMENTAL POLLUTION PREVENTION EFFORTS

The forest service should continue with the restoration of fish habitat. Healthy stream and lake environments will promote strong and sustainable fisheries. Funding should be diverted from stocking efforts and placed on habitat restoration and environmental pollution prevention efforts. (Individual, Beverly Hills, MI - #A4756.50100)

BY COMPENSATING CITIZENS WILLING TO SET ASIDE THEIR LAND FOR HABITAT

. . . we can utilize PERC's recommendations, compensating Americans willing to set aside their land for habitat. "Market-oriented solutions are offered in the areas of endangered species, national monuments, grazing rights, recreation fees, and water management." (Individual, Jefferson, OR - #A777.54100)

BY ALLOWING CONTINUED MAINTENANCE OF WILDLIFE HABITAT IMPROVEMENTS

While we are disturbed and disappointed with the final rule adopted on January 11, 2001, we hope that the USFS will manage inventoried roadless areas to allow the continued maintenance of wildlife habitat improvements. Wildlife habitat improvements, especially wildlife openings in areas of extensive forestland, represent considerable investment of public resources by the VDGIF and the USFS. The areas not only provide important foraging habitats for white-tailed deer, black bear, and wild turkey, but also provide opportunities for the public to see the species. (State Agency, Richmond, VA - #A6048.53100)

655. Public Concern: The Forest Service should provide habitat for umbrella species.

Forests should be managed to provide habitat for game animals and umbrella species, and to provide a quality outdoor experience for many. Near-roadless areas have their place, but making Forest Service lands inaccessible to a substantial number of people should not be a policy of the Forest Service. (Individual, No Address - #A16447.50000)

656. Public Concern: The Forest Service should provide natural habitat for wolf and fox.

Allow wolves and foxes in natural habitat. (Individual, Atlanta, GA - #A873.53100)

657. Public Concern: The Forest Service should address the loss of habitat through canopy closure.

We are concerned that the presence or absence of roads in an area will overshadow the appropriate consideration of other values such as healthy forests and wildlife habitat. As an example, if an area is inaccessible for management, there may be a significant loss of important wildlife habitat through canopy closure. (Association, Portland, OR - #A19004.30200)

THROUGH THE FOREST PLANNING PROCESS

If an area is inaccessible for management, there may be a significant loss of important wildlife habitat through canopy closure. At the forest plan level, the analysis must consider these changes in wildlife habitat versus the need or desire to keep the area inaccessible. We do not feel that such analysis and consideration of site specific impacts can be done at the national level. (Association, Salem, OR - #A21754.45500)

658. Public Concern: The Forest Service should prevent habitat fragmentation.

BY PROTECTING ROADLESS AREAS

Looking at the whole picture, the least damaged public lands should be preserved in blocks large enough to preserve the native plants, animals and fish of the United States. A strong roadless areas will do this. I

can move and survive fine in another area. Marbled Murrelet, Northern Spotted Owls and Coastal Coho can't. (Individual, Deadwood, OR - #A881.50500)

BY ESTABLISHING ROADLESS AREAS WHERE THE GREATEST CONNECTIVITY CAN BE ACHIEVED

The current pattern of roadless areas is of course an artifact of chance, not of conscious design. In consequence, many ecologically important areas and types are under-represented or un-represented in the current universe of roadless lands (both inventoried and uninventoried). Even a policy that thoroughly protects all existing roadless areas will fail to achieve substantial and obvious ecological and biological benefits because no consideration will have been given to where the roadless areas *ought* to be. The ecological limitations of the current pattern of roadless areas can be remedied in part by creating new roadless areas where they are needed most - in the highly functional areas but lightly roaded areas, and in the areas where small amounts of road removal can achieve vast increases in connectivity. There are many such areas. In cooperation with our colleagues, Pacific Rivers Council has mapped areas of high aquatic integrity in much of the national forest system (including the Columbia Basin, the Sierra Nevada, and the Southern Appalachians) this has shown that protection of the existing pattern of roadless areas will only partly protect the remaining high quality diversity areas, since many high quality areas have been lightly compromised by roads. (Business, Coarsegold, CA - #A1589.50520)

BY PROHIBITING ROAD BUILDING

As is true of all ecosystems, high elevation ecosystems such as those in the Gunnison Basin-forests, shrub steppe, meadows and others-are easily damaged by human activity. In particular, ecosystems are damaged when the habitat they contain is divided into smaller fragments. The building of roads is a major cause of fragmentation. Fragmentation disrupts natural ecological interactions among species, as my research and other research at RMBL and elsewhere shows. The building of roads also damages ecosystems by serving as an entry for alien species to invade. Fragmentation and biological invasion are very serious threats in our area, as BLM and USFS scientists clearly recognize as well. (Individual, Crested Butte, CO - #A3696.50100)

Science uses a word that denotes ecosystem death and destruction: fragmentation. Slicing and dicing an ecosystem into smaller parcels because of building roads causes the instability and death of an ecosystem, or FRAGMENTATION. Our forests are not merely trees and landscapes; they are Earth's ecosystems. "Man cannot live without ecosystems". Our living Earth is alive because of ecosystems. Man breathes, drinks fresh water, has food to eat and crops to grow because of Earth's ecosystems. Every aspect of life on Earth is governed by strict natural laws that are structured by Earth's ecosystems. Ecosystems maintain and govern the atmosphere and the climate. Earth's populations of viruses and bacteria, in the food chain with man, are also checked and balanced by ecosystems, or Earth's natural wild places and things, that is, our roadless forests that denote inherently life and stability. Any form of human intrusion inherently kills an ecosystem. Each native animal, bird, planet, and tree that evolved within an ecosystem holds down a job for that entire system. Birds, salamanders, frogs, and lizards are an ecosystem's natural pest control system. The protectors and champions of the ecosystem. Every tree removed or killed to build a road, destroys a member of the work force of the ecosystem and the home and cover and shelter of its native species. All native trees and plants and all native animals are the strands in the virtual web of all life. (Individual, No Address - #A609.50510)

TO REDUCE AGGRESSIVE ANIMAL ENCOUNTERS

The continued fragmentation of these areas leaves wildlife isolated and leads to the extinction and/or more frequent altercations with the more aggressive inhabitants, black, brown and grizzly bear. (Individual, Mohawk, NY - #A3753.50510)

I have a hard time dealing with people saying that wildlife is becoming more aggressive. It's no wonder why they might. They are being driven from their homes and forced into our backyards. . .places that are fearful to them as they aren't used to it. . .{and worse, into the roadways only to die} all for the sake of mining and constant building to compensate for a growing number of people. Wouldn't you be a little aggressive if someone came in and took away the only home you have? (Individual, Sarasota, FL - #A1339.53100)

659. Public Concern: The Forest Service should provide a brochure that identifies prime habitat in all states.

There should be a brochure to identify to preserve prime habitat in all states. (Individual, Raleigh, NC - #A11420.14100)

Effects of Activities/Disturbance on Wildlife Habitat

Positive Effects

660. Public Concern: The Forest Service should allow various activities due to their positive effects on wildlife habitat.

LIMITED TIMBER REMOVAL

I am a professional, wildlife biologist now writing a part of a Status Assessment for an endangered species that occurs in National Forests in eastern U.S. For the sake of this species, I would prefer to see some management option allowing very limited clear-cutting in some of the areas which might become roadless. (Individual, Ithaca, NY - #A416.53200)

Instead of logging roadless areas, open up logging in those forests with environmentally sensitive techniques that leave some timber but clean out the old timber growing too dense to provide suitable big game habitat. (Individual, Idaho Falls, ID - #A4337.53300)

THE USE OF FIRE OR SOME OTHER MEANS TO CLEAR OUT OLD GROWTH

If the small companies who lease timber rights are also used to clear dead brush from the areas where they are working, this will reduce the fire hazard. This brush clearing should also be required of neighbors and inholders. An area that I am familiar with is the San Bernardino National Forest. I can remember reading newspaper articles about how there weren't very many deer there anymore and, while the Forest Service was trying to blame this on people, the article stated that the manzanita brush that the deer feed on was so old and woody that the deer couldn't eat it. After about three years of growth, this brush becomes so tough that it might as well be ironwood. If this brush isn't cleared off in one way or another, there aren't going to be any deer because they can't survive without feed. Nature takes care of this problem by fire, but you people try to put out fires as soon as possible and that means that there must be another way to clear out the old growth in order for new growth that deer can feed on can appear. (Individual, No Address - #A8252.30500)

DREDGING

They did a study about the damage that dredging does to streams and rivers and found that it was beneficial to the fish. A dredge picks up the overburden first and then puts the gravel on top of it, which makes it much easier for the fish to use the gravel to make their nests. And many fresh water fish do build these gravel nests to put their eggs in. (Individual, No Address - #A8252.54100)

661. Public Concern: The Forest Service should recognize the beneficial impacts of timber removal, grazing, and road building on wildlife habitat.

Wildlife habitat: good logging and grazing practices can ensure the varied landscape necessary to support abundant wildlife and many species. Roads can help hunters access areas to help maintain healthy populations. Fires destroy large expanses of habitat. (Individual, McCall, ID - #A29305.53100)

662. Public Concern: The Forest Service should allow even age management.

TO MAINTAIN HABITAT DIVERSITY

I believe that some clear-cutting should be allowed in order to maintain habitat diversity and to support species of disturbance ecosystems. This exception . . . should amount to a small percent of the roadless areas, perhaps 5% per century. (Individual, Ithaca, NY - #A27558.50100)

Negative Effects

663. Public Concern: The Forest Service should prohibit various activities due to their negative effects on wildlife habitat.

ALL ACTIVE MANAGEMENT ACTIVITIES

Stop destroying wildlife habitat for putting houses in them. Everything needs a place to live, not only people. And the addition of urban things into forests will pollute America even more than it already is. (Individual, Flushing, NY - #A11503.50000)

Activities such as logging, road building, suction dredge mining, and motorized recreation need to be prohibited from roadless areas to improve protection of salmon and steelhead populations and reduce the risk of extinction. Existing wilderness and adjacent roadless areas provide de facto salmon refuges for geographically distinct populations of steelhead trout, Chinook salmon and cutthroat trout in the Siskiyou National Forest. Populations of Coho salmon may be found associated with smaller, isolated roadless areas 1,000 acres or less. Spring Chinook and summer steelhead are found associated with roadless areas in the Siskiyou, Klamath and Six Rivers National Forest. The Klamath/Siskiyou region has the largest concentration of undamaged rivers outside of Alaska. These undimmed rivers and creek support native, naturally reproducing salmon and steelhead. Roadless areas are seldom stocked with artificially produced salmonids thus promoting genetic integrity. Activities such as road building, commercial logging, salvage logging, heavy handed fire suppression, suction dredging, home building associated with mining, water withdrawals for mining, fish stocking, ski area expansion, and access with motorized vehicle have negative impacts to salmon and steelhead and should be prohibited. Forest managers often allow these activities to occur by claiming the impact is negligible. Cumulative impacts, which eventually become significant over time, are rarely taken seriously. The result is a degraded ecosystem with reduced production of salmon and steelhead. (Organization, Cave Junction, OR - #A17235.54200)

ROAD CONSTRUCTION

I am particularly concerned about the proposed Finger Mountain sale in Tenakee Inlet. The area in Goose River where road building is proposed is a high salmon producing spot and waterfowl feeding area. Bears, deer mink and marten also frequent that area. Prohibiting roads would save this important habitat. (Individual, Tenakee Springs, AK - #A5143.53100)

THINNING

I am 60 years old and I can remember when the deer were very plentiful in the area of the Ochoco National Forest. I am planning on hunting this area next week and am wondering if I will find more forest thinned when I arrive. I believe thinning of the forest and making them look like a huge park has destroyed more habitat for deer and elk than anything else. The land looks the same but the forest is left without any cover for these animals to hide and bed. It used to be the policy of the National Forest to leave the north slopes with the original cover so the deer and elk would have a place to hide and bed and signs were posted stating this. Last year I found one of these signs posted on a tree and it made me laugh inside. Somewhere along the way the USFS has decided we need the forest cleared of undergrowth and denuded of natural growth. I don't know why this policy was reversed but I think it should be given consideration again. I know the area that I hunt has been thinned three times in the past 7 yrs. and the deer and elk are not as thick as they were. This is an area that has road closures and is being managed by ODFW, USFS, and Rocky Mountain Elk Foundation for better game habitat. I think these groups should look at this thinning issue a little more closely. (Individual, Forest Grove, OR - #A6045.53300)

MINING

I live in Florida, where mining of phosphorous and other minerals is taking away a precious "home" for wildlife in the Everglades. I have a hard time dealing with this thought, especially when I know that it's cheaper for us to buy these minerals from outside countries due to their failing economies, than it is for us to mine them right out of our own state. (Individual, Sarasota, FL - #A1339.53100)

664. Public Concern: The Forest Service should address the negative effects of log transfer facilities on aquatic habitats.

Road building and subsequent clear cutting have also resulted in hundreds of log transfer facilities through Southeast and South-central Alaska. Bark from logs deposited into Alaska's inland marine waters covers thousands of acres of near-shore habitat. In many bays, fish and invertebrate habitat and important crab fisheries have been adversely affected because of this activity which is a direct result of road building and high volume timber sales. Many log transfer facilities are on the Clean Water Act [section] 303(d) list of impaired water bodies and probably will remain on the list until an active program is implemented to clean up these sites. Bark in large quantities does not seem to decompose or wash away passively. (Individual, Juneau, AK - #A23242.54100)

665. Public Concern: The Forest Service should address the negative effects of roads on wildlife habitat.

ON AMERICAN MARTEN

Marten (*Martes americana*) are widespread in the Tongass National Forest, and are an important furbearer. Density of roads has been found to affect the quality of habitat for marten where there is potential for overtrapping. A habitat capability model developed for evaluation of marten habitat on the Tongass National Forest predicts declines in marten densities at road densities as low as 0.2 miles per square mile, and population declines of 90 percent where road densities approach 0.6 miles per square mile. (Permit Holder, Juneau, AK - #A23220.50000)

ON BEAVER

As a resident of an area surrounded by national forests, it is the roadless areas that I most cherish. The areas with roads have lost their scenic values due to logging. The huckleberry patches have been destroyed, never to return in my lifetime. The elk calving areas are gone. The nests of goshawks and other forest raptors have been lost. In areas where there are roads but no commercial logging, firewood gathering and associated activities have vastly reduced the quality of the forest—one finds skid tracks, non-native vegetation, litter, and the lack of snags and woody debris so essential to many kinds of wildlife. The rich humus from decaying logs is not present, reducing the vitality of plant communities. Hydrological processes, including beaver populations, with their capacity to create and restore wetlands, have been disrupted and degraded by roads and associated development. (Individual, Victor, ID - #A20625.45100)

666. Public Concern: The Forest Service should close roads after timber removal.

TO PROTECT WILDLIFE HABITAT

I live in the center of the GMUG forests and all are in serious climax situations due to fire suppression. This has led to the decline of our deer herds in Colorado. Additional travel corridors will only make the situation worse. If areas need to be harvested for habitat improvement I support that as long as roads are closed on completion of timber harvest. (Individual, Delta, CO - #A4287.5300)

667. Public Concern: The Forest Service should address "edge effects" on songbird populations.

Excessive logging roads have harmed much of the wildlife by making too easy access for humans and allowing decreased songbird survival by the now well understood "edge effect". (Individual, Cheney, WA - #A6154.53000)

There is some indication that unroaded tracts of forests 1000 acres or less can provide enough interior habitat to suit at least some interior birds, which is one of the reasons parcels of this size should receive immediate protection under roadless policy. (Organization, Washington, DC - #A22129.45320)

Threatened and Endangered Species

Summary

General Comments – A number of comments regarding threatened and endangered species suggest reasons for and methods to protect these species. People request that the Forest Service protect roadless areas as habitat for endangered species, specifically for the spotted owl, bald eagle, and grizzly bear. Some suggest that protecting roadless areas would prevent costly listing of species under the Endangered Species Act (see also Chapter 2: Other Legal Concerns: Federal Laws, Acts, and Policies: *Endangered Species Act*). An organization requests that the Forest Service manage roadless areas in accordance with the Canada Lynx Conservation Agreement. Others ask that the Agency address habitat improvement for threatened and endangered species in forest plans.

Some assert that management of endangered species requires access. The Forest Service, some say, should not designate roadless areas in endangered species habitat because access is needed to accommodate fuel reduction projects and fire fighting. Additionally, a few respondents say that species extinction is a natural occurrence and assert that the Forest Service should not take special steps to protect endangered species.

Effects of Activities/Disturbance on Threatened and Endangered Species – Several respondents suggest activities which, they claim, would help protect endangered species. One individual suggests that the Forest Service should permit wildlife rescue operations in roadless areas because roadless designations may prevent such rescues of endangered species. Another individual suggests that the Forest Service relocate endangered fish species during times of drought. While some respondents conclude that certain disturbances are beneficial to endangered species—such as flooding for salmonids—others assert that the Forest Service should consider the negative impacts of various activities/disturbance, such as roads, timber removal, and wildfire, on threatened and endangered species.

Threatened and Endangered Species General

668. Public Concern: The Forest Service should protect roadless areas.

AS ENDANGERED SPECIES HABITAT

We do not have the remotest idea what the consequence will be when a species becomes extinct as a result of human actions. Certainly one impact of the demise of the spotted owl is likely to be an increase in the rodent population in that area—which could have very serious consequences. If other species suffer the same fate as a result of this proposed amendment, how will we know what other consequences there might be? (Individual, Bakersfield, CA - #A390.50000)

The main role in my opinion is for endangered animal protection and watershed health. (Individual, Wheaton, IL - #A52.50000)

The obvious and most important benefit is the habitat it would provide for over 1600 rare, threatened, endangered and sensitive species and the benefit to our air, water, and land for future generations of people, families, communities, and wildlife. (Individual, Bellevue, WA - #A637.50000)

We are now on the steeply rising slope of exponential population growth. Humans are pressing out everywhere. Dr. Richard Leakey now says that “between 50,000 and 100,000 species are lost every year.

The current rate of species loss is imperiling the planet” (BBC news 8/24/01). With an ever increasing human population, we must provide an increasing land base of protected areas for natural recreation and research. We must preserve some natural ecosystems while we still can. (Individual, Sitka, AK - #A15506.50400)

South Fork Mountain IRA here in North Idaho, for instance, will already be reduced in size due to Stimson Lumber Company’s ANILCA access easement yet South Fork Mountain and roadless lands to the west on the Colville National Forest comprise extremely important refugia for a host of ESA listed species that are suffering continual assaults on their habitat from motorized recreationists, inholding timber corporations, and fragmentation from numerous activities that inexorably shrink these few remaining islands of viable habitat. It is no accident that their viability as habitat is directly tied to their status as roadless lands.

This example is not unique. If you would look at the grizzly bear management units (CMUs), the lynx analysis units (LAUs) and refugia for bull trout in the south Selkirk Mountains, you would see that all of the best remaining habitat is found in roadless areas. This is surely not coincidence.

While recovery of ESA listed species is not popular with extractive industries, it is the mandate of our public agencies. Unless we wish even more contentious battles in the future over species extinctions, we should take all reasonable steps now to ensure that adequate viable habitat exists and that further listings can be avoided. Roadless areas protection is sound policy and furthermore, it is the will of the American people (to whom these forests belong.) (Individual, Blanchard, ID - #A17249.53200)

We are very concerned that the loss of additional large blocks of forest areas in Washington State could directly contribute to future Endangered Species listings. It would be difficult to estimate the economic costs that could be associated with such potential listings, but in Washington we know from past history that these costs can be tremendous. (Organization, Seattle, WA - #A21904.53200)

AS SPOTTED OWL HABITAT

It should be noted that after an aggressive timber harvest by the tribe adjacent to the northern boundary of the LNF, a decrease in the Mexican Spotted Owl population in the LNF was observed coincidental with an increase of that species on tribal land. Similar observations have been made concerning the California Spotted Owl. One suspects that the USFWS needs to revise its opinion regarding habitat of the Spotted Owl. (Individual, Ruidoso, NM - #A17775.53200)

AS BALD EAGLE HABITAT

Please protect the habitat of the Bald Eagle, the symbol of our nation’s freedom and strength. (Individual, North Hollywood, CA - #A19944.53200)

AS GRIZZLY BEAR HABITAT

As fragmentation and degradation of habitat expands, more populations are forced to assume metapopulation structures. Metapopulations are assemblages of local populations sustained by a balance of extinction and colonization (Hanski 1994; Hanski and Gilpin 1997). Metapopulation viability is maintained through the migration of individuals between patches of habitat. It is essential that large patches of core habitat, such as that provided by roadless areas, be protected. Habitat fragmentation may result in smaller and more isolated wildlife populations, particularly for species such as Grizzly Bears with demanding habitat needs. Smaller populations are more vulnerable to local extinction, due to stochastic events (Gilpin and Soule 1986). Smaller populations are also more susceptible allowing for the replenishing of populations and expansion of the gene pool (Noss 1983, 1987, 1992; Noss and Harris 1986; Craighead and Vyse 1995; Paetkau et al. 1997; Beir 1993). Fragmentation may substantially alter the microclimate of forests edges as well as interiors (i.e. radiation, wind, and water fluxes). (Organization, Missoula, MT - #A613.53110)

I write to you to protect grizzly bears and their babies and their habitat. One of the best ways you can do this is to implement the Forest Service’s historic rule to protect roadless areas in our national forests.

Along with more than one million other Americans who commented on this policy, I strongly support the protection of wild places and wildlife like the grizzly. (Individual, Stillwater, MN - #A5162.53100)

I strongly support the protection of wild places and wildlife like the grizzly. (Individual, Portland, OR - #A1583.53000)

TO PREVENT COSTLY LISTING OF SPECIES UNDER THE ENDANGERED SPECIES ACT

The Wyoming Range is a spectacular forest with Canadian lynx and Bonneville cutthroat trout—two wildlife species that are very sensitive and imperiled. We need to protect the last remnants of unroaded country in Wyoming to maintain habitat for these unique species. In fact, there are over 110 wildlife species at-risk in Wyoming that need the undeveloped, lower altitude, roadless areas forest for their survival. Listing and ensuring the protection of these species under the Endangered Species Act would cost Wyoming millions of dollars. It would be better we maintain the roadless areas as pristine, providing habitat for wildlife, than allowing the expensive development of wild forests to the detriment of our wildlife. (Individual, Jeffrey City, WY - #A27115.53000)

669. Public Concern: The Forest Service should manage roadless areas in accordance with the Canada Lynx Conservation Agreement.

We would like to point out that on March 1, 2000 the National Forest Service signed the Canada Lynx Conservation Agreement” agreeing that the assessment and strategy were acceptable and would be followed. Because of the priority to manage corridor as a healthy eco-system and encourage movement of species such as the Canada lynx, I feel that the NF recognize the extreme importance of roadless lands as a potential “safe area” for species. McKelvey et al. (2000d) argued that a system of reserved embedded in a fragmented and non-natural landscape would be sufficient to sustain lynx populations. Rather, a strategy that encompasses the entire landscape may be necessary. Conservation Assessment and Strategy recommends that “refugia” be created to encourage the return of this threatened species. Refugia are large, contiguous areas encompassing the full array of seasonal habitats, in which lynx are present or occurred historically, and where natural ecological processes predominate. Refugia must be relatively secure from human exploitation, habitat degradation, and substantial winter access. Refugia should be sufficiently well connected to permit genetic interchange within and between geographic areas. We believe that many of the roadless areas in conjunction with now existing wilderness areas are the only prime “refugia” possibility available within the north-south wildlife corridor. Most lynx occurrences (83) were associated with Rocky Mountain Conifer Forest, and most (77%) were within the 1,500-2000 m (4,920-6,560 ft) elevation zone (McKelvey et al, 2000b). These statistics enforce the roadless area habitat as being critical. A wide variety of factors have influenced lynx status. These include excessive legal and illegal trapping, extensive timber harvest, habitat modification, thinning, slash treatment, brush control, pesticides, herbicides, livestock grazing, fire suppression, forest maturation, catastrophic fires, recreational use, patchiness of suitable habitat, geographic isolation, prey availability, competition with other carnivores. (Organization, Logan, UT - #A15400.53200)

670. Public Concern: The Forest Service should address habitat improvement for threatened and endangered species in forest plans.

The current roadless area conservation rule allows for activities that would help create habitat for threatened and endangered species or maintain/restore historical ecosystem composition and structure. Specifically, the rule allows for timber management designed to *(I) improve Threatened, Endangered, Proposed, or Sensitive species habitat, or (II) to maintain or restore the characteristics of ecosystem composition and structure.* We believe it is important to specify in the Forest plan—to the extent possible—in which roadless areas these exemptions would apply. The Forest plan should also outline what activities would be needed to create the habitat for the T and E species or would maintain/restore desired ecosystem composition and structure. This outline should provide sideboards for any projects that might be proposed later. (Civic Group, Roanoke, VA - #A1713.50510)

671. Public Concern: The Forest Service should not designate roadless areas in endangered species habitat.

I would recommend that you do not have roadless areas where endangered species exist. Road access could provide for fuel reduction projects and fire fighting access in order to save the habitat. (Individual, Leavenworth, WA - #A6617.53200)

Access is the foundation for all management activities on our public lands. Lack of access to unroaded areas prevented spotted owl census takers from truly measuring populations effectively. Spotted owl populations were inaccurately counted resulting in decisions that were not based on solid science. Take a look at the maps showing spotted owl nest locations. Few locations are very far from existing road systems. Census takers did not have access and spotted owl populations were inaccurately counted. Bad decisions resulted. (Individual, Springfield, OR - #A15730.53200)

672. Public Concern: The Forest Service should recognize that species extinction is a natural occurrence.

I know that the fate of greater than 90% of the species which existed upon this earth was extinction. By attempting to protect endangered species, we are interfering with the natural process of evolution, e.g., the Darwinian principle of mutation plus survival of the fittest. (Individual, Jackson, WY - #A29552.53200)

And [land use restrictions] don't mean let some "taxonomist" turn a variant into a separate "species" to protect some land some "environmentalist" wants to keep everyone off. Use some common sense and recognize that some animals go to the edge of their range, and then die. Allowing a state or government to declare an endangered species because an animal is beyond their normal range is BS. Genetic diversity is not the be-all and end-all of reasons for existence. Natural selection means some animals will die out. It's nature's way. And environments change without man, resulting in extinction. So let's use some common sense here. (Individual, Centerville, OH - #A27001.50200)

Effects of Activities/Disturbance on Threatened and Endangered Species

673. Public Concern: The Forest Service should permit wildlife rescue operations in roadless areas.

TO PROTECT THREATENED AND ENDANGERED SPECIES

Roadless designations diminish/prevent wildlife rescue operations of the very species mandated for protection. Including us. (Individual, Santa Ysabel, CA - #A26392.91110)

674. Public Concern: The Forest Service should prohibit hunting of threatened or endangered species.

The following activities should be completely prohibited in roadless areas: . . . hunting of threatened or endangered species . . . (Individual, Port Angeles, WA - #A6179.90110)

675. Public Concern: The Forest Service should relocate endangered fish species during times of drought.

The lack of water in Klamath Basin is killing deer, birds, etc. Cannot the shortnose suckerfish be relocated in ponds where the water is abundant, such as my area, Jefferson, Oregon? I know of many large ponds. If the lake had no water, you would relocate the shortnose suckerfish until the lake once again has enough water to sustain the environment. The Cohn salmon could be relocated until the river is at its normal depth next year or the year after; rather than exchange the death of 100,000 other species by denying them water in order to keep the river full of water in order to save particular species. (Individual, Jefferson, OR - #A777.54100)

Positive Effects

676. Public Concern: The Forest Service should recognize the importance of flooding to salmonids.

The environmental and ecological values of these areas are already well known. To the extent unfragmented forest habitat still exists in the United States, it exists in the Inventoried and Non-Inventoried Roadless Areas under Forest Service management, within designated Wilderness areas, and in some National Parks. This small remnant of our once vast natural forests is all that remains. The unfragmented forest landscapes provide the best hope for the retention and restoration of wide-ranging carnivores (like grizzly bear, wolf, lynx, wolverine, fisher, and pine marten) within the United States. These areas also provide the last and best opportunity to study natural processes (windthrow, flooding, wildfire, and insect outbreaks) operating within large landscapes. While these natural processes may be locally destructive, they serve the intricate web of species dependent upon them. To cite but one example, flooding—while potentially destructive in the short term—is absolutely essential to the long-term survival of salmonids in Pacific coast streams. Floods remove silt, transport various sized rocks necessary for replenishment of spawning gravel, and create off-channel sloughs where juvenile salmon can feed and escape predators. The Forest Service has a critical role to play in preserving this and other system-wide natural processes—and the species dependent on these processes. As a necessary first step, the protection of roadless areas significantly advances this goal. (Individual, Seattle, WA - #A11805.50000)

Negative Effects

677. Public Concern: The Forest Service should consider the negative impacts of various activities/disturbance on threatened and endangered species.

ROADS

Roads encourage poaching, and incidental road kills of protected or endangered species. (Individual, Seattle, WA - #A8810.90130)

TIMBER REMOVAL

Significant threats abound to this nation's threatened and endangered wildlife, and recovery prospects too often depend on existing roadless areas for their very significant habitat values. Here in North Idaho and Eastern Washington, for instance, timber companies are already encroaching into some of the last redoubts for several ESA listed Threatened and Endangered species. Often, the only viable habitat remaining is found in roadless areas that are typically surrounded by miles of roads and clearcuts. Past Forest Service and timber corporation logging and road building has led to these highly fragmented landscapes. As a result of rampant corporate logging and the Forest Service's legacy of "multiple use", Agency Biological Assessments increasingly are finding that further activities will be likely to "adversely affect" numerous Threatened and Endangered species like grizzly bear, mountain caribou, Canada lynx, gray wolves and bull trout. (Individual, Blanchard, ID - #A17249.50000)

Logging may cause soil erosion that may lead to landslides and siltation of salmon-spawning streams. For specifics, guess where the best salmon-spawning habitat in Eastern Oregon is located. In my backyard—the North Fork John Day River, flowing through a wilderness and several nearby roadless areas. For the most part, our National Forest roadless areas are the healthiest forests we have. (Individual, Bates, OR - #A15564.54200)

WILDFIRE

It is hard for me to believe that all rare species occur only on private property. If we do not protect these from fire in our forests, how do we require private property owners to take extraordinary measures to protect them? (Individual, Loveland, CO - #A7090.30400)

Vegetation and Botanical Resources

Summary

General Comments – Those who address the topic of vegetation and botanical resources request that the Forest Service provide protection to these resources, especially by protecting roadless areas and old-growth forests. Respondents suggest that protecting roadless areas would serve to prevent the spread of invasive species, protect endemic plants, and allow old growth to return. People ask for the protection of old-growth forests for ecological values, to compensate for global losses of old growth, to help lessen global warming, to preserve biodiversity, and to protect against natural disasters. Some respondents assert that old-growth forest protection is warranted because old growth is not replaceable and because that is what most citizens want. Others state that the Forest Service should protect forests to prevent single-species monocultures.

Species-Specific Considerations – A few respondents comment about specific botanical species. One individual requests that the Forest Service protect black spruce while another wants the Agency to maintain or increase the amount of aspen forest. Others request that the Forest Service protect lower elevation hardwood forests, plant more oak trees, and discontinue the practice of replacing hardwoods with pine.

Effects of Activities/Disturbances on Species – One individual suggests that the Forest Service should manage vegetation with longer harvest rotations. A few respondents suggest that certain activities are beneficial to vegetation resources. Some believe that selective timber removal encourages the growth of young trees while others conclude that thinning second growth trees promotes old-growth characteristics. One individual proposes even-age management as a method for regenerating even-aged forests.

A number of respondents state that roads have negative effects on vegetation. Some comment that roads allow the introduction of invasive species, while others discuss the effect of roads on rare plant species. One individual suggests that the Forest Service should consider the role of animals in spreading noxious weeds. (See also Chapter 6: Protecting Forests (Question 3): Roads/Access, Timber Harvest, and Insects, Disease, and Noxious Plants.) Others believe that tree farms and livestock grazing have negative effects on vegetation resources.

Vegetation and Botanical Resources General

678. Public Concern: The Forest Service should identify the vegetative cover affected by the Roadless Area Conservation Rule.

I appreciated the July 10 Federal Register notice's having given the summary facts, but still don't know certain key facts involved. We know that the January 12 rule effectively "saved" from logging and roadbuilding only the 9 million acres of timberland classified as CAS timberlands in existing forest plans. Are all 9 million acres pristine old-growth forest? (Since many of them are in Idaho and I just finished reading Stephen Pyne's new book about the 1910 Great Fires, I gotta ask.) Are the other 47.5 million acres of inventoried roadless lands ancient forests? I doubt it. If this initiative is not about "saving" 58.5 million acres of pristine old-growth forests from logging and roads, how much pristine old-growth is it about? What's the rest of the vegetative cover? (Individual, Quincy, CA - #A30023.14140)

679. Public Concern: The Forest Service should protect roadless areas.**TO PREVENT THE SPREAD OF INVASIVE SPECIES**

Roads and disturbances from logging, and grazing have also increasingly become vectors and corridors for the introduction of invasive non-native plants. We ask that you consider the effects of roadbuilding on the prevalence and spread of invasive species, as well as on the viability of native plant populations. Roadless areas are essential to maintaining the genetic and ecological integrity of our last remaining wild forests. (Association, Kelsey, CA - #A15815.14500)

TO PREVENT HABITAT LOSS

As the long-time Forestry Coordinator for the California Nature Plant Society, I am painfully aware of the habitat loss that has taken place on USFS lands, and that is why I feel so strongly about protecting the remaining roadless areas. (Individual, Carmel Valley, CA - #A4741.60400)

TO PROTECT ENDEMIC PLANTS

CNPS still fully supports this measure, as we did in 1999 and 2000. The remaining roadless acres in our public forests are the last reservoirs where native plants and wildlife can exist without continuous pressure from intrusions that threaten to erode habitat and threaten their continued viability. Roadless areas in our region are precious public treasures because of their resource values diversity, relatively pristine condition, and aesthetic, scientific, and other resource values that make them irreplaceable, and their protection a necessity. The Klamath-Siskiyou ecoregion, for example, contains the greatest diversity of conifer species of any of the world's temperate forests (30 species of conifers). More than 1,800 different species of plants have been documented for this region, of which 131 are endemic and do not occur anywhere else on Earth. Yet, only 10 percent or less of the area is legally protected from logging. (Association, Kelsey, CA - #A15815.45000)

TO ALLOW OLD GROWTH TO RETURN

A roadless area helps what is now not an old growth area have a chance to become one. A lot of effort is put into saving old growth and wilderness areas which I feel is a good thing but there are places which can develop naturally back into that state if they are not seen as "up for whoever wants to grab it". (Individual, Crystal, MN - #A23605.60120)

FOR NATIVE FORBS, LICHENS, AND FUNGI

DellaSala and Strittholt (1999) have documented the importance of smaller roadless areas, which share many attributes in common with inventoried roadless areas, including:

Source areas for recolonization of native forbs, lichens, and mycorrhizal fungi. (Organization, Ashland, OR - #A20421.45100)

680. Public Concern: The Forest Service should protect old-growth forests.

Rather than defend this popular act in court against Boise-Cascade, my government rolled over and greased up. Now it's time for USDA, the stewards of my forest, to defend this dwindling legacy. Even without the Act, you can protect the old growth forests. Please do. (Individual, Bothell, WA - #A639.30100)

I feel our forests are much like Central Park in New York City. When Olmstead designed the park, there was only open land all around. But today such a different sight to behold. And I hope you and the rest of our government could have the same foresight and plan ahead to the time when our forests could possibly be the only natural green space we have left. It'd sure be nice if that green space had mature trees set in their natural state. I'm sure you've been to the Redwood's in California, what a wonderful sense it is walking around them. It would be so nice to let other trees mature around the U.S. in large quantities. (Though of course I know the other trees wouldn't be quite the scale!) (Individual, Brevard, NC - #A151.50000)

FOR THEIR ECOLOGICAL VALUES

To maintain fish and wildlife habitat and forest diversity on the Tongass, the remaining high-volume stands of old growth should be conserved for their ecosystem values. To date, the timber industry has harvested over 70 percent of the most valuable timber stands in Southeast Alaska, which includes both national forest lands and Native corporation lands that were selected from within the Tongass for their high economic value. Protecting the remaining roadless areas on the Tongass will help achieve balanced forest management. In addition, steep rugged terrain makes roads in this region very expensive to construct and vulnerable to erosion and landslides. The ecological risks associated with developing these areas are extremely high and may jeopardize commercial and sport fishing, hunting, tourism, recreation, and subsistence opportunities in Southeast Alaska. These multiple resource values of the Tongass are basic to maintaining and increasing economic diversity, as well as for maintaining the quality of life for people who live in Southeast Alaska. Furthermore, the high costs of road construction and the deficit timber sales on the Tongass do not justify entering the remaining roadless areas. (Organization, Anchorage, AK - #A22992.50100)

TO COMPENSATE FOR GLOBAL LOSSES OF OLD GROWTH

It seems very plausible and acceptable to allocate on a national scale, a larger percentage of federal land as older mature forests to compensate for the mature forest type that has been lost nationwide on private and public lands. It would seem likely that higher percentages than the historic range of variability suggest is needed if mature forest on a local scale should be preserved in order to compensate for the overall huge losses on a national scale. Since private land is susceptible to changing ownership and therefore management, that land base cannot be counted on to provide forest types that may take several hundred years to produce. Therefore, the majority of this older age forest must be maintained in federal reserves. (Individual, Penrose, CO - #A21448.50410)

TO HELP LESSEN GLOBAL WARMING

An important feature of mature or old growth forests that is overlooked in the typical agency analysis is the contribution of these older forest types to carbon sequestration. The accumulation of carbon into the cellulose of trees, downed timber, and forest floor humus is a cumulative event. This type of accumulation increases only over time and older forests hold much larger amounts of carbon than younger forests can. Young forests may hold increasing amounts due to high growth rates but they lack the large amounts of carbon found in dead and downed timber or in the soil horizons that are found in older forests. The large amounts of carbon that are held in older forests serve to keep this carbon from being released into the atmosphere and contributing to global warming. Those forests in designated roadless areas will continue to serve as carbon sinks on a national and global level.

On a national level, the vast majority of mature forest types that contribute most significantly to carbon sequestration especially in the east and Midwest are gone. Since the vast majority of land in the U.S. is private land, and much of that was former old growth woodland that is now converted to mature carbon sink forests. The percentages of forests found nationwide in old growth structural stages is minute compared to that of pre-Columbian times. On a national level, we now are no doubt extremely below the minimum Historic Range of Variability in the older forest structural stages. The Global and hemispheric climate and ecosystems equilibrium developed and was adapted to those conditions where a great deal more carbon remained trapped in mature forests and their resulting soil horizons. The release of this carbon from forests on a national and global level in the last century is considered a major contributor to global warming. . . . Roadless areas designation is a major step in the right direction in our nation doing its part to lessen global warming. (Individual, Penrose, CO - #A21448.50410)

TO PRESERVE PLANT AND ANIMAL SPECIES AND GENETIC DIVERSITY

The last 150 years has seen the relentless destruction of forests and ecosystems at an unprecedented rate. The devastation that resulted from the clear cutting of old growth redwood and Douglas fir forests in the northwest should be a clear lesson to us all. The streams have become polluted to the point that they are no longer support wild fish and populations. Even the climate has changed as a result of the loss of cover of trees that held moisture, and cooled the surrounding area. Animal species that flourish within the protection and shade that the forest provided have disappeared. Bird species that used to move through the upper story of the forest have become isolated because they will not move into the barren stump fields that remain. Plant species that require shade and decomposing parts of the trees are gone as well.

The genetic diversity of seedlings in a fragmented forest may be relatively small indeed. (Individual, Corpus Christi, TX - #A15488.10111)

TO PROTECT AGAINST NATURAL DISASTERS

One weakening element to the health of an ecosystem causes susceptibility to others, setting off chain reactions of unforeseen and potentially devastating consequences. This country's trees are in a state of decline. Older growth trees are the strongest—those forests best able to withstand disasters—natural, such as fires, tornados, or hurricanes, and other threats; they also provide a canopy that is an integral part of an ecosystem, that would take centuries to replicate (assuming optimal growing conditions, which is not, unfortunately, the case). (Individual, Piermont, NY - #A28736.60120)

BECAUSE THEY ARE NOT REPLACEABLE

The 2001 Montana legislature declared the sole value of the State's old growth forests is as lumber, and that preservation for any other use (ecological diversity, wildlife, etc.) can only be done by paying the stand's lumber value to the State. This opened up logging of fifteen old growth stands just this summer. One federal environmental value should be the preservation of old growth forests, since neither Montana nor the forest industry has any intent of doing so. Fortunately many of the proposed roadless areas are old growth, preserved for over a century of extensive logging and mining. Old growth is not replaceable. (Individual, Lolo, MT - #A111.60120)

We have very little left in the way of old growth forest, especially old growth that has not been compromised in one way or another. What is left should be protected. It cannot be replaced for centuries and, once cut, is not likely to be spared in the future. Please, we have little of our forest heritage left. What is left is precious. Please work for the forest, not deforestation. (Individual, Cherry Hill, NJ - #A1789.60120)

Competing Values-Limited Resources: It should be remembered that a true old growth forest is NOT a renewable resource! Man can destroy pristine old growth forests, but we can not restore one. A second growth into an area of second or third growth is struck by the magnitude of the changes caused by logging—even logging done more than 100 years ago. **TRUE, PRISTINE OLD GROWTH FORESTS MUST BE PROTECTED FOR FUTURE GENERATIONS.** I would hate to think of a time when the only exposure to the glory of a true old growth forest was with virtual reality on a computer. (Individual, Reno, NV - #A5110.60120)

BECAUSE THAT IS WHAT THE MAJORITY OF CITIZENS WANT

The reason that the recent Presidential election was so close is that we, the voters, didn't want either Bush or Gore. We, the voters, have repeatedly indicated in polls that we want the environment protected. When there is a candidate who is truly concerned about the environment, that candidate usually wins. Unfortunately, the Republican and Democratic parties are both controlled by the people who give money for election campaigns, and they—a minority—are the ones who don't care about the environment. Please do what we, the voters, want, which is to protect the remaining old growth forests and all our National Forests from unneeded exploitation (that only benefits a greedy and already wealthy few). (Individual, Portland, OR - #A14737.15000)

681. Public Concern: The Forest Service should recognize that old growth cannot be preserved.

From a biological point of view, absolutely no living organism can be preserved. This includes an old-growth forest.

Therefore, how can this country justify setting aside any more lands from timber production? (Individual, No Address - #A25635.60120)

682. Public Concern: The Forest Service should recognize the value of forest fungi.

The fungi that live in symbiosis with the forest trees have evolved over millions of years and provide enjoyment and gourmet delights to many of us mushroom hunters. These forest fungi also provide essential nutrition for those mighty trees and underground food webs for hundreds of plants and insects important to the integrity of the forest ecosystem. (Individual, Elizabethtown, IN - #A19017.60300)

683. Public Concern: The Forest Service should recognize that deforestation leads to desertification.

Worldwide man has a habit of depleting forests, which gradually leads to desertification. The Mediterranean had chiefly evergreens, oaks, and pines, and Attica was entirely deforested in the 5th century B.C. In Europe, deforestation did not begin until the Middle Ages and by 1862 most of the beautiful forests had vanished. (From Before Nature Dies by Jean Dorst) 75% of forests worldwide have been cleared. 15% of original U.S. forests remain. (www.bhs.berkeley.K12.CA.US/departments/science/APwgs/Killas/deser.htm) 67% of total area of U.S. forest are commercial (www.forestinformat.com) let that be enough! (Individual, Seattle, WA - #A20824.50420)

684. Public Concern: The Forest Service should protect forests to prevent single-species monocultures.

BECAUSE THEY PROVIDE LITTLE HABITAT FOR BIRD AND PLANT SPECIES AND DO NOT DRAW TOURISTS

Much of the current National Forest is managed to promote the growth of particular tree species. There is nothing natural about a red pine stand, planted row by row. My own research indicates mono-cultural stands provide little habitat for bird and plant species, nor do they draw crowds of tourists to bolster the local economy. The over abundant white-tail deer have also impacted the woody cover and herbaceous layer of the forest. The impact of too many deer is evident in the inability of eastern hemlock and northern red oak to recover to pre-timbering year percentages. (Individual, Eagle River, WI - #A844.60100)

BECAUSE THEY ARE NOT CONDUCIVE TO SPECIES DIVERSITY

This protection is especially significant in my area as most privately owned forest here are rapidly being converted to single species pine forest which, as you know, are not conducive to species diversity, in wildlife and obviously in tree and understory species. (Individual, Troy, NC - #A1625.60100)

BECAUSE THERE IS ALREADY ENOUGH LAND DEVOTED TO SINGLE SPECIES

As a life-long inhabitant of the Oregon forest land, I know that there is already enough land devoted to single-species tree farms. That small portion of land with a variety of interdependent species which actually constitutes viable and true forest must be preserved as the soul of our land. There is more to life than the dollar. (Individual, No Address - #A3925.60100)

685. Public Concern: The Forest Service should promote regeneration in previously harvested areas.

TO REPLACE VALUABLE TIMBER

On the Forests where I worked, areas where commercial timber production was considered the most important resource were not managed properly for timber production. Regeneration was not adequate in many areas, or seedlings came in too thickly and stunted at small diameters, creating areas of little value for timber, wildlife or recreation. (Individual, Bozeman, MT - #A5649.65200)

686. Public Concern: The Forest Service should protect national grasslands.**BECAUSE THEY ARE ENDANGERED AND FRAGMENTED**

I'm particularly concerned about our National Grasslands, vulnerable as they are to off roaders. There are many National Forest wildernesses, both designated and de facto, but grasslands are an endangered and fragmented stepchild. (Individual, Flagstaff, AZ - #A5026.60400)

687. Public Concern: The Forest Service should recognize that forest cover is increasing.

I have read that some people believe that our forests and wildlife are on the verge of extinction. Nothing can be farther from the truth. In fact, the forest cover of this country is increasing and has gradually done so during much of the 20th century. (Association, South Hill, VA - #A17035.50000)

688. Public Concern: The Forest Service should allow local decisionmakers to develop unique approaches to managing successional disturbance.

The Society of American Foresters, in their publication, *Forest Types of the United States and Canada*, lists 145 different forest types present in the United States. Each of these forest types is defined by a distinct set of species. Different species respond differently to natural- or human-caused disturbances. Early successional species require disturbance to perpetuate. Late successional species are often replaced by early successional species following disturbance. These different responses to disturbance require unique approaches to management, and forest managers need the flexibility to make decisions from a local perspective. (Governor, State of South Dakota - #A23354.13110)

*Vegetation and Botanical Resources – Species Specific Considerations***689. Public Concern: The Forest Service should protect black spruce.**

Minnesota is suffering a severe lack of reproduction in its black spruce stands. Black spruce usually thrives in lowland swampy areas, like the area around Baldpate Lake. Unfortunately, black spruce is coveted by the timber industry even though the LRMP does not make allowances for such logging.

Black spruce provides valuable habitat for boreal owls, Canada lynx, and other sensitive species. Most of the acreage identified in RARE II is adjacent to the BWCAW and provides a good buffer area for the wildlife that lives in this wilderness area. (Individual, Lake Tomahawk, WI - #A29653.60100)

690. Public Concern: The Forest Service should increase the amount of aspen forest.

In the Chequamegon-Nicolet forest where I live I would like to see efforts to maintain if not increase the amount of aspen forest. I realize this means clear cutting but in 1 to 2 years after a cut the regrowth is impressive. (Individual, Phillips, WI - #A801.60100)

691. Public Concern: The Forest Service should protect lower elevation hardwood forests.

Large tracts of undisturbed wild forest have great ecological, recreation and spiritual benefits that far outweigh any temporary economic benefits that might accrue from logging these areas. There are too few of these lands left in the Northeast today, and we should preserve those that are left for future generations. In particular, lower elevation hardwood forests are underrepresented in currently protected wild lands on the WMNF. [White Mountain] (Some of the WMNF Wilderness boundaries seem to have been drawn to exclude the valley hardwoods.) (Individual, Lincoln, NH - #A5640.45000)

692. Public Concern: The Forest Service should plant more oak trees.

Also need to plant more oak trees. (Individual, Lumberton, MS - #A11159.60000)

693. Public Concern: The Forest Service should discontinue the practice of replacing hardwoods with pine.

Money is lost every year by selling NF timber and replacing hardwoods with pine only benefits the lumber producers. Pines have no nutritional value and leach the nutrients from the soil leaving it unproductive for the future. (Individual, Houston, AR - #A4162.65230)

Effects of Activities/Disturbance on Vegetation and Botanical Resources

694. Public Concern: The Forest Service should manage vegetation with longer harvest rotations.

If we were to manage the forest rather than a tree farm then 250 to 500 year rotations (in Douglas fir) would be the norm rather than 40 to 100 years. It seems to me that long rotations would serve most creatures' needs, including ours. (Individual, No Address - #A14054.60120)

Positive Effects

695. Public Concern: The Forest Service should allow selective timber removal.

TO ENCOURAGE GROWTH OF YOUNG TREES

I believe "Health" in a forest is best achieved and maintained by selective logging of areas and replanting. Young healthy trees take upon more carbon dioxide and release more oxygen into the atmosphere than "Old Growth". This has a "global" effect and benefits all mankind, and also a product is harvested which has many uses and therefore employs many people. (Individual, Olympia, WA - #A20848.60100)

696. Public Concern: The Forest Service should thin second growth forests.

TO PROMOTE OLD GROWTH CHARACTERISTICS

There are millions of acres of second-growth forests within late successional and riparian reserves that, according to scientists at the PNW Research Station, will not develop the old-growth characteristics needed in these areas without being thinned. (Individual, White Swan, WA - #A25726.60100)

697. Public Concern: The Forest Service should allow even-aged management.

AS A METHOD FOR REGENERATING EVEN-AGED FORESTS

The Wilderness Society with paid executives has skillfully used "clear cutting" as a "cause," much the same as Hitler used the "Jewish" problem to support his efforts at world domination. Yet, clear cutting is very simply one method for regenerating even aged forests. However, the Wilderness Society has convinced a large portion of the public in metropolitan areas that "NO" trees should be cut. This has led to vast accumulations of woody fuels and thus the increase of very severe fire seasons (i.e., 2000 and 2001) (Note—at the time of this writing, a 25,000+ acre uncontrolled fire is burning on the Gallatin National Forest mostly in a designated wilderness study area south of Livingston, Montana.)

The congressional establishment of wilderness study areas in western forests has placed the U.S. Forest Service in a no-win situation for almost 25 years, and has severely eroded their ability and credibility in the management of the forests. This administration needs to end the wilderness study concept and move forward. (Individual, Bozeman, MT - #A13871.90510)

Negative Effects

698. Public Concern: The Forest Service should address the negative effects of roads on vegetation.

INTRODUCTION OF INVASIVE SPECIES

Roads can enable invasive plants and animals, many of which are nonnative, to expand their ranges. Exotic species often thrive in the environments created by roads and can also be inadvertently transported by vehicles. Roads create open edges to forests that can make species more vulnerable to pest epidemics, invasion of nonnative species, and nest parasites. Examples include: weeds, such as spotted knapweed; aggressive brood parasites, such as the brown headed cowbird, and pathogens, such as cedar root rot. (Professional Society, No Address - #A26799.50000)

EFFECTS ON RARE PLANT SPECIES

This roadless policy is very important. The Nature Conservancy, a mainstream conservation group, has documented that one third of the plant and animal species in the United States area at risk of extinction. Scientists have shown that many species need large areas free from development impact to maintain viable populations. Easy access through roads or off road vehicles can be a disaster for plants and animals with commercial value. International markets for all sorts of rare wild plants and animals are putting more and more of them at risk. A recent conviction of a man for illegally harvesting at least 107 tons of beargrass from the Willamette National Forest highlights the problem. So do internet ads for the rare Cascade Range Lady Slipper Orchid which cannot be cultivated and cannot be legally harvested. The last thing this rare plant needs is more roads so more people can easily harvest it. (Individual, Deadwood, OR - #A882.50500)

699. Public Concern: The Forest Service should recognize the negative effects of tree farms on adjacent areas.

In our Pacific Northwest, less than 7% of our old-growth forests are left. But some of the Forest Service lands contain older second-growth that has naturally re-generated and could maintain the forest canopies to restore wildlife. But this land is surrounded mostly by tree farms that cut and spray extensively. Each tiny piece of land is precious.

Our little group is a loose-knit, local watchdog group working on various issues. We have united for many reasons, but our main, ultimate goal is one thing: to bring the wildlife that has been wiped out with all the logging activity. The apples lay uneaten for months at a time in this valley. It is dead and sterile. They've wiped out habitat sprayed poisons on everything, then the hunters and trappers take whatever is left. Our valley is lifeless! (Organization, South Prairie, WA - #A28978.50500)

700. Public Concern: The Forest Service should recognize the role of animals in spreading noxious weeds.

An issue raised by those against vehicles in the forest is the spread of weeds. I have pulled noxious weeds on my property and on adjoining forest lands for many years, and I can tell you that animals, both wild and domestic, are high on the list of both weed spread and erosion of the road banks. Many of the knapweeds I have pulled originate from the middle of a cow pie in an area where motorized vehicles cannot access. Hikers and horses are not immune from spreading weeds either. (Individual, East Helena, MT - #A20422.15168)

701. Public Concern: The Forest Service should address the effects of livestock grazing on vegetation.

The sheep under shepherds guide were not controlled from devastating certain land. Certain wonderful wildflower areas were being damaged. (Individual, Reston, VA - #A11846.60100)

Social Environment and Values

This section includes two subsections: Social Values of Roadless Areas and Adequacy of Analysis.

Social Values of Roadless Areas

Summary

Social Values General – a number of respondents comment on the social values they associate with roadless areas. Some urge the Forest Service to adopt the Roadless Area Conservation Rule as written in order to best protect these areas' social values.

Respondents describe a wide range of social values that they believe would best be maintained through implementation of a national rule. One of the most commonly mentioned of these values is the contribution of roadless areas to overall quality of life for local residents and visitors alike. People also state that they value these areas as places to escape from modern pressures, such as a fast pace society, and motorized vehicles; as places to experience natural grandeur; and as places to experience the solitude and natural quiet to be found in them. Others emphasize the multitude of irreplaceable non-monetary values and healthy ecosystems which, they say, roadless areas provide. Some state that human survival and modern society depends on these values, yet they are taken for granted. (See also Chapter 4: Economic Environment and Values: Evaluation of Roadless Areas: *Comparative Costs and Benefits of Ecosystem Protection and Resource Extraction.*)

People also comment on the spiritual values they associate with roadless areas, from the perspective of both traditional institutional religious tenets and more general non-denominational beliefs of spiritual connection and renewal. These respondents state that their religious faith demands careful stewardship and protection of the natural environment, and they say the Rule best embodies this imperative.

The effects of population growth, immigration, and urban sprawl are also topics of comment among many respondents who discuss social issues. Respondents assert that the Rule provides an important counterbalance to continued urbanization and development of private lands. According to some, roadless areas provide an important backcountry recreation outlet for growing metropolitan areas and can take the pressure off of overused wilderness areas. Others state that urban sprawl which encroaches on public lands impedes effective forest management through natural disturbance processes, and ask the Forest Service to help combat this problem.

Although some believe the Rule will protect important social values, other respondents disagree with respect to certain values. These respondents suggest that important social values will be lost due to implementation of the Rule. On a related note, while some respondents assert that roadless areas have their own intrinsic values and right to exist distinct from the human values placed upon them, others believe that roadless areas have no intrinsic value apart from human use and enjoyment.

Some state that intact roadless areas are a vital component of the true American or western experience and provide critical freedom values to an increasingly rule-bound society. In contrast,

others assert that the Rule violates true western values by imposing too many restrictions of its own and restricting the traditional motorized use of these areas.

People also discuss the value they find in personal challenge due to the remoteness of many roadless areas. They claim that the more difficult the journey, the higher the personal sense of accomplishment, and state that this is lacking in a world filled with modern conveniences and immediate gratification. Other respondents disagree and state that the time pressures of modern society necessitate easy vehicular access, or that modern technology makes a true wilderness experience impossible.

While some respondents describe the non-motorized recreational activities in roadless areas as fostering their own family togetherness and which, they assert, will be protected by a national rule, others who enjoy motorized sports state that their family activities are threatened by the Rule. In both cases, respondents agree that these roadless areas are important, but they disagree about which activities are compatible with roadless area values.

Bequest Values – Many respondents who discuss social values cite bequest values to future generations of Americans. They believe that the Roadless Area Conservation Rule will best preserve these bequest values, leaving a legacy of environmental protection and roadless area values to their own children and grandchildren as well as to society in general. Some respondents, however, state that traditional multiple use management and resource development provide the proper legacy to future generations, and that a national rule not only threatens roadless areas with disease and catastrophic fire, but prevents future generations who prefer motor sports from access to these areas. A few writers say that bequest values are overblown, and state that a national roadless rule should either be implemented or abandoned to benefit the current generation.

Educational Values – Some respondents state that they associate educational values with roadless areas. For some, these areas serve as classrooms for their courses, such as college-level biology or wilderness challenge and backcountry skills programs. Others ask that the Forest Service help educate youth about the values of intact ecosystems in order to increase support for their preservation.

Access for Special Populations – Access for special populations is frequently mentioned by those who address social values. Respondents conclude that a national rule will unfairly restrict access to public lands by the elderly and disabled because motorized opportunities will be lost. A number of people describe their own disabilities or age, and assert that their needs are being ignored.

Other respondents believe the Forest Service should dispute the claim that the Roadless Area Conservation Rule will adversely impact these populations. Some state that roaded areas of national forests and other public lands provide ample roaded access to the natural world for the elderly and disabled. Other older Americans state that they still prefer to hike in roadless areas, and that even when they are no longer able to do so, they will benefit from the protection of these areas under a national rule. Others say that special populations can enjoy roadless areas by non-motorized means like other more able-bodied citizens, and will benefit from a national rule. Finally, some respondents suggest that a set of exceptions and accommodations for the elderly or disabled could be incorporated into a national rule.

Health and Wellness Values – Some respondents suggest that unmanaged roadless areas make important contributions to health, both physical and mental. Many assert that these areas provide rejuvenation and stress reduction, while others say they provide wilderness therapy opportunities for troubled youth. Some suggest that a national roadless rule will help to encourage walking and help combat the national obesity epidemic. One woman states that she feels safest in roadless areas, far from roads and the easy access they provide to potentially dangerous characters. Others note safety hazards posed by roads cut on steep slopes from landslides, and urge the adoption of a national rule for human safety considerations. Some respondents, however, suggest that a national roadless rule will hamper search and rescue efforts, threatening public health and safety.

Noise – A few respondents discuss noise levels in roadless areas, and ask the Forest Service to establish baseline natural sound levels and to set decibel standards, especially for exhaust systems of motorized vehicles and for aircraft. They suggest that high noise levels cause stress to humans and wildlife and are not appropriate for roadless areas. Others state that loud vehicles contribute to conflicts between user groups, so quieter machines could help minimize this problem. Several other respondents assert that the Forest Service should not arbitrarily require roadless areas to have semi-primitive core areas in order to qualify as inventoried because a complete absence of sights and sounds from surrounding areas is not possible, particularly in the eastern United States. They suggest that this requirement will disqualify otherwise deserving roadless areas from protection under a national rule.

Social Values of Roadless Areas General

702. Public Concern: The Forest Service should protect roadless areas with a national roadless rule.

The roadless areas in our national forests have values beyond the board feet that can be hauled from them. These are places of immense biological importance for maintaining genetic diversity, these are areas that allow for recreation that cannot be found in more developed areas. We must preserve areas that are difficult to reach. These are the areas that lift our spirits, test our bodies, renew our sanity and allow for encounters with creatures that do not live in our crowded neighborhoods. (Individual, Bound Brook, NJ - #A1601.70000)

We in Boulder County continue to support the Roadless Area Conservation Rule (the Rule) and urge its implementation. Our constituents value unspoiled wilderness and recognize that wild lands have a special significance for our own quality of life. They also take a strong interest in preserving this land for the enjoyment of future generations. The Rule is consistent with these priorities, and the public's extensive participation in shaping this rule should be honored. (Elected Official, Boulder County, CO - #A18117.70300)

In Montana we love to hunt wild game. I can tell you from experience where the elk, bighorn, deer, grouse, and all other variety of wildlife like to hang out. . . . Roadless Lands of the National Forests. Cowboy Heaven, the Snowcrest, Wolverine Basin in the Gravellys, Hellroaring in the Centennial Mountains. These places are priceless and they would provide very little long-term economic gains by being developed in any way shape or form. They are serving the greatest good for the greatest number just as they are; by being in their wild state as a part of our health, good fortune, and heritage. It is not often that society will look back in 50 years and comment on how beautifully that road, or that oil and gas well looks upon the landscape, but they will understand what is special about their public lands when they see them unimpaired because we took the right action back in the year 2001. I ask you Chief Bosworth to use your empirical judgment, your heart, and your vision for the future when you recommend to President Bush what should be done regarding America's prized public treasures. As time

goes by our undeveloped lands where clean air, water, solitude, and wild integrity exist will only become more treasured. Let's do what the majority of Americans want, let's keep logging, mining, oil and gas development, and commercialization out of our roadless lands. (Individual, Harrison, MT - #A6949.70000)

The past greatness of this country consisted in subduing nature; our glory as a nation today is commensurate with our understanding of how deeply our actions effect nature and making a conscionable effort to prevent its mindless destruction. Chief Seattle summarizes this greatest of all threats we face today with these immortal words: "Whatever befalls the earth, befalls the sons and daughters of the earth. We did not weave the web of life. We are merely a strand in it. Whatever we do to the web we do to ourselves." (Individual, Osburn, ID - #A8307.70500)

FOR THEIR NATURAL GRANDEUR AND BEAUTY

To exclude merely 30% of America's wild national forests from logging, mining, and drilling is already a generous sacrifice of the lustrous heritage of the pristine New World which has shaped so much of American consciousness. And where the sense of the grandeur of our great nation's natural glory has fallen into disregard, it needs to be shored up and revitalized. How can we grow a proud people and expect them to invest in the preservation of the natural state of it that so impressed our forefathers and pioneers. If we become a people for whom that natural grandeur has been lost, we will lose a concrete seed which would have continually replanted a kind of pride of place the loss of which will leave us spiritually impoverished. We need, if anything, to heighten the pride of place that preserves and conserves and honors with the awe that our natural grandeur can still evoke. (Individual, Lexington, KY - #A244.70000)

I would just like to say that it is a true enjoyment to have vast areas to wander and hunt without roads. I enjoy a lot of activities in life that are in and amongst the general public however I do love to be able to break away and have space (a lot of it!) to myself. If you take this space away how could we ever get away to our more natural surroundings? My other point is we all know what will happen if you open these areas up with more roads, we will never be able to enjoy the freedom of roaming these unbroken forests and prairies again. Land is a limited resource and we should hold onto its natural beauty as long as we can. (Individual, Roseville, MN - #A4969.70300)

There is nothing more beautiful than camping in the national forests and not have to worry about ATVs or logging trucks disturbing our pristine forests. Please do not contribute to the destruction of our nation's natural beauty. (Individual, Louisville, CO - #A1917.70310)

I would also like to say that these forests and their ecosystems are a very important part of my life. I thrive on their natural beauty. Please take these comments and consequences of deforestation as seriously as I do. (Individual, Laramie, WY - #A1929.70310)

There is the plain old aspect of aesthetics. We just need to have some areas that are in their natural state. (Individual, Bozeman, MT - #A15403.70310)

FOR THEIR INTRINSIC VALUE

The true value of our forests lies not in industrial timber harvesting or in the creation of more agricultural tree farms but in the many benefits the forests give us as intact ecosystems - some of which can be assigned a monetary value and others (i.e., the experience of being in such places) which defy any simple method for inclusion in a cost-benefit analysis. (Individual, Coos Bay, OR - #A180.70500)

Our nation must work to maintain the value that is held in the simple knowledge that lands still exist free of human interference. (Individual, Dallas, TX - #A289.70500)

A forest should not be viewed in the same light as a field of corn. The corn was specifically put there by man for a specific purpose, whereas the forest was inherited with no specific purpose. It is an integral part of our home. We must treat it that way. (Individual, No Address - #A594.70500)

It seems to me that the economic values of these landscapes pale in comparison to their intrinsic values. No logging should be permitted unless for general forest health or in imminent danger of wildfire. Absolutely no drilling for oil or other natural fuels—it's time we utilize solar and wind power. The Roadless Area Conservation Rule preserves the recreational and environmental qualities we all enjoy and also provides the Forest Service with a reliable, sustained monetary income. (Individual, Cedar City, UT - #A865.70500)

It is time for our government to exercise a deeper strength and dignity of power that reflects our greater human awareness of the inherent value and the awe-inspiring beauty and magnificence of this part of life on earth. Please do not give in to those who look at such magnificence and can see only manufacturing materials and dollar signs. We cannot afford a government now with such limited vision. (Individual, Alexandria, VA - #A15814.70500)

FOR THEIR REPLACEMENT VALUE

Replacement value—roadless areas are finite. They can be eliminated in as little as a summer, but require decades-to-centuries to be recreated. Because they are vulnerable and important, they need protection. (Individual, Northridge, CA - #A21249.70000)

The ultimate consideration, to me, is the fact that no matter what values you associate with a roadless area, once a road incurs upon that area, the values are lost forever. This should be the cautionary guide you use to help you protect roadless values. (Individual, Lewiston, ID - #A29569.45100)

FOR THEIR NON-MONETARY VALUES

Knowing that there is something else out there, wildlife, in their natural habitat, knowing such beauty exists, FAR FAR outweighs the material goods that may come out of logging Alaska's wildlife. Can you just imagine a world, well it isn't getting too hard, but a world in which we have caged all remaining, suffering wildlife, and replaced it with virtual reality? Do you know the psychological consequences of cutting down our natural surroundings? Can you honestly say that, in your heart, you know that you are doing the right thing? . . . Just step back from your this-second-comfort-bond reality and take heart. Consider the possibilities of the beginning of compromise. Please, respect the wishes of millions (for, environmental concerns have grown ostensibly among the public, and are becoming a sincere, given interest of the citizens of the world). Thank you for opening your heart. (Individual, Schererville, IN - #A3790.70500)

Our present attitude of disregarding everything and anything of non-monetary value is getting completely out of hand. Please, let's keep something! (Individual, Bronx, NY - #A4296.70500)

What makes some of our natural areas also special is the distance between roads. I would love to see what happens in those places where there is little or no interference. Even if humans have limited access (non-motorized vehicles), no grazing, mining, logging, etc. I think humans can benefit in SO many ways. (I also do not believe that we should always and only be concerned about how humans benefit over and above all other life forms). Humans might benefit scientifically in being able to observe how plant and animal wildlife populations arise, dwell and vanish from areas. What happens when there are natural outbreaks of fire, insects, non-native species of plants and what species are benefited by those outbreaks? (Individual, No Address - #A4477.70500)

Tell the Forest Service that roadless areas are precious in their wild, natural condition, not just for wildlife, but for recreation, watershed values, biodiversity, and scenic splendor. (Individual, Murphys, CA - #A4809.70300)

Regarding the Forest Service balancing competing values and limited resources, the Forest Service should remember that roadless areas are a limited resource. Logging, mining, oil and gas development and their associated infrastructure (roads) are single uses pushing out all other values of clean water and air, open space, wildlife winter and summer range, solitude and yes, that favorite place in the Wind River Mountains some “local” told us about. (Individual, No Address - #A4523.70500)

FOR THE AMERICAN EXPERIENCE

There is an ever-shrinking inventory of wilderness in the country. In most of Europe, there is no such thing as wilderness, and to follow their lead in the name of “progress” would be a serious and unrecoverable error, one which our descendants will one day curse us for. The preservation of what little wilderness that remains in the US is essential to the preservation of the American experience. Even people who never go to the wilderness are enriched by the knowledge that it is there, as Wallace Stegner so eloquently wrote. (Individual, No Address, #A470.70300)

As a Native American let us keep this land so all of us can use it. Hunting, fishing, camping. And keep big business out of it, this belongs to all of us free people. I am also a W. War Two veteran who has paid the price in keeping America a free land to live in. (Individual, Kalamazoo, MI - #A7203.70000)

Cultural value- wilderness is an American idea of one of our greatest exports. Vast roadless areas built the national character, influenced our expansionist history, and our writers like Cooper, Emerson, Thoreau, and Leopold. The continued loss of roadless areas breaks our links with our history and our sense of identity as Americans. (Individual, No Address - #A12601.70200)

Bush’s devious manipulation of the Clinton Roadless Area Conservation Rule is a disgrace to our national honor and its cherished legacy of wilderness protection—one of America’s greatest contributions to world culture—and the right of every American to inherit that legacy. (Individual, Osburn, ID - #A8307.70400)

FOR THE WESTERN EXPERIENCE

I sincerely feel that the Roadless initiative is the only and best way to preserve the Montana lifestyle and beauty that we love. Eventually, if we don’t preserve it the way it is, Montana will be like all the other overpopulated, wildlife scarce states that are nothing but roads, factories, houses etc. Preserve our Montana heritage!! (Individual, Polson, MT - #A5800.70300)

FOR THEIR FREEDOM VALUE

Freedom value—in his novel 1984, George Orwell’s totalitarian dictator “Big Brother” made the elimination of wilderness his top priority. Wilderness was a place where thought could not be monitored or controlled, and therefore represented a threat to the regime. (Individual, Northridge, CA - #A21249.70000)

FOR RURAL COMMUNITIES’ QUALITY OF LIFE

Rural communities next to National Forests have something that no amount of money can buy. Please live near the forests for the quality of life, not the profit. (Individual, Bozeman, MT - #A284.70300)

The San Juan National Forest contains 500,000 acres of inventoried roadless areas. These include the largest single non-wilderness roadless area in the Southern Rockies—the 150,000-acre Hermosa Roadless Area. Hermosa is one of the most popular backcountry recreation areas in the entire state. The area is used by a wide variety of backcountry users, and the Hermosa Creek Trail is a widely advertised single-track trail for mountain bicycling. Hermosa includes start of the highly popular Colorado Trail, which winds 470 miles through Colorado from Durango to Denver. The Colorado Trail begins along Junction Creek on the outskirts of Durango, and heads into the high alpine country of the La Plata Mountains and the heart of the Hermosa Roadless Areas. Hermosa is only the best-known of numerous backcountry recreation areas located on national forest lands near local communities in southwest Colorado. The presence of these primitive recreation opportunities on national forest roadless lands next

to local communities is an extremely important factor in the quality of life for local residents. The Haflin Creek, Missionary Ridge, First Fork, and Red Creek Trails are all located in a national forest wilderness area within 10 miles of Durango, for example. (Individual, Durango, CO - #A11655.70300)

FOR OVERALL QUALITY OF LIFE

One of the major characteristics of roadless areas is the high quality of life that they provide to Americans. Quality of life attributes attract businesses, commuters, retirees, and other non-local wage earners. Because private lands are generally managed for commodity extraction and with little foresight or broad analysis, the burden of providing these quality of life attributes falls on the public lands network. A recent poll conducted by the Mellman Group, Inc. and commissioned by the Heritage Forest Campaign, the National Audubon Society, and The Wilderness Society found that 63 percent of Americans support a proposal to permanently protect all unroaded areas 1,000 acres or greater on public lands. Only six percent of those surveyed thought too much land was already protected. The segment of society that is moving to regions for their wilderness and quality of life values, clearly, wants to see the area they are moving to protected. (Organization, Portland, OR - #A12004.70300)

New Hampshire is the proud home of the White Mountains National Forest which provides solitude and recreational values for our residents, along with the residents of several other states who travel here every year to enjoy the White Mountains. In fact, more people visit *our* National Forest every year than the combined number of visitors to Yosemite and Yellowstone. Residents of states with no national forests depend on the government to protect such places, along with seashores, wilderness areas and sites vital to our common history. These areas have been set aside and preserved for everyone to experience and enjoy. The Roadless Area Conservation Rule, as it is written in the January Record of Decision is already a compromise, and ensures the same status is given to the remaining unspoiled 31 percent of our national forests, while leaving more than half open to logging, mining and drilling. (Elected Official, State of New Hampshire - #A22595.70300)

FOR TRUE CONSERVATIVE VALUES

True conservatives value stewardship and saving for the future. Since the days of Theodore Roosevelt, true conservatives have supported protection of our beautiful natural heritage for future generations. Roadless areas are America's last wild places. These pristine lands provide clean water, wildlife habitat, and great opportunities for hunting, fishing, hiking, and other recreation. If we lose our last wild places to bulldozers, they will be lost for good. (Individual, San Diego, CA - #A23757.70400)

FOR SPIRITUAL RENEWAL

The forests are our children's heritage. The forests are our spiritual connection with our planet. If we allow them to be plundered for the sake of big business, we are committing a very slow and painful suicide. We will lose our humanity and our ability to care. (Individual, Red Lion, PA - #A1900.70000)

51% of America's National Forests are already open to logging, mining, and drilling. This policy represents a balanced approach to managing our National Forests by protecting the remaining 31 percent. The Roadless Area Conservation Policy was developed to ensure the last remaining 31% of unspoiled National Forest lands are preserved for the enjoyment and use of all Americans. These treasured lands provide a recreational and spiritual escape for all Americans. (Individual, Portland, OR - #A3678.70000)

This forest is important due to the enormous size and age of its trees. From the Pope to the Dalai Lama, you will find serious established religions encourage the experience of the immensity of the natural world, and the protection of the natural environment. Entering this park is like visiting the Cathedral at Chartres, or our own St. John the Divine. It allows you to feel connected to something much bigger than you are, and this is a wonderful thing for many human beings, and always has been. A huge living cathedral is very special indeed, rare in the world, incomparably valuable—compared to the need for more decks and lawn furniture, headed eventually to some landfill. (Individual, No Address - #A491.70330)

I am a Protestant clergywoman who believes that we need to keep some lands from our intrusion so that we can enjoy them as God made them. (Individual, New York, NY - #A633.70330)

Spiritual values are present in the forest for both Native Americans and others. As a mainly urban society, cut off from our root connections to nature, these forests will serve to renew our spirits. (Organization, Cookeville, TN - #A5451.70330)

TO UPHOLD RELIGIOUS TENETS

Our Torah teaches us that it is forbidden to kill a species and commands us to choose life. The Central Conference of American Rabbis, the largest rabbinic assembly in our country, in a March 2000 resolution, reminds us that we are called upon: “to serve as protectors and defenders of God’s magnificent creations” and “to safeguard and weave together the patchwork of remnant forests as best we can.” (Individual, Walnut Creek, CA - #A1101.70330)

Bush has promoted the importance of upholding Christian and diverse religious values. Even before God gave the Ten Commandments to Moses, He made a covenant with Adam and Eve to keep the garden—to care for all His creation. This is one of the highest callings of any faith. Ecumenical Patriarch, Bartholomew I, spiritual leader of the world’s 250 million Orthodox Christians, proclaims that “To commit a crime against nature is a sin. For humans to cause species to become extinct and to destroy the biological diversity of God’s creation; for humans to degrade the integrity of the earth by causing changes in its climate by stripping the earth of its natural forests, or destroying its wetlands; for humans to contaminate the earth’s water, its land, its air and its life with poisonous substances—these are sins.” Pope John Paul II calls our Godless, materialistic society the “culture of death.” The slaughter of innocent nature confirms this as much as any social problems. One of the greatest holocausts of the Twentieth century has been the ruthless and arrogant clear cutting of our National Forests and the corresponding global deforestation by multinational corporations, which has led to the highest extinction rate civilization has ever known. (Individual, Osburn, ID - #A8307.70330)

Let’s keep the wild outdoors, God’s great outdoors and leave things the way that God meant for it to be wild!! (Individual, Lineville, AL - #A12276.70330)

Along with other Christians and Jews I have been praying and fasting for these roadless areas to not be defiled. Instead please set aside these areas as sanctuaries which testify to the glorious handiwork of our Creator. In the least, let us leave them for our children to better learn how nature operates, to recreate and refresh their bodies and spirits in, and to have the opportunity to decide for themselves, when they grow up and are in charge, how this land should be managed. We have been praying and fasting together to PETITION our God to conserve our national Roadless Areas on the public’s lands by protecting them from human exploitation. We have been CONFESSING our greed and ignorance that has resulted in so much destruction in our nation’s forests. We have been MOURNING the consequent suffering and loss of life therein. We have been REPENTING of this sin by seeking to halt the destruction of Roadless Areas and instead of exploiting these pristine places, we have been working to restore—with the help of Almighty God—the public forests which have already been damaged. We are calling the Christians among your and President Bush’s administration to WORSHIP God by honoring Jesus Christ through whom and for whom all created things were made (Colossians1: 16-17) and by whose blood shed on the cross all things will be reconciled to God (1:19). (Individual, Saint Paul, MN - #A19042.7033)

FOR ESCAPE FROM MODERN PRESSURES

I am a frequent user of our National Forest lands, hunting, fishing, hiking, and camping and would like to keep as many of the currently roadless areas roadless for future generations to enjoy. Nothing is more enjoyable than to walk into an area void of normal human activity and escape modern pressures and get a small glimpse into the natural past of our nation’s wild areas. (Individual, South Point, OH - #A4198.70000)

Keep our roadless forest roadless. In this high tech world where even small children are wired to the hilt with cell phones, PCs, PDA, FAXs, are driving ATVs, motorcycles - let us keep these places natural-native. If for nothing else as an example of what the world was like before the Internet, bar codes and gas powered vehicles. Don't get me wrong I like technology and use it but I also like some down time, some peace and quiet. Keep the "wild" in wilderness. (Individual, No Address - #A339.70300)

It is bad enough that the thousands of government related forms and assorted paperwork require the demise of millions of trees each year just to produce the paper necessary to print them on, but this frontal attack on America's National Forest lands is adding insult to injury. If you truly doubt the importance of preserving these forests, then I ask you to personally spend a full day (24 hours) within one of the threatened areas. Be there when the first glimmers of sunlight filter through the deep green foliage, watch Nature's wildlife as they scurry around searching for bits of food and/or just playing among the leaves and branches, and stay long enough to observe as the evening shadows fall and the moon and stars appear in the sky: Open your mind and your spirit to the unique peace that is found in very few places in our hectic lives. If, after 24 hours in this calm, peaceful, secluded wilderness, you can return to the hustle and bustle of the city, pass a road construction area, and truly believe in your heart that the rumble of heavy equipment would indeed be beneficial to the serenity of the forest, then may whatever God you believe in, have mercy on your soul. In the words of the songwriters, "Don't it always seem to go that we don't know what we've got 'til it's gone . . ." Be sure that YOU know what we've got before YOU contribute to its being gone. (Individual, Milton, FL - #A1298.70300)

FOR ESCAPE FROM CAPITALISM

Forests serve as a place of respite from the grinding capitalism that surrounds us every day. Please, I beg you, leave this last remnant of our country's wilderness as it is. Once these forests are opened up to logging and mining, they will be plundered by self-seeking, aggressive folks as surely as have all other forests with road access. I live most of the time here in Massachusetts, but every chance I get I head up to New Hampshire or Maine. These forests are a huge chunk of my delight in living, my favorite places to walk and just to be. It is simply unthinkable that they should be exploited, developed, stripped of their beauty. (Individual, Cambridge, MA - #A6268.70300)

FOR SOLITUDE

Roadless areas are important to hikers seeking undisturbed, scenic landscapes and solitude in wild backcountry and outstanding natural areas. Roadless areas are also critical for ecosystem protection, including water quality, wildlife, and vegetation—all valued pieces of the hiking experience. (Individual, Sebastopol, CA - #A5115.70000)

FOR NATURAL QUIET

I have been to the BWCA for about 25 years plus several years in the Quetico. The "silence" is marvelous—it leaves plenty of room to hear the loons and to see moose "playing" in shallow water; and enjoying "listening" to the wind, looking at the stars and sunsets. (Individual, Milwaukee, WI - #A8098.70320)

Like Aldo Leopold, Henry D Thoreau, and many others, I require wilderness, wilderness, wild nature. And places clean, with solitude. There are precious few such places. I go to, e.g., to a waterfall some miles from US28, select a high rock with a good view, and prepare myself for a time of quiet and recreation. But in the distance or even nearby I hear ATVs, vehicles, airplanes, chain saws, radios, boom boxes. And I live surrounded by Monongahela, George Washington and Jefferson National Forests. (Individual, Bartow, WV #A8759.70320)

Our population continues to demonstrate by its use patterns that people need quiet, wild places to visit to regenerate themselves physically, mentally and spiritually. We are on the right track toward accomplishing this most important goal. I implore you to keep us moving steadfastly in that direction. (Individual, Charlottesville, VA - #A4886.70300)

There is no necessary hierarchy of values inhering in and services provided by roadless areas, so my list is not necessarily in rank order from highest to less high: . . . Quiet. Something so rare that finding it in a wild area is even surprising. Quiet is not soundless but includes the sound of falling water, singing and twittering birds, the rustle of trouser legs and boots on bushes, but it ends with the racket of gunned engines and the clank of machinery. (Individual, Big Fork, MT - #A17221.45100)

FOR THEIR ABILITY TO REVEAL THE INTERCONNECTEDNESS OF HUMANS AND NATURE

Wild areas make our interconnectedness to other life forms evident and take us out of ourselves to see our place in the whole. (Individual, Westfield, NY - #A14074.70000)

There are few places left in this country, where a person may go and listen to the Earth's voice. To be able to stand on the edge of a ridge top and see nothing of man. I have, as a child, been to places like that. Many of those areas are now resorts, housing developments, or cities. I feel that a species that cut itself off from Nature, as She decides to grow and develop, is a small and futile species. When you cut the foundation out from under something, it weakens it. Nature is our foundation and in all times past, our strength. (Individual, Houston, TX - #A1372.70300)

Much of our culture is focused on immediate gratification and material goods to the detriment of our psychological health and our relationship with the earth. We need the Forest Service's assistance in taking the long-term view of a protective stewardship of the earth and the deeper satisfactions of a quiet, respectful, harmonious relationship with the natural world. (Individual, Needham, MA - #A15773.70000)

FOR THE PERSONAL CHALLENGE IN THEIR INACCESSIBILITY

The natural barriers that the land presents to those who would enjoy them are their greatest blessing and benefit. I can personally relate to this concept, as I recently returned from one of the most physically challenging trips to the Boundary Waters Canoe Area Wilderness in early August.

Despite these challenges, including injuring my back on the return trip and having to paddle and portage through it, this was probably one of the best trips we have ever experienced. The heart-to-heart talks I enjoyed with my son, cuddling up together in our sleeping bags, are a priceless treasure. Where else but in the wilderness could I tell my son that even though I would not always be with him in life, these times we shared would be? Where else could those bonds be experienced and tested?

The wilderness has a value, but its price cannot be measured in human terms. Its chief value is in its remoteness and the challenges it presents to those who would experience its wonders—not in its accessibility. Please preserve its wildness and pristine beauty for all to enjoy, both now and long into the future. (Individual, Roseville, MN - #A16399.70000)

FOR ESCAPE FROM MOTORIZED VEHICLES

This rule is important to me as a commercial outfitter and outdoors tour guide. I use public lands for low-impact hiking tours for persons of all ages. My focus is on education of the public on public lands issues, local flora and fauna, history and archeology of the Rio Grande National Forest and adjacent areas. The only man-made sounds we encounter are airplanes flying overhead. For my guests, this is a relief to be away from the noises and pollutants perpetuated by motorized vehicles. (Individual, Del Norte, CO - #A5289.70300)

I live close to the BWCA [Boundary Waters Canoe Area]. Last fall I went on a canoe trip in this relatively small but popular wilderness area. I camped at a beautiful spot on a lake sitting on an island of granite. For a while I thought I found silence and escaped the motorized world then I heard motors in the distance. You can't even go to the BWCA and not hear motors. (Individual, Eveleth, MN - #A5766.70320)

We need more places to hike and get away from their obnoxious abominations of sno-cats and A.T.V.s and their noise and pollution. (Phoenix, AZ - #A6523.70300)

FOR FAMILY TOGETHERNESS

My fondest memories are the times spent with my father in the wilderness areas of the National Parks system. No vehicles or radios gave me time to know my father better. A million sons need this time away from the cities with their dads. (Individual, Dallas, TX - #A4206.70340)

I live in northern Utah, but I have visited the forests in both northern Utah and Montana with my family. Roadless areas are important to me and my family because being in them has healed us mentally, spiritually, and physically as individuals and as a family. Going out in those forests has literally kept our family together by healing us because of the awe and wonder they have provided. As I mentioned in a previous letter, going out into our wild forests has also brought us closer to our Creator and has given us hope in life and faith to continue on. Our administration says that it is for family values. Protecting our natural areas, including our roadless forest lands will help to protect wholesome family values by keeping families together. I can personally bear strong testimony of that. (Individual, Kaysville, UT - #A5231.70340)

Entering into the natural world on its own terms, by foot or paddle craft, has been the bedrock of our family vacations for two decades, and for my family of origin for three decades before that. Time spent in natural beauty is one of the strongest builders of "family values" available in our culture today and economic development has eliminated vast amounts of that natural beauty during my lifetime. (Individual, Needham, MA - #A15773.70340)

These areas are important to me not just to look at, but to use. I have backcountry skied, climbed, and backpacked extensively in Colorado, Utah, Wyoming, New England, Maryland, Virginia, and Washington State. Since I moved to Colorado in 1984, my wife and I have sought out roadless areas all over the west as places to spend our vacation time. Our climbing and backpacking trips have brought many memories with friends and families. I'm now at a time in my life where I want to share this with my 5-year old daughter. We have taken her backpacking in Washington State and Colorado. Therefore the Wilderness areas, the National Parks and the roadless areas of our nation are very important to me. All of them are, not just the local ones, because I use them and I see myself using them even more in the future. (Individual, Glenwood Springs, Co - #A17313.70000)

FOR HUMAN SUSTENANCE

Our family uses and values roadless lands. Our wild game which we use for sustenance comes from wild lands, as does our drinking and municipal water. My four year old daughter and eight year old son frequently walk or snowshoe into roadless national forest areas of Montana and Wyoming. Lazy men who say they need yet more roads (and ORVs) lack credibility and perspective. (Individual, Helena, MT - #A1717.70300)

FOR HUMAN SURVIVAL

The evaluation of uses of roadless areas should not be reduced to simply economic evaluation. As our population grows, development will encroach on those areas which are undeveloped and unprotected, thus putting additional pressure on the remaining undeveloped areas which have protection. In addition, we need only look at what transpired on Easter Island to see what happens when over utilization of the natural resources occur. (Individual, Troy, IL - #A6981.70500)

It is time that we begin stewardship of the greatest gift we have, the air we breathe and the naturalized planet that provides us with it. Continued destruction of natural areas will only have ill effects on our health and longevity as a species. (Individual, Silver Spring, MD - #A7905.70300)

How enriched my life has been from witnessing 7 bald eagles in their natural habitat. How much more respect I have for nature (forests, mountains) and wildlife. We cannot sell these things out for the sake of oil or timber. If we do, we will not only lose our forests, mountains, wildlife we also will lose mankind

for each is codependent on the other. Man cannot exist without nature and nature cannot exist without man. (Individual, Dracut, MA - #A6220.70000)

FOR SCIENTIFIC RESEARCH

Roadless areas: Offer opportunities for scientific study and research. (Individual, Olympia, WA - #A4959.70300)

People need these areas so they can compare with the managed areas of the past. (Individual, Lamona, WA - #A5460.70300)

Social and economic values are immensely enhanced by and near such climax forests. . . . Such forests provide an immensely valuable scientific laboratory where discoveries of nature's processes lead to enhancements to civilization such as new medicines. (Individual, Salem, NH - #A8263.70000)

There are tremendous environmental, social, and cultural values associated with roadless areas. These include: (1) scientific value—they provide the only meaningful baseline against which forest management can be evaluated. (Individual, Northridge, CA - #A21249.70000)

703. Public Concern: The Forest Service should protect roadless areas.

DUE TO INCREASED POPULATION

There are many reasons why I believe protecting roadless areas is the very best thing to do for health of this planet. The population is growing rapidly. (Individual, Lafayette, CO - #A807.70100)

At every opportunity I make a trip to my home state to regenerate in the Wasatch and Uinta mountain ranges. With increasing population growth it is imperative it seems to me to preserve and maintain roadless areas as roadless and wilderness areas. (Individual, Aubrey, TX - #A15526.70100)

Over the years, I have seen the impacts of population growth on the fragile ecosystems of our wilderness areas, and it is a disheartening sign of things to come as more and more people use the resources of our National Forests, be it recreational or commercial. Removing the Roadless Policy would be an irreversible action that would open up these areas and spoil these natural sanctuaries, I believe. (Individual, Broomfield, CO - #A6301.70100)

Washington State's population growth is burgeoning and many of the roadless areas contain trails that are used by our many new hikers. Mountain recreation is growing exponentially and many areas are very crowded. As sprawl envelopes the country we should be banking these areas for future generations. Let's put "conservation back into "conservative" and be a model for a world that is fast being trashed. (Individual, Seattle, WA - #A7086.70100)

DUE TO THE HIGH NUMBER OF IMMIGRANTS

I am writing to request that no changes be proposed or made in the present roadless policy. As additional hundreds of millions of immigrants, both legal and illegal, enter the U.S. in coming years we will need all the remaining unroaded wild lands that can possibly be saved. (Individual, West Linn, OR - #A687.70100)

It is imperative that the rules be unchanged when considering the immigration policy now in place and the unchecked flood of illegal immigration. A greater population will lead inevitably to greater environment damage. Please! Lets keep America Beautiful. (Individual, Yorba Linda, CA - #A3802.70100)

Since 1970 when I commented on the Rare II issue, this country's population has grown by 84 million. It will double by 2050, 90% due to our elected officials refusal to address immigration. This shortsighted population policy makes it imperative that we protect what little roadless areas are left. (Individual, Whitefish, MT - #A5594.70100)

The long term result of opening roadless areas and the wilderness involves some thinking. Firstly, should roads increase in the backwoods, the wilderness will gradually fragment as it is segmented piece by piece. Slowly at first for sure, which is why the short-term extraction profits are appealing right now, but add the projected, immigrant population growth for North America from places like Asia and Mexico and Latin America over the next 10-30 years (a factor short-term extraction industries or track-housing developers rarely consider), and that roadless areas/wilderness fragmentation will increase proportionally as the ecosystems are torn down for living space and urban sprawl. If you doubt that many immigrants are coming, please look at Vancouver, British Columbia and note the impact of surround, once roadless areas now being opened and cleared for an exploding Chinese population. The Chinese flee to Japan to make money with one goal in mind: to emigrate from China and immigrate to the space and 'freedom' of North American through Canada (permanent visa status for Chinese coming to America is still very difficult to obtain; Canada welcomes Chinese and immigrants with easy permanent visa requirements). A quick look at migration patterns across the globe will alert the Forest Service to this trend and, though the emphasis of the Forest Service these days mirrors the goals of a business, the fundamental paradox of capitalism no country can escape is that economic development erodes its own ecological base. (Individual, Saitama, Japan - #A26099.50300)

DUE TO URBAN/SUBURBAN SPRAWL

We simply must face the problem of urban/suburban sprawl and the need to cut back on our energy consumption or the cost will be great. If you think the short term slow down in productivity or economic strain is tough, just wait! Cleaning up the environment may very well bankrupt this country in the future. Or, we can simply decide human life is less valuable than once believed. Cancer, loss of clean air, and polluted waters are what we shall sow if ecologically sound principles are not followed. One key thing we can do is keep wilderness wild. Set aside what we can for now and for future generations. I endorse this roadless policy and know most Americans do also. Let's not let special interests supporting so-called wise-use (sic, develop and harvest it!) dictate our nation's environmental policy. (Individual, Bellingham, WA - #A1909.70100)

Dealing with the impact of growth is the number issue here in Colorado. My constituents fear losing the great quality of life we have. They recognize the importance of being good stewards of our natural resources and open spaces. They understand if we want clean air, clean water, thriving wildlife, we must be proactive with the necessary legislation and rules needed to protect and preserve what we have for generations who will follow. (Elected Official, State of Colorado - #A11820.70300)

More roads are just another form of urban sprawl. Forest animals do not need the noise and trouble brought to them by more roads. (Individual, Providence, RI - #A11478.70110)

I am all for increasing as much undisturbed forest lands as possible. I am in the building industry (house design) and believe developments can be much more concentrated with less sprawl. I know development does not affect much of the forest service property (at present). (Individual, Brevard, NC - #A151.70110)

The most spectacular characteristic of our great nation is its enormous stands of wild national forests. It literally breaks my heart to see them disappearing and concrete and asphalt replacing them. I live in the northwest and the trees are there one day and gone the next. I am angered and disappointed by this reckless use of one of God's greatest gifts to us . . . the BEAUTY OF HIS CREATION! We already have more new houses built than we can ever fill, and while they may be attractive places to live they

will NEVER compare to the beauty of a stand of an old growth conifer forest. (Individual, Vancouver, WA - #A1488.70300)

One of the greatest hindrances to effective forest management is encroachment of residential development into forested areas adjacent to public lands. This increases the difficulty of using prescribed fire and mechanical thinning to control fuel buildup, increases the risk of human carelessness causing fires which spread to the public lands, and increases the political fallout if fire crosses from public to private land. This issue should be addressed by funding development of guidelines and specialist teams to work with state and local authorities to put in place land use policies that keep development out of forested areas and away from public land boundaries. (Individual, Dallas, OR - #A3697.70110)

704. Public Concern: The Forest Service should work with other government officials to promote population control.

Please recognize that this issue is only one more symptom of a world out of control. We are beset by a host of environmental and social problems. They are solvable only if we recognize that overpopulation is at the root of them all. Please work with other government officials to help women—both domestically and abroad—learn about and control their own fertility. (Individual, Candler, NC - #A3068.70100)

705. Public Concern: The Forest Service should not implement a national roadless rule.

BECAUSE ROADLESS AREAS HAVE NO INTRINSIC VALUE

What values are there to consider in roadless areas. They have no value at all if there is no access. They are worthless except to a few greedy people who will only use that area to hike or camp in maybe once in a lifetime if at all. It can't be cleaned up with no roads in it, so you will be wasting your time cleaning up areas next to it, if a fire breaks out it will burn all areas anyway. (Individual, Escalante, UT - #A20305.45100)

BECAUSE IT THREATENS WESTERN TRADITIONS AND CULTURE

We are concerned about the protection of our western culture. This culture is characterized by access to the land for multiple-uses, friendliness, good neighborliness, and sharing. Motorized access to the land provides opportunities for sightseeing, exploring, weekend drives and picnics, hiking, skiing, mountain biking, riding horses, camping, hunting, fishing, viewing wildlife, OHV recreation, snowmobiling, gathering of firewood and natural foods, and physically challenged visitors who must use wheeled vehicles to visit public lands. Our observations indicate that over 90% of the visitors to the forest are within these profiles and rely on motorized access for their visits. We are fortunate to have extensive public lands to support the western culture. Western culture must be protected. We respect the use of public lands by others but they cannot trample our rights in return. Multiple-use management principles will protect western culture and values and the decision-making should be based on implementing a multiple-use alternative. The document should evaluate the multiple-use measures required to protect western culture and values. (Organization, Helena, MT - #A13226.70200)

BECAUSE IT RESTRICTS FAMILY STABILITY AND TOGETHERNESS

My family enjoys off-road recreation. It is the only time we are able to spend the quality time together they deserve. I am also able to teach the children about the environment and the outdoors. We have played together generation by generation and our family continues to stay together. We have learned through off-road recreation how to stay close and keep family a priority. Don't close the land, my family depends on it to keep us together. (Individual, No Address - #A567.70340)

Taking the experience of the family camping away will soon affect the family experience and will further reduce the morals and ethics of the future children. (Individual, West Jordan, UT - #A711.70340)

The forests belong to the people and the people in family units do in fact need to use the forests to the greater extent possible. By allowing the use of the forests in family units (whether it be a family of one, two, or five, etc.) the crime rates [that] result from inactivity or economics, could be drastically reduced both in and out of the cities. (Individual, Maricopa, CA - #A3732.70310)

There are many young families who belong to our club and enjoy snowmobiling as a family sport on federal lands. We know many other families who belong to the four-wheeler club. It is great to see these families enjoying the land and teaching their children to be responsible citizens. Please do not deny any of us access to those lands. (Individual, Riverton, WY - #A27896.70340)

Politicians talk about the American family and family values. I guess this must just be the current buzzword for the campaign trail. Because if any politician were to spend a weekend out in the desert or forest with the off-road community they would see Dad, Mom and the little one all gathered together, building a strong family bond. Enjoying the outdoors! They're not home doing one thing while the kids are watching all the crap on TV. They are out around the campfire, sharing their outdoor experience with one another. And you want to take this away. Just think in a couple of years they'll have to put together some type of environmental group to resurrect the soon to be extinct group know as the off-road community . . . Kind of like the spotted owl. (Individual, Valencia, CA - #A26162.70340)

BECAUSE IT REDUCES MOTORIZED USERS' QUALITY OF LIFE

Forest visitors use all of the motorized roads and trails that exist today. The use of this network of motorized roads and trails is part of local culture, pioneer spirit, and local tradition. The quality of life for the multiple-use public is being impacted by the cumulative effects of all motorized access closures. The significant closing of motorized routes in the project area does not meet the basic requirement of the NEPA act of 1969 as stated in "Sec. 101 (b) (5) achieve a balance between population and resource use which will permit high standards of living and a wide sharing of life's amenities." A high standard of living includes recreation opportunities that meet the needs of motorized visitors. We do not understand why this area and many others in the National Forest cannot be shared with all forest visitors. The environmental document must evaluate the current allocation of motorized versus non-motorized recreation and access opportunities in the National Forest. A fair allocation would be based on meeting the needs of non-motorized and motorized visitors equally. The decision-making must provide for a high standard of living and equivalence in quality and opportunity for motorized visitors in comparison to non-motorized visitors. The environmental document must evaluate the impact of this proposed action and the cumulative impact of other decisions on environmental justice and the standards of living for multiple-use and motorized visitors. (Organization, Helena, MT - #A13226.70300)

BECAUSE IT RUNS COUNTER TO AMERICA'S MODERN, FAST-PACED LIFESTYLE

We live in a society where everyone lives by the clock. We are all trying to cram our recreation time into as efficient a package as possible. We are also living in a continually advancing technological atmosphere where faster and more efficient transportation is required to compete with the ticking of the clock. Common sense dictates that more of public land, as opposed to less, must be open to motorized transportation. The more time that passes, the more this will become what is needed to provide busy Americans with a positive outdoor experience. It may take 2 days to hike into a remote area to camp, and 2 days to hike out. That leaves 3 days for camping. The same remote area could be accessed by ATV in a few hours, leaving considerably more time to camp, with considerably less physical effort. This would allow the less than able-bodied citizens the same opportunities as the more physically fit. Ever tried to hike a couple miles toting 3 kids? Not a pretty site. Family outdoor recreation is being killed by these roadless designations. The young, able bodied, single enthusiast is being given more and more opportunities while the family is losing out. Who is going to look after our lands when these able greedy enthusiasts are through? The kids, I think we need to get the kids involved while they are young to foster future stewardship. (Organization, No Address - #A26800.70000)

BECAUSE A WILDERNESS EXPERIENCE IS NO LONGER POSSIBLE DUE TO TECHNOLOGY

Eliminate the notion of “Wilderness experience,” which really can’t be had due to cell phones, spy satellites, helicopters, medicine, hunting and fishing restrictions, fire use restrictions, convenient man-made backpacking equipment, et al. (Individual, Greeley, CO - #A28995.70300)

BECAUSE IT WILL CAUSE EMOTIONAL DISTRESS TO MINING INDUSTRY EMPLOYEES DUE TO LOSS OF CONTACT WITH NATURE

Many of our members, especially exploration geologists and drillers, entered their professions because of the opportunities to work close to nature. They pride themselves on being able to practice their respective arts in an environmentally responsible manner so they will not interfere with other long-term uses and values. These members and their families living in neighboring communities affected by the January 12 rule also would suffer extreme emotional distress, as well as a deep philosophical and cultural loss, by being prevented from enjoying existing and newly declared Roadless Areas in the same manner as they have for as long as six generations. Such a human toll cannot be measured in dollars. (Association, Spokane, WA - #A17351.70200)

706. Public Concern: The Forest Service should ensure that activities on private inholdings are compatible with the social values associated with surrounding lands.

Even the most broad property rights are not absolute, and need to be consistent with public responsibilities. Property rights regimes are a human construct, an overlay on underlying ecosystems. Activities on private inholdings must be compatible with the social values associated with surrounding lands, just as they are in more populated areas. (Individual, Corvallis, OR - #A650.70000)

*Bequest Values***707. Public Concern: The Forest Service should protect roadless areas for future generations.**

Seeing these remaining roadless areas (or just knowing they exist) has value to many Americans. This value however is not measured in terms of profit margins or portfolio balances but rather in a legacy that this generation can pass on to future generations. We must move beyond the mind set that our western lands are still part of a frontier that needs to be developed by government subsidies to extraction industries. (Individual, Evergreen, CO - #A430.70000)

It is the mission of the Forest Service to preserve and maintain the land set-aside by our government for preservation, conservation, and educational purposes. If we are to leave any part of the grandeur and magnificence that is so integral to the American spirit to future generations, we must allow the forest Service adequate room to fulfill the mission set before it. The Roadless Area Conservation Rule provides this room. Do not limit the ability of the Forest Service to preserve lands for the benefits of generations of Americans to come. (Individual, Conyers, GA - #A342.70400)

I am too old to be concerned about the welfare of our roadless areas - Wilderness - for my own use or benefit, but I adamantly support the right of future generations to have that privilege. (Individual, Willmar, MN - #A16939.70400)

I urge you to adopt a second metric for forest use planning which concerns sustainability—maintain the Forest in a fashion that future generations of U.S. citizens have use of those lands just like percent generations do. (Individual, Boulder, CO - #A26916.70400)

Through four decades, over 250,000 Outward Bound students have experienced the challenge, risk and adventure of a wilderness education course in the American backcountry. They have come to know the risks and rewards that come from testing one’s limits in areas beyond the reach of modern convenience

and technology. Proper protection of our remaining roadless areas will enable future generations of young Americans share in the experience. (Permit Holder, Golden, CO - #A29630.70300)

I voted for President Bush. I consider myself a conservative. I believe that being a conservative must include a dedication to conserving our nation's total resources for future generations. To be truly responsible and honorable, each generation must leave our country, and the world as a whole, in at least as good condition as it was in when we received it in trust. We have not been doing so, and that is wrong. It is long past time for us to change our ways. We can and must find ways to do this that are economically responsible and democratic. (Individual, Hopkins, MN - #A191.70400)

BY USING TREE FARMS FOR TIMBER NEEDS

The biggest consideration is that pristine areas of our National Forest are disappearing and will not be there for future generations. There are plenty of places to log, ever hear of tree farms. Try South Georgia or north Florida. They seem to be doing fine. (Individual, Atlanta, GA - #A4509.70400)

708. Public Concern: The Forest Service should continue traditional multiple use management of roadless areas for future generations.

I want my 2 and 4 year old Georgia grandsons to be able to visit their "papa" and enjoy backcountry fourwheeling, fishing and camping—responsibly! and that means continued access to our public lands. (Individual, Larkspur, CO - #A18020.70400)

I support the repeal of the inventoried roadless areas. I've lived in Utah for my entire life. I grew up playing in the mountains, camping, fishing, hunting, four-wheeling, hiking, and just driving the roads. I'd like my future children and grandchildren to grow-up being able to do the same. For this to happen the forest needs to be managed and protected, but this is going too far. (Individual, Tooele, UT - #A12640.70300)

709. Public Concern: The Forest Service should protect national forests for the present population.

Forget the "we need to leave something for our grandchildren" way of thinking. We need to give ourselves something. For many people, a trip to a National Forest is the only wildlife they experience. Capitalism is fine and good but do we really need a McDonald's on every corner? (Individual, San Antonio, TX - #A1185.70320)

710. Public Concern: The Forest Service should exploit national forest resources for the present population.

The idea that millions of acres of our national forests must be completely road free is ridiculous. Road free for what? If we have no access to them, it's as if we have no forests at all. It flies in the face of good, common sense. Wilderness is of no use to anyone if people are taken out of the equation. The earth itself is a useless ball of wasted mass if people are not there to use its resources and to care for it. But care for it doesn't mean let it go unused and its resources wasted, supposedly saved for some unknown and unspecified generation. This generation is as important as any future generation, and should have full use of the forests throughout this generation, while preserving the renewable resources for future generations. (Individual, Manti, UT - #A27830.70500)

Educational Values

711. Public Concern: The Forest Service should consider the educational potential of remaining wild forests.

I especially value the educational potential of our remaining wild forests, especially as our increasingly urban society grows increasingly disconnected from the natural processes that make life, as we know it possible. Without understanding and appreciation for the natural processes that sustain us, we lose our

ability to see the connections between healthy functioning ecosystems and our personal lives. This disconnection plays a significant role in the ecological crisis that we now face. Mass extinctions, air, water and soil pollution, and the general degradation of our living Earth are all symptoms of our loss of connection with the wild. Ultimately we must ask ourselves what kind of world we want to pass on to our children and grandchildren: a world homogenized and marginalized due to our shortsighted decisions to not protect our remaining wild lands; or a vibrantly diverse world where functioning ecosystems and protected wild forests are an integral part of our cultural heritage? (Professional Society, El Cajon, CA - #A5016.70000)

Within the Forest Service, the phrase "Recreation Opportunity Spectrum" is well known. For purposes of these comments "recreation" will be set aside to focus of the concept of the opportunity spectrum available in wilderness, roadless areas and other backcountry or non-developed venues. For Outward Bound, the issue is one of appropriate classroom space. For four decades, wilderness, primitive and roadless areas have been our classroom and teacher. In places such as Rocky Mountains of Colorado, the Cascades of Washington and Oregon, or the Sierras of California, Outward Bound has tapped the educational value of remote backcountry venues. Today, in all of these areas, Outward Bound is working to reduce our impacts on the wilderness classroom. This is particularly true in designated wilderness. Wilderness use is increasing. The capacity the Forest Service to effectively administer and manage these areas is declining. As a result, Outward Bound, and others like us, want to look, need to look, for a range of effective classrooms or program areas, including wilderness, primitive, roadless areas and others. Roadless areas have, can, and must continue to play a critical role in providing a spectrum, of backcountry opportunities and experience. (Permit Holder, Golden, CO - #A29630.70000)

712. Public Concern: The Forest Service should educate children regarding our dependence on undisturbed natural systems.

Please do not overturn a sensible ruling as a result of pressure from those who feel that a natural resource serves our purposes only, these are ignorant (yes I realize I may alienate some, but it really is a lack of education, as we should be educating our children in the ways in which we are dependent upon undisturbed natural systems for our life, this no one can deny) people concerned with profit for some company whose shareholders are of those ignorant masses. (Tribal Department, Mescalero, NM - #A4905.70500)

Access for Special Populations

713. Public Concern: The Forest Service should not implement a national roadless rule that restricts access for the mobility-impaired.

THE ELDERLY

I am 67 years old, I have been hunting and fishing in my tax supported national forests since I was 5 years old and I will continue. Just let me use the roads that are already there except in wilderness areas. Public lands should be accessible for senior citizens also. (Individual, Mesa, AZ - #A99.70700)

Please do not close forest roads. I am 65, retired and love to spend time out in the hills. I cannot hike like I did when I was 20, I need access by vehicle. I understand you are talking about closing roads (call them trails if you like) that I have used for 40 years. Access does not require a lot of maintenance, graveled and graded roads are not necessary in many cases. Contrary to the environmental groups, roads do not cause any significant damage. (Individual, Salt Lake City, UT - #A705.70700)

THE DISABLED

I am a Viet Nam Vet with some limited physical abilities. I believe that the recent conversion of public lands in the West to "wilderness" or "roadless" status has gone too far. I am supporting political groups and public groups that wish to stop the increased designation of "roadless" areas. I will also vote for public officers who agree with my stance. The only way I can visit and enjoy some of these areas is by

Jeep and I do not consider that an intrusion or damaging situation. (Individual, Aurora, CO - #A538.70700)

I help pay for the national lands and access for all is reasonable, even people like myself who have mild handicaps that limit how far we can walk. (Individual, No Address - #A917.70700)

I am strongly opposed to any actions that would reduce the accessibility of the national forest system in any way. Indeed my wife is handicapped with constant pain and limited motion. If our forestlands and parks are truly to be open to all people then please consider our position. The only way my wife and many other people will be able to enjoy these public lands is from the seat of a vehicle. These vehicles can only be useful if they have access. My family and I have dreams of travel to Yellowstone Park someday. With her discomfort during travel and the current status of massive crowds during the warmer months we are considering the winter as an alternative. I understand that the opportunity to do so may be limited to specialized mass transit vehicles or foot travel during the winter months. We do not consider this an acceptable alternative. (Individual, Brighton, MI - #A10549.70700)

I am very concerned for the proper management of the forest; for all outdoor users including the elderly and handicapped. I believe a scientifically managed program can be developed which includes a reasonable access for the elderly and handicapped. (Individual, Iron Mountain, MI - #A11408.70700)

I am a C-5 quadriplegic and I like to hunt and fish. I ride in a small trailer pulled by an ATV. This is the only way I can access the woods to hunt and fish. I'm not the only disabled person that hunts in this manner. A person that is a paraplegic can ride most ATV's but a quadriplegic like myself has to use trailers. Please keep this in mind when making new regulations. In Louisiana the Wildlife and Fisheries make special trails in the Wildlife Management Areas for disabled hunters and special places by streams, rivers, lakes and ponds for the disabled to fish. Without roads and trails the disabled hunter and fishermen are denied access to the woods and streams. Please keep this in mind. (Individual, Westwego, LA - #A7465.70700)

The Forest Service is under no legal obligation to provide handicapped access to the forest—a fact that was thrown in my face at least a dozen times. All “officials” were ambulatory, standing on two feet, and quite arrogant about a law they apparently memorized the night before. No one even offered a solution for my physically challenged readers. I guess the Forest Service’s “Roadless” initiative is above moral concern. There but for the grace of God go I. (Individual, Tucson, AZ - #A5278.70700)

714. Public Concern: The Forest Service should not implement a national rule that closes existing roads.

BECAUSE IT WOULD RESTRICT ACCESS FOR THE MOBILITY-IMPAIRED

I have been hunting and fishing the public lands all my life. I did so with my father and grandfather, and continue to do so with my wife and children. It would be outrageous if these lands were closed to vehicle access now. I am not requesting new roads, only that the current roads continue to be responsibly used and maintained. There are places that my father still loves to go and could not access any more without a vehicle. The same goes for my children. These are public lands and should remain public lands, access as is, and never denied as long as we, the sportsmen and women, the original and true conservationists of this nation, continue to use them. (Individual, Gardnerville, NV - #A4157.70700)

My legs and feet are not the best. The only access I have to these areas are through the old logging roads with my truck. It's breaking my heart to see favorite roads ripped out because someone doesn't like a quad runner or my truck. I am part of the public too and really resent having more of my freedoms removed. In this case it is my freedom of access. I desire to get into the back country also but because I can't walk 20 miles a day anymore, it's too bad? I can't walk on ripped out roads. My legs can't take

that terrain. I have walked many miles on old logging roads and marvel at the old cabins we find. Tearing out these roads narrows down the number of people who can use these areas. (Individual, Bountiful, UT - #A21161.70700)

715. Public Concern: The Forest Service should not use access for the elderly and disabled as an excuse to build roads in roadless areas.

I grew up in the mountains of Montana and we visit there often. My wife and I enjoy hiking in the mountains but because of physical disabilities, we cannot hike as much. So we now see the “back country” by driving Forest Service roads. However, we do not want any more roads in our national forests. In fact, we would prefer that more roads were closed, even if it means that we will not be able to see as much. It is enough for us to know that the forests are protected. (Individual, Rockford, IL - #A6270.70700)

I do not buy the idea that handicapped persons need to ride motorbikes. I’m handicapped, too, have never been able to balance on a bike or motorbike; my ears are very sensitive to noise. (Individual, Tacoma, WA - #A11709.70700)

I’m 70 years old with bad knees, but I still want the existing roadless areas to remain roadless and would like to see more wilderness areas. (Individual, Fruita, CO - #A7591.70700)

Now a senior citizen, I still would prefer an easy hike into our beautiful backcountry, than taking a vehicle in with all its destructive impacts. The forests of Basalt Mountain are an example where one can drive fairly close by and then walk into still unspoiled forests which have not been marred by roads and vehicles. (Individual, Snowmass, CO - #A5718.70300)

The roadless policy would not close off any trails available for hiking, mountain biking, or horseback riding; that defines “reasonable access” in wilderness areas. Some have argued this policy would prevent handicapped people from accessing all National Forest lands; and we need to do a better job of making more areas already roaded accessible to them with trails they can use. But it is not possible for someone in a wheelchair to climb Mt. Everest, and no one is advocating a paved trail all the way to the top. There are some areas that are, by nature, wild—and should be left that way. (Individual, Cumming, GA - #A21156.70700)

Non-motorized recreation is a valid use of public land, and more and more people are seeking the solitude and quiet that roadless lands can offer. I am over 50 years old and intend to use public roadless lands by walking until I no longer can. Then I will be glad to know that they are still there and that the flora and fauna supported by such lands are still intact. I do not think I need to change the character of the land I love to insure my own “pleasure” as some motorized users apparently do. (Individual, Clancy, MT - #A17117.70320)

BECAUSE AMPLE ACCESS EXISTS IN ROADDED AREAS

Some roadless opponents argue that maintaining the status quo in currently roadless areas would be unfair to the disabled and the elderly. However, those who cannot, or choose not to, walk or ride a horse are accommodated by the current road system. There are 380,000 miles of roads in the National Forest system, more than 30,000 miles in Montana alone. I no longer have the energy and endurance to hike as I did for more than 50 years. However, I am not so self-indulgent that I now want roads built to wild places I can no longer reach. One doesn’t need to be physically present in wild country to appreciate its existence. I am most concerned about perpetuating wild country experiences for my five children and five grandchildren. I do not believe most people are absorbed with doing only those things that are simple and require no effort. Future generations deserve our prudent care of roadless areas. As Aldo Leopold wrote, more than half a century ago: “Recreational development is a job not of building roads into lovely country, but of building receptivity into the still unlovely human mind.” (Individual, West Glacier, MT - #A5946.70000)

ORV groups have argued that the roadless proposal discriminates against motorists and the handicapped. This hollow argument lacks substance. In reality, the number of handicapped people who desire access into remote roadless areas is extremely small. Of course, the handicapped, elderly, and motorists currently enjoy access to all of our national parks and the great majority of National Forest lands. It is not reasonable or prudent to believe that incapacitated or motor-bound persons should be allowed access to every last remote place in our country. We all have our limitations; many of us are not capable of mountain climbing, for example. No one is advocating the construction of a road to the summit of Everest just because some people are denied access. Those confined to vehicles enjoy excellent access to most of our natural wonders, it is not reasonable to expect that they will be able to travel to every last corner of our wild lands. (Individual, Durango, CO - #A5420.70700)

Political rhetoric of locking up the forest to motorized users has been used to slant the process away from protecting roadless areas. The reality is that there is an over-abundance of roads on public lands now. A recent study done for the southern Rockies Ecosystem project produced GIS mapping of roads within my region. The area reaches from southern Wyoming to northern New Mexico and is bounded on the east by the Great Plains and the west lies on eastern border of Utah. This included National Forest, BLM, and private land GIS map coverages in the database. One map that was generated from the data showed the distance one could get from the nearest road. In the analysis, 93.8% of the land base was within 1/2 miles of an existing road. How well does this fit with the average person's desire for the wild, rugged, wide-open spaces that bring them to the west and National Forests?

I have visited many designated wilderness areas over the years, and managed a few in my career. As a younger man, I was driven to visit these areas for the soul-nurturing solitude they provided. After several decades of familiarity, I now have come to realize just how small these areas are. Even in the larger wilderness areas designated in the original act of 1964, there are only small portions in each where one can be 5 miles or more from a road. The vast majority of land even in designated wilderness areas is within less than 3 miles from a road. In the entire southern Rockies only 1.2% of the land base is over 4 miles from a road. (Individual, Penrose, CO - #A21448.70320)

716. Public Concern: The Forest Service should protect roadless areas from timber removal.

TO PRESERVE OPPORTUNITIES FOR THE DISABLED TO EXPERIENCE UNSPOILED NATURAL AREAS

I want to express my opposition to any proposed changes to the Roadless Rule that would weaken the protection that your agency has already granted in the Tongass National Forest. ORCA (Outdoor Recreation and Community Access) uses and depends on the Tongass for almost all of our activities. Last year a group of Southeast Alaskans with severe physical, mental, and developmental disabilities kayaked from Hoonah to Tenakee. This was a life-changing experience for all involved. This year the area is facing the chopping block. Our program offers kayaking, hiking, fishing, and sailing all within the Tongass. Imagine the experience a few years from now when we take our clients to a barren wasteland and tell them about all the opportunities that used to exist in the Tongass. ORCA's continued use of these areas depends upon them remaining pristine and undeveloped. There are already 4,650 miles of roads and millions of acres of the Tongass that are developed. Leave the remaining Roadless Areas wild. (Organization, Juneau, AK - #A24938.70300)

717. Public Concern: The Forest Service should allow some exceptions to a national rule to facilitate access by the disabled.

There should be trails within roadless areas that any disabled, handicapped, or elderly citizen will be able to access these areas with a motorized conveyance. These citizens deserve the right to utilize these lands. If they are not able-bodied enough to do so without the assistance of a conveyance, they should not be denied access, and an electric wheelchair is not a conveyance which can navigate any terrain, or snow. They should be allowed to utilize ATVs, snowmobiles, trail bikes, or automobiles whenever and wherever need be. (Organization, No Address - #A26800.70700)

Great question, been there too. Yes, very difficult to satisfy everyone, but my response is we have plenty of roaded national forest acres and areas. Every motorized aficionado has plenty of great places to go and see a motor under the hood or between their legs. Leave something behind as a legacy of what's left of the natural or nearly so landscape of our great continent for current and future generations to see. In fairness to those who are mobility impaired, I would like to see a flexible approach or policy that would allow on occasion, motorized transport of such individuals so they too can enjoy and see what an area undisturbed or largely undisturbed by development looks, feels, smells, and even tastes like if they so desire. (Individual, Olympia, WA - #A28646.70700)

718. Public Concern: The Forest Service should exempt ski areas from a national rule.

TO ENSURE ENVIRONMENTAL JUSTICE TO LOW-INCOME FAMILIES

Sipapu's ski school program teaches more than 1,300 students from 45 different schools each year in multi-week programs at very affordable rates. Sipapu's inability to provide these services in the future would be an "Environmental Injustice" for the low-income families in Northern New Mexico. (Permit Holder, Vadito, NM - #A20142.75310)

Health and Wellness Values

719. Public Concern: The Forest Service should protect roadless areas.

FOR HUMAN HEALTH AND WELFARE

I strongly believe in the preservation of wilderness as a key to the health and welfare of human beings. (Individual, Boulder, CO - #A212.70300)

I am a clinical psychologist and healthy lifestyle behaviors are a significant professional focus. Research, clinical practice and personal experience have combined to reinforce the value for health and psychological well-being of time spent exercising on a daily basis in natural settings. While we do not all have ready access to roadless areas, the more natural vegetation, free flowing waters and undisturbed landscape, the less noise, the cleaner the air and bluer the sky, the greater is the spiritual renewal derived from an excursion into the natural world. Peace of mind seems to be an increasingly expensive commodity in our society. Precious are the avenues to achieving it. (Individual, Needham, MA - #A15773.70320)

FOR PHYSICAL AND EMOTIONAL REJUVENATION

To me, roadless areas are places where humankind is a visitor and guest. Traces of man should be non-existent. The only signs that do exist are those of wild indigenous inhabitants. I rely on roadless areas to rejuvenate myself both physically and emotionally. (Individual, Aspen, CO - #A5116.70000)

Our population continues to demonstrate by its use patterns that people need quiet, wild places to visit to regenerate themselves physically, mentally and spiritually. We are on the right track toward accomplishing this most important goal. I implore you to keep us moving steadfastly in that direction. (Individual, Charlottesville, VA - #A4886.70300)

FOR WOMEN'S SAFETY

Roads in the Western forests bring pick-up trucks carrying men with guns, fugitives from the law, and teenagers looking for excitement or on a drunk. As a woman who enjoys being in nature as my primary leisure activity, I often avoid roaded areas in the National Forests not only because they are relatively unpleasant, [but] because I think they may be dangerous. Roadless areas, on the other hand, provide peace and tranquility and a sense of safety that I find nowhere else in our increasingly troubled society. (Individual, Victor, ID - #A20625.70320)

FOR HUMAN SAFETY

This road runs along a steep mountain slope where there is a government recognized and mapped geological fault where one part of the mountain is sliding over another and there is ongoing shifting masses of earth, but the U.S. government has also chosen to implement a timber sale that will dramatically increase dangers to human life. How can anyone justify voting for a rule that prioritizes timber sales over human life? (Individual, No Address - #A27962.70300)

FOR WILDERNESS THERAPY OPPORTUNITIES FOR YOUNG PEOPLE

We use the backcountry wilderness to help treat our students. If the areas we use were full of logging trucks and oil exploration equipment, our students would lose the effect of wilderness therapy. In fact while I was writing this letter, a student that had transitioned into our resident part of our program came to visit me. He had a difficult time last night and is returning to the wilderness for two days to try to clear his head. As you can see, the wilderness is an invaluable healing tool for our students. (Individual, Georgetown, CO - #A18074.70300)

Now I am “home” with my parents near Washington D.C. and I work with children and teenagers—I take them canoeing and rock climbing—I take them to where there are no roads, where many of them for the first time are in a setting where traffic is not a background noise, and I see what a transformative affect it has on these children, many of whom have difficulty in school, drugs, or with the law. I share these memories of mine with the idea of creating an impression of the value of wild places, and the importance of this land to the future generation. I am made to understand that you have the awesome role of determining the fate of America the Beautiful, of a say at least, in reserving the last remaining tracts in the condition the Creator said was good, and I ask that you do all you can for the future generations to ensure that is still good. (Individual, No Address - #A4605.70400)

720. Public Concern: The Forest Service should not implement a national roadless rule.**THAT WOULD HAMPER SEARCH AND RESCUE EFFORTS**

We need **access for search and rescue efforts**. The cost and effort required for search and rescue in the absence of roads is very high in time, money, safety and lives. (Individual, West Point, UT - #A5415.90120)

721. Public Concern: The Forest Service should protect roadless areas and discourage motorized recreation.**TO HELP COMBAT THE NATIONAL OBESITY EPIDEMIC**

One of America’s biggest national problems is obesity. Encouraging people to rely on motorized transportation for their ongoing activities contributes to this endemic health issue Americans manifest. We hike, fish, bird watch, camp, and enjoy our national forests tremendously. Hundreds of thousands of miles of roads exist in our forests now. Let’s do all we can to keep as many areas “roadless” as possible. We owe it to future generations. (Individual, Anderson, CA - #A7052.70400)

722. Public Concern: The Forest Service should make special land use permits available to citizens disabled by Toxicant Induced Loss of Tolerance.

Special permit land use should be made available to citizens disabled by Toxicant Induced Loss of Tolerance who can no longer tolerate even low levels of common chemicals. If America can provide sanctuaries for bears an other endangered species, we “ought” to provide sanctuary for fragile humans. (Individual, Marion, NC - #A4691.70700)

Noise

723. Public Concern: The Forest Service should establish baseline sound levels and quantifiable noise standards for roadless areas.

TO REDUCE STRESS

PROTECTION OF "THE NATURAL QUIET" AND A "NATURAL NIGHT DARKNESS"

To escape from the unwanted stress-producing sounds, noises, and (nighttime) lights of "urban life" and to experience the "natural quiet sounds" and a "naturally dark night sky" of the "great-out-of-doors" are issues, I feel, of great importance to many. Motorized vehicle noise and lights and air overflight noise are obnoxious to many, and efforts should be made (a) to document a baseline of the "natural (sounds and) quiet" in various parts of these areas, and (b) to establish quantifiable noise and audibility standards and criteria to help determine what types and levels of man-produced sounds, including military, commercial, or other air overflights, constitute an unacceptable "pollution" of the "natural sounds and natural quiet." (Individual, Bishop, CA - #A20954.70320)

724. Public Concern: The Forest Service should establish a reasonable decibel limit for exhaust systems.

TO DECREASE CONFLICTS BETWEEN MOTORIZED USERS AND OTHER RECREATIONISTS

Conflicts with other recreationists were often associated with sound. During the 1970s, when the orders were developed, snowmobiles and motorcycles were much louder than today's machines. Concern with sound levels may have led to the creation of Executive Orders 11644 and 11989. Today's technology provides machines that are significantly quieter than in the 1970s. Furthermore, the technology exists to make motorized vehicles even quieter. Therefore, concern with sound can be mitigated by establishing a reasonable decibel limit for exhaust systems. States such as California and Oregon have enacted sound emission limits. Public land-use agencies could establish reasonable sound limits and use this approach to address the sound level issue. Why hasn't this been done? This solution is more equitable than closures. This issue must be addressed in the document and decision-making. (Organization, Helena, MT - #A13226.15168)

725. Public Concern: The Forest Service should not arbitrarily require roadless areas to have semi-primitive core areas in order to qualify as inventoried.

BECAUSE A COMPLETE ABSENCE OF SIGHTS AND SOUNDS FROM SURROUNDING AREAS IS NOT POSSIBLE, PARTICULARLY IN THE EAST

Definition of "solitude" should not require cores of Recreation Opportunity Spectrum categories of Semi-primitive Non-Motorized or Semi-primitive Motorized lands as was done in the SAA roadless inventory. Nor should the agency's consideration of "whether and how to protect roadless characteristics" (dispersed recreation) be dependent upon the presence of these ROS categories (see DEIS A-13-14). Definition of ROS categories is oftentimes a cartographic and/or computer based exercise that may not reflect the reality of on-the-ground roadless recreational opportunities. Also, definition of "solitude" should not require absence of "sights and sounds" from surrounding areas throughout the roadless area, especially not east of the 100th meridian. Because of the on-the-ground reality of the terrain in Virginia and many other places (e.g., ridges and valleys with long sight lines) such an all-pervasive "absence" is simply not possible. Although the "zone of disturbance related to road noise [for wildlife] is estimated to be as great as one-half mile in forested areas"(DEIS 3-71), the writer of these comments can attest to being disturbed in Virginia NFs by intrusive motor noise originating from a much greater distance. This is just one more piece of evidence of the need for expanded roadless area protection. Demand for Semi-Primitive and Primitive "dispersed recreation opportunities is increasing . . . in an environment of diminishing supply." (DEIS 3-122). (Individual, Staunton, VA - #A29325.70320)

The FS defines recreational opportunities by the amount of roads an area has, or its distance from them. To be officially "Primitive" a tract of land must be at least 3 miles from an open road. Our forests are so heavily roaded that there is not a single Primitive recreational area available in any eastern National Forest. Sometimes we cannot escape from the sight or noise or smell of machines no matter how hard we try. Imagine how bad it must be if you are somebody (e.g. a bear) who actually has to live in these woods. (Individual, Staunton, VA - #A29325.70320)

Adequacy of Analysis

Summary

Some people question the sociological research and analysis that was conducted in preparing the Roadless Area Conservation Rule Draft EIS. These respondents state that residents in rural, forest-dependent communities were unfairly portrayed in a negative light, and ask that the Forest Service reject those studies and acknowledge positive attributes of these communities. Conversely, one respondent asserts that his personal experience as a law enforcement officer corroborates the view that commodity-dependent communities suffer negative social impacts, and urges the Forest Service to adopt a national rule.

726. Public Concern: The Forest Service should reconsider sociology studies that portray rural residents in a negative light.

Conservation groups and many rural sociologists, especially from University Sociology Departments, portray rural Americans in a very negative light. They conduct "studies" that show that rural areas are "economically depressed (or distressed)" because their incomes are not up to their standards. The truth is that rural residents trade the higher incomes they could make in the cities for the cultural and social values they enjoy living in rural areas, especially when they are raising their children. When this question comes up, please consider the fact that millions of Americans work for years in the cities so they can retire in the country. Rural "values" are not easy for many urbanites to understand, but they are very real and we adamantly defend those values and rural lifestyles.

Another social issue they "study" is education. They have successfully painted rural American school children as being under par with lower grade-point averages, or "below" the national standards. This is also a farce and is simply not true. Rural schools may not have the computer capabilities and other amenities of urban schools. But rural parents are more involved in their schools and their children's education and lives. Many children choose to follow the same occupations of their families, such as ranching, farming, logging, mining, recreation, and tourism. Some of those occupations do not require college degrees. But they do require the opportunity to pursue them. Rural areas provide those opportunities, and additional education can be obtained if necessary. When FS considers "values" those negative studies should not be used as a controlling factor in its decisions and should show more respect for rural American values, culture and society. (Organization, Three Rivers, CA - #A28739.70130)

727. Public Concern: The Forest Service should consider that commercial resource users create negative social impacts in rural communities.

I work as a law enforcement officer and am fortunate to serve a very peaceful community. I fear that by scaling back the roadless policy, industries like oil and gas and logging will begin to have a negative effect upon the peace of my community and many communities whose way of life depends on the wildlands near it. The type of people these industries attract are not the type of people I want in my community. From my experience, the employees of these industries are a black eye in the community. Alcohol abuse and a blatant disregard for law enforcement runs rampant among the employees of the extractive industries. I look at communities built around oil and gas, logging, and mining. They are marred with law enforcement challenges. Jackson Hole and many other communities along the Rocky Mountains do not need this headache and burden. (Individual, Jackson Hole, WY - #A30312.70000)

Economic Environment and Values

This section includes six subsections: Economic Environment and Values General, Evaluation of Roadless Areas, Adequacy of Analysis, Economic Effects, User Fees, and Subsidies and Agency Expenditures.

Economic Environment and Values General

Summary

A number of respondents discuss economic values at some point in their response to the Advance Notice of Proposed Rulemaking. Overall, the public asks that the Forest Service make sound economic decisions and only permit activities with positive economic benefits. Some respondents assert that commodity values are most important, while others suggest consideration of a broader array of economic values.

728. Public Concern: The Forest Service should make sound economic decisions.

Now is a difficult time. Our energy prices are at an extreme high, and our economy is slowing down. Let's not panic and make rash decisions. Let's make the right choices for the long haul. (Individual, Peterborough, NH - #A205.75000)

BY ADOPTING THE ROADLESS AREA CONSERVATION RULE

The Roadless Plan makes economic and fiscal sense. The Forest Service currently has an \$8.4 billion backlog of maintenance and construction on its existing 386,000 miles of roads in the national forests and grasslands. Many of these poorly maintained roads contribute to environmental threats to fish and wildlife by causing soil erosion in fish spawning areas and by damaging water quality. Building more roads into roadless areas while allowing the backlog of repair and construction on existing roads to go unaddressed is ludicrous. (Individual, Ethel, WA - #A11767.17240)

A reason to generally prohibit road construction in roadless areas is the cost of such construction. In Colorado, almost all easily accessible areas already have road access. Road construction into most of the remaining unroaded areas would be costly, difficult, and highly impacting to the environment. The value of any resources extracted from these areas, would probably not equal the cost of accessing and developing them, let alone justify the despoiling of the environment. (Organization, Denver, CO - #A12008.17100)

729. Public Concern: The Forest Service should promote only economically viable activities within national forests.

The only activities that should be promoted within National Forests are those which are economically viable. The Forest Service should also take into consideration issues such as watershed protection, endangered species habitat and other irreplaceable attributes when determining the most viable long-term uses of public land. (Individual, Skokie, IL - #A529.75100)

Economic Evaluation of Roadless Areas

Summary

General Comments – Members of the public suggest a wide variety of evaluation criteria which, they assert, the Forest Service should use when conducting roadless area evaluations. Suggestions range from considering purely economic values—especially of commodity resources—to a combination or ordered hierarchy of economic, social, and environmental values. Some state that the Forest Service has already adequately evaluated the economic contributions of roadless areas, and has determined that timber resource values are insignificant in comparison with other benefits; thus no further analysis is necessary. Likewise, some alleges that the Agency continues to over-emphasize market values, and should more effectively balance these against non-market and social values. Finally, some respondents state that it is not appropriate to consider economic values at all when conducting roadless area evaluations.

Comparative Costs and Benefits of Ecosystem Protection and Resource Extraction – A number of people frame their comments as a comparison between competing forest management activities and human activities. As such, respondents compare activities which, they believe, are mutually exclusive and request the Forest Service to favor one over the other based on economic reasons. There are those who suggest that recreational activities should be favored over commodity management due to economic advantages. Others assert that the Agency should emphasize profitable and moneymaking activities over those that do not pay, favoring commodity use over recreation or preservation. A number of respondents ask that the Forest Service better account for long-term rather than short-term benefits when evaluating roadless areas.

730. Public Concern: The Forest Service should consider only economic values.

The Forest Service should take only economic values into consideration. (Individual, Port Townsend, WA - #A964.17000)

The Forest Service has more than adequate information on the value and considerations to be taken due to past planning efforts, EIS and environmental impact studies. We do not believe that efforts should be made to expand these. In fact, they should be identified in the forest planning process only to the extent of economic impact. (Organization, No Address - #A30026.45100)

731. Public Concern: The Forest Service should not base the value of the land on the value of the resources that can be removed.

The values of roadless areas are innumerable, but basing the value of these lands on the value of the resources that can be extracted from them is ludicrous. (Individual, Portland, OR - #A13949.45100)

DO NOT CONSIDER THE HISTORIC ECONOMIC COMMODITY VALUES OF THE LAST FIFTY YEARS

The USFS should focus on alternative values, not the historic economic extraction values of the last 50 years that have not put the USFS in the place it is today! The USFS manages roadless areas that are of international value for scenery, wildlife, air quality, and backcountry experience. The USFS needs to get into the 21st century and consider values other than resource extraction as priorities. Demographic issues in respect to socio-economic outcomes of roadless enactment is a marginal issue on the national level. (Individual, No Address - #A15444.45100)

732. Public Concern: The Forest Service should describe values in terms of cost/benefits or some other economically definable method.

BECAUSE VALUES ARE MEANINGLESS WITHOUT AN ECONOMIC ANALYSIS THAT CAN BE PEER REVIEWED

“Values” must represent the potential to affect the local economy—positively or negatively.

“Values” need to be described in terms of cost/benefits or other economically definable method. Subjective evaluations are basically a report writer’s opinion. This is political management. Without an economic analysis that can be peer-reviewed values are meaningless when we are discussing public land policy. (Individual, Libby, MT - #A10531.45000)

733. Public Concern: The Forest Service should consider relevant economic factors in second-stage roadless area evaluations.

Relevant economic considerations for the second-stage roadless area evaluations [following evaluation for wilderness designation] include, but are not limited to: mineral values accessible without use of roads; current and future hunting and fishing use expressed as wildlife and fish user days (WFUDs); recreation use of the area expressed as recreation visitor days (RVDs); grazing uses; and water uses. (Civic Group, Roanoke, VA - #A1713.75000)

734. Public Concern: The public should evaluate roadless areas, first according to economic considerations and second by social considerations.

What are the characteristics, environmental values, social and economic considerations, and other factors the forest Service should consider as it evaluates roadless areas? The FS shouldn’t do the evaluating, the public should, and the public should be governed first by the economic considerations: Are there minerals there we could extract? How much merchantable timber is there, and what’s the best way to get it out? Would it be suitable for grazing? Could the ground be used for other purposes such as a ski area, a golf course, etc. Second, by social considerations: How will this affect my community? My state? (Individual, Philomath, OR - #A943.75000)

735. Public Concern: The Forest Service should give equal weight to the economic value of roadless areas as intact ecosystems as to other economic values.

We need to stop thinking in terms of all public lands having nothing more than dollar values (i.e., needing to be “harvested,” “utilized,” “healthy,” and other code-words meaning “exploited for profits”). Public lands left in their natural, wild state have tremendous values in themselves. Recreation in these areas, for example, actually has much higher dollar values in economic terms than logging, mining, and drilling, if that is how we must evaluate their worth. (Individual, Cumming, GA - #A21156.75000)

The economic value of the roadless ecosystem itself should receive as equal weight as other economic factors, such as use by local communities. The value of roadless areas in terms of services and economics is not easily traced through classically defined financial markets. The benefits of clean air, clean water, soil, climate, recreational lands, healthy forests should all be considered in their economic terms. This can be accomplished and estimates exist (Sullivan J and Krieger G Environment and Health: Going into the Twenty-First Century, Chapter 1 in Clinical Environmental Health and Toxic Exposures, Lippincott Williams and Wilkins, Philadelphia, 2001). The Forest Service should not use traditional economic benefit alone (logging, mining, recreation) any more than it weighs the economic benefit of a roadless area in and of itself for its overall ecosystem services. I would subjugate local economic values to the overall economic value of an intact ecosystem or roadless area. (Individual, Tucson, AZ - #A872.75000)

I urge you to read the enclosed article *Economic Laws Clash With the Planet's* and accept these comments also as if they were my own in response to the Roadless Area Conservation Advance notice of proposed rulemaking.

“The first commandment of economics is: Grow. Grow forever. Companies must get bigger. National economies need to swell by a certain percent each year. People should want more, make more, earn more, spend more - ever more.

The first commandment of the Earth is: enough. Just so much and no more. Just so much soil. Just so much sunshine. Everything born of the Earth grows to its appropriate size and then stops. Its creatures learn, mature, diversify, evolve, create amazing beauty and novelty and complexity, but live within absolute limits.

Now, when there's an inconsistency between human economies and the laws of planet Earth, which do you think is going to win? . . .

Economics say: Use it up fast. Don't bother with repair; the sooner something wears out, the sooner you'll buy another. That makes the gross national product go round. Throw things out when you get tired of them. Throw them to a place where they become useless. Grab materials and energy to make more. Shave the forests every 30 years. Get the oil out of the ground and burn it now. Make jobs so people can earn money, so they can buy more stuff and throw it out.

The Earth says: What's the hurry? Take your time building soils, forests, coral reefs, mountains. Take centuries or millennia. When any part wears out, don't discard it, turn it onto food for something else. If it takes hundreds of years to grow a forest, millions of years to compress oil, maybe that's the rate at which they ought to be used.

Economics discounts the future. Ten years from now, \$2 will be worth \$1. You could invest that dollar at 7 percent and double it in ten years. So a resource 10 years from now is worth only half what it's worth now. Take it now. Turn it into dollars.

The Earth says: nonsense. Those invested dollars grow in value only if something worth buying grows, too. The Earth and its treasures will not double in 10 years. What will you spend your doubled dollars on if there is less oil, soil, dirtier water, fewer creatures, less beauty? The Earth's rule is: Give it to the future. Lay up a fraction of an inch of topsoil each year. Give your all to nurture the young. Never take more in your generation than you give back to the next.

The economic rule is: Do whatever makes sense in monetary terms.

The Earth says money measures nothing more than the relative power of some humans over other humans, and that power is puny, compared with the power of the climate, the oceans, the uncounted multitudes of one-celled organisms that created the atmosphere that recycle the waste, that have lasted for 3 billion years. The fact that the economy, which has lasted maybe 200 years, puts zero value on these things means only that the economy knows nothing about value - or about lasting. . . .

We don't get to choose which laws, those of the economy or those of the Earth, will ultimately prevail. We can choose which ones we will personally live under - and whether to make our economic laws consistent with planetary ones, or to find out what happens if we don't. (Individual, Mena, AR - #A11984.70500)

736. Public Concern: The Forest Service should recognize that roadless areas do not contain economically viable timber resources.

By and large, National Forests were created from the dregs of the forested lands in the public domain. And the remaining roadless land is the worst of the dregs. If they were primarily valuable for timber, minerals and grazing they would already have been developed. It appears to me the highest and best use is to leave the land undeveloped. Leave them just as they are today! (Individual, Hamilton, MT - #A5811.10111)

It is my personal opinion that the roadless initiative as already developed has received about as many million comments as could possibly be desired. What is incomprehensible is that the overwhelming majority in favor of this proposal—including most of us who live in Montana—are not considered an acceptable measure of what has to be a clear mandate. Despite all the ridiculous rhetoric, the acres

involved are not, will not, and cannot be converted to productive timberlands. Their absolute best value is non-motorized recreation and wildlife. (Individual, Missoula, MT - #A4209.10153)

The argument that roadless areas are a lucrative source of commercial value is groundless. Those areas provide less than 0.2% of our timber supply, and large taxpayer subsidies would be required for commercial logging in roadless areas. The real economic value of national forests comes from recreation and environmental quality of life, which the Roadless Areas Conservation Rule carefully preserves. (Individual, Ft. Meade, MD - #A4749.75500)

The national forest roadless areas were left roadless between 1950 and 1990 because the value of the timber in these areas was so low it could not be sold despite road-building and fire protection subsidies. In the 1950's and '60's Forest Service foresters created timber sales which included valuable low elevation timber at the mouths of valleys and worthless high elevation timber on the ridges. Loggers complained that to get the valuable timber they also had to buy the worthless logs. The idea was what if a logger bought such a timber sale, he would have to build roads (in the end subsidized by the government) to the ridges, so that the poor timber site could be "brought under management." Several million such acres are now "under management". But there is no money to manage these poor sites. The Siuslaw National Forest had to abandon hundreds of miles of decaying roads because they degraded water quality. There is no money to maintain these roads and there is no money to pre-commercially thin the poor quality stands the roads were built to access. The Mt. Hood N.F. had to abandon over a hundred miles of road of road in Fish Creek because it could not justify the expense of rebuilding them after repeated landslides: the timber was not valuable enough to justify repeated road rebuilding them floods in 1964, 1972 and 1993. This is a problem in national forests all over the Pacific Northwest. The 58 million roadless acres on the national forests for a reason: it has never been, nor will it ever be, economically feasible to manage them for timber. (Individual, Portland, OR - #A6269.75600)

737. Public Concern: The Forest Service should recognize that it has already demonstrated that the commodity values of roadless areas are insignificant as compared to recreation and non-commodity values.

In developing the Rule, the USFS also showed that the commodity values of roadless areas are not significant, and that their real economic values come from recreation and quality-of-life enhancement. (Individual, Oak Ridge, TN - #A12830.75440)

The Forest Service's own figures, supported by independent studies, clearly demonstrate that recreation and tourism contribute far more to the GDP nationally than logging, mining, and other extractive and destructive industries in our National Forests. Nationally, recreation and tourism in the National Forests provide thirty times more revenue than logging and thirty-eight times more jobs. (Organization, Bland, VA - #A17007.75440)

In addition to the substantial public responses to the Roadless Initiative, this theme has emerged from other inquiries by the Forest Service: "Most studies indicate that the majority of the American public places a higher priority on non-commodity uses than on commodity uses of public lands." Pg. 3-17, Roadless Area Conservation FEIS. (Individual, Sedona, AZ - #A17217.70500)

738. Public Concern: The Forest Service should not consider economic factors when evaluating roadless areas.

Economic considerations should be omitted from consideration in the roadless areas, especially since the Forest Service has identified they will lose money on roadbuilding activities in these areas. Less than 1% of the nation's wood supply would be provided by logging in these areas, and they are in hard-to-reach areas or they would have been logged already. (Individual, Olympia, WA - #A4929.75000)

All of this is so tiresome. If most Americans want to preserve our forests, why does the minority win? It's incredibly demoralizing to live in a country where the only thing that matters (that talks) is cold, hard cash. (Individual, Brooklyn, NY - #A1397.75000)

I am a Republican and believe in the merits of capitalism; but I also believe that we need to exercise some restraint. Capitalism should not be the driving force behind our decision-making. I believe that most Americans would agree that we need to reduce our dependence on foreign oil, but raping what little is left of our national forests is not the answer. We will simply be trading one crisis for another. (Individual, Peterborough, NH - #A205.75100)

What are the characteristics, environmental values, social and economic considerations, and other factors the Forest Service should consider as it evaluates inventoried roadless areas? Two words: Intact ecosystems. Economics have been considered on the other 98% of the USA. You don't need to consider it here. In reality, protecting roadless areas is a good economic move, you just need to think long term. (Individual, Hampton, VA - #A16453.75900)

Comparative Costs and Benefits of Ecosystem Protection and Resource Extraction

739. Public Concern: The Forest Service should consider long-term costs/benefits a higher priority than short-term costs/benefits.

The true economic cost of natural resources must take into account the degradation of the land and wildlife (which includes our stand of living). Extinction costs more than just us, it costs for all generations. Long-term cost/benefit must be made a higher priority than short-term costs/benefits. (Individual, Bozeman, MT - #A961.75900)

I am a recreational user of National Parks and wilderness lands, and I am always appreciative of the efforts of Federal agencies to make otherwise-inaccessible areas available so that I may enjoy the natural beauties of our beautiful continent. But I am also deeply appreciative of the fact that roadless areas comprise a critical part of our national assets—and that must not be compromised for short-term economic gain! Not for the pleasure of tourists like myself, nor for the profit of resource development companies. (Individual, Chestertown, MD - #A462.75000)

The Forest Service should NOT use as criteria the short-term economic gain of timber and mining interests; only LONG-term economic factors (including the future sustained yields and compatibility with surrounding areas) should even be considered. (Individual, Bozeman, MT - #A285.65000)

When considering a commercial use, Forest Service managers should carefully weigh the environmental impact (via objective, science based studies), the impact on all forms of recreational use, the availability of the natural resource targeted by the commercial use in privately owned areas, the cost incurred by the forest service to support and manage the use, the return value gained by the Forest Service as a result of the use, and the value returned to the public at large. (Individual, Saint Louis, MO - #A629.65000)

740. Public Concern: The Forest Service should not place economic interests above other interests.

Ensure that economic interests are not placed above other interests in public ownership of forest land, including recreation, wildlife habitat, carbon sequestration, watershed hydrologic processes. (Individual, Lacey, WA - #A530.75000)

Competing personal values should have very little to do with your decision, especially when some of those values are ill-informed, as it often the case in our part of the country. Limited resources must be managed not for the satisfaction of a misguided sense of personal freedom, local autonomy, recreational preferences or “economic necessity” but for the health of the land and its complex community of life. It is time for harvestable trees and extractable hydrocarbon to take a back seat in management considerations for our precious remaining roadless areas. (Organization, Vernal, UT - #A20753.70000)

As global population grows, it will be ever more important to maintain wild untrammled places known to man and beast in their beginnings. There is a line in the sand. On one side is humankind and beast together, circumstantially foe of friend. On the other side is a world of humanity’s making, of machines and technological wonder. It is a fine line. As Hope Ryden says in *God’s Dog*, “Nature, too, must be served if she is to renew the bounty upon which all her life forms depend and to which each must also contribute. For ultimately, the green leaf has a more legitimate purpose than any technology, and each creature, linked in a chain that is also man’s lifeline, has more purpose than economic growth. (Organization, Bismarck, ND - #A19108.75530)

BY MANAGING FOR THE PROTECTION OF FORESTS RATHER THAN FOR PROFIT

The role of the Forest Service is to protect the forest, not the potential profits that could be made from any resources contained therein. (Individual, Bozeman, MT - #A284.15100)

There are those of us who do not have a private ranch with rolling hills, unspoiled forest ranges or endless prairies. We must be content to visit such places or view them from afar to remind ourselves of what our America once was and to bask in the wonder of nature. Sadly, we must . . . be content to believe that our elected officials aren’t just businessmen looking to exploit whatever is available in nature in a quest for the almighty dollar. Please be aware enough to realize that keeping whatever unspoiled areas still remain off-limits will not sink the United States economy. (Individual, Hammond, IN - #A4373.15000)

The arguments which favor continued development and exploitation of our irreplaceable public lands are fallacious and designed primarily to provide economic advancement for a few special interests, to the detriment of the populace as a whole. The American people have grown tired of seeing their prized public lands—which belong to ALL of us—exploited and destroyed for the sake of quick economic gain for a few greedy, short-sighted, sociopathic special interests. We want it stopped. Now. (Individual, Visalia, CA - #A275.15120)

It is past time for the current Executive Branch to provide leadership for us, not the few rich, special interests who would benefit from more harmful extraction from the National Forests, probably in a taxpayer subsidized way that has been so typical of many Forest Service timber sales. Be true to Teddy Roosevelt, a true conservative Republican. (Individual, Salem, WV - #A351.15120)

741. Public Concern: The Forest Service should allow profitable natural resource management in roadless areas.

What are the characteristics, environmental values, social and economic considerations, and other factors the Forest Service should consider as it evaluates IRAs? The Forest Service should look into what makes money, like drilling for oil, logging or whatever would make that land actually profitable. (Individual, Silver Springs, MD - #A4593.75500)

Opponents and advocates of timber harvest need to take off their blinders to see that neither the left nor the right are the only answers, that there is a broad middle ground where logging of our National Forests can be accomplished in a manner that will result in economic benefit for those performing the harvest and a healthy forest for the flora and fauna for generations to come. (Individual, Troy, MT - #A664.75100)

IN SUCH A WAY AS TO OFFSET ENVIRONMENTAL IMPACTS

The Forest Service should base their decisions on the economic base of the natural resources first with management to off set environmental impacts but with the intent to allow the development of our resources. Any economy is based on the development of natural resources such as mining, timber, and agriculture. We have the strongest economy in the world and two drivers of this economy are free enterprise and the development of natural resources. Sometimes we view our present time as not needing the resources that past generations have but some things do not change. Without these bases then the economy suffers. If the Forest Service can replace this need then great “roadless” management is simple. Replacement does not count for Americans to have to leave this country to seek employment. (Individual, Elko, NV - #A4853.75000)

742. Public Concern: The Forest Service should ensure that moneymaking projects on National Forest System lands are a by-product of managing for long-term forest sustainability and biodiversity.

Timber harvest projects on our National Forests can help local community stability and economics. As I said before, that’s why I think the Administration wants more local control. Such moneymaking projects must be a by-product of managing for long-term forest sustainability and biodiversity. Impactive, moneymaking, timber harvest or mining projects must never be an objective unto themselves. The National Forests are in no way responsible for maintaining the economic health of local community, nor are they responsible for providing local employment opportunities. This must be made quite clear within the USFS and the communities adjacent to and inside the forests. (Individual, Grangeville, ID - #A830.75300)

743. Public Concern: The Forest Service should manage roadless areas for long-term local economic stability rather than short term benefits.

Washington state, as well as much of the rest of the western USA, is littered with the ruins of towns abandoned when the mines shut down or the forests were all cut down leaving nothing but a great mess and an economic desert. National Forests in general, and roadless areas in particular, should not be managed merely to create a short-term economic bonanza and long-term devastation. Many of those ruined towns would now be flourishing, prospering on the economics of recreation and of providing a desirable residence to a population increasingly untied from a particular place, had they been willing to view their resources on a long-term basis. (Individual, Seattle, WA - #A17261.70100)

Rural development should not depend solely on one industry, especially if it is not sustainable. Rural Western economies have seen such a decline because timber industries pulled out when they knew that the old growth was gone. What is going to happen after they log the remaining roadless areas? The boom and bust cycle of extractive industries has been the bane of the western economy. Local communities that are told that opening roadless areas will provide them with jobs and growth should be reminded that logging old growth or mining gold, or drilling oil never lasts forever. (Individual, Amasa, MI - #A793.75100)

A word on the false “jobs vs. the environment” dichotomy that is so often used to frame this debate: though it is true that the implementation of the full RACR passed under President Clinton would result in some disruption in one sector of the U.S. job market, the cost is well worth the benefit, especially when one considers that such a move would spur changes in forest-dependent rural economies which they would benefit from in the long run. Many Americans rely on the unstable, boom and bust timber industry for seasonal income, but forest economies which focus commerce around preserved forests provide over 30 times the jobs and income as extractive forest economies do. And, significantly jobs dependent on standing forests are stable if the forest is left standing. It only takes one cut to eliminate all those jobs overnight. (Individual, Knoxville, TN - #A8753.75310)

INCLUDE THE TONGASS NATIONAL FOREST

Public land should not be managed in the short-term, short-sighted interest of a handful of local interests, but in the long-term interest of the country as a whole. Specifically, no exception should be made in the rules under suspension for the Tongass rainforest area in southeast Alaska. (Individual, Seattle, WA - #A17261.70100)

744. Public Concern: The Forest Service should consider that tourism and recreation produce more revenue than commodity use.

I believe that the roadless areas of our National Forests deserve the strongest possible protections. This isn't just a good idea, it also make good economic sense, because timber and mining provide a small and diminishing monetary input to our local communities, while tourism and recreation provide a large and rapidly increasing element in our economy. In short, it's far more valuable for us if the trees are left standing on the mountainsides than if they are cut and used for timber. There are many other important reasons to leave our roadless areas unroaded and uncut, including protection of game, fish, and plants that many of us depend on for food. We also depend on the commercial salmon fishing industry in the Tongass, and salmon are a forest species whose spawning streams can be seriously damaged by logging. Our very large population of brown bears has become economically valuable as a major tourist attraction, and biological research is showing that our bears make very little use of fresh clearcuts, virtually no use at all of second growth forest. (Individual, Sitka, AK - #A698.75500)

Although timber production has become a dominant use of our National Forests, this was not their original intent, and the American people have made very clear their opinion that it should not be their intent today. Only 5 percent of America's timber comes from the National Forests, and less than 5 percent of that comes from areas protected by the original roadless policy. By far the most important economic value of the Tongass and other National Forests) today (85% of total revenue) is from tourism, recreation, and other uses such as hunting and fishing, and this is more than five times the revenue from logging. The roadless policy is very important for protecting the most economically valuable uses of our National Forests, while industrial activities such as logging and mining devalue and detract from all other uses. (Individual, Sitka, AK - #A698.75500)

The largest economic value of national forests is its contribution to recreational capacity and regional quality of life, which the Roadless Area Conservation Rule would enshrine for all time. Approximately 85 percent of the revenue generated from America's national forests comes from recreational activities, dwarfing the revenue yielded from logging. (Individual, Logan, UT - #A939.75000)

We operate a tour business in Southwest Alaska (have for 20 years) aboard three small passenger vessels. Recently, we committed almost \$2 million of corporate money to move our maintenance and operations departments to Sitka (building a warehouse and docking facilities at the old pulp mill site). In the process, we expect to triple the number of Alaskans we employ. As tourism has grown and timber harvesting continued in The Tongass, we have noted increasing competition for . . . a decreasing number of untouched areas. Accordingly, we disagree with this Administration's policy of revising the Roadless Area Conservation Rule as published by the previous Administration this past January. (Business, Washington, DC - #A3620.75540)

The two dozen diverse communities within the Alaska rainforest range from Juneau, the state's capital with 29,000 resident, to small remote villages of less than a hundred. Government, construction, and service industries are the largest segments of the local economy. But commercial fishing, tourism, and subsistence on fish and wildlife dominate the forest-dependent economy throughout the region, especially in the rural and Native villages. Logging and wood-processing support a few important communities. Generally, however timber plays a lesser role. The regional economy continues to grow, despite periodic declines in timber related jobs. Alaska's long-term economic gold mine is tourism, increasingly and effectively promoted on the basis of its unspoiled environment and abundant wildlife. Since statehood, Alaska's annual tourism growth has averaged 10 percent. Recent trends point to even

higher growth rates. Tourism in Southeast Alaska averaged an annual increase of over 20 percent since 1988, with a cumulative increase in revenue of 108 percent. But some tourism businesses now find themselves confronting limits to growth, caused by clearcut logging and related development. The commercial fishing and seafood processing industry accounts for approximately 20 percent of southeast Alaska's private industry employment. Commercial fishing provides large incomes, over a short summer season, to a broad spectrum of Southeast Alaskans. This income provides the critical source of capital to most rural communities, where year-round employment is scarce. The industry is dominated by salmon harvesting, which depends on high-quality stream habitat in the rainforest. (Organization, Nevada City, CA - #A4941.75100)

While the Forest Service has plenty of money budgeted for its money-losing timber program, they are underfunded when it comes to managing the forests for a growing tourism industry. Visitor impacts are increasing and the USFS is way behind the curve on assessment and planning for the number of people who are currently using the Tongass. In 2001, Southeast Alaska is expected to host over 680,000 cruise ship tourists. Local tourism businesses and visitors of all types rely on intact watersheds for recreation opportunities. When will the Forest Service in Alaska begin to manage the forests for tourism rather than logging? (Organization, Sitka, AK - #A12003.17100)

745. Public Concern: The Forest Service should consider that local communities would benefit more from investing in new technologies than from relying on forest commodity jobs.

Without question, the Roadless Areas could provide jobs and income for local economies, but better jobs and greater economy can come from investing in new technologies and new materials. I am absolutely convinced the reasons for considering changing the Roadless Area Conservation Rule do not outweigh those against. (Individual, Durham, NC - #A770.75100)

Adequacy of Analysis

Summary

General Comments – Both those who ask that the Roadless Area Conservation Rule not be implemented and those who ask that it be implemented question the adequacy of the economic analysis that was conducted during the rulemaking process. Some respondents assert that negative economic consequences were underestimated, while others state that net benefits were underestimated. Some people conclude that the Forest Service still fails to fairly consider or quantify non-market values and ecosystem health benefits, dismissing them as qualitative and therefore failing to incorporate them into the net public benefit valuation as required by statute. Some state that economists have now developed tools to quantify these values, which the Forest Service should adopt. Suggested benefits to be quantified include economic valuation of healthy ecosystems, including water purification, and intrinsic values.

Economic Effects – Some individuals specifically ask the Forest Service to quantify the effects of the Roadless Area Conservation Rule on the recreation sector. Both those who ask that the Rule be implemented and those who ask that it not be implemented state that such an analysis will vindicate their position. One organization asserts that the economic analysis failed to analyze or consider negative effects on agency employment that may result from adoption of the Rule, and requests that this analysis be completed. (See also Chapter 2: Other Legal Concerns: Federal Laws, Acts, and Policies: *Regulatory Flexibility Act*.)

The Roadless Area Conservation Rule EIS – Several respondents specifically discuss elements of the economic analysis in the Roadless Area Conservation Rule EIS. Some request that the

Forest Service should better explain its methodology and data used in its preparation. One respondent questions the analysis of effects to the timber industry, asserting that it overstates economic effects to the timber industry by failing to account for the distorting effects of annual subsidies to this industry and by excluding any adjustments to timber receipts to account for payments to states. This individual requests that these deficiencies be corrected.

Adequacy of Analysis General

746. Public Concern: The Forest Service should produce competent, unbiased economic analyses.

For years, these figures have been thrown out and never seriously refuted: 4 billion dollars from timber production from Forest Service lands; 10 times as much return to local communities from their recreation, tourism, etc. If anywhere near true, the USFS must have competent, unbiased economic analysis and utilize that as the primary guide in balancing competitive interests in the Forest Service land use. (Individual, Kalispell, MT - #A27715.15160)

747. Public Concern: The Forest Service should refocus its cost benefit analysis on economic consequences when evaluating a national roadless rule.

Economic consequences should be considered when evaluating inventoried roadless areas. Many individuals and governments have made considerable investments to better serve those individuals interested in visiting forest areas. The reasons for those investments must be considered before changes are made that could devastate family and small town/rural economies. Realistic economic data is available through local Chambers of Commerce or CVBs and through many EDCs and Economic Planning Units. (Business, Haslett, MI - #A4861.75000)

In order to achieve multiple-use, the agency must retain a reasonable balance of uses on the NFS. Therefore, we strongly oppose the FS intent to assign its first management priority as ecological sustainability. The FS has an obligation to the public to adopt management policies that take into account the social and economic needs of the nation through an unbiased approach to land and resource management planning. The FS's final rule places an inordinate focus on aesthetic and ecological values while discounting the needs of the communities who survive in the western states in part due to activities on the NFS. We urge the agency to revise its rule to one that meets the precise intent of the law. (Business, Denver, CO, - #A25688.75900)

748. Public Concern: The Forest Service should conduct adequate cost benefit analyses before issuing a new rule.

The cost-benefit analysis accompanying the prior administration's proposed rule was inadequate and incomplete. The best tool the Forest Service has to balance competing values and limited resources is through solid cost-benefit analysis. Our July 2000 comments provide examples of how the previous cost-benefit analysis was short on information necessary to support the policy of the prior proposal. (Business, Washington, DC - #A3690.75900)

We believe that a complete economic assessment be done regarding the non-consumptive uses on these lands. This should include the values for fishing, hunting, bird watching, and all recreational uses. This should be done in comparison to the value that is usually given for an area that is basically taken from the commodity extractions presented. (Business, Coarsegold, CA - #A1589.75900)

The FEIS chooses assumptions that purposely minimize the net economic impact calculated for the proposal, and yet fails to demonstrate that the proposed alternative(s) is warranted on environmental or economic grounds. (Professional Society, Anchorage, AK - #A21707.75200)

BY ANALYZING THE COSTS AND RISKS ASSOCIATED WITH DEVELOPED ACTIVITIES IN ROADLESS AREAS

Please analyze the ecological benefits of conservation of roadless areas. Also, analyze the costs and risks of alternatives that allow the roading of these areas and the costs and risks that prohibit roading but permit degrading activities such as logging, mining and vehicular use. This analysis of the costs and risks associated with roading, logging and otherwise will suffer and which will risk extinction. An analysis of the resultant ESA listing and their associated costs should also be discussed and quantified. (Organization, Cave Junction, OR - #A17235.14500)

BY CONSIDERING ECONOMIC ECOSYSTEM VALUES OF NATURAL RESOURCES

Also, remember that the economic non-use values of natural resources are consistently under estimated in cost benefit analyses preformed by the EPA and other government groups. (Individual, Ridway, PA - #A3822.70500)

BY ACCOUNTING FOR RESOURCE DAMAGE FROM COMMODITY USES

Do more cost-benefit analysis—one that takes into account the social, environmental and economic costs (including the costs to the USFS for “cleaning up” after cattle and logging activities). (Individual, No Address - #A410.75900)

BY CONSIDERING THE COMMERCIAL INTERESTS OF LOCAL AREAS

The Forest Service asks what are the characteristics, environmental values, and social and economic considerations that should be considered in determining what activities should be allowed or prohibited in roadless areas. [Footnote 6: 66 *FR* 35920 (July 10, 2001).] The main consideration is not to exclude any value that is important to the locality. We are pleased to see in this advance notice that the Forest Service has raised the possibilities of economic interests in roadless lands. The previous proposal did not provide for an assessment of commercial interests in an affected forest area. Without an understanding of all interests, including commercial considerations, the Forest Service is not in a position to fully appreciate the cost-benefits of its management decisions. (Business, Washington, DC - #A3690.75500)

BY ANALYZING LIKELY TRENDS IN THE FUTURE VALUES OF RECREATIONAL AMENITIES AND NATURAL RESOURCE COMMODITIES, AND LOST OPTION VALUE INHERENT IN FURTHER DEVELOPMENT

Obviously the Forest Service needs to think carefully through a number of implementation issues as outlined in the ten questions, reasonable application of some variant of cost-benefit analysis seems warranted. The central point, however, is that this cost-benefit analysis must take into account both likely trends in the future values of recreational amenities and natural resource commodities, and also the lost option value inherent in any further development of currently roadless areas. (Individual, Boston, MA - #A30308.11100)

749. Public Concern: The Forest Service should consider both market and non-market values in its economic analysis.

Market and non-market economics must be taken into consideration to provide a realistic and accurate analysis of the benefits and costs associated with our public lands. Non-market economics are difficult, to some extent, to incorporate into analyses because they are frequently economic factors that cannot have a real dollar figure attributed to them. However, non-market economics, using the most sophisticated analysis possible, is absolutely crucial and perhaps the most important element to making policy decisions (Morton, 1999). Unfortunately, land management agencies such as the Forest Service have historically ignored the non-market values of public lands, and have instead assessed only the commercial value of forest commodities like timber. (Although the Service does a very poor job of utilizing non-market analysis, the agency is required by law to take forest values beyond commodity production into consideration when doing economic analysis of management under the Multiple Use Sustained Yield Act (MUSYA, Public Law No. 86-517 Stat. 215)). (Organization, Nevada City, CA - #A4941.75800)

The characteristics, environmental values, social and economic considerations, and other factors should include both market and non-market economic to provide a realistic analysis of the cost and benefits the Forest Service as it evaluates IRAs. The Piasa Palisades are dismayed that the Forest Service has

historically ignored any non-market values of public lands, insisting on assessing the commercial value of forest commodities like timber. Roadless areas provide less than two-tenths of one percent of the nation's timber supply, any commercial logging of these areas would require large taxpayer subsidies.

We realize that non-market values are difficult to incorporate because they may not have a positive dollar amount attributed to them, but we also realize the time has come to balance the multi use land with multi use values. Further still, we ask the Forest Service to solely use sophisticated non-market economic analysis, omitting the market economics. (Organization, Alton, IL - #A13847.75800)

750. Public Concern: The Forest Service should base its economic analysis on real data rather than inaccurate models.

There must be a comprehensive evaluation of the social and economic impact of each alternative on surrounding communities. This should be based on real data, not models bearing little resemblance to the real communities. (Individual, Cloquet, MN - #A8272.75300)

751. Public Concern: The Forest Service should improve socioeconomic input/output modeling in updated or amended forest plans.

IN COLLABORATION WITH OTHER AGENCIES

To better understand the nature and magnitude of potential socioeconomic impacts that may be caused by the roadless rule and other related actions, we recommend related Forest plan updates or amendments include socioeconomic input/output modeling. To improve the quality of such modeling, save money, and take a major step towards more collaboration, such modeling should involve other organizations, including federal, state, and local agencies. For example, we are working with the BLM in Nevada to form a collaborative socioeconomic working group. This group will include a wide range of agencies and organizations that have an interest in the socioeconomic assessment of the management alternatives being assessed in a new resource management plan for a National Conservation Area and associated wilderness areas. The working group will help the BLM conduct the socioeconomic modeling and compile the related database, including fiscal conditions in local countries. There is a significant opportunity to coordinate the modeling approach and databases compiled for this project, and previous projects in other parts of the state, with the upcoming update of the Humboldt-Tonya Forest Plan. (State Agency, Carson City, NV - #A17669.12310)

752. Public Concern: The Forest Service should provide information regarding maintenance costs of roaded and unroaded areas.

Other concerns related to this issue are the lack of information regarding the costs of maintaining areas which do have roads and the costs of maintaining areas which do not have roads. (Individual, No Address - #A448.17230)

753. Public Concern: The Forest Service should adopt a quantitative valuation formula for spiritual value in evaluating roadless areas.

In a broad sense stewardship, economics, and ecology are and should be interrelated. The three purported to all be interested in making sure that God's household (the world) runs well for the common good of all, that is the whole of God's good (efficient!) creation. In the section "National Forest Timber Sales—Facts and Analysis," I suggest that the value of the religions or spiritual "*Oikos*" (SpV) in economic terms could be equated to the sum of the Bequest Value (BV) plus the Existence Value (EV) plus the Nonhuman Value (NHV). These economic categories capture the less material and non-material values that reflect for the religious community the awe and self worth, the beauty and importance of God's good creation. Spiritual Value is then: $SpV=BV+EV+NHV$. It is a real factor in how many people value the environment and needs to be carefully considered when doing a benefit-cost analysis. (Individual, San Diego, CA - #A21653.75900)

754. Public Concern: The Forest Service should consider the positive effects of ski areas on local economies in greater depth.

We are glad to see that, in this question, the Forest Service is giving as much emphasis to social and economic consideration in evaluating inventoried roadless areas as it is placing on environmental values and other characteristics. The Forest Service needs to recognize the high demand for recreation on public lands and the contribution that ski areas make to the economies of the local communities. To bring this about, we suggest consideration of the following information:

Annual skier days on Brundage are currently in the neighborhood of 100,000. This means that for 100,000 times each winter a visitor devotes one day of his/her time and a significant amount of disposable income to recreating on National Forest lands at the resort. This alone, without even considering the people using the summer mountain bike program, conferences and musical events, demonstrates that the public endorses the resort and provides some measure of the amount of money brought into the community of Brundage.

Also to be considered is the economic contribution the resort generates in the City of McCall and other nearby communities in the way of direct employment, payroll and spin-off patronization of other secondary businesses such as restaurants, bars, service stations, etc, i.e., the multiplier effect. (Permit Holder, McCall, ID - #A15317.75540)

755. Public Concern: The Forest Service should incorporate the positive contribution of wilderness to nearby real estate values into its economic analysis.

The segment of society that is moving to regions for their wilderness and quality of life values, clearly, want to see the area they are moving to protected. A direct result of this can be seen in the increasing private property value associated with a property's proximity to protected publicly owned wilderness. In an analysis of protected wilderness in the Green Mountain National Forest in Vermont and private property values in relation to the wilderness, Phillips (1999) found that towns could be expected to have an average of 13 percent more valuable private property if they were in the immediate vicinity of designated wilderness than if they were not. (Organization, Missoula, MT - #A17234.75440)

756. Public Concern: National Forest System lands should be appraised and taxed like private lands.**INCLUDE NON-MARKET ECONOMIC VALUES IN APPRAISALS**

Finding equity values for forest resources—Commercial resources extraction has dominated the management agenda of federal forest lands. How can the Forest Service develop methodologies to equitably value all forest resources? And how can local government derive equitable compensation for forest land uses. Social scientists have been working on non-commodity for decades. While there is much work yet to be done, methodologies now in existence can significantly improve forest management.

Federal forest land should be appraised and taxed just like any other landowner. The argument that comparable market values are lacking is a weak excuse. If the methodology is good enough for private timber lands, range lands and recreation lands, why isn't it good enough for federal lands?

In most western interestingly timber lands yields little tax while recreational land and scenic land yields high taxes. I would suggest this is because recreation and scenic values are actually more important to westerners than logging. Why do we, for instance, pay professional baseball players, rock and roll musicians and movie actors high salaries and professional loggers low salaries? . . .

The US Forest Service can either learn to value non-commodity resources or perish. (Individual, Colville, WA - #A20889.75800)

757. Public Concern: The Forest Service should consider the economic value of healthy ecosystems.

Critics of roadless area conservation contend protecting public lands will adversely affect economic growth. But evidence strongly shows that economic vitality and conservation of wild forests are not mutually exclusive. In fact, the economic health of rural communities that contain a large portion of federal land is actually ENHANCED by wildlands protection. For example, extractive industries no longer drive the economic engines of rural California. High tech business, tourism, recreation, and outside investments have helped diversify local economies in the Sierra Nevada, replacing the boom and bust cycles of unsustainable extractive industries. As a result, Sierra Nevada, once dependent upon activities like logging and mining, are thriving in large part because of the unique quality of life attributes public lands provide (see below for more details on shifting economics). The overwhelming contribution National Forests make to the economy is in the form of “ecosystem services”—products of the function of the Earth’s living systems society does not have to pay for but needs nonetheless. Those “services” include clean air and water, pollinators, pollution filtration, and topsoil. An economic analysis of the world’s native forests recently concluded that the ecological services of forest ecosystems worldwide was worth at least \$4.7 trillion per year (Constanza, et al. 1997). Moskowitz (1999) estimates that ecological services make up 83.1 percent of the economic contribution of National Forests. (Recreation is the next highest sector, with 10.2 percent. Fish and wildlife make up 4.1 percent. Resource extraction contributes 2.7 percent.). It is also important to note such services are not merely amenities. Natural ecosystems literally sustain humans and other species, a formidable argument for the preservation of wild forests and rivers. (Organization, Nevada City, CA - #A4941.75540)

Decisions to allow logging, mining, public land grazing and motorized recreation are also decisions that degrade social values such as biodiversity, high quality wildlife habitat, clean water, and human powered recreation opportunities that are enhanced by natural ecological and quiet conditions, etc. Semi-natural forest matrix areas accessed by nearly 400,000 miles of existing roads already comprise most national forest land. In light of the fact that over 70% of USFS land is already roaded, and has in many cases already been logged, these broader, non-market social values must come first in areas that remain roadless. (Individual, Corvallis, OR - #A650.75800)

It is essential to protect what few natural settings and open space we have left in this country. In the long run, and if we internalize factors that are often not part of our cost accounting—for example, the function of roadless forests in maintaining water quality, air quality and fish habitat—economic considerations strongly favor wide roadless protection. This is especially true given that the Forest Service has acknowledged they will lose money on roadbuilding activities in these areas. Less than 1% of the nation’s wood supply would be provided by logging in these areas, and they are in hard-to-reach areas—or they would already have been logged. Road construction to support destruction of the naturalness of these lands would be at taxpayer expense and the only benefactors would be timber corporations. Very few local and sustainable jobs would be created, since the jobs would disappear on completion of the logging, as demonstrated previously. Solitude, recreation, ecosystem and watershed protection should be the priority for the roadless areas. (Individual, No Address - #A6110.75000)

The Forest Service has already adequately identified roadless area values through the public involvement process for the Roadless Area Conservation Rule. Roadless areas include the economic benefits associated with: 1) recreational opportunities and tourism, 2) commercial and recreational fisheries within the boundaries of National Forests and downstream and offshore, 3) habitat for important game species and hunting both within and outside of the National Forests, 4) water for cities, industries, businesses, and individual households downstream from National Forests, 5) the regulation of water flowing through rivers and streams, including flood control, 6) non-timber forest products such as wild mushrooms, herbs, and medicinal plants, 7) mitigation of global climate change through absorption and storage of vast amounts of carbon, 8) enhancing the quality of life of neighboring communities, 9) harboring biological resources that either have value now or have as yet unknown but potentially large economic and social value, 10) harboring biological and genetic resources that can improve the long-term productivity of all forest land, 11) pest-control services provided by species that prey on agriculture

and forest pest, and 12) pollination services provided by species that pollinate important forest and agricultural crops. The real economic value of national forests comes from recreation and environmental quality of life, which the Roadless Area Conservation Rule carefully preserves. (Individual, Santa Fe, NM - #A19211.75500)

The overwhelming contribution National Forests make to the economy is in the form of “ecosystem services:” products of the function of the Earth’s living systems society does not have to pay for but needs nonetheless. Those “services” include clean air and water, pollinators, pollution filtration, and topsoil. An economic analysis of the world’s native forests recently concluded that the ecological services of forest ecosystems worldwide was worth at least \$4.7 trillion per year (Constanza, et al. 1997). It is estimated that Forest Service recreation directly contributes \$10 billion annually to private sector outdoor gear sales, and contributes directly to the economy \$7.94 billion through recreation programs and \$3.04 billion through fishing and hunting (Moskowitz, 1999). Moskowitz (1999) estimates that ecological services make up 83.1 percent of the economic contribution of National Forests. (Recreation is the next highest sector, with 10.2 percent. Fish and wildlife make up 4.1 percent. Resource extraction contributes 2.7 percent.) It is also important to note such services are not merely amenities. Natural ecosystems literally sustain humans and other species, a formidable argument for the preservation of wild forests and rivers. (Organization, Portland, OR - #A12004.75800)

It is vital that non-traditional values of these forests be considered. Ecosystem services include flood control protection, soil and slope stability, erosion control, pest control, and maintenance of soil fertility and water infiltration. In other words, the healthy functioning of the forest and the watershed provides significant real value to communities. The value of intact ecosystems to local economies—lifestyle, real estate values, tourism, clean drinking water, fishing, and beauty—must also be considered. (Individual, Ashland, OR - #A23399.75800)

INCLUDING THE ECONOMIC BENEFIT OF EXISTENCE VALUES

Recreation is the highest sector of economic output from the National Forest System that can have a market value figure put on it, and reflects society’s appreciation of natural areas. However, there is also the economically important consideration of “passive use” or “existence value” benefits that society places on natural areas. This reflects many people’s strong emotional attachment to nature and feeling that it should be protected regardless of whether they plan to travel to a specific area and recreate in it or use it in any specific way. The simple knowledge that a species has not gone extinct or that a forest remains standing is of enormous importance to a large segment of society, whether or not they will ever encounter the species in the wild or visit a roadless area. These people are often willing to pay to keep areas protected simply for the sake of preserving nature. In its analysis of use, the Forest Service does not even include existence value as a category (USDA Forest Service, 1990). This element of economic output from the National Forest System is tremendous, but is also extremely difficult to quantify. (Organization, Missoula, MT - #A17234.75540)

According to a January 12, 1998 letter to President Clinton signed by some of the country’s leading economists, such a focus [on commodity values] is too narrow: There are non-extractive uses for which markets are either incomplete or nonexistent, but which nonetheless provide significant economic value. For example, many people enjoy recreating in pristine forest environments. Although these activities may not be purchased in market transactions, the time and other goods that people give up in order to enjoy them provide evidence of their economic value. Existing wilderness areas in our national forests and national parks meet some this recreational demand. But as these areas become increasingly congested, the recreational value increases for other roadless areas that are currently unprotected. (Whitelaw et al. 1998). (Organization, Portland, OR - #A12004.75800)

The “passive use” or “existence value” of natural areas is also economically important. This reflects many people’s strong emotional attachment to nature and feeling that it should be protected regardless of whether they plan to travel to a specific area and recreate in it or use it in any specific way. The simple knowledge that a species has not gone extinct or that a forest remains standing is of enormous

importance to large segments of society, whether or not they will ever encounter the species in the wild or visit a roadless area. These people are often willing to pay to keep areas protected simply for the sake of preserving nature. (Organization, Bozeman, MT - #A22092.75800)

The economic impact of a roadless area designation to the local communities should not be used as a limiting factor of such designation. The National Forests are for everyone, not just for some local community to sustain itself on. The Forest Service should consider existence value above the value to the local economy, how much do Americans as a whole value the existence of an intact ecosystem or wilderness. That way, you could use the appropriate metric, the sentiment of the American people, to gauge such decisions.

You should consider the impact to the environment of fragmenting an intact ecosystem with roads. This is a change that can have permanent impacts and, as yet, has not been given the appropriate significance in the Forest Service.

You should consider the fact that National Forests were intended to be America's reserve of natural resources. If we cut down all of the old-growth timber, other than the amount required by specific species, then we have none left for 80+ years (depending on how "old-growth" is defined). How is that reserving the resource for the future? It will just eventually result in another "timber industry vs. species X" scenario. We will have to disallow timber harvest because we've removed all but critically important habitat to a species listed under the Endangered Species Act. Our National Forests should have some resemblance to an actual reserve, rather than just one big shopping cart for the timber, mining, and other extractive industries. We have to actually set something aside in order to have a reserve, so let's set the roadless areas aside. (Individual, No Address - #A29243.45000)

INCLUDING QUANTIFIED ECONOMIC VALUES FOR CLEAN WATER

Frankly, I am sick of the "economic" considerations so often used to justify environmental degradation. All of the legislation that guides the FS today was initiated in response to the fact that industry will maximize profits to the detriment of all other factors. This was deemed incompatible with the American dream.

Externalities are never factored into economic equations. Can you put a price tag on clean drinking water? Until you do, environmental degradation will appear, on paper, to be economically expedient. But if you factor in the cost of purifying water for the entire Columbia Basin, logging as we know it would cease. (Individual, Lewiston, ID - #A29569.75800)

Adequacy of Analysis – Economic Effects of a National Roadless Rule

758. Public Concern: The Forest Service should quantify recreation-based economic effects of a national roadless rule.

Local decision making must take into consideration the amount of public access and recreation opportunities that are currently supported by these lands, and the effects of the future reductions caused by this decision, particularly in rural communities. Quantifiable recreation-based data from industries, rural tourism associations, and user groups that will be impacted by the reclassification of roaded and roadless areas must be analyzed in great detail prior to implementation of proposed rules for roadless area management. Again, the most practical means of accomplishing this is through the local Forest Plan Amendment process. (Elected Official, Alpine County, CA - #A8597.75540)

Demand for dispersed recreation opportunities in public wildlands is increasing, in an environment of diminishing supply (Morton, 1999). In the literature, the average value per recreation day was \$42. The literature also indicated that protecting a 10,000-acre roadless area in the West provides 3,875 visitor days per year, for an estimated annual \$162,750 in recreation value to visitors (Ibid.). Protecting 10,000 acres in the eastern portion of the country yields approximately 11,000 visitor days per year, with an annual recreation value to visitors of \$462,000. Maintaining all 42 million acres of national forest roadless areas in the conterminous United States would support 14.6 million visitor days of non-

motorized recreation, worth \$600 million in annual recreation benefits to the visitors (Ibid.). (Organization, Denver, CO - #A21367.75540)

Opponents of wildlands protection often argue that protecting public lands locks up resources, locks out people, and is bad for the economy. Facts state otherwise. The benefits of protecting roadless areas—from protecting watershed and wildlife habitat to providing much sought-after backcountry recreation opportunities—are immense and have been well documented. Although roadless wildlands are highly valued by society, without formal markets, the benefits of wildland conservation are often difficult to quantify in economic terms.

The record number of public comments received by the Forest Service in support of the roadless policy provides empirical recognition and support for the multiple uses and benefits generated from roadless area conservation. While no quantitative estimate of the benefits of the rule was provided in the Roadless EIS, the Forest Service believes the benefits of the rule outweigh the costs (USDA Forest Service 2001, Regulatory Impact Analysis). In a more sophisticated analysis, Loomis and Richardson (2000) estimated that in their current, unroaded condition, Forest Service roadless wildlands in the lower 48 states can be expected to provide almost \$600 million in recreation benefits each year, more than \$280 million in passive use values, and nearly 24,000 jobs. The authors also estimated annual benefits from roadless area ecosystem services to include between \$490 million and \$1 billion worth of carbon sequestration services as well as \$490 million in waste treatment services (Ibid, pp. iii-iv). Estimating the net impacts of the roadless rule should fully account for the benefits of conserving roadless areas as well as the potential costs with respect to the decline in quality and quantity of the other multiple uses generated by the public estate as a result of exploiting energy resources. (Organization, Denver, CO - #A21367.75800)

759. Public Concern: The Forest Service should analyze the impacts of a national rule on recreation-related economic activity.

NEGATIVE EFFECTS OF A NATIONAL RULE ARE UNDERESTIMATED

The DEIS is remiss in making no specific estimates for the impact on recreational uses (either good or bad). So the reviewer is really left with nothing to comment on—this is certainly a gross defect of the DEIS. The reviewer will again take a stab at estimating the impacts—not to claim it to be a true economic analysis, but rather to show that the impact on recreation, even if its a small impact, may be substantial in terms of economics. Using the Draft 1995 RPA report, it is estimated the impact of recreation on the national economy from National Forest recreation is \$98 billion. Road-based recreation accounts for the major recreational use of the National Forests.

But the DEIS claims that there will be little impact from Alternative 2, 3, or 4, because it will not close roads or trails. But the cumulative impact will certainly be noticeable because: 1) roads will no longer be built, which will reduce any growth in the recreation industry; 2) roads are being closed in otherwise roaded areas to meet other forest objectives; and 3) road definitions are changing that will allow trails to be no longer classified as trails or roads and thus be closed. How much will recreational use of the forest be reduced? If such recreational reduction is only 5%, that would amount to a \$4.9 billion economic loss. Whether or not this number is accurate is not important for this discussion, but what is important here is that the impact is so potentially large that the DEIS is very lacking in not doing a real economic analysis of that impact. (Union, No Address - #A28881.75540)

POSITIVE EFFECTS OF A NATIONAL RULE ARE UNDERESTIMATED

The argument that roadless areas are essential for a healthy tourism industry is further supported by the example of . . . an original permit holder at Pack Creek bear observatory, a ship captain who has been guiding boat tours of the Tongass for the past 25 years. [He] now captains a small charter boat known as the *Discovery*, and I spent a week with him on it in July 2001. In his words, “If it was up to me this would all be protected as wilderness.” [His] comments come from his intimate connection to the Tongass, even to individual whales and brown bears, and his love of the wild nature that is so unique to Alaska. But [he] is an independent, smart and reasonable man. He understands the nature of humans in Alaska as well, and, though it is hard for him, he shares the beauty of Alaska with more and more tour

boats and tourists every year. That is why it was even more convincing when he said to me as I showed him Forest Service planning maps that put Roadless areas east across Stephens Passage from Admiralty Island on the chopping block, “People don’t want to come to Alaska and see clearcuts!” As we sat in the water just below these roadless areas with two humpback whales just yards off our bow, just off a small island hosting both and stellar sea lion rookery and harbor seals, John was blown away by what the maps clearly showed was scheduled.

There are hundreds of sustainable businesses like [this] that will absolutely suffer if big corporations maintain access to exploit the riches of these areas and take them away from the rest of the population. THE ROADLESS ANALYSIS TO DATE HAS NOT ADEQUATELY VALUED THESE BUSINESSES AND HAS UNDERESTIMATED THE IMPACTS TO THESE BUSINESSES. (Organization, Bloomington, IN - #A28110.75320)

760. Public Concern: The Forest Service should analyze the impacts of a national rule on agency employment levels.

The FEIS did not address impacts on Forest Service employees. We estimate that between 1,000 and 1,500 Forest Service jobs will be eliminated, with 300 of those being on the Tongass National Forest.

The DEIS has made no attempt to analyze the impact of Alternative 2, 3, or 4 on Forest Service employment levels. But if the resulting impacts cause a 5% reduction in timber and recreation use, and that is reflected in a 5% reduction in Forest Service jobs, that would be a 1,500 reduction in the number of Forest Service employees. Is that accurate?—no analysis was done. Other jobs could possibly be found, but that will not likely happen considering that the employment level of the Forest Service has fallen by 20% (about 7,000) in the last seven years, and there is no indication that any attempt will be made to retrain people (for example, to do jobs such as writing environmental impact statements). (Union, No Address - #A28881.75310)

761. Public Concern: The Forest Service should address the impacts of a national rule on fair housing and lending provisions.

ADA, Fair Housing, Federal non discrimination provisions, private and federal lending criteria and other areas of interest most often under Federal law, the review of States, Indian and Public Housing authority, or agencies such as HUD and USDA-RD are inadequately addressed in the proposed rule and current FS policy. Housing issues fundamental to and integral with local and state planning efforts are not fully considered in the proposed rule and existing FS policy. (Union, No Address - #A30595.70300)

762. Public Concern: The Forest Service should assess the cost of withdrawing millions of acres from the country’s natural resource base.

Public Concern: The Forest Service should provide the public with an assessment of the opportunity cost of withdrawing millions of acres of land from our country’s natural resource base. These lands contain valuable reserves of oil, gas, coal, timber, and many other minerals. If we are no longer permitted access to these resources, then the Forest Service should provide information detailing where they will come from, what the national security implications of outsourcing are, and what will be the likely consequences of outsourcing these materials in other parts of the world. (Organization, Maryville, TN - #A8754.65000)

Analysis of Analysis – the Roadless Area Conservation Rule EIS

763. Public Concern: The Forest Service should better explain the methods and data used in the economic analysis for the Roadless Area Conservation Rule EIS.

I am also concerned with the economics of the “roadless” proposal. You say \$565,000 would be “saved” from road maintenance costs—how was this figure computed? Did you calculate any “cost” to lost revenue from foregone resource opportunities lost???? You say the “roadless” designation could cost \$21,000,000 in (lost) timber revenue—how was this figure determined—at what stumpage rates—have

these timbered areas been adequately cruised??? What other natural resource values have been estimated (if any)—what about mineral potentials???? (Individual, Tucson, AZ - #A5625.75900)

764. Public Concern: The Forest Service should correct the Roadless Area Conservation Rule EIS timber-related job data to account for the fact that most employment resulted from taxpayer subsidies of below cost sales.

The Roadless Area EIS is not only misleading, but also gives the impression it seeks to foster protests from those who believe they will be cut off from the subsidized largesse they desire from the resources on these lands. The estimate of 26,610 timber related employment from the total 3,214 MMBF estimates cut doesn't match the TSPIRS jobs data. But not to worry; this claim, which projects a \$39,000 annual job income, isn't worth the paper it's printed on. (ibid @ S 32) The EIS totally ignores that 94% of the 65,557 jobs claimed for the 9 years, 61,657 jobs were subsidized because timber sales were -\$1.32 billion in the red for the 9 years, 1992-2000. (Professional Society, Saint Leonard, MD - #A9040.75710)

765. Public Concern: The Forest Service should correct the Roadless Area Conservation Rule EIS timber program cost analysis to include payments to counties.

The Roadless Area EIS is not only misleading, but also gives the impression it seeks to foster protests from those who believe they will be cut off from the subsidized largesse they desire from the resources on these lands. Whenever running an analysis of the timber program, such as TSPIRS, the Service always omits COUNTY PAYMENTS, CLAIMING THEY ARE IRRELEVANT. WHEN ANALYSES ARE DONE FOR A PROPOSED WILDERNESS OR A PLAN TO CURB ROAD BUILDING, REMARKABLY ESTIMATED LOSS OF COUNTY PAYMENTS APPEARS ON CENTER STAGE. (EIS @ S-32). By November 2000 when the EIS was issued by President had already signed the law disconnecting timber and other receipts from paying 25% to the counties. Old habits die hard. This "red herring" makes its typical appearance. One of the vain hopes in changing the 25% county payment law was that disconnecting county payments as a cost would make timber sale losses evaporate. Red ink is so indelibly etched into the costs of running sales that no sleight-of-hand will make losses disappear. My estimate relying on F.S. data, OMITTING COUNTY PAYMENTS, is that 86 of the 109 Forests ran - \$1.32 billion in the red for the 9 years, 1992-2000. Each job costs \$2,400. The cost per job jumped from \$1,828 in 1992 to \$3,258 in [2000], up by 1.8 times. With county payments counted the job costs rises to \$4,600 each. (Professional Society, Saint Leonard, MD - #A9040.75730)

Economic Effects

Summary

General Effects on Local Communities and Economies – General comments on this topic revolve around the consideration of the economic benefits of roadless protection to state and local economies. One organization cites a study which, it claims that contrary to popular belief, protected areas are more economically beneficial to rural communities than the relationship between natural resource dependant industries and the same communities. Respondents point specifically to the importance of protected areas to companies seeking locations which offer a high quality of life. One elected official comments that proximity to roadless areas is a very important tool in interesting companies and people in staying in and moving to their town.

Effects on the Resource Dependent Communities and the Timber Industry – Comments about the possible effects of a national roadless rule on the timber industry are varied. Many people assert that the Roadless Area Conservation Rule will have a significant negative impact on resource-dependent communities generally and timber-dependent areas specifically. One individual states, the federal government has almost destroyed the timber industry in Idaho. And is now worried that if more roads are closed, then it will be too expensive to remove trees,

making it impossible to stay in business. Other respondents assert that the Rule will not have a negative economic impact. They often cite the Final EIS's claim that only a small percentage of the available timber supply will be withdrawn and therefore that there will only be minor impacts to this sector. These respondents often state as well that negative economic effects have generally been exaggerated by those who ask that the Rule not be implemented, and that the timber industry itself is most to blame for the current slowdown. Over-harvest, mechanization, the global timber trade, and lack of long-term vision have all contributed to its decline, not environmental concerns, these respondents assert.

Some say that the Forest Service has failed to follow its "sustained yield" mandate, as demonstrated by declining timber removal volumes. Some state that the Agency should focus timber removal activities in roaded areas, and also help local mills to retool in order to process smaller diameter stems. Others assert that chip mills are inferior economic engines for local economies, with lower wages and benefits to communities.

Finally, some respondents urge the Forest Service to continue to utilize natural resources from roadless areas in order to meet American consumer needs. Some cite the increasing cost of homebuilding in their request that a national rule not be implemented. Others, however, say that they would rather change their buying habits and purchase more sustainable products in order to end timber removal and other resource commodity use in roadless areas. (See also Chapter 5: Activities (Question 7): Timber Removal.)

Effects on the Agricultural and Ranching Sector – Those who discuss the effects of a national rule on agricultural and ranching economies state that a national rule will have detrimental impacts. One respondent specifically requests a review of aquatic species protection on agriculture, since recent drought conditions have exacerbated conflicts between wildlife and rural communities. (See also Chapter 5: Activities (Question 7): Grazing.)

Effects on the Mining, Oil, and Gas Industries – There are several comments that directly address effects of a national roadless rule on mining, oil, and gas industries and the communities that are dependent upon them. They state that the Forest Service should not implement the Roadless Area Conservation Rule or any national policy that restricts locatable and leasable mining exploration and development in roadless areas. Some respondents discuss specific lease areas or mining operations which, they believe, are threatened by the Rule, such as coal mines in the West Elk Roadless Area, the gold mines in Jerritt Canyon on the Humboldt-Toiyabe National Forest, and oil and gas leases on national grasslands in North Dakota. These respondents request that the Rule be dropped, or that it be modified to exempt all mining activities in roadless areas. They assert that the Rule will have serious negative effects on local communities and the nation's mineral industry and supply. One respondent questions the allegation that mining results in higher road costs to the Forest Service, since they must post special bonds for road maintenance.

Some question the claim that the Rule will have any noticeable effect on the nation's supply of energy or minerals because, they say, only a relatively small percentage of the total reserves are located in roadless areas. (See also Chapter 2: Other Legal Concerns: Federal Laws, Acts, and Policies: *Mining Laws General, Mining Law of 1872, and Mining and Mineral Policy Act*; and Chapter 5: Activities (Question 7): Mining, Oil, and Gas Development.)

Effects on the Recreation Sector – A number of respondents cite positive economic benefits to the outdoor recreation and tourism sectors as a prime reason for implementing a national roadless

rule. People assert that the Roadless Area Conservation Rule correctly places emphasis on non-commodity uses and recreational values of roadless areas, and state that the tourism industry is a viable economic base for communities near roadless areas. Some respondents ask that a national roadless rule be implemented as long as it does not exclude mountain biking from these areas. They believe their expenditures provide an increasing economic boon to areas with good opportunities for their sport.

Others assert that a national roadless rule will best protect game species habitat and superior hunting and fishing opportunities, which in turn will directly benefit local economies. Many small business owners, from professional photographers to gear shop and lodging owners to outfitter/guides, ask that roadless areas be protected in order to support their economic well-being. Some question the claim that a national rule will restrict recreation and therefore rural economic development, citing statistics that demonstrate the opposite trend.

Other respondents ask that a national rule not be implemented, and state that the economic contributions of motorized sports to local economies will be reduced. As one individual points out, there are many outdoor recreational activities, such as camping, hiking, horseback riding, fishing, hunting, bird watching and other wildlife observation that are economic contributors and all rely on the availability of good roads. Several others ask that the rule exempt ski area expansion or that the rule be abandoned entirely. Some ask that the rule not restrict horseback riders access to roadless areas due to their economic contributions to the economy as a whole. (See also Chapter 5: Activities (Question 7): Motorized Recreation, Off-Road Vehicles, Snowmobiles, Non-motorized Recreation, Mechanized Recreation, Ski Area Development, Hunting and Fishing, Outfitter-Guides, and Equestrian Use.)

Effects on Employment – A number of comments regarding the possible employment impacts of a national rule are closely related to comments about economic effects to communities and businesses generally. Comments are vary between those who assert that a national rule will have favorable effects on local employment due to economic diversification, and those who state that it will eliminate too many high-paying commodity-related jobs, resulting in further economic deterioration of rural communities. Some respondents assert that the Forest Service has exaggerated job losses, and that the local commodity-based economies are inherently unsustainable. Some say that export of raw logs for processing abroad has had a negative effect on domestic employment; others state that the timber industry itself is to blame for unsustainable harvest levels which have led to the current environmental concerns and lower timber harvest levels from public lands. Others say that less expensive Canadian lumber is flooding the market, and assert that lowering Forest Service stumpage rates is not the answer to this problem.

A number of people write to request that the Roadless Area Conservation Rule not be implemented, and state that their businesses and the jobs they create are at risk from this Rule. Likewise, some state that no restrictions should be placed on mining activities in roadless areas in order to preserve high-paying jobs in this industry. Some respondents question the benefits of diversifying local economies toward tourism-dependent business activity. They assert that tourism-based jobs are often seasonal, low-paying, and rarely provide health or retirement benefits to employees. These respondents cite the historical viability of their rural communities and credit the timber related jobs as the reason. They now worry that these jobs have disappeared and see citizens having to work 2-3 jobs and still not making ends meet, plus there are no benefits attached to these low paying service jobs.

A few respondents ask that, if job losses do result from a national rule, the Forest Service provide job training to displaced workers. A few suggest that these workers be employed in ecosystem restoration projects. Others assert that the Agency is not responsible for employment levels; private sector employees in non-commodity industries often face layoffs and dislocation too, thus they say, timber workers should not be given special treatment.

Effects on Tax Receipts – A number of respondents believe that a national rule will result in the loss of tax receipts from local businesses as well as reduced payments from the federal government that are tied to resource extraction levels. People comment in particular on possible reduced funding for local schools and public services. Some say that reduced payments to states were not adequately considered in the Roadless Area Conservation Rule Final EIS and should be better analyzed at this time. Respondents are also worried that there will be a drop in mineral royalty payments and so request that these activities be exempted.

Some urge the Forest Service to compensate local communities for losses due to a national rule. Others state that the best way to address any decrease in federal payments is to completely overhaul the financing system; such an overhaul, some suggest, could include taxes on raw materials to support affected communities. Others assert that these payments should not be made up with other federal payments because they imply welfare or attempts to buy local support for a national rule.

Effects on the Global Economy – Respondents who discuss global economic considerations generally assert that the United States should make use of its own natural resources to avoid dependence on foreign sources of raw materials. These sources may be threatened by political instability or supply disruptions, some state, and therefore the Roadless Area Conservation Rule should not be adopted because it would limit locally available resources. Some people also comment that a national rule would result in the transfer of environmental effects of resource removal to less environmentally conscious countries. Others say it is unwise to continue to export our own forest resources, such as Alaskan timber, to other countries and generally ask for implementation of a national roadless rule. Some urge the Forest Service to take the lead in setting an example for the rest of the world about truly sustainable forest management and rainforest conservation.

General Effects on Local Communities and Economies

766. Public Concern: The Forest Service should consider the economic benefits of roadless protection to state and local economies.

Southwick Associates (2000) examined 410 counties across the western US to document the relation between county growth and employment levels and the percentage of lands in protection within 50 miles of the county center. This study demonstrated that while many argue that protecting lands from extractive activities is especially harmful to rural communities the relationship between economic growth and protected areas was stronger than the relationship between economic growth and extractive activities:

During the period 1969-1997, in western rural counties, the amount of protected lands within 50 miles of a county's center was positively and significantly correlated with employment growth and with income growth. The amount of Forest Service roadless areas within 50 miles of a county's center was positively and significantly correlated with employment growth and with income growth. Accordingly, counties containing protected lands are more likely to experience stronger economic growth than those without. Further, counties with the highest proportion of land in protected areas are growing the fastest:

Employment in non-metropolitan counties with more than 10% protected areas grew more than 1.85 times faster than the average non-metropolitan county.

Employment in non-metropolitan counties with more than 10% Forest Service roadless areas grew more than 1.43 times faster than the average non-metropolitan county.

Income in non-metropolitan counties with more than 10% protected areas grew more than 1.4 times faster than the average non-metropolitan county.

Income in non-metropolitan counties with more than 10% Forest Service roadless areas grew 1.25 times faster than the average non-metropolitan county.

The study concluded that. . . . the presence of Forest Service roadless or protected areas was not correlated with slower income or employment growth in any of the county clusters. This means that the statistical test could not find any indication that roadless or protected areas have caused county economies to grow slower. Instead, there is evidence that for some county types the presence of roadless areas was correlated with income and employment growth. (Organization, Ashland, OR - #A20421.75500)

DUE TO THEIR IMPORTANCE TO COMPANIES SEEKING LOCATIONS WITH HIGH QUALITY OF LIFE

For economic concerns with respect to roadless areas, the founder of the company I work for started Bend Research in Oregon to be near public land amenities. Part of the “quality of life” drawing care we use to lure new qualified employees is recreation opportunities on public land, including roadless areas. Grant County would do better to emphasize public land recreation in their economic development, rather than trying to return to the timber industry-dominated past. (Individual, Bates, OR - #A15564.75540)

Economic statistics show that protection of public roadless lands is consistent with a thriving economy, and maintains the natural capital that forms the foundation of Colorado’s identity, quality of life, and economic well being. . . . It is high quality of life offered by Colorado that continues to attract our educated workforce, drawing new high-tech businesses to locate here. (Organization, Denver, CO - #A17162.75540)

Proximity to roadless areas is a very important tool in interesting companies and people in staying in and moving to our town. We promote our nearness to those wild resources that few other places in this great nation have been able to preserve. Our future lies in the preservation of those few wild places that are left in our region. Montana has a dismal history of short term reliance on extractive industries that abuse then abandon the resources they touch. The pro development community would have us stuck to that same tar baby again. Let’s learn from our past experience. The Good Lord isn’t making any more of those few wild acres that are left. (Mayor, City of Great Falls, MT - #A28912.75500)

Washington State is in a unique position to emerge as a respected leader in the so-called ‘green movement.’ Our state holds a large portion of the lands protected by the Roadless Area Conservation Rule, and yet our internal economy is not as highly dependent on the logging industry as are other states in a similar position. Protection of our forests can be viewed as a boon to our state as it makes us more enticing to outside investment that is looking for a corporate home that offers an educated population, high tech resources, and a high quality of living for its workforce. Mining or logging our currently protected forests would be in direct opposition to the efforts of a great many programs at work in Washington to attract new industry. (Individual, Auburn, WA - #A1347.75700)

767. Public Concern: The Forest Service should protect roadless areas to prevent future financial burdens caused by flooding.

Millions of dollars in damages can be caused by severe flooding. Roadless and unlogged watersheds could help to mitigate the severity of the floods and thus save millions of dollars and a lot of human suffering. This may be especially important if we experience climate change. (Individual, Las Vegas, NV - #A5694.51330)

Recent severe flooding in Southern Virginia during a major storm event has been linked to upstream logging on both private and public (National Forest) lands. This damage, running into the millions of dollars locally, was also responsible for loss of life and human suffering, not to mention the impacts on the wildlife populations in that stream channel. Many Appalachian communities, nestled in narrow stream bottoms, are especially susceptible to such catastrophic damage as a result of mining and logging operations and their associated roadbuilding at higher elevations. Communities wind up bearing the brunt of these actions, while corporate players reap the profits on public lands at taxpayers' expense. (Organization, Bland, VA - #A17007.75700)

768. Public Concern: The Forest Service should consider the economic impacts of weakening protection for roadless areas in the White Mountains.

The Roadless Area Conservation rule (as published in January 2001) already provides exceptions that allow roadbuilding when needed to address concerns of wildfires and forest health and management; so, any argument that closure is a detriment is just plainly a non-starter. Not only am I concerned that changes to the rule will significantly weaken protections for the designated areas in the White Mountains which would definitely have an impact on tourism, I am equally concerned at the unequal playing field and economic disadvantage created by such proposed re-openings. Woodsmen and loggers in my part of New Hampshire do not have the luxury of such Federal largesse or indirect subsidy and cannot benefit as those on the other end of the state who would have direct access to the areas in question. (Elected Official, State of New Hampshire - #A4951.75200)

Effects on Resource Dependent Communities and the Timber Industry

769. Public Concern: The Forest Service should consider the negative economic impacts of roadless protection on the economy.

ON RESOURCE-DEPENDENT RURAL COMMUNITIES

The rule does not represent a balanced approach to forest conservation. However, it does create havoc in rural communities which depend on logging, ranching, mining, and drilling. (Individual, Manchester, NH - #A1183.75300)

The entire management of the forests needs to be reviewed to ensure that decisions affecting the viability of each individual forest and the very communities dependent upon the forest for their existence are not regulated out of existence by distant agencies, generic national rules, nor by influential special interests wielding indiscriminate political power over the Agencies mandated with performing this task. (Business, Juneau, AK - #A30599.13100)

The Forest Service must analyze potential impacts on community and provide property, and must give these national forest neighbors meaningful opportunities to comment on decisions about federal lands. One key ingredient of communities is a healthy economic environment on which to base the livelihood of individuals living in the community. Economic development and/or the use of natural resources within the National Forest are key components of the economic viability of communities near the forest. The Forest Service must, at a minimum, seriously consider any and all economic impacts that a "roadless" designation might inflict upon nearby communities that could be affected by such a designation. (Individual, Reno, NV - #A20857.75500)

First you must consider the economic impacts on the area served. Will roadless areas destroy local economies? If they do, make some adjustments. 'My way or the highway' is not the proper tack for a government that constitutionally is pledged to preserving individual rights. Sometimes as the Supreme Court has said in numerous decisions, the rights of the few will supercede the rights of the many. I also believe you have the duty to protect small town America and it's unique way of life. The rights of the Sierra Club, Earth First, etc., should not supercede the rights of those who live in rural America. (Individual, No Address - #A834.75300)

ANPR Question 4-Protecting Communities: One key ingredient of communities is a healthy economic environment on which to base the livelihood of individuals living in the community. Economic development and/or the use of natural resources within the National Forest are key components of the economic viability of communities near the forest. The Forest Service must, at a minimum, seriously consider any economic impact that a "roadless" designation might inflict upon nearby communities that could be affected by such a designation. (Association, Novato, CA - #A17652.75300)

Rural economies will suffer from this action. In a county such as Lake County in Northeastern Minnesota, 58% of the land base is federal, and the timber that is grown and managed on federal lands is a very important resource. This resource is very important to the economy and social well being of Lake County. Recently, timber management by the Forest Service has not been an end in itself. For example, timber products coming off of federal lands have been the by products of aesthetic enhancement, wildlife habitat creation or fuel loading reduction management. It is important to understand the consequences of reduced timber quantities on the economy, schools, communities, local units of governments and the people of a region that is so largely dependent on the land for its way of life. When the majority of land in a region is controlled by an agency that no longer sees that resource as important as a product, there are many negative far reaching effects. (Elected Official, Lake County, MN - #A15552.75510)

ON TIMBER-DEPENDENT BUSINESSES

The timber harvest on the Nicolet has gone from the 96 million board feet per year the operating plan to 40 million board feet currently. This has already caused abandonment of the only railroad in Florence County-The N.B.N. Railroad. The new "Roadless Area" when coupled with all the other Forest Service set asides such as Ladd areas, wilderness, semi primitive non motorized areas, research natural areas, Wild River classifications and River-Lake corridors have heavily impacted the multiple use of our Nicolet National Forest. The Preservation goal of "No Timber Cutting on Public Lands" is rapidly approaching and with it goes the economic viability of Florence County and my company-Pine River Lumber Company, Ltd. Good management of our forest Service lands will protect these 50 jobs and still provide "all" the other multiple uses so important to National Forests Management. (Association, Long Lake, WI - #A8046.75320)

Three Rivers Timber, Inc., is a family owned, small business sawmill operation located at Kamiah, Idaho. Approximately 200 families are supported by jobs in the sawmill, woods operations, and trucking. The local national forests are the primary sources of both raw materials to run our operation, and recreational opportunities for our employees. (Association, Kamiah, ID - #A3685.75320)

This letter is the voice of 40 people employed at Great Northern Bark Company. It produces decorative landscaping bark which is shipped throughout the U.S., Canada, and Japan. Four thousand semi trucks of product are shipped each year which generates \$8 million of revenue. Obviously, Great Northern Bark Company is entirely dependent on nearby lumber mills who are in turn dependent on the forests. Many small lumber mills have already been forced out of business because of federal and international influence on the lumber industry. **The Roadless Areas Conservation Rule clearly threatens Montana jobs and the lumber industry further.** (Association, Columbia Falls, MT - #A26902.75300)

Central Point Lumber Company was a small log mill operating in Central Point, Oregon, until the fall of 2000. At that time, the mill which had been in continuous operation since shortly after the end of World War II, Central Point Lumber, shut down and was auctioned in the spring of this year. Central Point Lumber closed because without fee timberlands and the lack of a federal timber sale program on the national forests of southern Oregon and Northern California, it could not compete in a global market. As you are already aware, some 19 billion board feet of the 50+ billion board feet of softwood lumber consumed annually in the United States comes from Canada. Central Point Lumber Company and the 80-100 family-wage jobs it provided our local economy is gone forever. Should this economic

information be of interest to the Chief of the U.S. Forest Service? SOTIA believes the answer is yes. (Association, Medford, OR - #A17183.75400)

The federal government has almost completely destroyed the timber industry in Idaho. Don't destroy it altogether. It is much too expensive to log most areas using transportation means other than roads. Existing roads should all be maintained. Funding should be provided to do so. (Individual, Boise, ID - #A9.75200)

770. Public Concern: The Forest Service should consider the economic benefits provided by the timber industry.

Timber harvest is a boon to our national economy by providing good paying jobs to those who do the harvesting and to those who utilize the products to make paper and build the many types of construction. (Individual, Whitefish, MT - #A5102.75510)

771. Public Concern: The Forest Service should act to create a more streamlined legal process to dispose of frivolous legal challenges to timber sales.

IN ORDER TO MAINTAIN THE VIABILITY OF SMALL MILLS

Our state has an unbalance portion of Federal Lands, Forest Service and BLM. The poor management of these lands has decimated the smaller sawmills in the state because they were dependent upon Forest Service timber. Over the last 5 years, because the Forest Service was no longer a reliable source of timber, the smaller mills in Western Montana went out of business, leaving, for the most part, only the large timber companies who own their own timber. These companies can now dictate the price of timber from the National Forests because they don't have to buy Forest Service timber and there is no competition. The roadless initiatives, legal actions and the resulting long resolution time for disputed sales, and a Forest Service organization responding to politics not science has made the reasonable management of our National Forests a disgrace. Not only causing the loss of timber industry jobs but also allowing the build up of high fuel loads in the forests resulting in catastrophic fires in dryer years. I think this can be changed by a more streamlined legal process with recourse for frivolous legal challenges, control and management turned over to smaller local units, the State of Montana, or as I mentioned, to a quasi private organization. (Individual, Missoula, MT - #A4891.75100)

772. Public Concern: The Forest Service should acknowledge that sustained yield has never been practiced, with prior over-harvest leading to current reductions in commercial timber volume.

The economics of timber harvest on the western forests is questionable. It is our observation that the best timber has already been harvested on most National Forests and definitely over-harvested on the Bighorn National Forest. . . . Sustained yield was not understood or certainly not practiced and now we have a huge decrease in timber production and sawmills closed. The timber that remains will be very expensive to harvest, as it is located in the most rugged parts of the mountain. Road building will be extremely expensive for a product that can't pay the costs and at the expense of many other users including recreation, watershed quality and wildlife habitat. (Individual, Sheridan, WY - #A15725.75400)

I believe it is time to reevaluate the congressional mandate for the Forest Service to provide sustained yield of renewable resources. Past forest management has not provided sustained yield as required by the 1960 MUSYA Act, and public forests have been decimated over the past 40 years. Private logging should not occur on public lands at taxpayer expense. (Individual, Olympia, WA - #A6929.75600)

773. Public Concern: The Forest Service should reiterate that negative economic impacts from reduced timber removal will be minimal.

The Facts and Figures on the Economic Impact of Prohibiting Logging in the Roadless Areas of Montana's National Forests:

1. The Relative Importance of Forest Products in the Economy: Most of Montana's forest products industry is located in western and southwestern Montana. In the counties adjacent to the National Forests 3.4 percent of all jobs were directly related to forest products activity (11,000 forest products jobs out of 340,000 total jobs).
2. The Change in National Forest Timber Harvests and Local Economic Impacts: The peak year of harvest off of both federal and other lands was 1988. Since then the harvest from the National Forests has fallen by 76 percent or 473 million board feet (mmbf). During that same period the Montana counties adjacent to the National Forests added about 91,000 new jobs.
3. The Impact of Prohibiting Logging in Roadless Areas on the Local Economy: Between 1993 and 1999 the National Forest timber harvest that came from the inventoried roadless areas on the Montana NFs was 4 million board feet (mmbf). For the 2000-2004 period, the Montana NFs plan to harvest about 3 mmbf in the roadless areas. Thus, the "loss" to this part of the west central Montana economy of putting all roadless areas off limits to roading and timber harvest would be a small reduction in NF timber harvests, at most 4 mmbf or about 2 percent. If these NF counties in Montana were able to digest a 473 mmbf reduction during the 1990s without serious economic consequences, they should be able to digest a 4 mmbf reduction with ease. . . . The direct employment impact of a 4 mmbf reduction in NF timber harvest would be about 40 jobs. Each year during the 1988-1997 period about 10,000 jobs have been added in these counties. The 40 job reduction represents about 1 job out of every 8,500 jobs in the Montana NF counties. Less than two days of normal job growth would replace them. Thus, ignoring any economic benefits of protecting these areas, the economic cost of permanent protection would be a less than a one-hundredth of one percent reduction in employment or a 2-day pause in the region's ongoing economic vitality. (Organization, Missoula, MT - #A21359.75310)

The enactment of the Roadless Area Conservation Rule did have some impact in my industry in the Mid-Atlantic regions hardwood lumber markets with the closing of roadless areas in Monongahela and George Washington National Forests in West Virginia and in Virginia. The negative impact on the secondary products manufacturing segment was very short lived with domestic hardwood pricing stabilizing within 60 days. (Association, Hershey, PA - #A31493.75510)

774. Public Concern: The Forest Service should focus timber removal in roaded areas.

The Forest Service and our current national administration is too concerned with spending tax dollars to subsidize timber harvest in roadless areas and not concerned enough with proper management including regeneration and pre-commercial and commercial thinning in areas already roaded and committed to timber management. (Individual, Bozeman, MT - #A5649.75600)

The value of our National Forests can only be described as priceless. The worth of almost anything increases as it becomes more scarce, and we all know old growth forests are becoming rare. If we continue to allow further logging of our national forests, old growth forests and all the plants and animals that thrive in their environment will be lost. Anyone who traveled in other parts of the world has seen what happens to forests when the only criteria for protecting trees is economical. The famous Black Forest in Germany is basically nothing but a giant tree farm. The formerly forested British Isles are now hills of heather. We have plenty of commercial and BLM tree farms to support the timber industry. Leave what little remains of the old growth forests for our descendants to enjoy. The roadless ban is one small way to preserve the true value of our National Forests. (Individual, Port Angeles, WA - #A1044.70000)

TO SUPPORT LOCAL MILLS

There are plenty of road-accessible lands available for logging. Using the FS's own numbers, we estimate there are over 10 billion board feet of timber available for cutting within a quarter mile of the more than 4,650 miles of existing logging roads on the Tongass. That's enough to support sustainable, small-scale, locally owned, high-value timber businesses. (Individual, Auke Bay, AK - #A8021.90130)

775. Public Concern: The Forest Service should implement a national rule to encourage private forest landowners to make more efficient use of their resources.

Corporate interests need to better utilize the vast land assets they still retain. Humans need to make more efficient use the vast tracts they already occupy and dedicate to their exclusive use and pleasure. It is simply imperative that some significant, unbroken stretches of wild remain protected. If you try to please everyone, you will simply destroy the remaining forests. (Individual, Olympia, WA - #A16987.70500)

776. Public Concern: The Forest Service should not implement a national roadless rule because it will further encourage overharvest of private lands.

The reduction in Forest Service timber sales in recent years has led to a profound imbalance in Montana's log supply equation. Inventories show that Montana as a whole has not been overcut, but rather has more timber than in 1950. However, the private industrial timberlands of Montana have been very heavily logged in recent years as mills have had to compensate for the lack of National Forest timber. Their motivation is simple, to try to avoid shutting down, losing the investment in their sawmill, and throwing their employees out of work. The data gathered for an interagency task force which was summarized in the 1993 publication "An Assessment of Montana's Timber Situation" clearly show that we will need substantial amounts of National Forest timber in the near future if Montana's forest products industry is to avoid collapse. The policy of decimating the timber sale program, through a series of moratoria, listings of species such as Bull Trout under the ESA, and initiatives such as the "lock up" of 50 million acres, will in turn decimate Montana's timber dependent communities. (Organization, Missoula, MT - #A28141.75300)

777. Public Concern: The Forest Service should help local mills retool to maximize benefits to local economies.

The FS should work with local communities to help them utilize any forest products that are removed so that maximum economic benefit stays in the community. (Re-tooling mills to take small diameter wood, for example.) (Individual, Carlton, WA - #A30322.75400)

778. Public Concern: The Forest Service should consider the small number of jobs created by chip mills versus those created by conventional saw mills.

As a large number of chip mills have moved into our area because of our reputation for poor environmental protection. With their insatiable appetite for wood, projections show that they will denude the Upstate at an unsustainable rate. And all of this havoc is wreaked while a trivial number of jobs are created by a chip mill, about 1/100 of what would be created with a conventional saw mill. (Individual, Clemson, SC - #A1455.75310)

779. Public Concern: The Forest Service should allow resource development in roadless areas to meet the needs of American consumers.

Given the fact that your agency has de facto control over the lands which you claim, I would like you to consider the fact that our country needs the resources which are upon the public lands in order to maintain our standard of living, and to remain a light of freedom to the entire world. If we close off all of our public lands, and do not allow the resources in them to be developed, then our nation will become poor. I do not want my children and grandchildren to grow up as the children and grandchildren of people in third world countries, where the government controls everything, and the people are homeless and poor in this our land. (Individual, Las Vegas, NV - #A1078.70300)

780. Public Concern: The Forest Service should stop claiming that the lumber needs of American consumers justify timber removal in roadless areas.

There are no reasons or rationale adequate to continue destroying these pristine national treasures. The selling off of these forests only benefits a few timber barons. As a citizen and a taxpayer I state emphatically that you may not use my "needs" for lumber or paper pulp as an excuse to destroy these biologically rich habitats; I WILL DO WITHOUT! (Individual, Eugene, OR - #A14374.75500)

781. Public Concern: The Forest Service should consider the negative economic impacts of roadless protection on the economy.

ON THE HOMEBUILDING INDUSTRY

There is a real concern among lumber dealers and all those in the building/housing sector about how the management, or non-management, of the US forest resources impact the ability of people to purchase a home. The laws of supply and demand dictate that whenever supply is lessened, costs rise. Each time the United States shuts down access to the forests, thereby shutting down any kind of logging or selective harvesting, it impacts the cost of lumber—and it drives the US to more dependency on foreign sources of product. Lumber is the largest single component in the building of a house and when the cost of lumber increases, the cost of the house increases. For each \$2,000 increase in the cost of a home, according to the US Census Bureau, 300,000 Americans nationwide are kicked out of eligibility for a home mortgage. This is great concern for lumber dealers because if people can't afford homes, homes don't get built. When homes don't get built, lumber dealers don't have business. (Association, Washington, DC - #A6211.75400)

I have been a great supporter of yours here in Colorado and appreciate the delay of enforcing the anti-capitalist approach of the Clinton Administration on Public Lands. At one time the public lands were a Land of Many Uses. Now, they seem to be the land of socialism. The U.S. Forest Service Roadless Rule permits our public lands to decay and additional chances of wild fires of those forests and the surrounding areas. Without Roads to set up fire blocks, we are sitting on tinder here in the west so the environmentalists/socialist agenda can be promoted. By implementing the roadless rule it will increase the cost of the homes in the United States, increase the Energy Crisis and assist in bringing down our economy. (Individual, Castle Rock, CO - #A3628.10112)

Effects on the Agricultural and Ranching Sector

782. Public Concern: The Forest Service should consider the social, cultural, and historic value of the sustained use of these areas and the local communities they support.

The current Roadless Area Conservation Rule fails to account for the social, cultural, and historic value of the sustained use of these areas and the local communities which they support. As rural communities are economically besieged by impacts from a faltering economy, increasing agricultural input costs, and the loss of public resources, our country's valuable cultural heritage is slowly being eroded away. The economic and social value of these roadless areas to many industries, including ranching, cannot be understated, and should be taken into account in the decision making process. (Association, Sacramento, CA - #A3681.75000)

783. Public Concern: The Forest Service should consider the negative economic impacts of roadless protection on the economy.

ON RANCHERS

The roadless initiative also hurts my family in that it will make it harder on the ranchers who have permits to graze their cattle on the mountain. Not having any roads sure makes it hard to manage cattle. (Individual, Manti, UT - #A23591.75520)

784. Public Concern: The Forest Service should address the effects of aquatic species protection on agricultural areas.

This community has seen the worst drought in decades, although it is usually plentiful with water flowing off the Southeastern Cascades. The very recent Federal decision to shut down the "A" canal run-off of the upper Klamath Lake, that has been designated for the local farming community for decades, to supposedly spare the hardy Sucker fish and the unpredictable salmon at the mouth of the Klamath river has undoubtedly hurt the economy and the morale of the people here yet again. There has been an angry outcry to "kill the Sucker-fish" and to amend the Endangered Species Act, which was the "official" basis for the Federal decision, although there is a cynical suspicion that California's demand for more [electricity] played a role in this decision. There is a contingent here with whom almost all of the regional rural populous sympathizes with, that is on the verge of an all-out rebellion. (Individual, Klamath Falls, OR - #A6931.51200)

*Effects on the Mining, Oil, and Gas Industries***785. Public Concern: The Forest Service should consider the negative economic impacts of roadless protection on the economy.****ON MINING-DEPENDENT COMMUNITIES**

The roadless rule prevents the mining and drilling of natural resources on public lands that has yet to be extracted, costing local governments millions of dollars. This would directly affect me in a number of ways. Higher taxes would be required with the loss of taxes collected on mining companies and other businesses forced to close due to the abovementioned actions. (Individual, Sterling, UT - #A8924.75700)

786. Public Concern: The Forest Service should prepare an Energy Impact Statement for mining-dependent communities with inelastic economies.

The Roadless Area Final Environmental Impact Statement clearly noted that in some areas of the country (particularly rural western states), that the economy is relatively or completely inelastic. This means that if historic mining jobs are eliminated, there won't be anything available to replace them, or they will be replaced by minimum wage jobs. Input is needed from local and county commissioners, agencies and public to determine the importance of coal mining to the region. Careful consideration should be given to those counties and communities where mining activities are critical to the economy and well being of those areas. An Energy Impact Statement would prove useful to this deliberation. (Business, Wright, WY - #A23085.75530)

The amended rule should include the President's Executive Order requiring that any federal action to incorporate lands into inventoried roadless designation must also include an Energy Impact Statement that identifies and quantifies impacts to energy resources within the area. (Business, Wright, WY - #A23085.65300)

787. Public Concern: The new rulemaking process should reevaluate coal leasing restrictions in the West Elk Roadless Area.**DUE TO THE IMPORTANCE OF MINING TO THE REGIONAL ECONOMY**

There have been several Forest Management Plan revisions over the past 20 years, as well as several Environmental Impact Statements for such things as Oil and Gas Development in the Grand Mesa, Uncompahgre and Gunnison National Forests (GMUG). In fact, the Oil and Gas FEIS Record of Decision stated, "The West Elk Roadless Area has been divided into two general areas, the area west of Coal Creek and the area east of Coal Creek. West of Coal Creek existing coal leases, coal exploration activities, and roads and spurs have compromised the roadless values. Standard Lease Terms will apply west of Coal Creek. East of Coal Creek, this part to the West Elk Roadless Area is of the Kebler Pass

Corridor. The decision of the Kebler Pass Corridor is No Lease” The coal mines are located in the area west of Coal Creek.

In addition, the area has experienced extensive drilling programs for coal exploration, as well as coal leasing. Delta County has been supportive of these coal mining activities, as it serves to extend the future of the economy of the region which supports so many of our residents. Little to none of this information was considered in the previous rulemaking, as the boundary was pre-determined. There was not an opportunity to discuss modifications in the boundaries, and as such the revised rule needs to provide that opportunity. Informed decision-making does not mean that every last bit of information be available, but pertinent and relevant data/information is critical. The Forest Service needs to ensure that the key information is brought to light. (Elected Official, Delta County, CO - #A15550.75530)

DUE TO POTENTIAL IMPACTS ON THE WEST ELK MINE

Development of the West Elk Mine historically has required several ventilation shafts and development of drilling activities requiring the construction of access roads over National Forest lands. In addition, last year, the Mine experienced a serious underground mine fire as a result of spontaneous combustion. Road construction was vital to locating the fire, determining its extent, and extinguishing it, thereby preserving vital natural resources, jobs, and associated federal coal royalties, state taxes, and revenue sharing to Gunnison County. Therefore, roadless designation of the area affecting the West Elk Mine would significantly impede future mine development and exploration by cutting off access to the surface necessary for safe and productive mining operations.

This problem is [not] merely hypothetical. Indeed, it is very real—because under the Roadless Rule, almost all of the West Elk Mine’s future expansion areas required for operations to continue would be designated as roadless since those expansion areas lie within inventoried roadless areas. Indeed, West Elk already has faced effects from the Roadless Rule. It sought permission to conduct exploration drilling in the future expansion area, but the Forest Service recently denied that request based upon the anticipated roadless designation of that area.

This denial by the Forest Service is particularly ironic since the Roadless Rule supposedly has not been implemented because of the preliminary injunction granted to plaintiffs on May 10, 2001 by the United States District Court for the District of Idaho in *Kootenai Tribe of Idaho et al v. Veneman*, Civil No. 01-010 (D. Id. filed Jan. 8, 2001), and *State of Idaho v. Dirk Kempthorne, Governor v. US Forest Service*, Civil No. 01-011 (D. Id. filed Jan. 9, 2001). Indeed, this very ANPR is an acknowledgement by the Forest Service that the rulemaking process resulting in the Roadless Rule was flawed and should be corrected. (Association, Washington, DC - #A19636.65320)

Unfortunately in the interim, however, Arch’s West Elk Mine has been caught up in the middle and is experiencing actual, not hypothetical, problems. Arch fears these problems are representative of only the tip of the iceberg should the Roadless Rule be fully implemented. Thus, as of the date of this filing, the West Elk Mine is in jeopardy due to the enjoined Roadless Rule. More specifically, even though the Roadless Rule is not in effect, the West Elk Mine has been unable to proceed with a recently approved BLM modification of two of the Mine’s coal leases, adding 160 acres to the 4836 acres in Lease C-1362 and just under 150 acres to the 2770 acres in Lease COC-56447. These lease modifications, which constitute less than a 3% increase in the size of the Mine are needed to adjust lease boundaries in order to avoid the bypass of economically recoverable coal and to provide for the efficient use of Mine resources and infrastructure without extensive expansion to new land areas. All of this has been explained and analyzed in the Forest Service’s Environmental Assessment (“EA”) related to the exploration license applications filed with BLM to cover activities in the acreage included in the lease modifications. Nevertheless, the Forest Service is proposing a stipulation to these lease modifications that will require the application of road building prohibitions.

Denial of Arch’s exploration license applications by the Forest Service based on the application of road building prohibitions will not only result in a waste of otherwise recoverable coal, but also raises real concerns that such restriction represents a portent of things to come—with adverse effects not only for Arch, but to our local communities as well. (Association, Washington, DC - #A19636.65320)

788. Public Concern: The Forest Service should adequately consider impacts to the Utah coal industry.

If implemented, the current proposed rule will jeopardize hundreds of millions of tons of Utah's known coal reserves and will threaten the very energy independence of the State of Utah. The U.S. Department of Agriculture and the U.S. Forest Service failed to adequately address the impact of the Roadless Area Rule on Utah's coal industry because of a complete lack of detailed maps during the public scoping process. As a result, the estimated 50 million tons of Utah coal identified by the Agency's final Environmental Impact Statement (FEIS) grossly understates the proposed rule's impact on Utah's dwindling coal reserves and the corresponding economic impact on local economies. (Association, Salt Lake City, UT - #A20464.75530)

789. Public Concern: The Forest Service should allow access for mining to protect investments made by the industry.**IN NEVADA GOLD MINES**

AGNA is the majority owner and operator of the AngloGold-Meridian Jerritt Canyon Joint Venture that operates the Jerritt Canyon Mine on the Humboldt-Toiyabe National Forest in the Independence Range. The Independence Range lies northwest of Elko, Nevada, and southwest of the Jarbidge Wilderness.

Approximately eight miles north of the Jerritt Canyon Mine is the Big Springs mining area. Independence Mining Company Inc. (an indirect predecessor of AGNA) produced as much as 60,000 oz. of gold annually in the 1980s and early 1990s from Big Springs; AGNA has conducted some additional exploration activities in the area within the last year. Squeezed between the Jerritt Canyon Mine and Big Springs is an inventoried roadless area identified in the FEIS for the Roadless Rule, see FEIS, Vol. 2, at 117, where valuable mineral deposits quite likely exist and could be found if exploration remains feasible. The designation of this area as "roadless," however, will significantly impair any such mineral exploration and development because: (1) the preparation of new forest plans triggered by the proposed rule will cause significant delay; and (2) the likely necessity of conducting an EIS at substantial costs will make most exploration activities uneconomical. Indeed, the roadless designation itself creates a major new disincentive to making the substantial investments needed to carry out mineral exploration. (Association, Washington, DC - #A19636.75530)

790. Public Concern: The Forest Service should consider negative economic impacts to the oil and gas industry.**IN NORTH DAKOTA**

This rule will have a devastating impact on the oil and gas industry of North Dakota and drastically impacts the economy and well being of the state as a whole. The current management direction of the grasslands allows multiple uses as determined at a local level by the Forest Service's Bismarck office. The Roadless Initiative would take nearly 25% of the Dakota Prairie Grasslands out of multiple use management and set it aside for amenity uses by small special interest groups. (Business, Bismarck, ND - #A19269.75530)

BP Amoco has put their Mandan refinery up for sale. This was announced the same week the Final EIS for the Roadless Plan was released. Why would a company do this when the lack of refinery capacity is one of the main contributors to the current oil shortage? It is my understanding that the Mandan Refinery has had difficulty in obtaining sufficient oil to operate at optimum capacity. It also obtains approximately 36% of its volume from wells located on the National Grasslands. I do not believe that if they felt assured of adequate oil supplies that they would have put the refinery up for sale. (Elected Official, McKenzie County, ND - #A27737.65300)

791. Public Concern: The Forest Service should consider negative economic impacts to the phosphate mining industry.

The proposed ANPR poses serious threats to our company's ability to continue providing critical phosphate soil nutrients to America's farmers. (Association, Pocatello, ID - #A20842.75530)

792. Public Concern: The Forest Service should abandon the Roadless Area Conservation Rule.

DUE TO NEGATIVE ECONOMIC IMPACTS TO THE HARDROCK MINING INDUSTRY

The USFS proposal would adversely affect NWMA members economically, spiritually, and emotionally. A significant number of our members have made substantial investments in mineral related activities occurring within the National Forest System. Their future business interests are directly and irreparably harmed by the January 12 Rule, as needed access is prevented. (Association, Spokane, WA - #A17351.75530)

793. Public Concern: The Forest Service should consider the conclusions of the National Academy of Sciences report on hardrock mining.

These letters refer to an October 1999 report entitled "Hardrock Mining on Federal Lands," prepared by a balanced, blue ribbon panel of experts under the auspices of the National Academy of Sciences/National Research Council, pursuant to a request by Congress (the "NRC Report"). That Report specifically found, as an overarching conclusion, that existing federal and state regulation of hardrock mining on Federal lands (including National Forest lands) was "generally effective" and that "improvements in the implementation of existing regulations present the greatest opportunity for improving environmental protection and the efficiency of the regulatory process. (Association, Washington, DC - #A19636.75530)

794. Public Concern: The Forest Service should refute the allegation that coal mining results in higher road costs to the Agency.

BECAUSE INDUSTRY RECLAMATION BONDS FINANCE MAINTENANCE

Clearly note that surface disturbances associated with coal mining (i.e., road construction and reconstruction) to the Forest Service. Federal and State rules, regulations and statutes require that the operator reclaim the disturbance to a condition at least as good as the pre-mining land condition and that it be done at the operator's expense. A reclamation bond is held by the State until such time as the reclamation is deemed satisfactory (usually 10 years after completion of the finalization of the reclamation). The Forest Service needs to refute the allegation that coal production is creating road maintenance costs for the Forest Service. (Business, Wright, WY - #A23085.75600)

The Forest Service has a unique relationship with coal mining on Forest Service lands in that there are state and federal requirements to reclaim any surface disturbance associated with mining activities to a condition that is at least as good as the pre-mining land condition. **Coal mining activities cannot by definition result in the need for the Forest Service to expand any further dollars for maintenance of roads, as it is the responsibility of the operator to reclaim those disturbed areas to the satisfaction of the landowners.** The amended rule should clearly and distinctly recognize this fact. (Business, Wright, WY - #A23085.65320)

795. Public Concern: The Forest Service should discourage boom and bust oil and gas development.

Depopulation in North Dakota's western counties is a longstanding circumstance. The economics of oil development in western North Dakota, only a small part of which is dependent on the National Grasslands, causes boom or bust scenarios in local communities. In 1999, on the other hand, twenty-eight percent of North Dakota's primary sector economy was attributed to our most active growth

industry—tourism. Guide services, food and sleeping accommodations, outfitters, educational and entertainment opportunities, and related retail sales and services give local citizens options for livelihoods alongside historic ranching traditions. (Organization, Bismarck, ND - #A19108.75530)

796. Public Concern: The Forest Service should reiterate that a national roadless rule will not impact the nation's energy supplies.

Roadless area in the Rocky Mountains are not a major domestic source of oil and gas. These areas contain only 0.04% of the nation's oil and resources and 0.06% of U.S. gas resources. Protecting roadless areas will not impact the nation's energy supplies. (Individual, Laramie, WY - #A22540.75530)

Roadless areas in the Rocky Mountains contain only four-tenths of one percent of the nation's oil resources and six-tenths of one percent of U.S. gas resources. In fact, these wild forests are worth more standing. (Organization, Portland, OR - #A12004.75500)

Most roadless areas have been available for oil and gas leasing for decades, but few have been leased. Extensive portions of the lands which the oil and gas industry believes have high potential are already under lease and therefore would not be affected by the Roadless Rule. Specifically, according to the Forest Service, 759,000 acres of national forest roadless areas with high oil and gas potential—mostly located within the Intermountain, Northern, and Rocky Mountain regions—are already under lease. The Roadless Rule would have no effect on these existing oil and gas leases and, in fact, provides for future development, with roadbuilding, on lands currently under lease. For this reason, claims of the Rule's impact are usually overestimated. (Organization, Denver, CO - #A21367.75530)

Effects on the Recreation Sector

797. Public Concern: The Forest Service should consider the economic benefits of roadless protection to state and local economies.

DUE TO THEIR IMPORTANCE TO THE TOURISM INDUSTRY

Alaska's long-term economic gold mine is tourism, increasingly and effectively promoted on the basis of its unspoiled environment and abundant wildlife. Since statehood, Alaska's annual tourism growth has averaged 10 percent. Recent trends point to even higher growth rates. Tourism in Southeast Alaska averaged an annual increase of over 20 percent since 1988, with a cumulative increase in revenue of 108 percent. But some tourism businesses now find themselves confronting limits to growth, caused by clearcut logging and related development. (Organization, Plymouth, MN - #A7116.75000)

My family business has depended on roadless wilderness areas for more than 80 years. For this business to survive another generation or two we must have wilderness. We have already been impacted by logging and developments. Please, no more roads in the little that remains. (Individual, No Address - #A8149.75310)

My business employs 30 people directly related to the Boundary Waters Wilderness activity and the last thing my customers want to hear is the roar of road building and logging. Keep the Roadless Rule intact. (Business, Ely, MN - #A6610.75320)

We are grandchildren of a dude ranching family legacy. For the legacy to continue to us and our children we need to not change the Roadless Area Conservation Rule. Please keep it JUST AS IT IS. The guests that have come here for over 80 years want wilderness w/o roads. As an appointed official of our national forests you are representing us as owners of government lands. Please heed our wishes. (Individual, No Address - #A8151.75540)

We live in Bristol, VT and use the Green Mountain, Pisgah and other National Forests in the East, as well as some in the West, as owners of Wonder Walks, a permitted tour company that leads guided outings. We also hike, snowshoe, cross-country ski, and use the forest for enjoyment on our own. So, naturally, maintaining the ecological integrity of the forest is of utmost importance to us and our business. (Business, Bristol, VT - #A8734.75540)

Many of my constituents have contacted me in support of this measure. They believe it is important for both our surrounding Six Rivers Forest ecosystem and our local economy. Currently, our economy is becoming more balanced with the attributes of ecotourism, coupled with logging on other Forest Service Lands. (Elected Official, Humboldt County, CA - #A22067.75540)

It has been said many times that folks do not come to the mountains or the forests to see clear cuts, logging, or roads. The Southern Appalachian National Forests, in particular, are within one day's driving distance of half the nation's population, and are under increasing pressure from recreation and tourism. Wilderness areas in some places, particularly closer to these large urban centers, are facing overuse, while at the same time the existing roadless inventory is being whittled away by so-called "local" management into smaller and smaller parcels by roadbuilding and logging. In the end, such industries leave local communities with nothing but denuded hillsides or "beauty strips", and the departure of the loggers leave a tourism industry in shambles. (Organization, Bland, VA - #A17007.75540)

DUE TO THEIR IMPORTANCE TO RECREATIONAL NON-MOTORIZED USERS

This past summer, I spent 22 days backpacking in roadless areas out West. With the purchase of some new gear, airfare, and the use of guides, the economies of several cities benefited by having roadless areas close by. That dollar amount is multiplied many times over, and having a roadless area to attract people such as myself and others who benefit from roadless areas use, it is a continuing source of revenue for communities. (Individual, Plymouth Meeting, PA - #A8071.45100)

DUE TO THEIR IMPORTANCE TO THE MOUNTAIN BIKING COMMUNITY

Mountain biking is one of the most popular recreational uses on the TNF, by virtue of its affordability, popularity among all age groups, and accessibility to miles of trails from large Northern California population centers. The tourism associated with mountain biking on this Forest is significant to the small towns in the area, particularly Downieville, California, in the heart of the Forest, as well as the Lake Tahoe/Truckee area. Much of the social fabric of the Forest on summer weekends is strongly influenced by mountain biking activities. (Organization, Boulder, CO - #A17252.75540)

Due to popularity among all age groups, the accessibility of Tahoe NF trails from urban centers and large number of riding areas in the TNF, mountain bikers provide communities such as Downieville, Sierra City, and other smaller towns assistance from the money spent by mountain bike visitors. Larger areas such as the Truckee/Tahoe Lake area also benefit for the same reasons. Social functions within these communities celebrate mountain biking and the contributions of cyclists. (Individual, Woodland, CA - #A18071.75500)

DUE TO THEIR IMPORTANCE TO RECREATIONAL FISHING AND HUNTING

Fishing and hunting values and traditions are deeply held in the United States and must be considered in decisions that affect the roadless areas in the forests and grasslands—the nation's best remaining fish and wildlife habitat. The Forest Service should also consider the huge economic benefits roadless areas bring to state and local economies. A 1999 report by the American Sportfishing Association found that in 1996 alone, fishing in the National Forests contributed \$8.5 billion to the nation's economy. Keeping roadless areas in our national forests and grasslands roadless, will help to sustain these economic benefits. (Individual, Beverly Hills, MI - #A4756.75000)

The Forest Service should also consider the huge economic benefits roadless areas bring to state and local economies. A 1999 report by the American Sportfishing Association found that in 1996 alone, fishing in the National Forests contributed \$8.5 billion to the nation's economy. Keeping roadless areas

in our national forests and grasslands roadless will help to sustain these economic benefits. Regarding allowable activities in roadless areas, roads should not be constructed in the existing roadless areas of our national forests and grasslands. These roads threaten vital trout and salmon habitat by increasing sediment in streams - sediment that fills pools and smothers spawning gravel. (Individual, Minneapolis, MN - #A5301.75500)

Remember take away the animals and fish and we have no reason to buy a license, so you won't have any money for paying for wardens, etc. (Individual, Campbellsport, WI - #A3971.53300)

DUE TO THEIR IMPORTANCE TO PHOTOGRAPHY-RELATED BUSINESSES

Today I primarily make my living shooting wilderness landscape photographs here in Colorado. Colorado's roadless areas are the heart and soul of my business. This is not a simple-minded issue of jobs versus the environment. Preserving all of Colorado's remaining wild areas is essential for me to continue my career. (Individual, Boulder, CO - #A13461.75320)

DUE TO THEIR IMPORTANCE TO OUTFITTER-GUIDES

Inventoried roadless areas are critical to small outfitting and guide businesses permitted to operate on national forests throughout Montana. Inventoried roadless areas provide approximately half of all service days, more than designated wilderness. 235 wildlands outfitters (77% of all wildlands outfitters) depended on unprotected roadless areas for a significant portion of their business. For those wildlands outfitters, that depended on unprotected roadless areas for a portion of their business, sixty percent of their service days occurred in roadless areas. Only twenty-three percent of Montana wildlands outfitters utilized designated wilderness but no inventoried roadless areas. Thirty percent of wildlands outfitters depend on unprotected roadless areas to provide a "wild" experience. \$83 million in economic activity and 3,339 Montana jobs stem from businesses who operate in Montana's inventoried roadless areas. (Business, Bozeman, MT - #A21902.75320)

DUE TO THEIR IMPORTANCE TO THE OUTDOOR GEAR INDUSTRY

REI is a major specialty retailer of outdoor gear and clothing. Our projected sales for 2001 will exceed \$700 million, making us a significant part of the \$18 billion outdoor industry. As the nation's largest consumer cooperative we have more than 1.8 million members actively purchasing annually nationwide. . . . REI members and our 7,000 employees are passionate outdoors people and active stewards of our outdoors. Our research indicates that protection of Wilderness and pristine outdoor places for recreation is overwhelming favored by our members and employees. As a company, we've worked for more than 25 years with the outdoor industry, land managers, outdoor groups and the conservation community to ensure our members can enjoy a diversity of outdoor experiences. Forest Service lands are significant and vital to ensuring this experience.

The roadless policy is important to our business because it would have preserved 58.5 million acres of land for the 137 million Americans who last year participated in human-powered outdoor recreational activities. It also recognized that the real growth in use of public lands is in recreation. (Business, Sumner, WA - #A21731.75540)

From the muscle-powered recreation standpoint, roadless areas offer a unique and pristine outdoor experience where one can experience nature in its original state and with minimal intrusion from the outside world. These opportunities are dwindling and the REI's business is critically linked to successfully ensuring a diversity of outdoor experiences on these lands. These lands are increasingly important as urban growth continues and close-to-home recreation areas are more and more frequently surrounded by intensive development. In the long-term, these roadless areas will be in greater demand by people who want a more primitive outdoor experience. A lack of availability of such outdoor experiences will affect the future growth and success of outdoor companies such as REI, as well as manufacturers, outfitters, travel companies and the recreation-dependent communities adjacent to the resource areas. (Business, Sumner, WA - #A21731.75540)

As an employee of Tent and Trails located in New York, permanently protecting roadless areas in America's National Forests is vital to the sustainability of the \$18 billion outdoor industry that supports more than one million jobs—including mine. (Individual, New York, NY - #A27278.75540)

798. Public Concern: The Forest Service should refute the claim that roadless area protection will harm recreation-dependent communities due to loss of visitors.

Some opponents of the RACR claim that roadless area protection will diminish recreation opportunities on public lands, undermining the progress many rural communities have made in diversifying their economies. Potential conflict between roadless area protection and recreation has become one of the most prominent and contentious issues in the debate over public lands. Contrary to anti-roadless area propaganda, the amount of recreation on a given National Forest does not decline when a forest has a higher percentage of protected lands. When combined with the understanding that wilderness and recreation in primitive areas is an opportunity unique to the public lands system—one that cannot be replaced once it is gone—and combined with the host of other economic and community benefits wilderness provides outside the direct sector of revenue generated from recreation, further protection is clearly a prudent measure to take for our public lands. (Organization, Portland, OR - #A12004.75540)

799. Public Concern: The Forest Service should protect big game habitat.

DUE TO THE CONTRIBUTION OF HUNTING TO THE LOCAL ECONOMY

Southwest Colorado's economy receives a large boost every Fall from an influx of hunters. The thriving elk herds sought by these hunters rely on the security and solitude of national forest roadless areas during spring calving and rearing seasons. This is another important way in which the Roadless Rule will protect and enhance our local economy, by protecting the habitat that sustains our big game herds. (Individual, Durango, CO - #A11655.53100)

800. Public Concern: The Forest Service should consider the negative economic impacts of roadless protection on the economy.

ON THE RECREATION-DEPENDENT TOURISM INDUSTRY

I think recreation has a considerable economic impact and the stifling of recreation would lead to a corresponding stifling of our economy. (Individual, Palmer Lake, CO - #A23361.75540)

There is the issue of road access for recreational purposes. Outdoor recreational activities such as camping, hiking, horseback riding, fishing, hunting, bird watching and other wildlife observation are an important economic value to our area. We need good roads. (Association, Port Angeles, WA - #A17190.75540)

In past years, we have seen the impact of severe wildfires upon many communities in the United States. Burnt forests have a negative impact upon the General Public when they visit affected areas. Very little tourist activity occurs in the midst of a fire—and the resultant impact to the very area people are coming to visit may have a negative effect for several years beyond that of the fire. As many communities have become reliant upon tourism as a substitute and/or replacement for other Forest uses that provided the foundation for their communities and social structure, these same communities are extremely vulnerable to any impact on their ability to maintain jobs, and directly to provide and sustain the services and facilities required to maintain the viability of the community. I have spent time in communities that have been devastated by changing rules and laws—in many cases leaving the inhabitants with no choice other than to leave, in order to provide for their families. A healthy forest also includes its human inhabitants! (Business, Juneau, AK - #A30599.30130)

ON SKI AREA-DEPENDENT COMMUNITIES

The economic and social impact of a ski area closure will be detrimental for Taos and Mora counties whose already high unemployment rates are among the highest in the nation. Sipapu is the largest private employer in Southern Taos County and employs about 70 full and part-time citizens in the winter and about 25 in the summer. (Permit Holder, Vadito, NM - #A20142.75310)

Sipapu was begun by the Bolander family in 1952. Today the resort remains a small family ski area. The Roadless Initiative is a broad action, which has benefits for certain areas of public lands. However, it will be detrimental to this small family ski area and the communities surrounding it. Over the past 50 years the Bolanders have invested significant funds, including a half million-dollar state-of-the-art waste treatment plant with enough capacity for the expansion of the ski area. If the forest plan had not designated this area for ski area expansion the family would not have invested their life savings in Sipapu Ski Area. **We are asking for your help in insuring the viability and continuance of this valuable community resource in Northern New Mexico.** (Permit Holder, Vadito, NM - #A20142.75320)

ON THE MOTORIZED RECREATION-DEPENDENT TOURISM INDUSTRY

Some for this law say that it would boost the tourist trade. I can't see how this is possible. The truth of the matter is they come to Utah because of the easy access to our mountains. Take for example the ATV Jamboree, ground zero for this event is Richfield, Utah my home town. This single event attracts people from all over the world. I've personally met people from far away as Russia that have come to ride four-wheelers in our mountains. It is a huge event, the only other event that coming to ride and hunt there would significantly drop. Without the tourist brought in for these events the business driven by them would go under. Greatly hurting the local economy. (Individual, Richfield, UT - #A12640.75540)

801. Public Concern: The Forest Service should exempt the proposed Pelican Butte ski area from the Roadless Area Conservation Rule.**TO HELP REVIVE THE DEPRESSED LOCAL ECONOMY**

Klamath County is in a crisis. My hope for this community, as is the hope of many of the long-time residents here, is that there could be economic diversification away from a resource-based economy (i.e. lumber) towards non-resource-based economy in order to smooth out the economy here while avoiding environmentally adverse industries. The Jeld-Wen Corporation's \$4,000,000 commitment to develop Pelican Butte, one of 51 peaks in this county, into the most environmentally conscientious ski-destination in the country was one of this community's isolated hopes of pulling it out of the economic doldrums just prior to the proposed "Roadless ban." This \$4,000,000 commitment has largely gone into the single most extensive environmental impact study in the history of skiing in this country. If the "Roadless ban" is assumed to the degree that Mr. Clinton proposed without any real local input whatsoever, then there is no hope for such a ski-development. Although the 3,000 acres that was proposed to be set aside for this project represents only 1/10,000th or 0.01% of the total Clinton "Roadless ban" area and although it would only have the capacity of 12% of the Vail ski-area before its recent expansion, this ski-destination would have a decidedly positive impact here, and hence, there has been a 70% local approval of such a project. Not only would it provide employment for the local community, but it would entice environmentally clean industries to develop branches here, thus affording the technical graduates of the Oregon Institute of Technology, 97% of whom currently leave the county for metropolitan areas, local employment. (Individual, Klamath Falls, OR - #A6931.75100)

802. Public Concern: The Forest Service should not reduce trail access to recreational horse riders.**BECAUSE THIS USER GROUP HAS A SIGNIFICANT IMPACT ON THE U.S. ECONOMY**

Recreation use of the horse is the fastest growing segment of the horse industry and plays a major role in the United States economy. With an economic impact of more than \$28.3 billion, recreational riding supports 316,900 full-time jobs and involves more than 2.9 million individuals. Any action by the

federal government that could affect the opportunities of recreational riders to ride their horses on trails or public lands would have major influence on the viability of this very important industry. (Organization, Washington, DC - #A23320.75540)

Effects on Employment

803. Public Concern: The Forest Service should protect roadless areas.

TO CONTRIBUTE TO THE HEALTH AND DIVERSIFICATION OF LOCAL ECONOMIES

Critics of roadless area conservation contend protecting public lands will adversely affect economic growth. But evidence strongly shows that economic vitality and conservation of wild forests are not mutually exclusive. In fact, the economic health of rural communities that contain a large portion of federal land is actually ENHANCED by wildlands protection. For example, extractive industries no longer drive the economic engines of rural California. High tech business, tourism, recreation, and outside investments have helped diversify local economies in the Sierra Nevada, replacing the boom and bust cycles of unsustainable extractive industries. As a result, Sierra Nevada, once dependent upon activities like logging and mining, are thriving in large part because of the unique quality of life attributes public lands provide . . . (Organization, Missoula, MT - #A17234.75540)

Another problem we are facing across the nation is that unstable unsustainable economies have been developed, such as subsidized logging in the Tongass, and irrigated farming in the arid West, and these economies simply can't be maintained forever under increasing and competing resource demands. The Forest Service must work in concert with other agencies to phase out these economies. People must understand the limitations, must see the transition coming, and hopefully have some job retraining or other opportunities to help weather the transition. Honestly is an important element here.

When timber planners in the Tongass experienced falldown (the gap between timber predicted, and timber available on the ground), they deferred the problem to the future by expanding and shifting unit boundaries. This was illegal, kept the timber industry functioning at inflated levels, and caused greater hardships to rural communities, when those future timber sales had no real timber supply on the ground. You can't promise everything to everyone. Ultimately, people can recognize and respect the idea that the more people wanting a slice of the pie, the smaller the pieces have to be. The Forest Service has to be honest about the amount of resources that are available, and the limits of exploitation of those resources. (Individual, Sitka, AK - #A15506.75610)

Nor am I willing to put our forests at the mercy of politicians such as Montana Governor Judy Martz, Idaho Governor Dirk Kempthorne, or any of our Western congressional delegations and state legislature who, instead of seeking to diversify and modernize our economies, resort to anti-environmentalist demagoguery while continuing to over-emphasize the failed natural resource economy that has left my state, Montana, with the poorest performing economy in the nation. (Individual, Bozeman, MT - #A27944.12240)

TO ENCOURAGE EXTRACTIVE INDUSTRIES TO REPLACE UNSUSTAINABLE BUSINESS PRACTICES WITH SUSTAINABLE ONES

What viable business would deplete the very resources it needs for survival? The timber industry, the mining industry, the off road vehicle industry, and the petroleum industry. These industries need to find sustainable ways to create and use the products they sell. If industry cannot do this with the 380,000 miles of existing forest roads, their business is in need of some serious re-evaluation of the methods they use. If these industries cannot make this change, more sustainable industry will rise up and replace their biologically destructive products. WE need to protect all of our public lands that remain even remotely intact. The survival of the environment that sustains all life is in serious question. PROTECT ALL OF OUR NATIONS REMAINING AREAS OF ROADLESSNESS! Logging, mining, and road building interests must be held responsible for the impacts they have put on the US population's land. (Individual, Carbondale, CO - #A17312.75400)

804. Public Concern: The Forest Service should consider the effects of timber export on employment.

Too much of the harvested crop [logging on national forest] is shipped abroad and not used to provide additional jobs for Americans. (Individual, Williston, TN - #A1394.75310)

805. Public Concern: The Forest Service should consider the effects of timber import from low-wage countries on domestic employment.

Because of globalization these local mills are facing competition from cheap wood products made in low wage Asian, Mexican, South and Central American and African countries. Our local mills for that reason are not doing well. Flooding the market with more and more wood would be insane. (Individual, Klamath Falls, OR - #A2537.75950)

806. Public Concern: The Forest Service should act to preserve local jobs by keeping roadless areas available for timber removal.

I am writing to say open the roadless areas, and let the people that will still work for a living, have a job. I live next to the Bankhead Wilderness area, and it's a shame to even ride through it and see all the rotten and fallen trees, that someone could have used. The jobs that it would have created, and the money the schools lost out on is laying on the ground doing no one any good. (Individual, Double Springs, AL - #A120.75310)

As an employer of over 50 people I would like to express my concerns regarding the ROADLESS issues in our National Forests. The working families that we employ as a company depend totally on the forests of the United States for their livelihood. This includes the National Forests as well as private lands. Our products depend heavily on both the White Mountains National Forest in New Hampshire as well as the Monongahela National Forest in West Virginia. Any laws established to restrict the multiple use of these or any other National Forests are a direct threat to the people who's lives depend on the resource. (Association, Kingston, NH - #A21599.75300)

The USFS has been completely insensitive to the local people who use and enjoy these public lands. They have demonstrated their insensitivity in past decisions. There have been no tears shed by the environmentalists or bureaucrats for the folks who have lost their jobs and livelihoods over the past few years as a result of the decisions made by the USFS. I wonder how environmentally militant they would be if the decisions they made eliminated their own jobs. (Individual, Stayton, OR - #A1042.75310)

Satterwhite Log Homes in Gunnison, UT has a contract to log the Manti LaSal National Forest. This has a great economic impact on the community. The jobs offered by the sawmill are very beneficial. They employ 51 people along with 60 loggers who are from the surrounding areas. The lumber contributes to area farmers and ranchers allowing them to make improvements on their corrals, barns, fences, as well as other uses. The community uses the lumber for the construction of houses and fences. Lumber scraps are used for firewood. Being able to log in the Manti La Sal National Forest is very important to the Gunnison community and the surrounding areas. (Individual, Manti, UT - #A20336.75510)

807. Public Concern: The Forest Service should act to preserve high-paying local jobs.**BY KEEPING ROADLESS AREAS ACCESSIBLE TO MINING**

It is well known that development of hardrock minerals creates new wealth, which is distributed throughout the U.S. economy and society. . . . Mining on USFS administered lands also provides the Nation's highest paid non-supervisory wage jobs. These jobs are one of the cornerstones of diversified rural economies in many parts of the West. They also are the foundation for the creation of many non-mining service and support businesses found in or near National Forests. (Mining Industry/Association, Spokane, WA - #A17351.75530)

808. Public Concern: The Forest Service should consider that low-wage recreation-based jobs are no substitute for commodity-based high-wage ones.

Despite inflated claims to the contrary, recreation related jobs and industries are no replacement for the resource-based economies which have been devastated by decades of the protectionism advocated by self-declared environmentalists. Although through hard work and good fortune, I was able to attend law school and establish a successful career as an attorney following the decline of the timber industry in the early 1980s, many of my contemporaries continue to suffer from the economic deprivation caused by the closure of national forests to true multiple use management. Recreational industries simply do not provide family wage employment. (Individual, Portland, OR - #A7955.75310)

The Tongass has been managed over the past five to ten years with regard for only agenda put forward by the environmental industry. This has resulted in an erosion of the lands available for development and maintenance of an economic base. The Tongass timber program was established in the 1950s to create an economic base that provided year round employment for the citizens of SE Alaska. By following the agenda of the environmental industry, SE Alaska has returned to an economy based on seasonal employment. The tourist industry provides only 3-4 months of work per season. The timber industry has been reduced to the point that there remains only about 100-150 year round jobs out of the 3,000 that existed when the land base was large enough to provide the raw material for a substantial forest products industry. The fishing industry is and always has been seasonal with a large portion of the fleet coming in for the fishing season only and therefore limiting the contribution to the economy. This therefore has reduced the wealth producing ability of the area, and leaves only the wealth draining public sector jobs. (Individual, Wrangell, AK - #A2360.75500)

Timber jobs have always made this valley thrive. The people here are now working 2 or 3 jobs still they make less money than one job in a mill. They have no benefits, or retirement. I know many people with kids that have multiple jobs and can't even pay their heat bill. (Individual, Kalispell, MT - #A17704.75310)

809. Public Concern: The Forest Service should provide assistance in diversifying local rural economies.

Local interest can be extremely biased when it comes to the use of these public forests. We don't like to change and oftentimes diverse local economic opportunities are hard to foster, leaving past experience as the only way. Helping our communities diversify our economies should be the main priority. (Individual, No Address - #A17946.75100)

810. Public Concern: The Forest Service should provide career assistance.

RETRAIN FOREST WORKERS

I am astonished at the number of "trophy" homes being constructed, often as second homes, in Montana, in locations that provide a favorable environment and view. These are often adjacent to national parks, forests, wilderness areas and preserves. As in the past, Montana's forest workers may need to relocate, retrain, and learn new skills. Businesses are relocating in Montana because of our stable workforce and quality of life. If anything, our forest workers need help to acquire new skills. I recall an equivalent period when thousands of displaced aerospace industry workers were retrained with federal subsidy - many becoming career Forest Service personnel. (Individual, Lolo, MT - #A111.17300)

Ex-loggers can retrain and start new lives. (Individual, Bozeman, MT - #A284.75310)

If the logging industry gets their way, all our trees will be gone. Surely, our wonderful forests are too great an asset to just sacrifice them for some temporary jobs. Let's find something else for the loggers to do. Let's give them training for new and different jobs. Let's not destroy this beautiful land of ours. (Individual, No Address - #A623.75310)

Local communities and profit-making ventures that rely on the taking of resources from public land (logging, wildlife grazing, mining, the off-road industry) must be “weaned” off their dependence on government subsidies. Other government programs, focusing on education and training must be developed to help these entities toward viable economic independence. (Individual, Portola, CA - #A695.75000)

PROVIDE RESTORATION-RELATED CAREER OPPORTUNITIES TO DISPLACED TIMBER AND MINING WORKERS

Any timber-or mining-related jobs that may be lost through these conservation measures should be replaced by jobs that will tend to SUPPORT environmental preservation and restoration. This is something we owe to all hard-working Americans, their families, and their progeny, for many generations to come. (Individual, Bradford, NH - #A5980.75300)

We believe that ecological integrity must never be sacrificed on the altar of private economic convenience. This is not to be construed as a dismissal of the problems of workers whose employment may be jeopardized by implementation of the final Rule. The ecological abuses—that were permitted from the late 1940s to the late 1980s—have resulted in forest conditions (fuel accumulations, watershed degradation, noxious weed invasions, etc.) that demand restoration activities. These activities as well as implementation of the ‘Cohesive Strategy’—can provide many opportunities for employment of those workers whose jobs are jeopardized by the roadless area protections. (Organization, Mariposa, CA - #A23321.75310)

One excellent role for local communities who may lose logging jobs is to replace these jobs with restoration, such as thinning of unnaturally crowded ponderosa pine and Sequoia forests and conducting restorative controlled burns. These activities are needed over a vast area of ponderosa pine and ponderosa pine/Douglas fir forests and could help to sustain local communities/replace logging jobs for years to come. I have traveled a large enough area of our National Forest system to know that this is a tremendous task that has the potential to provide thousands of jobs for years to come. (Individual, Davis, CA - #A30523.75310)

The good news, particularly for those protesters at that wake-like rally, is that there can be better economic times ahead for them and their families; better times doing the work they want to do—outside, in the forest, working with their hands and equipment, operating around the trees and on the old mining properties. This time of environmental consideration can mean jobs, both old and new, and a lot more of them at wages and benefits matching and likely exceeding what they are earning today—after all, these workers have a long tradition of organizing themselves into unions.

First, however, we all need to recognize that the war is over. Industry should sue for peace. An armistice must be declared, hostilities suspended and environmentalists must come to the table.

Then the old adversaries can sit together, retool our natural resource economy, save many of our small towns and the fine people who live in them.

We can do it by protecting some of the old jobs and creating many new jobs in the land. Let’s use the muscle and genius of our best loggers and loaders, mill workers and miners in restoring the land. Let’s reclaim and renew and reforest. There are thousands of jobs and profits aplenty in all rational effort of environmental conversion. (Individual, Polson, MT - #A30763.75310)

PROVIDE CAREER OPPORTUNITIES TO ENVIRONMENTALISTS

I am aware of animosity between recreational users of the White Mountain National Forest (WMNF) and the Forest Service. I believe that both should be regarded as environmental concerns and that the WMNF should provide career jobs to environmentalists. A job with the Forest Service should be regarded as highly as a job with the AMC or other environmental organizations. (Individual, Birmingham, AL - #A1111.16000)

811. Public Concern: The Forest Service should recognize that its management decisions are not responsible for local timber-related job losses.

The [FS] has to recognize that most of these mills are doomed for reasons much more complicated than lack of timber from the [FS]. Our western small mill economy has been nothing more than a government welfare program for years now—The Flathead is the only forest in my recent memory to have shown timber sales operated in the black. The [FS] has to drop the line that deficit sales are justified because they save 35 jobs in Darby—Wal-Mart, Costco, and Home Depot all have more to do with the eventual failure of these mills, and the people working in those mills shop in all these stores! (Individual, Missoula, MT - #A5.75310)

The National Forests are not intended to be welfare for a dying timber industry or timber-dependent communities. And yet, in many cases, these are the reasons given for harvesting timber. In a recent newspaper article, Jerry Ingersoll, the district ranger overseeing lands around Ketchikan, Alaska, said of the proposed timber sale on Gravina Island, “Recognizing that the point is not to add money to the federal treasury,” Ingersoll said, “we’re managing timber to provide jobs for the local economy. That is the purpose of this program.” But I counter that providing jobs for Ketchikan, Alaska, is not the point. The Forest Service isn’t responsible for holding together and ensuring the solvency of the local economy. I don’t want my tax dollars used to keep Ketchikan, Alaska, fiscally afloat at the expense of the forests of Gravina Island.

The decline of the local economy, loss of jobs, homeless people, etc. are all blamed on disallowing timber harvest. These could all be blamed on poor economic planning as well, perhaps more appropriately.

We don’t compensate day traders when they’ve invested poorly and go broke, but we should compensate foresters when they’ve over-logged their forests to the point that they can no longer bear the burden of another cut? This sounds merely like a poorly managed investment, and this is how it should be treated. The National Forests are for the Nation and any justification to treat local communities disparately because they have inappropriately invested in a risky business, the timber business, is an invalid use. We have enough timber to harvest in the already roaded areas. Let’s just use those and leave the rest without roads. (Individual, No Address - #A29243.75600)

Although public perception assumes that in order to have greater environmental protections, we must lose jobs, declines in employment in the timber industry are not directly linked to tougher environmental regulations. Increases in mechanization and over-cutting are the primary causes leading to mill closures and decreased employment in the field. Technological advances in the timber industry in Oregon, for example, cost about 13,800 jobs from 1980 to 1988, even as output continued to increase by almost 20%. [Oregon State Department of Employment, 1996.] *By its own nature*, industrial logging (though not necessarily selective, sustainable logging) of our national forest is an economic paradigm that is—by way of the diminishing returns principle—on the way out. The fact of this presupposes and supercedes any circumstantial contentions made by timber barons or conservationists alike, for the situation writ large is one of an industry that in this typical *modus operandi* has grossly surpassed its means—effectively putting *itself* out of business (while notably, the great potential for job opportunities in ecological restoration work remains largely unrecognized.) (Individual, Bozeman, MT - #A23574.75510)

Enough is enough! Public lands are just that! The day of the Federal Land Giveaway should now be over! As a nation, we are punch drunk on growth! It is time we sobered up! Return the land to the people, just the way it is, and let those whose incomes are bloated by Federal Land Bargains go find another way to add to their already obscene fortunes. And when you remind me about “jobs”, let me remind you that those jobs were artificially created by those who really profit from these land grabs, and those people who will “lose” jobs will find more, and find jobs more in tune with the land. No, I don’t think this is an easy decision, and that is the first indication it is the right one. (Individual, Redmond, WA - #A1249.75310)

The economic impacts of a scientifically-based roadless area policy to the timber industry and industry jobs would be negligible: "In particular, concerns recently have been expressed regarding potential job loss associated with protection of roadless areas covered under the spotted owl conservation plan (within which some timber harvesting is permitted under Option 9). The probable sale quantities of timber within these areas, however, represent only a very small share of total timber production within the region, and thus cannot be expected to have a substantial impact on industry employment or earnings, or on timber prices. [This] should be kept in mind as your administration considers the inclusion of these lands in your roadless area initiative. The employment, income, and price impacts of protecting these areas are likely to be extremely small in percentage terms" (Whitelaw et al. 1998). (Organization, Missoula, MT - #A17234.75510)

It is not true that the forest products industry is dying because it is denied access to the roadless remnant. The mill owners we know blame their economic woes on a flood of subsidized Canadian lumber imports and on high stumpage rates. We don't know what the solution to Canadian lumber imports is, but there must be one at the international level. The solution to high stumpage rates is not for Ranger districts to charge less. Nothing would be solved by stumping the last of what's left. We do not believe that our state's economy is dependent on roading and logging the last 6 million acres. If a road hasn't been punched through an area by the last of the 20th century, it is probably because there was no economic incentive to do so. The best economic draw we have is a relatively clean environment, enhanced with natural roadless areas. We can't have it both ways. (Individual, Helena, MT -#A5666.75000)

AUTOMATION AND THE TIMBER INDUSTRY ARE TO BLAME

Another excuse put forth by the timber industry is the claim that because of environmental restrictions, local economies are suffering. Nothing is further from the truth. Many logging communities have suffered not because of environmental concerns, but because they simply have used up a limited resource.

I strongly advise you to visit the Olympic Peninsula, and see what the timber industry has done to the forests there. That has been akin to an arboreal massacre, and the local communities there are suffering as well as the forests.

Timber industry jobs have disappeared not because of environmental extremism, but because of automation in the timber industry itself, not to mention greed. Where at one time cut logs were milled near the forests from which they were culled, now they are shipped overseas to take advantage of cheaper labor. That hardly strikes me as being sympathetic to the needs of local forest communities. (Individual, Seattle, WA - #A26997.75510)

812. Public Concern: The Forest Service should consider that raw log exports lead to domestic job losses in manufacturing.

I would request that you check where the timber is supposed to end up. I think you will find that most of it is exported to the orient (especially China) where it is manufactured into cheap fiberboard furniture which is then shipped back to us, thus destroying US manufacturing jobs in the furniture industry. There can just be no rational justification for this. (Individual, Belleville, IL - #A23614.75510)

813. Public Concern: The Forest Service should not attempt to protect timber jobs.

The most significant consideration should be the conservation and maintenance of wilderness/inventoried roadless areas. Jobs for the local community should not be taken into consideration. The government should not be in the business of regulating and protecting jobs. In a free market system, there are no guarantees. If I open up a store but do not adapt to the changing needs of my customers, I will go out of business. The government should not bail me out. I am sympathetic to the needs of loggers but, frankly, the writing has been on the wall for quite some time now. Those who do not adapt and develop alternative skills should not be protected. If they lose their job, it is due to poor planning on their part. (Individual, No Address - #A22265.75310)

Recognize that no one owes anyone a job just because their parents moved to a certain place to take advantage of economic opportunities that, for reasons beyond their control, are no longer there. (Individual, Pendleton, OR - #A30482.75310)

I am a displaced nuclear worker and have not empathy or sympathy for people who do not want to create new jobs for themselves. (Individual, Silverthorne, CO - #A28101.75310)

YAA does not believe that federal agencies have an obligation to assure uninterrupted employment to any group of people or to assure the financial success of any private enterprise. (Organization, Mariposa, CA - #A23321.75310)

814. Public Concern: The Forest Service should place a higher value on roadless areas than logging and mill jobs.

Logging and mill jobs are not worth the trade off of sacrificing the relatively small amount of unlogged and unroaded area we have in the United States. (Individual, Portland, OR - #A3676.75000)

Local involvement becomes one of many factors, and the potential future use of a local economy should not be taken into consideration—for instance, opening new roadless lands to preserve a few timber harvest jobs is not a good idea. Roadless lands should be preserved beyond our immediate needs, unless in time of national or world crisis. Loggers can move; computer dot.com executives have had to adjust to a depressed new world, and so can traditional laborers. (Individual, West Yellowstone, MT - #A1045.75000)

Recognize that economic forces will assure that there will always be alternative private sources for timber, etc, but that the public lands must be held in reserve for public purposes that are not served by such private means. (Individual, Pendleton, OR - #A30482.75310)

Effects on Tax Receipts/Funding to Communities

815. Public Concern: The Forest Service should discuss impacts of a national roadless rule on Bankhead Jones payments to states and counties.

Also impacted are the Bankhead Jones payments to the state and counties. These payments are based on the revenue generated from the National Grasslands and are used for funding our roads and schools. The Final EIS failed to address these impacts. (Elected Official, McKenzie County, ND - #A27737.75500)

816. Public Concern: The Forest Service should continue removing timber to fund schools.

No more road closures and open the forests to harvesting its renewable resources which help to fund our schools and educate our children. Open the forests “For The Children.” (Individual, Kalispell, MT - #A1140.75730)

817. Public Concern: The Forest Service should work to change the rural school financing system.

TO REDUCE THE NEED FOR HIGH TIMBER REMOVAL LEVELS

The best way to manage roadless areas is as follows:

Alter the school financing system so that local school districts no longer have an incentive to push for high timber cut levels. (Individual, Dallas, TX - #A18002.30200)

818. Public Concern: The Forest Service should support a 100 percent tax on lumber to reduce demand and support affected local communities.

I believe if we doubled the price of lumber by taxing it at 100% of its retail price that would help demand. We could then take the taxes collected and put them into communities losing jobs and thereby help them make the transition to other economic activity. In the end, if we learn to live with less lumber by treating it as more valuable we have a chance to both slow consumption as well as raise the monies necessary to help those who depend on lumber get retrained for other jobs. If the price of lumber doubles, people will use more cement and other materials (adobe, etc.) that other countries without lumber resources have proven can be adequate for a manor of housing stock, including luxury homes. It is time to take aggressive, progressive action and this is one of many aspects of what that could be. (Individual, Portland, OR - #A6838.75000)

819. Public Concern: The Forest Service should ensure that counties understand the impacts of the Conservation and Reinvestment Act on their tax base.

Examine the tax revenues and fees (property taxes, assessments, etc.) that are generated from private lands within the political boundaries of the federal lands within their county. Between 1993 and 1998 the Forest Service and Bureau of Land Management studied property tax revenues in counties that receive PILT. That study was aimed at attempting to understand how the combination of PILT and 25% payments (logging and other multiple-use revenue shorting) would compare to property tax payments if the federal lands were privatized and managed in a manner similar to current federal management prescriptions. The results are dramatic and have broad application to how counties should think about CARA. Examine the costs and savings of federalizing the private lands within their county. (Individual, Jefferson, OR - #A775.75720)

The effect on economic activities on the lands likely to be acquired is a most critical consideration. Given federal land management over the last several years, and the objections to economic and recreation activity in federal areas by environmental groups, it is safe to assume there would be little or no economic activity generated if private lands are federalized by CARA through land acquisition. So, if the private lands within or adjacent to the boundaries of your national forest or other public land system are acquired, which businesses and how much employment activity will be lost? For example, the entire North Woods of Maine and the Northern Forests of New York, Vermont and New Hampshire are land acquisition targets for the environmental community. These groups have set their sights on 26 million acres for new Federal parks, refuges and national forests. The North Woods is almost all-private land at this time. How many jobs will be lost in the timber and recreation communities if even a small portion these lands are turned into new federal and state designations or National Monuments? There is no simple way to get this data or perform this analysis. Each county should make their best estimate to understand the potential impacts of CARA on their tax base and the economic future of their county. (Individual, Jefferson, OR - #A775.75700)

820. Public Concern: The Forest Service should not reduce minerals royalty payments and income to local governments by restricting access through a national roadless rule.

State and local revenues will be reduced by wholesale restrictions of federal mineral development in roadless areas. Exploration and development of minerals requires access. The rule prohibits access. It will also eventually end federal oil and gas leases on 219,000 acres, a large portion of the North Dakota Grasslands.

State and local revenues will be impacted because roadless areas will discourage mineral development on adjacent federal, state, or private mineral holdings. Isolated tracts, or tracts of smaller size are less desirable for mineral exploration and development due to economic factors associated with those activities. The rule ignores reserved oil and gas royalty interests of western counties that contribute to local revenues. (Governor, State of North Dakota - #A22065.75530)

Several counties, which have National Grasslands within their boundaries, reserved a 6.25% royalty interest in the mineral acres that were transferred to the federal government. This royalty interest will be affected by the roadless plan because the 266,000 acres of North Dakota's National Grasslands classified as roadless will not be leased or re-leased once the existing oil and gas leases expire. This decision will have an enormous impact not only on the county revenues generated from this royalty interest but on the economy of western North Dakota that depends on the oil industry as one of its base industries. (Elected Official, McKenzie County, ND - #A27737.75530)

The intermingled nature of the National Grasslands results in development of state lands and private mineral acres being closely associated with the development of the federal mineral acres. The failure to lease and develop the federal minerals will have a negative impact on the leasing and development of the state lands and private minerals. (Elected Official, McKenzie County, ND - #A27737.75530)

Coal has been produced from the southern part of the Piceance Basin, including the northern corner of Gunnison County, since the late 1800s with more than 100 miles having operated at various times along the margin of the Basin. . . . These two mines produce 35-40% of all produced in the State of Colorado, and the North Fork Valley is considered the premier coal-mining region in the State of Colorado.

These mines are among the top taxpayers in Gunnison County (the West Elk Mine is the #1 payer and the Sanborn Creek Mine is currently #3). Without access to coal reserves, the future of these mines is foreclosed and Gunnison County will be significantly impacted. (Elected Official, Gunnison County, CO - #A22061.75530)

The mining of western federal coal generates hundreds of million of dollars in federal royalties, states taxes, federal taxes, and it provides high-paying jobs for many thousands of rural residents in the western states. (Association, Washington, DC - #A19636.75530)

Unlike the question of roads, the Forest Service has a full record and a judicially mandated obligation to respect the county royalty interests. (*McKenzie County v. Hodel*) Nevertheless, when dealing with the roadless issue, the Forest Service again ignored the contractual obligation on the part of the United States to not take any action contrary to those interests, including placing them in wilderness and unavailable for mineral leasing.

Throughout the roadless rulemaking and the final plan revision, the Forest Service again ignores interests. Indeed, the Forest Service actually represented to the public that the roadless regulation would not interfere with energy production. In response to a letter sent by the counties, the Forest Service also failed to admit that more than 250,000 acres of the Little Missouri National Grassland would be closed to new energy development. (Elected Official, McKenzie County, ND - #A27737.65300)

821. Public Concern: The Forest Service should exempt Utah school trust land coal resources from a national rule.

BECAUSE THEY WERE INTENDED TO COMPENSATE FOR GRAND STAIRCASE ESCALANTE NATIONAL MONUMENT RESTRICTIONS

In light of this deliberate congressional intent to grant the State of Utah resources that could be readily accessed to quickly provide replacement school trusts funds for those lost as a result of the proclamation of the Grand Staircase-Escalante National Monument, it is not only arbitrary and capricious but also an extraordinary breach of good faith to now designate these areas within which the State of Utah holds coal resources from the 1998 Exchange as areas of "special concern" that require roadless area conservation status. Even though the State of Utah and its lessees are excepted from a prohibition on road construction in order to reach these resources, the Roadless Rule nonetheless creates an entirely new, special management designation for these areas that may include heightened environmental scrutiny, such as an automatic EIS requirement, that will lead at best to development delays. As the Roadless FEIS itself recognizes, these heightened requirements and their concomitant costs may even make the development of some resources uneconomic. See FEIS, Vol. 1 at 3-316 -3-317, 3-321.

These increased costs threaten to significantly diminish the flow of revenues to the Utah school trusts that Congress intended to protect in the 1998 Exchange. Moreover, the other beneficiaries of that exchange, coal lessees like Pacificorp, have their ability to economically develop coal lessees threatened. The Utah school trust lands gained in the 1998 Exchange were not meant by Congress to be so encumbered, and even in light of an exemption to build a road to reach the coal there, the designation of these areas thwarts the will of Congress. (Association, Washington, DC - #A19636.75530)

822. Public Concern: The Forest Service should recognize the positive contributions of ski areas to local and federal government revenues.

Winter sports resorts that operate on National Forest lands, contribute significantly to the local economies in other ways that add to the economic stability of the communities. The counties annually collect property taxes on the buildings and ski lifts that are located on lands within the counties. These taxes are paid on a regular basis and the counties can count on receiving these funds. Historically, property taxes paid to Adams and Valley Counties have increased on a regular basis since the resort opened in 1961. As is the case with other businesses catering to the public, the resort collects and pays sale taxes to the State of Idaho. A portion of this money is returned to the county in which it is generated.

Ski-based resorts also pay an annual use fee to the federal government based on the revenue generated each year. By law, a percentage of revenues from the sale of forest products and permitted operations are returned to the counties and used to fund public schools and roads. Unlike some of the other payments that go to the US Treasury for commercial use of forest resources (i.e., timber receipts), these taxes and fees are similar to rent for the use of the land and vary comparatively with the ski industry in that a significant amount of revenue is generated in almost perpetuity from a comparatively small tract of land. In the case of resorts like Brundage, which has been in operation for 40 years and intends to continue in business for the foreseeable future, this is an economic factor that should be considered in the roadless protection and forest planning process. (Permit Holder, McCall, ID - #A15317.75540)

823. Public Concern: The Forest Service should recognize its responsibility to rural western communities harmed by the Roadless Area Conservation Rule.

Governors Marc Racicot of Montana and John Kitzhaber of Oregon recently stated that they believed the federal government has a special responsibility, both moral and legal, to rural communities of the American West. They observed that the policies of the federal government for nearly 140 years encouraged development of this nation's natural resources. As a result, small towns sprang up and people put down deep roots that allowed them to weather market fluctuations and whims of nature. The one thing they thought they could depend on was continued access to the National Forests and other public lands that are the source of their livelihoods. Now, under the January 12 Rule, the federal government is poised to put an end to that possibility. (Association, Spokane, WA - #A17351.75200)

824. Public Concern: The Forest Service should provide a fund to benefit communities impacted by roadless designations.

Personally, I would be in favor of a fund to relocate, retrain, or otherwise benefit local communities impacted by roadless designation, but I feel that the importance to the nation outweighs the damage, if any, done to local interests. (Individual, Louisville, CO - #A30201.15100)

825. Public Concern: The Forest Service should not make payments to counties in lieu of harvest receipts.

Now, the federal government is making payments to counties in lieu of harvest receipts. Whatever happened to the idea of the American pioneer spirit; the spirit that so typified the westerner? Has the American lost that or has the federal government given it away as the price of appeasing a trespassing tree-sitter? Does society now "owe" us a living? How is it that, in less than a century, Oregon's Benton County went from 1-1/2% publicly owned to nearly a quarter? I see this as a very fundamental shift in our society and it disturbs me greatly. Now we want to guarantee payments to the county in lieu of timber harvest receipts. That sounds like welfare and socialism. We, the American citizen, the

stockholder in this enterprise, own the land; let's use it! Let's use our wit and intellect! This shift disturbs me greatly. (Individual, No Address - #A25635.75700)

826. Public Concern: The Forest Service should not attempt to buy the support of affected communities with transition payments.

The Roadless Plan indicates that the Forest Service will petition Congress for funding to provide "transition payments" to those communities that would have adverse economic impacts as a result of the Plan. We find it particularly abhorrent that the federal government would attempt to bribe affected communities with a risky and temporary payment scheme to accept a plan that is so devastating to our economy and our tax base. Are we supposed to use this money to rent U-Hauls for people leaving because they have no job and to hire plumbers to drain the water from the pipes in our schools when we have to close them? (Elected Official, McKenzie County, ND - #A27737.75200)

827. Public Concern: The Forest Service should not develop a plan to relocate affected residents in compensation for a national roadless rule.

We are particularly upset over a plan that advocates relocation of residents to other communities or regions of the country as a method of implementing the stipulations of the Roadless Plan. As an Agricultural State, North Dakota did not participate in the economic boom that the people on the East and West coast have experienced. To be then told that we will have to suffer additional economic damage so these people can feel good about there being "roadless" areas somewhere in North Dakota is especially disturbing to those of us who work hard in trying to build our local economies. (Elected Official, McKenzie County, ND - #A27737.75200)

Impacts on the Global Economy

828. Public Concern: The Forest Service should consider the potential transfer of environmental effects of timber removal to other countries with lower standards.

What is the long-term effect of making resources on roadless lands essentially off limits, locally and nationally? Will more pressure be placed on commodity production from other countries without effective environmental protections? (Organization, Salt Lake City, UT - #A12009.75950)

Regarding timber resource, the effect would further shift the burden and impacts of wood consumption to ecosystems contained in private forests in the U.S. or forests of other countries. The result in the last decade of federal timber harvests dropping about 79% from about 13 to 14 billion board feet annually, caused imports to rise dramatically to 36% of U.S. softwood lumber consumption. The high harvest and export of old growth boreal forests in Northern Quebec and Alberta is a public issue of concern to their citizens. The harvest of softwood timber from the private forests of the Southeastern United States currently exceeds the rate of growth. Tropical hardwood ecosystem can't continue to provide wood products at the current extraction rate. A roadless rule must consider the consequences of timber supply in the global market along with the associated "ecological transfer effects." (Organization, Lakeshore, CA - #A28962.65200)

SUPPORT INTERNATIONAL SUSTAINABLE FORESTRY PROGRAMS

The WRI report estimates that the world demand for industrial wood fiber will rise from current levels by 20 to 40% in the next ten years. This increased demand will likely be met on the global level but regional shortfalls are likely to occur. They contend that if the current harvesting patterns of production are not changed, that economic pressures created by the demand will result in wood fiber being obtained at an increasing level from the worlds remaining "frontier" forests. As a consequence, the tropical forests of the Amazon and equatorial Africa and the boreal forests of Siberia and Canada will continue to have more pressure for timber harvesting and management of their forest resources. What are the alternatives: Success with improved availability of wood fiber in developing countries will depend on a variety of issues and programs. Lack of land tenure rights, political instability, and lack of funds and

national programs to reinforce tree planting and tree care all contribute to loss of forest cover. Programs such as community woodlots, and agroforestry applications which provide crops and wood fiber from the same land area, continue to hold great hope for improving existing long-term supplies of wood fiber. However, global support for such programs must continue. (Individual, Fairbanks, AK - #A15.50420)

829. Public Concern: The Forest Service should allow timber removal in roadless areas.

TO REDUCE DEPENDENCE ON FOREIGN SOURCES

To reduce dependence on foreign sources It takes no sense to import almost half of our softwood lumber products from Canada, and at the same time allow millions of acres of dead, dying, unhealthy or burned acres of our National Forests to not be harvested. Just because the Environmental Extremists have learned how to use the courts to further their agenda, and have been successful in using the liberal media to brainwash the masses to agree with their agenda doesn't mean it makes sense or is what's best for the country or our National Forests. Most American's live in the bigger cities and they don't have a clue, as the old adage goes "where milk comes from," or for that matter what it takes and where a 2x4 comes from. (Individual, No Address - #A676.12200)

830. Public Concern: The Forest Service should allow mineral development in roadless areas.

TO REDUCE DEPENDENCE ON FOREIGN SOURCES

The establishment by administrative action on January 12, 2001, of roadless area protection for 60 million acres of non-wilderness areas has serious economic consequences to a large number of forest dependent local communities, states with significant national forest lands, and the nation as a whole. This alone justifies a serious, wholesale reconsideration of this rule. In addition, this area represents approximately **one-third** of the 192 million acres managed by the USFS. In the January 12 Rule, the Forest Service provided no evidence that a national roadless rule would improve the system under which local agency officials made decisions regarding road construction on a case-by-case basis utilizing the local forest planning process.

The USFS proposal would adversely affect NWMA members economically, spiritually, and emotionally. A significant number of our members have made substantial investments in mineral related activities occurring within the National Forest System. Their future business interests are directly and irreparable harmed by the January 12 Rule, as needed access is prevented. Also, they take great pride and comfort in the knowledge that America has viable sources of minerals vital to our national security and future prosperity. The new rule has shaken their confidence in the ability of our country to achieve sustainability. (Association, Spokane, WA - #A17351.75530)

The USGS July 2001 Report on increased U.S. reliance on imported minerals shows starkly how implementation of the Roadless Rule could well further weaken the minerals position of the nation. As a matter of sound policy and balanced implementation of its statutory authority, the Companies urge the Forest Service to carefully consider the USGS's findings. . . . Finally, in connection with locatable minerals, the Companies wish to reference the enclosed letters of this past November from members of the Armed Services Committees of the Congress and the Western Governors' Association. See Attachment 7. These letters, addressed to the Secretary of Defense, raise serious (and, as yet, unanswered) questions about the adverse impacts of the Clinton Administration's last minute regulatory binge upon the stability of the strategic and critical minerals supply in the United States. The Companies urge the Forest Service to be responsive to the questions raised by those letters as the Agency considers revision of the Roadless Rule. (Association, Washington, DC - #A19636.75530)

I feel that with the new Chief and Administration we will begin to head in a new direction, but I know it will take time. To me, just like it makes no sense to import so much of our energy needs from sometimes unreliable foreign sources (when we have untapped domestic sources). (Individual, No Address - #A676.12200)

. . . the coal reserves adversely affected by the Roadless Rule are substantial, even by the Forest Service's own flawed assessment. Thus, turning to the preamble of the Roadless Rule once more, the Forest Service stated: "Between 38 and 1,371 million tons of coal on the Grand Mesa, Uncompahgre, and Gunnison and Manti-LaSal National Forests [in Colorado and Utah] could be unavailable for development as a result of this rule." 66 Fed.Reg. 3268. Again, to provide a frame of reference, last year's *total* national coal production was approximately 1.1 billion tons of coal. As a nation, at a time when we are realizing that we need all the domestic energy that we can safely produce in an environmentally protective manner, we simply cannot afford to write off a 1.37 billion ton reserve of high quality, low sulfur clean coal. And with regard to protection of the environment, existing federal law specifically mandates that coal mining on National Forest lands must be conducted in accordance with stringent environmental standards and procedures—and, then, that same body of law requires the reclamation of coal mines when active mining is completed. (Association, Washington, DC - #A19636.20300)

TO AVOID VULNERABILITY TO SUPPLY DISRUPTIONS FROM POLITICAL AND MILITARY ACTIVITY ABROAD

The domestic mining industry provides about 50 percent of the metal used by American manufacturing companies, and the U.S. is among the world's largest producers of many important metals and minerals—particularly copper, gold, lead, molybdenum, silver and zinc.

But the U.S. Geological Survey recently reported that since 1993 (when mineral imports and exports were roughly equal), U.S. reliance on mineral imports has risen nearly sevenfold in terms of value. See Minerals Commodity Summary 2001, U.S. Geological Survey. By 2000, America had become reliant for some portion of its supply of a number of mineral commodities that it had previously exported, including aluminum, copper, lithium, magnesium metal, rare earths—and even cement. The U.S. remained more than 50 percent import reliant for at least 29 mineral commodities, including bauxite and aluminum, chromium, cobalt, iodine, manganese, nickel, platinum-group metals, potash, tantalum, tin, titanium metal, tungsten and zinc.

To avoid vulnerability to possible supply disruptions from political or military activity and unpredictable price fluctuations, the government needs to develop policies that encourage domestic mineral activity. The January 20, 2001 rule obviously would discourage mineral activity and likely further contribute to this nation's dependence on foreign supplies of certain minerals. The Forest Service must consider this country's mineral needs as it proceeds with this rulemaking. (Business or Association, Washington, DC - #A29622.65320)

831. Public Concern: The Forest Service should consider the effects of its management decisions on the global economy.

Speculating on Alaska's Forest Legacy, a land of immense forest, unsurpassed scenic splendor, and tremendous recreational opportunities, it seems easy to conclude that given the current relatively low level of harvesting and the large sustainable volumes of wood fiber that are available from both State and Federal lands, that this action will have far-ranging impacts on the management of forest plantations in other regions of the United States and in foreign countries. As the world demand for wood fiber and products continues to grow, forest management decisions in Alaska will have national implications for the cost and in some cases quality of wood products and homes both nationally and abroad. (Individual, Fairbanks, AK - #A15.75950)

EXPORTING OUR NATURAL RESOURCES CONTINUES OUR DEPENDENCE ON FOREIGN SOURCES

A great amount of lumber being taken from our forests is being sent overseas. This is what my relatives still in the business tell me. Its like the Prudhoe Bay oil . . . "too much sulphur to pay for refining it for our use," so it too goes to Japan. But we were assured that getting the oil would stop us from dependence upon the Arabs for gas. (Individual, Bismarck, ND - #A4194.75950)

832. Public Concern: The Forest Service should provide a model for other countries on how to preserve national forests from short-term economic benefits.

We must, as the most powerful and wealthy nation of the world and of history, take the responsibility of acknowledging that the forests of the world are in danger, and must be protected. Our protestations with respect to the brutalization of the rain forests fall on deaf ears when we use our forests for ever-increasing wealth, and expect nearly destitute people elsewhere to sacrifice short-term gain for the benefit of the planet. Let us be the models we can and should be by acknowledging our responsibilities as custodians of this precious planet. Let us put wisdom and future generations ahead of short-term greed. (Individual, Lamont, FL - #A1307.70400)

User Fees

Summary

A small number of respondents discuss recreational user fees. These comments are usually directed at management of National Forest System lands generally, rather than management of roadless areas specifically. Some assert that recreational users should pay their way, that these additional funds are badly needed by the Forest Service, and that this income will help broaden support for management direction that favors recreational over commodity uses. Some suggest that this fee structure be based on relative environmental impact of a particular use. Others ask that user fees, including the Fee Demonstration Project, be terminated. They believe that the fee demo program is discriminatory, violates the intent of the creation of public lands, is a double taxation, and promotes commercialization of the national forest. These respondents state that fees are unfair due to continued commercial user subsidies and disproportional impacts to low-income people.

833. Public Concern: The Forest Service should raise funds through user fees.

Fee-for-use can help defer costs tremendously. Build recreational areas to MAKE MONEY. (Individual, Humboldt, TN - #A464.17120)

Money is usually the issue and I would be in favor of "tolls" for wilderness access in order to assure proper enforcement of regulations in order to avoid closures. (Individual, Lake Havasu City, AZ - #A735.17120)

I also think the user fees the forest service charges are reasonable. I appreciate that you allow me to write a check and pay for my campground. (Individual, Paducah, KY - #A1693.17120)

As the population of Arizona (and other areas in the world from which tourists come) increases, the demand for uses of the roadless areas will increase.

This demand will require that the Forest Service request (or promulgate) clear policies and rules to deal with this increasing demand.

Enforcement of new policies and rules that are handed down or are promulgated by the Forest Service will usually require additional resources.

These resources can come from appropriations or sharing of resources by would-be users. The Forest Service might be well advised to ask users to pay for use at a rate that will meet the incremental management and maintenance costs. (Individual, Cottonwood, AZ - #A26396.17120)

FROM TIMBER REMOVAL AND ROAD USAGE

Management of FS lands in the future should be partly funded by drastically increasing the cost of lumber leases and by changing fees for road usage, as is done by many leases and by charging fees for road usage, as is done by many logging companies now to people who use their roads for recreation. (Individual, Winthrop, MA - #A19642.17100)

834. Public Concern: The Forest Service should implement a user fee system based upon relative impact.

TO HELP DEFRAY THE EXPENSES OF ROAD AND TRAIL MAINTENANCE AND LAW ENFORCEMENT

My property adjoins a portion of the Shawnee National Forest in Southern Illinois, and I have had the opportunity to observe the effects of various logging techniques and recreational vehicles over the years. From my observations, I have come to believe that the Shawnee Forest has been overdeveloped in terms of road access, and that maintenance of these roads has been sporadic and inadequate. Furthermore, a small but active group of recreational vehicle users has created significant erosion on the forest property for illegal activities (poaching, trespassing, theft, cropland damage). I therefore attended meetings last year to voice my support for designating Roadless areas, and implementing a user fee system based upon relative impact to help defray the expenses of road/trail maintenance and law enforcement on Forest Service property. (Individual, Cape Girardeau, MO - #A1674.45100)

The issue of FEES and the value of a LACK OF FEES when possible, should be addressed. When negative impacts are caused, then fees sufficient to rectify such impacts should be imposed. Otherwise, there should be no fees. (Charge what DESTROYS, not who ENJOYS!) (Individual, Bishop, CA - #A20954.17120)

835. Public Concern: The Forest Service should not charge user fees for recreational use of national forests.

Immediately banish the fees program as it is discriminatory, violates the intent of the creation of public lands and promotes commercialization of our natural lands. (Individual, Olympia, WA - #A20844.17120)

Additional examples of non-resident, but local increasingly restrictive forest access policy abound. One is the increased use of "fee" areas, another restrictions and paid parking at trail heads, another time limitations on camping and escalating fees in day use areas, once free. The FS feels sufficient consultation and public notice to comply with all governing regulations is made. The fact that subsequent actions ignore the public comment and notice does not seem a primary concern of the local FS. These fees have adverse and disparate impact on homeless, low income and local individuals, homeless being the least consulted group. Residents are probably the second least consulting group although not hard to find for comment. (Individual, Prescott, AZ - #A28094.17120)

BECAUSE THEY ARE UNFAIR TO LOW-INCOME FAMILIES

It is the public's right to enjoy all of the public lands their taxes pay for - and without extra park fees which stop poor families from exposing their children to the wonders of nature. (Individual, Phoenix, AZ - #A7809.70700)

BECAUSE CONSUMPTIVE USERS DO NOT PAY THEIR FAIR SHARE

The Forest Service has made a number of concessions to the logging industry. Roads have been built to facilitate the harvesting of timber, timber which is sold at a mere fraction of its value. On the other hand, recreational users like myself are expected to pay a user fee just to hike or engage in other non-destructive activities in our national forest. This is extremely unfair. (Individual, Philadelphia, PA - #A1623.75600)

836. Public Concern: The Forest Service should end the fee demonstration project.

Please end the Fee Demonstration Project now. With all of the money you are receiving from timber and mining interests, there should be no excuse for your mismanagement of funds. (Individual, Seattle, WA - #A7758.17120)

I hope that you will oppose all efforts to impose "Recreation Fees" by supporting permanent implementation of the Fee Demo program. If this program is allowed to continue, our forests will be developed for revenue intense recreation at the expense of simple activities such as hiking, study, education, or solitude. The Fee Demo program, written and supported by the ARC (American Recreation Coalition), is an attempt to undermine public will by imposing fees that demonstrate popular support for industrial recreation. Our forests should remain wild and free if this country is to remain so. Please support an end to this insidious program. (Individual, Boise, ID - #A12034.17120)

The real economic value of national forests comes from recreation and environmental quality of life, which the Roadless Area Conservation Rule carefully preserves. Approximately 85 percent of the revenue generated from America's national forests comes from recreational activities, more than five times the amount generated by logging. This fact, however does not justify or condone the imposition of an unfair user fee: the Fee Demo Program. (Individual, Las Vegas, NV - #A5989.75400)

837. Public Concern: The Forest Service should consider the economic impacts of user fees.

If fees are proposed or imposed, any impacts on the poor relative to the rich should be addressed. The poor often visit or even choose to live near roadless and wilderness areas because, unlike the rich, who can take a cruise, or vacation in Tahiti "to get away from it all," they often can only afford to hike or bike in wilderness or quasi-wilderness type areas "to get away from it all"! No provisions should be enacted which grant an advantage to the rich, as against the poor, in the ability to enjoy unroaded natural areas in a non-injurious manner. (Individual, Bishop, CA - #A20954.17120)

838. Public Concern: The Forest Service should ensure equal hunting and fishing fees in all states.

I also want to comment that all public lands should be accessible to all the public! Hunters and fishermen should not have to pay extremely high fees and licenses should be available for hunting and fishing for the same price for anyone from any state because it is federal public land. There should be a standard license fee set up and all states would charge the same for hunting or fishing on federal public lands. Lets equalize the fees so some states cannot gouge the public when they use the federal public lands. (Individual, Bellingham, MN - #A7339.17120)

Subsidies and Agency Expenditures

Summary

The topic of subsidies and agency expenditures generates a great deal of comment related to the economic effects of roadless area conservation. A number of respondents discuss the issue of subsidies for commodity users across National Forest System lands generally, and state that these subsidies also drive timber removal in roadless areas that would otherwise be uneconomical. Overall, respondents assert that private industries should not be subsidized to remove natural resources from public lands. They state that environmental degradation, restoration efforts, and deferred maintenance costs only add to direct subsidies, resulting in even greater losses to taxpayers. Such subsidies on the Tongass National Forest are a particular topic of comment to respondents, who often cite multimillion dollar annual losses to the U.S. Treasury as ample

reason to extend a national roadless rule to this national forest (see also Chapter 5: Designating Areas (Question 8): Inclusion/Exclusion of Specific Areas from a National Roadless Rule: *Inclusion*). Some respondents ask that any remaining long-term contracts be immediately cancelled. Others assert that subsidies are unfair competition with their own businesses, whether harvesting timber from private lands or producing recycled products as an alternative to virgin lumber. Several respondents suggest that, rather than allowing below-cost timber sales, the Forest Service should disburse subsidies directly to timber workers.

A number of respondents call for the Forest Service to end all below-cost sales, and to account for all costs in these calculations, including non-market costs. Some request that the true market demand for Tongass timber be recalculated to include the incentives to over-consume based on artificially low prices due to subsidies. Others ask that a more careful study of economic factors be carried out when making any timber sale decisions in roadless areas; such factors, people say, should include increasing agency losses in the timber program and rapidly increasing costs of road rebuilding and maintenance.

Some request that the Forest Service hold timber companies more fiscally accountable for the effects of their actions. Suggestions from the public include requiring companies to post bonds to cover the cost of restoring any damage to ecosystems, requiring companies to remove slash and to pay for all road-related costs, and deferring payments or credits until full stand replacement is verified. Some state that the agency should regulate timber companies as monopolies, with fixed rates of return and careful oversight.

Others assert that entrenched subsidy and personnel advancement policies within the Forest Service create incentives for employees to continue to support an otherwise unjustifiable timber program. According to one individual, the Forest Service should reform its financial incentive system that promotes active management in roadless areas and removal of old-growth timber, which this person believes ignores long-term ecological considerations necessary to ensure healthy, diverse ecosystems. This individual also writes that the Agency should no longer use Timber sales as employee incentives, bonus programs, or determining factors in funding jobs and programs. As an alternative to timber subsidies, some respondents ask that the Forest Service redirect these funds to ecosystem restoration efforts, sustainable timber removal in roaded areas, or private tree farms. Several also request that the Agency end subsidies to ranchers with allotments on National Forest System lands.

839. Public Concern: The Forest Service should not subsidize extractive industries on public lands.

More roads in such areas will remove more acres of land from production and threaten our water sheds, clean air, agricultural and recreation opportunities, and ultimately our local economy. Real costs can not be recovered by timber sales on public lands, and mining development usually results in costing more in local and federal clean-up and restoration expenses than it gains in tax revenue from the responsible companies. The price is too high for the taxpayer and the economy. (Individual, Bozeman, MT - #A6077.75600)

BECAUSE THE REAL VALUE OF FOREST LANDS LIES IN THE ECOSYSTEM SERVICES THEY PROVIDE

I think the economic value of logging has been overrated compared to the economic value of roadless areas, including tourism and local use related to fishing, hunting, rock climbing, backpacking, backcountry skiing, and wildlife/landscape viewing and photography. The economy of the Mountain West is in transition away from extractive resource-based industries, and resource management should recognize this. The economic future of the Mountain West will depend more and more on beauty,

recreation, and intact ecosystems. Let us not continue to subsidize destructive activities incompatible with the real value of this country. (Individual, Manhattan, MT - #A671.75310)

I am deeply concerned about the use of taxpayer dollars to subsidize the overuse and destruction of our publicly owned natural resources. This especially applies to roadbuilding in our National Forests. We must wisely use this land and I believe that the ecological service it provides will grow in importance as time goes on. Therefore, I urge you to let the roadless Area Conservation Rule stand as it is written in the January 2001 Record of Decision. (Individual, Fayetteville, AR - #A333.75600)

BECAUSE SUBSIDIZATION AMOUNTS TO CORPORATE WELFARE

Just like the guy who gets laid off from Motorola, so too must the logger/rancher adjust to the changing times? It is not the forest service's job to subsidize these industries with corporate welfare. (Individual, Wheaton, IL - #A52.75600)

It is apparent that our National Forests have historically been used as a corporate welfare program for the timber, mining, and oil industries. I believe that saving the last 30 percent of America's wild national forests from further corporate degradation is not only a reasonable compromise, but a critical step to take if we as a society hope to maintain wildlife habitat, protect water quality and preserve some of the last truly wild places. (Individual, Portland, OR - #A268.75600)

There is no value in a below-cost timber sale, but that is what we are being asked to support. This is corporate welfare at its worst, and don't think that millions of us Americans fail to make the connection between campaign contributions and losses to the treasury due to under cost timber sales. (Individual, Missoula, MT - #A1933.75610)

A key point U.S. Senator McCain makes repeatedly is that large corporations are the beneficiaries of large amounts of undue public largesse. The mining and timber industries are classic examples of this cronyism capitalism, something our country frowns upon when it happens in other nations. The Forest Service has a limited budget, and it cannot even afford the full costs of maintaining existing roads it built that give large mining and timber companies access to federal lands. Your departmental budget and that of every other federal department is likely to get even more limited, given other spending priorities and shrinking available taxpayer dollars. Much lip service is paid to cost-benefit analysis when it comes to environmental protection, but the same kind of cost-benefit study never seems to surface when it comes to the return on investment of taxpayer-subsidized environmental degradation. In our view, that was former Interior Secretary James Watt's greatest failure. We can respect, if not agree with, a position that all available natural resources are to be exploited in the name of free enterprise. However, there is no business case in any capitalist sense for unprofitable resource extraction. The only way it pays for mining and timber companies to exploit public lands is if they can externalize much of their true costs onto the backs of taxpayers, letting us foot the bill for the access roads and the cleanups. (Individual, Forest Hills, NY - #A6156.75600)

BECAUSE IT IS UNFAIR COMPETITION WITH PRIVATE FOREST OWNERS

Continuing to allow taxpayer subsidized harvesting is unwarranted competition or private forest owners. (Individual, Salem, OR - #A8263.75610)

As a private landowner (400 acres) of timberland, I ask that you not open the roadless areas to timber harvest. This puts the government in competition with woodland owners because of subsidies for roadbuilding. (Business, Portland, OR - #A37964.75600)

BECAUSE IT IS UNFAIR COMPETITION WITH RECYCLED PRODUCTS

Since the roads built through our Federal Forests (using tax dollars) often primarily serve private firms' needs to move timber, this rule is a critical step to reduce the subsidies for virgin materials that make it difficult for recycled products to compete. (Elected Official, Bronx Borough, NY - #A15554.75610)

When the government makes extractive resources cheaper—more available, it kills recycling—offices buy new paper because it is so cheap! Please help the market help the people and the future of our economy—don't weaken the Wild Forest Protection Plan! (Individual, No Address - #A1542.75000)

840. Public Concern: The Forest Service should recognize that the value of removing timber is outweighed by the cost of mitigation measures made necessary by harvesting.

When industry builds roads in the forests around the region I live in the government is required to build to a standard and to protect water quality from run off. The amount of personnel required to design and implement and the standard to which construction must be done makes the cost higher than the timber being harvested. (Individual, Lakeside, MT - #A5234.10111)

841. Public Concern: The Forest Service should not allow below cost timber sales to occur.

ADD A DIRECTIVE THAT NO TIMBER SALES WILL BE ALLOWED WHEN FULL COSTS EXCEED RETURNS BY MORE THAN 10 PERCENT

[Adopt] "No timber sales shall be made unless the benefits to the United States exceed the costs thereof, taking into consideration the costs of all payments to local governments (in lieu of taxes or otherwise), all credits against sales proceeds for road construction or other credits, costs of revegetation, and reasonably quantified costs to watersheds, watercourses, and commercial and game fish."

If possibly you feel that such a provision might be too strict, then please provide, instead, that those costs cannot exceed the sales proceeds (without credits) by more than ten percent. The Forest Service will be able to cost-out a timber sale to determine whether it is having a favorable financial impact. Therefore, it would appear in the great interest of the taxpayers that the Service adopt a regulation supplementing this rule or otherwise that, whenever a sale is shown likely to be unfavorable financially, then it [will] not be offered. We do not believe it is fair to the government's other efforts (such as defense, education and prescription drug benefits) or to the taxpayers that the costs of any sale should exceed the sale's proceeds by more than 10%; to do otherwise would be running too large a program deficit! (Organization, Birmingham, AL - #A21582.75610)

BECAUSE IT IS UNFAIR TO TAXPAYERS

The whole public owns the national forest; they're tired of having their tax dollars subsidize giant timber companies. The U.S. Forest Service loses hundreds of millions of dollars a year in below-cost-timber sales. (Individual, Lafayette, CO - #A807.75000)

I grew up in the Pacific Northwest. In my lifetime I watched clear-cut logging destroy our old growth forests in order to sell raw logs (with no value added quotient) to Japan. The taxpayer's subsidized this logging activity while the timber companies made all the profits. Next when the salmon runs were decimated from instream sedimentation, the taxpayer had to buy the fisherman's boats. Finally for the final fiscal insult the taxpayer paid to clean up small towns in W. Washington which were predictably flooded by spring run off coming unimpeded through the logged areas. (Individual, Bozeman, MT - #A7094.75600)

BECAUSE THE U.S. IS FACING BUDGET DEFICITS

Many of the roadless areas protected by the Conservation Rule would have been timbered if it were cost-effective to do so. However, many are too steep or too remote or, due to other factors, are not cost-effective to timber. It has been reported that the Forest Service, until recently, had lost between \$800,000 and \$1.2 billion every year on timbering in the national forests. In a recent year, \$29 million was lost in timber sales in the Pacific Northwest alone. Even though we are having some budgetary surpluses, it clearly appears that they are not as large as were anticipated and that we might be in a deficit position in the next few years. The nation, consequently, should not engage in subsidizing private interests when that is destructive of a natural resource. (Organization, Birmingham, AL - #A21582.75610)

BECAUSE TAX DOLLARS ARE NEEDED FOR OTHER PROGRAMS

If you do not wish to support the Roadless Area regulations (notwithstanding their support by the public), then please adopt fiscal directive prohibiting any sales that are not cost-effective to the government. In these days when the Administration has enacted a tax cut and also wishes to pay down the national debt and expand expenditures for defense, education and prescription drugs/Medicare benefits (all "big ticket" items), we just cannot afford any programs than lose substantial money! Therefore, in lieu of supporting the roadless area regulations and so as to save needed funds of the Forest Service, we urge you to adopt a fiscal directive that: "No timber sales shall be made unless benefits to the United States exceed the costs thereof, taking into consideration the costs of all payments to local governments (in lieu of taxes or otherwise), all credits against sales proceeds for road construction or other credits, costs of revegetation, And reasonably quantified costs to watersheds, watercourses and commercial and game fish." If you feel such a provision might be too strict, then please provide, instead, that those costs shall not exceed the sales proceeds (without credits) by MORE THAN 10%; to do otherwise would be running too large a program deficit! (Individual, Birmingham, AL - #A4991.75610)

BECAUSE THEY PRODUCE ROADS THAT THE FOREST SERVICE LACKS THE FUNDING TO MAINTAIN

Regarding economics, I hope it is more than obvious that no more below costs timber sales should occur. The roads we all end up paying for are not an asset when we have a huge backlog of needed repairs and maintenance on existing roads. (Individual, No Address - #A405.75610)

The federal government should NOT be subsidizing the forest products industry by building roads into these areas. Unfortunately there is a long and disgraceful history of the Forest Service building roads into these types of areas at the public expense to allow logging. In many, if not most, cases construction of the road network required to conduct the logging operations costs more than the value of the timber. This practice should not continue. (Individual, No Address - #A621.75600)

Economics alone should dictate that no new roads be constructed on public lands. We already have tens, if not hundreds of thousands of miles of roads, which have resulted in a maintenance backlog of billions of dollars. As a society, we cannot afford to maintain and monitor this sprawling network of roadways, nor should we desire to. In fact, I encourage the Forest Service to reclaim unnecessary roads wherever possible. The construction of new roads is certainly contrary to sound economic judgment. (Individual, Durango, CO - #A5420.75000)

Common sense (particularly the fiscal common sense touted by the Bush administration) should tell you that NOT building further roads into the backcountry represents a sound financial decision. Your own figures show the USDA Forest Service can't afford to maintain the roads already on the forest, much less allow for additional ones. (Individual, Atlanta, GA - #A26430.10150)

Protecting and preserving the remaining roadless areas on our public lands serves the public in many ways. The network of roads in the roaded portions of our public lands is already excessive and unmanageable. The U.S. Forest Service road maintenance program costs American taxpayers hundreds of millions of dollars per year and currently suffers a debit of hundreds of millions of dollars. U.S. Forest Service annual reports for every year since 1996 reveal further costs to the taxpayer in the form of heavily subsidized logging, mining, and grazing of our public lands all of which fail to return even the cost of administration. Yet these industries enjoy a second round of subsidies in the form of roads built across our public lands primarily to support extraction of natural resources with recreational access an afterthought often used [as] an excuse to perpetuate already heavily subsidized industrial use of our public lands. (Individual, Kennewick, WA - #A23359.75600)

842. Public Concern: The Forest Service should revise funding and staffing incentive policies that allow timber management to dominate forest values.

We think the agency lacks the incentive to balance the conflicting values of forest users. We think the incentives accrue to dominance and control on the side of timber management, rather than to balance,

because of fundamental flaws in the funding mechanisms. We have sat through too many interdisciplinary team meetings where the professional judgment of [wildlife] biologists is overridden by the dominance of the timber line officer; where the principles of watershed management offered by the hydrologists and geologists are squelched and censored by the dominance of the timber management staff; where scientific findings have been “reinvented” to satisfy the objectives of the timber management staff; where planning staffers, upon reaching consensus with conflicting interests, have expressed the frustration that we cannot implement the consensus because it will never be funded; where we have preferred trade-offs and bargained in “good faith” to achieve agreements with others, only to have reviewing officers accept our proffered by renegeing on the trade. We think these types of events transpire because funding allocations make timber management the dominating, controlling force in the agency. (Organization, Damascus, VA - #A17723.15122)

It is time for the Forest Service to reform its financial incentive system that promotes roadless area development and harvesting of old growth timber, causing your agency to ignore long-term ecological considerations necessary to ensure healthy, diverse ecosystems. Timber sales should no longer be used as employee incentives, bonus programs, or determining factors in funding jobs and programs within the agency. (Individual, No Address - #A15267.17100)

843. Public Concern: The Forest Service should implement a national roadless rule.

TO COUNTERACT REVERSE ECONOMIC INCENTIVES AT THE LOCAL LEVEL

We strongly oppose weakening nationwide protections for our remaining roadless areas through forest-by-forest decisions based on extraction rather than conservation. Extraction economics characterized by reverse incentives such as “purchaser road credits” and the Knutson-Vandenberg Act have undercut forest stewardship and imperiled our public lands through road building, logging, mining, and access by off-road vehicles. Please fully implement the January 2001 version of the final rule so enlightened management will finally prevail. (Individual, Oakland, CA - #A11880.75610)

844. Public Concern: The Forest Service should eliminate below-cost timber sales and raw log exports on the Tongass National Forest.

In recent years, the Forest Service has spent on average \$40 million more a year selling timber from the Tongass National Forest than it has returned to the U.S. Treasury. IN 1992, THE TONGASS TIMBER PROGRAM COST U.S. TAXPAYERS OVER \$64 MILLION, LOSING MORE MONEY THAN ANY NATIONAL FOREST IN HISTORY. Almost all Tongass timber is exported in nearly raw form, either as pulp or cants, squared-off logs, to the Far East where it is then processed into higher value products for export back to the U.S. In 1992, for example, 97 percent of the timber products and pulp produced in the Tongass and 72 percent of the cedar logs were exported to Japan. A smaller fraction of Tongass timber was shipped to other nations including Taiwan. (Organization, Missoula, MT - #A17234.75610)

845. Public Concern: The Forest Service should improve methods for calculating true market demand for Tongass timber.

INCLUDE THE COST OF SUBSIDIES

The Forest Service has overestimated true market demand in the Tongass by failing to take into account the subsidies included in every Tongass timber sale. Market demand depends on many variables, especially the price of obtaining timber. However, the Forest Service definition of market demand relies heavily on mill capacity, with little regard for the price that the public landowner (the Forest Service) might find appropriate to charge for timber. The agency’s interpretation of “market demand” overlooks a fundamental fact: If the U.S. government gives the timber away for free, or charges nominal cost (as it currently does), demand will be substantially higher than if the government charges prices comparable to private suppliers. The Forest Service is under no legal obligation to supply timber to Alaska mills on environmental or financial terms that ensure the mills can make a profit.

The industry claims the lower prices paid for federal Tongass timber reflect government use restrictions (namely, local processing requirements) and higher environmental standards for logging. However, “market demand” for that private timber is reflecting its own implicit subsidies. The biggest subsidy is private landowners’ ability to shift the environmental costs of widespread, unsustainable clearcutting onto third parties (usually, the general public). If that implicit subsidy for environmental costs were removed and those costs were put back onto the landowner or timber buyer, the private owners would have to charge a higher sale price, which in turn would tend to decrease market demand. (Organization, Sitka, AK - #A30486.75600)

846. Public Concern: The Forest Service should consider additional factors in timber sale decisions.

CONTINUAL AND GROWING CASH FLOW LOSSES

In 1980 the Forest Service substituted the term “Suitable For Timber Production” for the long-used term “Commercial Forest Land” (CFL). To qualify as CFL forest land must be able to grow 20 cubic feet of industrial usable wood annually. As Forest Plans were approved, 30,480,000 former CFL acres were eliminated from the “Suitable” rating, at 40% drop from 77,752,000 acres to 47,272,000 acres in 1998. Most of this elimination of acres from the timber base was in the 1980s. There are 165 Proclaimed Forests organized as 109 Administrative Forests. Four of these Forests cut timber, but lack any land rated “Suitable”. 14 Forests list 4,824,000 acres as “Suitable”, but their average annual timber growth rating fails the 20 CF CFL test; it is only 16 cubic feet a year, 20% under the CFL minimum. Therefore only 91 Forests have only 42,448,000 timber acres that pass the 20 CF test. Actually, there also may be areas on the 91 Forests that fail the 20 CF test. The amount of timber that can be cut each decade fell even more. This is called the “Allowable Sale Quantity”, ASQ. Since 1980 the 15,064 MMBF ASQ, fell to 6,959 MMBF a reduction of 8.105 MMBF as 54% decline. Most of that drop was in the ‘80s as new Plans were approved. There was no outcry from the timber industry in the Reagan-Bush Administration similar to the current one. As a reality check, when the 14 Forests that fail the 20 CF test are removed, the ASQ falls to 6.694 bil. BF. Leaving aside for the moment, the pervasive timber sale cash flow financial losses, also a characteristic of these 18 Forests, there are only 91 Forests with 42,448,000 acres rated Suitable for Timber Production, with an annual ASQ of 6.694 bil. BF. Continual and growing cash flow losses are not factored in to decisions to sell timber. (Professional Society, Saint Leonard, MD - #A9040.65260)

RAPIDLY INCREASING ROAD REBUILDING COSTS

In 1998 to run timber sales nationally 11.3 miles of existing logging roads were rebuilt for every new mile. It doesn’t take a genius to figure out that the Forest Service has serious road problems. 92% of the miles of timber roads built-rebuilt were financed by reducing the price of the timber to compensate timber firms for the estimated cost to build these roads. In addition millions engineering and inspecting these roads. A mere 13% of the timber road miles are built with appropriated money. In 1998 the cut was only 3.3 billion BF logging 525,000 acres. The ratio of miles rebuilt to new miles has grown every year, despite the cut falling to 60% of the 1992 level. Viewed over the long term, road deterioration is a growing cancer affecting streams, watersheds, soils and fish. For example, on the money-losing Tongass the road cost runs at least \$75,000 per mile. (Professional Society, Saint Leonard, MD - #A9040.75610)

847. Public Concern: The Forest Service should impose greater fiscal requirements on timber companies.

REQUIRE TIMBER COMPANIES TO COVER THE FULL COST OF ANY ROAD CONSTRUCTION, REMOVAL, OR RESTORATION

Forest timber sales should be made only at prices that reflect both the true value of the products harvested at a fair market price. The logging companies should pay for the cost of any road construction—under strictly supervised and environmentally sensitive methods—and then pay for the cost of removing/restoring roads or other damage if deemed appropriate by an agency and citizen committee. (Individual, San Antonio, TX - #A428.75800)

All costs of maintaining present roads (logging) roads and all other forest service costs associated with logging, should be fully and directly charged to timber companies prorated in relation to the board feet each harvests out of the total harvest. (Individual, Scio, OR - #A14375.17000)

The cost of building and closing of these roads reclaiming and seeding of the harvested areas should be shared with the harvester. (Individual, Rock Springs, WY - #A5695.75600)

The only problem with the roadless initiative is that it has too many loopholes and not enough protection of forests and the public interest. If there are to be any changes, they should consist of strengthening it, such as: Loggers, miners, and other beneficiaries of past roadbuilding must be required to pay all costs of remediation of the erosion, sedimentation, water quality degradation, destruction of fish habitat, and other damages that have been caused by roads. (Individual, Oakland, CA - #A28134.75400)

REQUIRE TIMBER COMPANIES TO POST BONDS FOR RESTORATION

The only problem with the roadless initiative is that it has too many loopholes and not enough protection of forests and the public interest. If there are to be any changes, they should consist of strengthening it, such as: Require the posting of a bond sufficient in size to cover restoration costs over multiple generations. (Individual, Oakland, CA - #A28134.75400)

REQUIRE TIMBER COMPANIES TO REMOVE SLASH AFTER LOGGING

The Forest Service does not require the timber industry to clean up after logging, slash piles are left for the Forest Service to clean up and the service is not funded to do the job. (Individual, Mesa, AZ - #A99.30100)

REQUIRE TIMBER COMPANIES TO ASSUME DIRECT FINANCIAL LIABILITY FOR ENVIRONMENTAL DAMAGE NOW AND IN THE FUTURE

Companies working with our natural resources shall assume full liability for any damage, including that not discovered until future generations, with no possibility of bankruptcy, and no shield of liability for the managers or investors. If we as a society are putting our living priceless natural resources at risk, the very least a company and its people can do is place their monetary resources at risk. (Individual, Oakland, CA - #A28134.75400)

PLACE ALL TIMBER CONTRACT PAYMENTS IN ESCROW UNTIL FULL STAND REPLACEMENT IS VERIFIED

All revenues from extraction of natural resources are held in escrow until replacement of the natural resources is confirmed. In the case of trees, this would take a minimum of decades. In the case of old-growth, this would take a minimum of centuries. Loggers are fond of saying there's nothing wrong with their practices, it will all grow back. OK, let them put their money where their mouth is. If it does grow back, then they'll get paid. If it doesn't, they're the ones who should take the loss, not the public. Anything less than this is a subsidy—i.e. a welfare program. (Individual, Oakland, CA - #A28134.75400)

848. Public Concern: The Forest Service should ensure that sales of resources are competitive.

BY ELIMINATING LONG-TERM CONTRACTS

I would like to preserve the logging industry, access to rock resources and other natural resources. Sales of resources and leases should be aggressive and competitive, with no long term agreement dates where values might change over time. (Individual, Lacey, WA - #A17762.15160)

849. Public Concern: The Forest Service should recognize the budgetary benefits of prohibiting timber removal and road building in roadless areas.

Strict protection of all roadless/unroaded areas also responds to budgetary concerns and the need to balance forest management objectives with funding priorities. It is a well known fact that management that suspends logging and road building and other developments on a National Forest is much cheaper to

implement than management that does not suspend such activities. As an example, Alternative 3 (which did not allow logging and new road construction) examined for the 1993 GWNF Plan Revision had by far the least cost to implement of any of the 14 alternatives considered in detail (see page B-100 of GWNF FEIS). Its budget was less than 60% of the budget for the alternative (8A) chosen by the FS to implement. Implementation of Alternative 3 would save the US Treasury and US taxpayers over \$6 million dollars a year on this one Forest alone. In addition, Alt. 3 had the highest benefit to cost ratio of any of the 14 alternatives (GWNF FEIS B-99). It is therefore reasonable to expect great benefits to the U.S. treasury and American taxpayers to similarly accrue from a prohibition on logging and road building in roadless areas. (Individual, Staunton, VA - #A29325.17100)

850. Public Concern: The Forest Service should regulate all commercial activities as monopolistic public utilities with fixed rates of fair return.

COMMERCIAL ACTIVITIES and RESULTING PROFITS. Commercial activities allowed on public lands should be allowed, if at all, subject to a public sealed bidding process and a review to ensure profits are not unreasonable. Operations allowed in limited areas of public lands intrinsically enjoy a certain degree of monopolistic benefit. As such, they should be subject to public scrutiny and regulation (as are public utilities) designed to ensure that this monopolistic advantage does not result in "UNDUE PROFITS" at the cost of the public affected by their activities. I propose as a very important general principle that any NOT non-profit operation authorized in or affecting these public lands be restricted to receiving no more net profit than that which constitutes a "fair return" on time and investment, exactly as public utility companies have been for many years. These determinations should be subject to full disclosure and public review, and any excess profits which may occur should be returned, with interest, to the people overcharged or to the authorizing agency. (Individual, Bishop, CA - #A20954.75500)

851. Public Concern: The Forest Service should disperse subsidies directly to local workers rather than remove unprofitable timber.

Have you ever considered simply disbursing the dollars that you presently spend to log National Forests to the people who have traditionally earned a living from this? This would be very much like the farm subsidy system that is presently in place. This could be completely eliminated after one generation. (Individual, Asheville, NC - #A6246.75600)

852. Public Concern: The Forest Service should buy back timber sale contracts.

As an adjunct to the present administration you should be raising the necessary funds to "buy off" the timber interests, and let them out to pasture (those who have been habitually involved with timber and can live no other way, nor can they be retrained to function sanely in any other occupation, as their heart will just not be in such "retraining programs"). They need to be pensioned off, and fund-raising then needs to be conducted to develop and produce any and all alternative products to wooden construction. To fail to do this is surely to monkey seriously with the regard and REKNOWN with which present and future generations will view the likes of you! (Individual, Bellingham, WA - #A1928.17000)

TO HELP COMMUNITIES ADAPT ECONOMICALLY

[Manage] as naturally as possible. NO LOGGING of salvage timber. No timber sales of any kind. If necessary buy back the contracts that have already been sold and help communities economically so they can sustain the changes. (Individual, No Address - #A29275.30100)

853. Public Concern: The Forest Service should provide economic incentives for responsible use of natural resources in roaded areas.

Provide economic incentives to behave responsibly, and renew our resources. If logging groups truly do so, they should not have to keep expanding into new areas. Provide additional incentives to recycle forest-derived resources to companies and individuals to reduce the demand for these resources. This is going to HAVE to happen sometime-why not now, before the situation is desperate and logging companies log themselves out of business? (Individual, Arlington, MA - #A1152.75000)

854. Public Concern: The Forest Service should subsidize commercial tree farming as an alternative to logging public lands.

Commercial tree farming is one alternative to logging public lands. If the government can afford to subsidize tobacco growers, why not subsidize tree growers? (Individual, Killeen, TX - #A43260.75600)

855. Public Concern: The Forest Service should devote more money and time to conservation.

One of the worst things about my job (besides the paycheck) is the thought of what is happening to forests throughout the world . . . I'm sure some of the forest destruction is inevitable, so many countries having floundering economic bases but the US . . . look at this time of economic prosperity, you'd think there would be more money and time to devote to the conservation of nature. (Individual, Allston, MA - #A186.75950)

856. Public Concern: The Forest Service should subsidize wildlands restoration.

Restoration of wildlands will take taxpayer subsidies, but as a taxpayer, I prefer to subsidize restoration rather than below cost timber sales. I do not think our slow growing northern forests can sustain the level of harvest required to keep busy the increasingly mechanized timber industry. More and more jobs will need to come from restoration. Restoration jobs rebuild communities and souls as well as ecosystems. (Professional Society, Missoula, MT - #A17054.75610)

857. Public Concern: The Forest Service should not subsidize ranching.

Ranchers' cattle are hurting national forests and ranchers get too good a deal for the pasture land. They should be charged much more. I pay more for an out of state hunting license than they do for a whole herd of cattle grazing for a year. (Individual, No Address - #A417.75620)

Remember that its time to start charging accurate rates for the grazing done on public land. (Individual, Blue Springs, MO - #A7209.75600)

Grazing, also, must now pay fair market value for grazing AUMs. Public land AUMs cost well below private sector ones. In too many areas, especially riparian, the damage from cattle and sheep in already fragile areas, is irreversible. (Individual, Kemmerer, WY - #A8383.75620)

Perhaps grazing fees should be increased to reflect a more realistic market value of the land and its use. (Individual, No Address - #A29334.90110)

Heritage Resources

This section includes one subsection: Heritage Resources General.

Heritage Resources General

Summary

Some respondents assert that roadless areas themselves constitute our national heritage and can best be protected through a national rule. Others specifically mention the need to preserve cultural and heritage resources such as historic sites and structures. One organization writes in that they are concerned about the preservation of old mines, cabins, settlements, railroads and other features used by pioneers, homesteaders, loggers, settlers, and miners, many of which they believe are located in roadless areas. While some respondents assert that a national roadless rule will aid in conservation of these resources, another respondent suggests that such a rule will hinder access, maintenance, and protection of heritage resources. State representatives request a complete inventory of heritage and paleontological resources in Wyoming that may be affected by a national rule. They request consultation with state historic preservation offices, American Indian tribes, and the Advisory Council on Historic Preservation to facilitate this process.

858. Public Concern: The Forest Service should preserve America's national heritage.

BY PROTECTING ROADLESS AREAS

Our nation's remaining roadless wild-lands should be protected not only to preserve wildlife, water purity, clean air, recreation areas, scenic values, cultural and historic sites, etc., etc., etc., (I could go on!), but also, quite simply, because they are part of our national heritage. Our great American landscape—the Rocky Mountains, the forests of the Pacific Northwest and Alaska, the swamps of the South, the woods of New England, and the Desert Southwest are not only God's wonderful creations, but they also serve and have served as a glorious backdrop for the great events of American history. We would not be who we are without them. Please protect these lands and let the roadless rule stand. (Individual, Summit, NJ - #A608.50000)

I do not want to see our National Heritage wiped out because our lawmakers were too influenced by shortsighted capitalists. Consider the future, and support this important conservation effort. (Individual, Cambridge, MA - #A1244.80100)

The roadless area conservation measures that have been placed on National Forest Service (NFS) lands afford a level of protections to NFS cultural resources that have not existed previously. Our heritage resources are endangered by any changes that weaken or render ineffective the cultural resource protection and Enhancement of the Cultural Environment. Federal agencies have been inventorying historic and prehistoric sites located on lands they manage. The NFS has inventoried over 277,000 heritage sites since 1973, and this is estimated only to represent about 25% of all their lands. Mike Kaczor of the U.S. Department of Agriculture Forest Service therefore estimates that NFS lands may contain up to one million prehistoric and historical heritage sites. These sites contain irreplaceable information of scientific and cultural value and historic importance to our nation. Therefore we are officially opposed to any attempts to repeal the roadless area conservation measures presently in place. The laws, regulations and enforcement of them need instead to be strengthened to preserve our cultural resources, so that future generations can appreciate the full value of our heritage. (Organization, Middleboro, MA - #A23043.80110)

BY PRESERVING HISTORIC STRUCTURES AND TRADITIONS IN ROADLESS AREAS

We are concerned about the preservation of old mines, cabins, settlements, railroads and other features used by pioneers, homesteaders, loggers, settlers, and miners. Many of these are located in roadless areas. These are important cultural resources and should not be removed from the landscape. Western culture has been characterized by opportunities to work with the land and preservation of any remnants of this culture is important. Current land management practices are not adequately protecting these resources and western culture including the opportunity to work with the land. (Organization, Great Falls, MT - #A15315.80100)

859. Public Concern: The Forest Service should identify historic properties which may be affected by a national roadless rule, and assess and resolve any adverse impacts.**IN CONSULTATION WITH STATE HISTORIC PRESERVATION OFFICES, AMERICAN INDIAN TRIBES, AND THE ADVISORY COUNCIL ON HISTORIC PRESERVATION**

Management of cultural resources on U.S.D.A. Forest Service (USFS) projects is mandated by, and conducted in accordance with, Section 106 of the National Historic Preservation Act and advisory Council regulations 36 CFR Part 800. These regulations require the USFS to initiate the Section 106 process (36 CFR Part 800.3), identify historic properties which may be affected by the project (36 CFR Part 800.4), assess any adverse effects which may result from the project (36 CFR Part 800.5) and to resolve these adverse effects (36 CFR 800.6). These efforts must be conducted in consultation with the Wyoming State Historic Preservation Office and any interested publics, Native American Tribes, and the Advisory Council on Historic Preservation as appropriate. All documentation of these efforts must meet the Secretary of the Interior's Standards for Archaeology and Historic Preservation (48 FR 44716-42). Provided the USFS follows the procedures required by federal law and established in the regulations, we have no objections to the project. (State Agency, Cheyenne, WY - #A22609.20000)

860. Public Concern: The Forest Service should preserve cultural resources.**BY PROTECTING ROADLESS AREAS**

Wilderness and roadless areas are where I (working as a Forest Service archaeologist) can locate historic and prehistoric cultural sites which have not been impacted by other recent development. Prehistoric use of high mountain lakes within some of our present designated wilderness areas, was as important to some people hundreds and thousands of years ago as it is for me and many others today. These remote areas support a variety of plants and animals not found where man dominates. (Individual, Troy, MT - #A1180.80100)

BY PROHIBITING ROAD BUILDING IN THE TONGASS NATIONAL FOREST

I oppose building new roads in the Tongass Nat'l Forest. I live in Tenakee Springs and feel some of my favorite places in this Inlet are in jeopardy if the ban on roads is lifted.

In Crab Bay there is a large and complicated petrograph that could be harmed by creation of road access. It would be a great loss to the early history of the area and perhaps to the native culture if these were exposed or harmed.

Please take steps to assure a no road policy in the Tongass Nat'l Forest. (Individual, Tenakee Springs, AK - #A5144.45623)

861. Public Concern: The Forest Service should ensure motorized access to historic sites in roadless areas.

We are concerned about the loss of access to historic sites that each closure may produce. That is an example of denying motorized visitors, handicapped, elderly, and physically impaired, access to the forest with out adequately addressing site specific and scientific reasons why. We request that the Forest Service analyze all the roads, trails, and features of interest that they provide access to in this area to determine the benefits of each route. These benefits must be carefully considered in the decision to keep a route open or to close it. (Organization, Great Falls, MT - #A15315.80000)

In addition to taking steps to protect our local western culture, federal agencies should implement a roadless rulemaking alternative that include these features [old mines, cabins, settlements, railroads and other features used by pioneers, homesteaders, loggers, settlers, and miners] as part of motorized interpretative destinations and loops. (Organization, Great Falls, MT - #A15315.80100)

862. Public Concern: The Forest Service should provide a detailed analysis of paleontological resources in roadless areas covered by a national rule.

IN WYOMING

We believe it is important that the following issues must be addressed in the underlying EIS, on a Wyoming-specific scale:

A detailed analysis of the paleontological resources that are present in the areas proposed for closure. (State Agency, Cheyenne, WY - #A22609.10135)

Chapter 5

Forest Management

This chapter includes four main sections: Forest Management, Activities (Question 7), Designating Areas (Question 8), and Agency Organization and Funding.

Forest Management

This section includes three subsections: Forest Management General, Adequacy of Analysis, and Roadless Areas General.

Forest Management General

Summary

A number of people comment about the Forest Service and its management of public lands generally, rather than its management of roadless areas. Some members of the public state that the Forest Service should shift toward a more balanced management strategy that focuses on recreational uses rather than commodity extraction. Others assert that the Agency has shifted too far toward environmental protection and needs to reemphasize traditional multiple use strategies which include commodity extraction and motorized recreational uses. (See also Chapter 1: National Roadless Protection – General Remarks: Need for a National Roadless Rule General and Need for the Roadless Area Conservation Rule.)

A few individuals suggest new approaches to timber and forest health management, calling for a new ethic of stewardship and ecosystem restoration among land managers. Suggestions include allowing local residents to conduct small-scale restorative logging and to help with controlled burns and fuels reduction, and agency support for the generational land steward program. These respondents state that non-traditional agreements are needed as a substitute for large-scale commercial contracts in order to support local economies and restore forest health. A few people suggest regional or local forest planning processes that should serve as models for the Forest Service as a whole or for its roadless area management, such as the Sierra Nevada Ecosystem Project and the Black Hills Forest Plan.

Others discuss organizational structure and the administrative framework of the Forest Service. Some comment that the Forest Service at the national level should ensure consistent decision-making at the local level; this assertion is echoed in comments which request implementation of a national rule. Some believe that the current agency structure is too complex, and that forests should be consolidated for more efficient management. A few individuals say they are dissatisfied with present Forest Service management and suggest that all roadless areas be turned over to the U.S. Department of Interior or the Park Service if traditional multiple use management is no longer practiced. Others suggest that National Forest System lands be privatized or turned over to local government control.

863. Public Concern: The Forest Service Chief should guide the Agency in the direction of balanced management.**EMPHASIZING RECREATIONAL IMPROVEMENTS RATHER THAN TRADITIONAL EXTRACTIVE USES**

I still am in favor of roadless areas and wilderness! I hope to God, Mr. Bosworth, that you have the guts it will take to face off with the President and the lumber lobby, the mining for the past 30 years—preserve our wilderness and roadless lands! Your 2nd big challenge will be to turn the Forest Service around to an agency interested in helping the public—not restricting it! I have watched for years now as you have spent my hard earned tax dollars blocking me from admission to the forest system. It is an affront I can hardly begin to describe! Go back to the days of well-maintained trails, good forest campgrounds, cable cars across streams, and the green truck the sign of a friend coming to help. You have inherited an agency at the bottom of its historical abyss—you can either turn it around into the proud agency it once was—or you can continue on the present path until some visionary president disbands the agency and replaces it with something new. Barring huge change—I would vote for immediate dismantlement—you are currently doing no one any good, and you cost a hell of a lot of money. Not much of a bargain in my book. (Individual, Missoula, MT - #A5.12120)

864. Public Concern: The Forest Service should manage National Forest System lands for a wide variety of uses.

I would say the highest good is the public usage of the land—that means recreation, the national economy and the local businesses. I do not believe using it solely for timber production is correct, but neither is using it solely as a wildlife preserve (for wolves, grizzlies, or owls), nor as a botany preserve (for the old growth), nor as a nostalgic attempt to recreate the west as it was before the white man arrived (or for that matter, before the Indians arrived—after all, they did burn the forest regularly and they did leave a mark on this Eden as some seem to think primitive America was). (Individual, Bozeman, MT - #A59.50200)

BECAUSE TAXPAYERS HAVE A RIGHT TO USE PUBLIC LAND

The world is made up of opinions, some of these get more attention due to the size of their budget not by their educated fairness! Too many people throw money at organizations which benefit nothing. The Earth is a fragile, yet not so fragile thing, it has survived many years of changes, many of which our species would not have survived. With that in mind, this land is here to use and use for all. The consideration needs to be given so that the people that fund this land (taxpayers) have rights within these lands. (Individual, No Address - #A426.15100)

These are public lands. Each taxpayer's tax payments bought and maintains these lands. They are not owned by the Forest Service. They should be enjoyed by all. The Forest Service are employees of the public and need to respect our wishes on how to both protect wildlife and utilize these assets. (Individual, No Address - #A457.15110)

865. Public Concern: The Forest Service should assure consistent decisionmaking for all national forests.**BECAUSE THEY ARE ALL A PART OF THE NATIONAL FOREST SYSTEM**

In exercising our stewardship over these forest resources and as supported by the many commenting interests representing all states, we should have a consistent basic regulation for all the national forests. It should not be easier to timber a national forest in Montana than one in Colorado or New York. Those living near a national forest in one state should be entitled to have it protected just as much as those living near another forest in another state. It is only fair and equitable that there should be a “level playing field” so that there will not be any discrimination among the forests. After all, they are all in the same national forest system. (Organization, Birmingham, AL - #A21582.13100)

866. Public Concern: The Forest Service should use the Sierra Nevada Framework policy as a model for management of the entire public lands system.

UNTIL ACTIVE MANAGEMENT IS PROHIBITED

Again, all of the so called “threats” to our forests have been used as a smoke screen to promote more logging. Why don’t you admit it—government studies have shown logging is the number one activity which increases wildfire danger? Let’s talk about hazardous fuels. What about the thousands of gallons of diesel fuel and atrazine that’s regularly applied to clearcut land throughout the west. Sure that’s on private lands, but what we’re dealing with is this same mentality. If it can be mined, logged, grazed, roaded, or destroyed [then] it must be? The USFS actually has done something positive in the last 100 years, it’s called the Sierra Nevada Framework. This policy should not be undermined as we know is in the works, it should be the model for the entire public lands system. At least until we finally wake up and stop all commercial exploitation of our national forests and public lands. (Organization, Santa Cruz, CA - #A29160.30100)

867. Public Concern: The Forest Service should adopt a management approach similar to that used to delineate and manage wetlands.

The Forest Service must adopt an approach similar to that used to delineate and manage wetlands of the United States. The Forest Service must start with clear and up-to-date criteria for the delineation of roadless areas. These criteria should include forest health, wildlife habitat, water quality, scenic values, access to non-federal land, and a variety of recreation opportunities. Once established, these criteria must be applied consistently to all forested lands while balancing the economic and social relationships that directly impact working families and local communities. (Individual, Hibbing, MN - #A21366.13200)

868. Public Concern: The Forest Service should employ a new “wilderness ethic.”

BY EMPHASIZING A LIGHT RESTORATIVE APPROACH TO SUSTAINABLE MANAGEMENT BASED ON INDIGENOUS PRACTICES

It is time that Americans let go of the Daniel Boone/Davy Crockett/Boy Scout approach of believing our American forest resources are limitless and our divine right to use and abuse. Our “wilderness” ethic needs to be replaced with a new “wilderness ethic” of a light restorative approach to sustainable management based on Return to the Natives (indigenous ways combined with modern science and technology in a ‘light restorative approach using the proper balance of native species and educated human use and appreciation of these areas). (Individual, Watsonville, CA - #A6767.30100)

The Indigenous Americans harvested forest resources and used controlled burns in a sustainable way for thousands of years and created balance with a light human touch. I truly believe that their ancestral history, knowledge and culture can provide “light touch” integrated approach (scientific observation, soft engineering/technology, restorative use, art and spiritual connectivity to the land and lifeblood waters) to management of our national forests. By returning to the Natives (our indigenous cultures and our own ancestral roots) and using native plants and animals in restoration management, we can empower and employ indigenous people and have a sustainable American landscape that President Bush and future Administrations can be proud of and set a world leadership example, so that developing nations do not repeat our same mistakes. (Individual, Watsonville, CA - #A6767.15162)

869. Public Concern: The Forest Service should be flexible in its management.

TO REFLECT CHANGING NEEDS

The history of the national forests clearly shows continuing change in economic and social needs, objectives, and opportunities, which calls for continuing flexibility in management. There is no reason to

think that we can better predict the future now than we did in times past. (Individual, Olympia, WA - #A811.15100)

870. Public Concern: The Forest Service should afford local citizens the opportunity to carry out land management activities.

BY ALLOWING THEM TO HELP WITH CONTROLLED BURNS AND SALVAGE OPERATIONS

Controlled burns are a good tool, but only along with free and easy access by caring people. After the fire in Los Alamos in the mid 70s that almost got the labs, the areas opened up to the population for gathering (before rot and insects got in) and there was a wonderful community experience involved and clearing the area of burnt but not destroyed trees. Why did we not do this again. It suggests that we have "Dogs in the Manger" behavior that needs to be stopped. Controlled burns need to be controlled by people with deep intuitive, spiritual, scientific and training in weather, forest behavior, etc. This is where you could have people of exceptional love for the forest caring for it. Not managers and people who just have a job to do. This is so much more important than that! (Individual, No Address - #A5360.30200)

BY ALLOWING CAREFULLY MANAGED PERSONAL USE TIMBER AND FIREWOOD REMOVAL

My belief is that, as now, we have to pay \$10 per cord to go into the forest to collect firewood, for instance. The collector can drive up to the biggest pinon tree he sees, stand in front of it and cut it off over two feet from the ground and fell this glorious tree right next to a road. Then the limbs are hacked off, the green tree is cut into big splittable lengths and loaded into the truck, leaving the limbs right there and also the garbage and the bad attitude towards the forest. It is not unusual for me to go up there and have to clean up this spiritual assault, aesthetic assault and very uncool behavior. The people with the permit are not distinguished as to whether they are commercial or not and the forest is not cared for. Let the little guy go in there and be in there with some guidelines that encourage him to take the burden out, not just the big hunks. Then make it easier for him to take that wood home and build something out of it, to use it, to heat his home with it, etc. When we begin this process of everyone tending the forest and not feeling like it is private property, then we make progress. The roads are only bad because of the type of roads we want to avoid. Don't make it so that no roads exist in an area that needs to be tended, and accessed by careful, deliberate, environmentally concerned citizens and caretakers. (Individual, No Address - #A5360.30200)

871. Public Concern: The Forest Service should enter into non-traditional forms of management agreements.

TO BENEFIT LOCAL ECONOMIES AND FOREST HEALTH

The USFS should enter into non-traditional forms of management agreements. For example, a community manages a forest area in agreement with the USFS; a preservation group pays for the privilege to manage a wilderness area; a forest products company manages a portion of forest land in cooperation with the USFS; the respective state forest departments manage portions of the National Forest, etc. We need more joint ventures based on sound business principles and active stewardship management of the forest resource to create a wealth in the local economies while building a healthy forest environment. We must have both man and forest benefiting. (Individual, Libby, MT - #A10531.15100)

872. Public Concern: The Forest Service should support the Generational Land Stewards.

The best way to protect what you term "roadless values" is to not interrupt the Generational Land Stewards from their good works in maintaining that critical standard of diversity of tangible commodities and societal values. Keeping Generational Land Stewards, would also be economically prudent; for to seek out, train, tool up and pay new folks, to attempt doing what a GLS now does for free, would be a huge waste of our dollars! If you have a desire to preserve something really precious, and of real value, I urge you to preserve the Generational Land Stewards! (Individual, La Salle, CO - #A1103.70000)

873. Public Concern: The Forest Service should pursue tree-planting restoration projects in old neighborhoods.

When will we start using common sense with Mother Nature? We strip wooded areas to develop neighborhoods and leave old neighborhoods in shambles. Why don't we clear some of these old places and replant trees? (Individual, San Antonio, TX - #A1185.70110)

874. Public Concern: The Forest Service should consolidate national forests.**SO THAT AREAS OF SIMILAR ECONOMIC, SOCIAL, GEOGRAPHIC, AND VEGETATIVE SYSTEMS ARE ADMINISTERED TOGETHER**

Consolidate national forests so that areas of similar economic, social, geography and vegetative systems are administered by one National Forest headquarters. (Individual, No Address - #A26264.13200)

875. Public Concern: The Forest Service should either actively manage public lands or relinquish its authority.

We are disappointed with what we see as an attempt by the USFS to refrain from managing our forests through the increasing creation of land designations that minimize or eliminate management. Perhaps we no longer need a USFS. Our local police could accomplish the goal toward which the USFS is working: lock it up and keep people out. (Individual, Cedaredge, CO - #A10364.12120)

876. Public Concern: The Forest Service should consider privatization of public lands.

Privatization of land is key. It results in stewardship and effective management. (Individual, Saint Paul, MN - #A11544.12000)

AUCTION TO THE HIGHEST BIDDER

I am opposed to the federal government building roads for private industry to exploit national natural resources, such as forests, mineral deposits, and oil reserves. Why not just liquidate the forest (or other inventory) that the government doesn't want to maintain, by selling it to the highest bidder. Let the winner of the bid build, maintain, and upgrade the roads as they see fit?. Then they will have to maintain their own property, and the government can tax them on it! (Individual, West Lebanon, NH - #A3812.15122)

Adequacy of Analysis

Summary

Some respondents assert that the Forest Service did not fully analyze the consequences of the Roadless Area Conservation Rule, and make specific suggestions for additional analysis needed during the current review process. Respondents state that forest health risks associated with eliminating commercial timber removal were not adequately considered. A similar assertion is echoed by others, who assert that the Rule deprives managers of tools that may be appropriate to improve forest health or function in specific places. These respondents state that analysis should be conducted for each roadless area to determine the best management approach. Others suggest that a regional-level analysis is the proper scale on which to evaluate roadless areas. Several respondents believe that potential increases in agency costs for firefighting were not properly evaluated.

877. Public Concern: The Forest Service should analyze the risks of eliminating timber removal and roading as management tools in roadless areas.

It is essential that roadless areas be accurately mapped, including those areas at risk of wildfire and insects and disease so that management options can be accurately assessed. In our opinion, the draft environmental impact statement for the previous rule did not adequately address wildfire risk. **(It is imperative that the Forest Service require that the risks and impacts of “doing nothing” be provided as well as an analysis of the risks or impact of roading or other management activities. In the final decision, the standards for no management on federal forest lands should be as any standard for management activities.)** (Association, Fernandina Beach, FL - #A15466.10135)

878. Public Concern: The Forest Service should compare the value of management activities versus the value of leaving areas roadless.

BY USING THE “CHOOSING BY ADVANTAGES” METHOD

What are the characteristics, environmental values, social and economic considerations, and other factors the Forest Service should consider as it evaluates inventoried roadless areas?

First and foremost is a definition of what is worth saving through management and what is classified as worthless and should be left to nature. Roadless areas have little social and economic value to the nation unless they are open to all the nation to use. Preservation is such a false word when defining these lands taken out of production. Preserving what for whom? Again, if you decide that this public land has no value, then keep it roadless. If it has value and is worth saving, then take it out of the roadless areas and manage if for multiple use!!!! (Individual, Montrose, CO - #A370.45100)

Roadless Areas are a conglomerate of lands designated TO NOT BE ROADED. They are not intended, nor for the most part fit in the Wilderness classification. Each Roadless Area needs local review to consider their value and reclassification (in partials) as to those values. When this is done appropriately some areas (within each) may fold out as Wilderness, other areas may prove roadable. From our window, a majority of these areas would remain under Roadless status, but certainly be available for some economical logging. (Individual, Forks, WA - #A877.45100)

Any description of values should attempt to balance characteristics that are enhanced by maintaining an area in a roadless state against: (1) the values that could be achieved through active management, and (2) the risks associated with maintenance of the area in a roadless state. There are any number of instances where construction of a road through a roadless area would result in a net gain to the environment.

For example, if an existing road is located in a sensitive riparian zone, it may be beneficial to relocate such a road to a ridgeline, even if the ridgeline is within the boundaries of an inventoried roadless area. Or, there may be instances where the risk of catastrophic wildfire is high enough that the benefits to be derived from construction of roads necessary to reduce the fuel load and restore the stand to historic conditions will outweigh any impacts caused by road construction. (Governor, State of Idaho - #A20141.45000)

ON A ROADLESS AREA-BY-ROADLESS AREA BASIS

We believe public input will identify the important values to be considered when evaluating inventoried roadless areas. Those values are too numerous to list here, but run the gamut from do-nothing to intensive management. The important point is those values will vary from forest to forest and between roadless areas within the same forest. The Forests need only listen closely to the various interests to see what those values are, and keep an open mind by not eliminating those values the Forest does not agree with. WE believe the end result will be that some roadless areas will remain roadless and others will be developed. This analysis must be done on a specific roadless area by roadless area basis, not a top-down, government-knows-best basis. (Elected Official, Saint Anthony ID - #A4942.45100)

879. Public Concern: The Forest Service should use large scale analysis to provide guidelines in establishing the role of national forests.

Large scale analysis (such as the ICBEMP), national and regional strategic plans, or a revitalized RPA are appropriate to establish the National Forests' role in providing commodity and non-commodity goods and services. This is valuable input to the individual National Forest planning process; however, these broad scale analysis and/or strategies should never be direction, only guidelines. (Individual, Colfax, WA - #A5421.16000)

880. Public Concern: The Forest Service should evaluate the impacts of land management decisions with respect to impacts on other public lands in the area.

Opinions from all concerned individuals and affected government agencies should be solicited and considered in land management decisions, and the consideration of impact should not be limited to the land parcels under review. The impact of land management decisions on any section of Forest Service land must be evaluated with respect to the impact on other public lands in the area. The potential negative impact from overuse of other public lands, especially other USFS and NPS lands, should always be considered before placing additional restrictions on access to public lands in the national forests. (Individual, Crystal River, FL - #A6257.12300)

881. Public Concern: The Forest Service should consider that reduced road access would increase costs of forest management.

The costs of fighting wild fires are higher where no roads are available to move men and equipment closer to battle the blazes. (Individual, Rogue River, OR - #A4802.17000)

Areas designated as "roadless" in terms in government expenditure can not be managed for fire and disease except at very high cost, which cost may include the safety of firefighters or the sustainability of growth. If for no other reasons, this proposal should be dropped. (Individual, Salt Lake City, UT - #A806.17100)

Roadless Areas Management General

Summary

General Comments – Some respondents question the terminology used to distinguish between types of roadless areas, and request that the Forest Service better explain the term "uninventoried." Some assert that this means that these areas have not been evaluated at all, in which case the rationale for including management direction for them in the final rule is illogical.

Among others, a common refrain is that the current review of the Rule is the result of political interference from the new Administration. These respondents specifically ask the Forest Service to base its decisions about the fate of the Rule on science rather than political expediency. There are people who assert that the last Administration was bowing to political pressure in formulating the rule in the first place and say the current review process is appropriate. (See also Chapter 3: Informed Decisionmaking (Question 1): Decisionmaking Authority: *Trust and Integrity*, as well as the discussion of trust and integrity in the Executive Summary.)

Authority for Roadless Area Management – A number of respondents question whether or not the Forest Service has statutory authority to manage roadless areas as such under a national rule. These people assert that the Wilderness Act makes no provision for such a de facto wilderness category (see also Chapter 2: Other Legal Concerns: Federal Laws, Acts, and Policies: *Wilderness Acts*, and Chapter 5: Designating Areas (Question 8): *Wilderness*)

Recommendations). Others state that a separate roadless management strategy creates illegal buffer zones around wilderness areas. Some respondents maintain that the Forest Service does have the statutory authority to manage roadless areas to maintain their unroaded character. Some respondents request that as the public debate continues over roadless area management, Congress be left out of the fray to avoid further politicization.

General Direction of Roadless Area Management – Citing the prohibition on most timber removal in the Roadless Area Conservation Rule, some respondents ask the Forest Service to cancel all existing timber sale contracts in inventoried roadless areas. There are others who believe that by focusing on road-related issues and prohibiting roadbuilding, the Agency is implicitly rejecting active forest management activities in roadless areas, which may ultimately prove detrimental to forest health. (See also Chapter 6: Protecting Forests (Question 3).)

882. Public Concern: The Forest Service should implement the Roadless Area Conservation Rule without political interference.

Citizens have overwhelmingly spoken our wish to keep our roadless areas roadless. Implementation should be the responsibility of professional foresters, acting without the political interference that has characterized this issue from the beginning. (Individual, Lolo, MT - #A111.10160)

I very much hope that you will let stand the Roadless policy it was written in the January 2001 Record of Decision. I hope you will realize that the previous decision itself is a compromise, far from a radical policy. Please do not cave in to political pressures to further develop the current roadless areas. (Individual, Lansdale, PA - #A611.10160)

BASE MANAGEMENT DECISIONS ONLY ON SCIENCE

The advent of the George W. Bush administration, with its generally anti-regulatory stance, may indeed be giving the Forest Service some second thoughts about how strong the proposed regulations should be, but science should decide this issue. The recommendations are based on years of thorough study. Court actions by resource extraction corporations are meant only to weaken the protection to public property that is offered by the Rule. This is the reason that our group will tolerate no exemptions or exclusions created to undermine or weaken the Roadless Area Conservation Rule. (Individual, Chico, CA - #A915.10150)

883. Public Concern: The Forest Service should explain why there are provisions for managing uninventoried roadless areas.

BECAUSE IF AREAS ARE UNINVENTORIED, GROUND CONDITIONS AND NEEDED MANAGEMENT IS UNKNOWN

Why is there a provision for managing “uninventoried roadless areas”? If it is in fact “uninventoried,” then the actual on-the-ground conditions are an unknown and therefore the type of management is also an unknown. Yet under the guidelines there is a broad definition of provision to manage these areas. (Organization, Orofino, ID - #A8393.45420)

Authority for Roadless Area Management

884. Public Concern: The Forest Service should consider that there is no statutory direction for managing areas as roadless.

The roadless issue started with the Wilderness Act in 1964. The intent of Congress in requesting the inventory is clearly spelled out in Sec. 3(b) of the Act. The values and characteristics to be considered are well defined in Sec. 2(c) of the act. These values have already been well defined by RARE I, RARE II and subsequent Forest Plans. It was the intent of Congress for the inventory to provide recommendations for Wilderness classification by Congress. There is no statutory direction for the

Forest Service to manage areas as roadless. It was not the intent of Congress as expressed in the 1964 act for the inventory to establish special classified areas without management direction. (Individual, Moscow, ID - #A5380.20206)

“Areas without roads have inherent values and characteristics that are becoming scarce in an increasingly developed landscape. While National Forest System inventoried roadless areas represent only about 2 percent of the total landbase of the United States, they provide significant opportunities for dispersed recreation, clean, clear sources of public drinking water, and large undisturbed landscapes that provide privacy and seclusion. In addition, these areas serve as bulwarks against the spread of invasive species and often provide important habitat for rare plant and animal species, support the diversity of native species, and provide opportunities for monitoring and research.” (Forest Service Roadless Web Page, Questions and Answers 2000).

Given such statements, it is difficult to discern how the protected roadless areas created by the January 12 rule would differ in any significant manner from wilderness areas established under the Wilderness Act of 1964. The Forest Service must respect the fact that the overwhelming majority of the roadless areas that are the subject of the ANPR and the January 12 rule were expressly rejected by Congress for Wilderness designation during consideration and passage of 19 separate pieces of legislation. In fact, virtually all areas targeted by this proposed action were specifically left open to mineral location under the Mining Law of 1872, leasing under the Mineral Leasing Act of 1920, mineral material sales, as well as for other multiple-uses, when Congress decided against wilderness designations for these areas pursuant to the Wilderness Act of 1964. Thus, “wilderness values” cannot be applied wholesale and without specific authorization from Congress. (Association, Spokane, WA - #A17351.25100)

BECAUSE IT IS PROHIBITED BY LAW FROM CREATING BUFFER ZONES AROUND WILDERNESS

In pursuing the ANPR process, the Forest Service must understand that a “national roadless rule” is unnecessary (and probably unlawful) given the existence of the Wilderness Act of 1964. Congress passed the Wilderness Act to establish a National Wilderness Preservation System because several decades of management of the public lands by administrative agencies through designation as “roadless,” “primitive,” “canoe,” “wild,” or “wilderness” areas, resulted in a patchwork administrative scheme for setting aside “wilderness areas” for special protection from multiple-uses. As the House Report accompanying the Act explained:

“A statutory framework for the preservation of wilderness would permit long-range planning and assure that no future administrator could arbitrarily or capriciously either abolish wilderness areas that should be retained or *make wholesale designations of additional areas in which use would be limited*. This committee accordingly endorses the concept of a legislatively authorized wilderness preservation system.” House Report (Interior and Insular Affairs Committee) No. 15338, July 2, 1964, at 3616-17 (emphasis added). . . . Through its express decision not to create buffer zones and instead limiting the special protection for wilderness areas to that area within carefully drawn boundaries, Congress made clear that the remaining lands not designated wilderness were to remain open to multiple uses. (Association, Spokane, WA - #A17351.25100)

The Forest Service traditionally has respected congressional will in regard to management of non-wilderness areas. For example, the Forest Service Manual on Recreation, Wilderness, and Related Resource Management explicitly forbids the maintenance of “buffer strips of undeveloped wildland to provide an informal extension of wilderness.” FSM 2320.3(5). The Forest Service must refrain from attempting to create the functional equivalent of congressionally designated wilderness areas in this roadless proposal. In the rulemaking process leading up to the January 12 rule, the Forest Service failed to do this by implicitly incorporating “wilderness values” to create unlawful buffer zones by informally extending congressionally authorized Wilderness Areas. (Association, Spokane, WA - #A17351.25100)

The process of creating “roadless” areas should not be used as an administrative method to circumvent issues with which Congress has dealt but may not have resolved. Congress created the Wilderness Act of 1964 to preserve areas of the country with unique value from man’s impact. Since the date 106 million acres of lands in the U.S. have been designated as “wilderness” by numerous acts of Congress. Congress

did not see fit to create “protected border areas” around or adjacent to the wilderness. The “roadless area conservation” program should not be used to create additional “protected” areas in addition to existing “wilderness areas”. Only Congress should exercise such authority where it deems necessary. (Association, Novato, CA - #A17652.25100)

885. Public Concern: The Forest Service should clarify that there is statutory direction for managing areas as roadless.

THROUGH THE FOREST PLANNING PROCESS

By law, national forest plans have to evaluate the wilderness potential of roadless areas and make wilderness recommendations to Congress. The Rule would not change that. Regardless of recommendations for wilderness, National Forest plans can also designate roadless areas for continued management as roadless areas. (Individual, Fort Thomas, KY - #A11699.25000)

886. Public Concern: The Forest Service should not involve Congress in management of roadless areas.

BECAUSE INVOLVING CONGRESS POLITICIZES MANAGEMENT

Based on what I know now, I would avoid the Congress in any way possible. Going to Congress will only serve to remove the management from professionals and make it political. (Individual, Hudsonville, MI - #A4928.25000)

BECAUSE CONGRESS IS UNABLE TO IDENTIFY WITH THOSE MOST AFFECTED BY ROADLESS DESIGNATIONS

Local forests should be empowered to close any sections of forest they deem fragile if overuse or abuse occurs. Congress should not be involved in “roadless” areas at all . . . they are unable to experience or interact with the people who are directly affected by such mindless designations as “roadless.” Remember, these forests are maintained by taxes. (Individual, Three Forks, MT - #A697.25120)

General Direction of Roadless Area Management

887. Public Concern: The Forest Service should immediately cancel all planned active management projects in roadless areas.

American Lands is not confident that these areas will be adequately protected by the Chief’s July directive or through the forest planning process. Nor is it likely that Congress will pass legislation in the very near future to protect all roadless areas as wilderness. With that in mind, the Forest Service should immediately protect all remaining roadless areas under its final rule. All development projects, including timber sales, off road vehicle trails, oil and gas drilling, and other schemes should be immediately cancelled. (Organization, Nevada City, CA - #A4941.25120)

888. Public Concern: The Forest Service should consider that forest management activities can take place in roadless areas while still preserving roadless area characteristics and values.

Oil and gas can be extracted from a roadless area in a pipeline and still keep the roadless character of the area if that was determined to be worth the cost. On the forest health side we feel very strongly that we keep the ability to carry out active management and then do just that. If keeping the roadless character of the area is an important value then we certainly have the equipment, expertise, and history to carry out tree removal from roadless areas. Throughout the West helicopters have been used to remove dead and dying trees from roadless areas for 40 years. Almost all of these areas are still roadless, but they are in much better shape than if nothing had been done. The Silver complex fire in Southern Oregon, the Foothills fire in Southern Idaho, and the hundreds of thousands of acres of mountain pine beetle salvage in the California Sierras are prime examples. And the beauty of how this was done is that great social and economic values were realized by doing the right thing for the environment. Today and under

Clinton/Gore rules none of this would be possible and we are a poorer people because of it. So we suggest the USFS go back to true multiple use where environmental, social, and economic values are all considered. We have been stuck on exclusively environmental values for so long we are about to destroy what we all would like to see remain for future generations. (Business, Portland, OR - #A10558.45100)

Roadless areas should not be automatically perceived as a “special place” or even a place with out roads. A major concern is that there is a perception that areas without roads are by definition, wild or wilderness and thus, should not be managed at all. The facts are that many of the inventoried roadless areas actually have roads in them. By focusing solely on the issues of roads or lack of thereof, we are missing the opportunity to consider the potential values of an area that the public may want such as healthy forests and wildlife habitat. These values are attainable through specific activities (management). Determining values desired, therefore becomes important. What is it, exactly that the public wants? It may not be areas totally off limits, but rather areas that provide primitive recreation, semi-primitive recreation, wildlife attributes and healthy forests. Local forest planning can best help to describe the values desired and the activities, which can be used to achieve such values within a specific area. (Association, Atlanta, GA - #A17805.45100)

The ecological, physical, and biological attributes present in a particular place best define the values of the national forests. Roads, trails, or other improvements can improve or maintain these values. In many cases, these facilities are necessary if the values are to persist over time, such as in the case of maintaining certain wildlife habitat or access to reduce hazardous fuels. In addition, many of the inventoried roadless areas are not roadless. They have roads, water developments, transmission lines, and in some cases have been previously agricultural land. (Association, No Address - #A22978.45100)

889. Public Concern: The Forest Service should use the Black Hills National Forest as a model for managing roadless areas.

I call your attention to the fine job your agency has done for the last 100 years in the Black Hills National Forest as proof that roads, logging, recreation, wildlife etc. are compatible. Since the first ever U.S.F.S. timber sale there in 1899 when the inventory was 1.5 billion board feet there have been 5 billion board feet harvested and over 5 billion board feet are still standing. An article in the January 2000 Journal Of Forestry reports the forest “now also supporting increased recreation, wildlife, water and other uses”. I have heard of no catastrophic fires on this forest. I challenge you to use this as a model for planning the future of the “roadless areas.” (Individual, Springfield, OR - #A21815.30520)

890. Public Concern: The Forest Service should not manage roadless areas as if it were the National Park Service.

The courts have separated the sustained yield and multiple-use mandate of national forests from other Congressional mandates, such as national park management, and have clearly distinguished national forests as being not wholly dedicated to recreational and environmental values. The roadless rule contemplates management akin to that of the National Park Service and has been created from a political basis, rather than by Congressional mandate or, more importantly, scientific necessity. (Professional Society, Anchorage, AK - #A21707.10130)

891. Public Concern: The Forest Service should turn protection of roadless areas over to the U.S. Department of the Interior.

I would even ask you to take this action one step further and turn these areas over to the protection of the Interior Department and someday make these areas a “National Wilderness” similar in concept to our National Parks which are so heavily overburdened at this point. (Individual, Estes Park, CO - #A3970.25200)

Activities (Question 7)

Question 7: Describing Activities. Are there specific activities that should be expressly prohibited or expressly allowed for inventoried roadless areas through Forest Plan revisions or amendments?

This section includes 24 subsections: Activities General; Travel Management General; Road/Trail Construction; Road/Trail/Maintenance/Reconstruction; Road/Trail Closure/Obliteration/Restoration; Natural Resources General; Timber Harvest; Mining, Oil, and Gas Development; Grazing; Utilities; Other Natural Resource Concerns; Recreation General; Motorized Recreation; Motorized Recreation – Off-Road Vehicles; Motorized Recreation – Snowmobiles; Non-Motorized Recreation; Mechanized Recreation; Ski Area Development; Hunting and Fishing; Outfitter-Guides; Equestrian Use; Camping/Shelters/Accommodations/etc.; Special Use Permits; and Other Recreation Concerns.

Activities General

Summary

General Comments – Respondents suggest that the Forest Service manage activities on National Forest System lands by seeking public input regarding which activities should be allowed or prohibited. Other suggestions include using the National Environmental Policy Act process, using existing individual forest plans, and using the Roadless Area Conservation Rule to govern activities in the national forests.

Adequacy of Analysis – One respondent recommends specific readings for the Forest Service to research in directing resource management: *Travel Management*, *Bringing People and Places Together* and *The Outdoor Recreation in American Life, A National Assessment of Demand and Supply Trends*.

Activities – A number of respondents comment on what activities they say should or should not be allowed in roadless areas. Comment on specific activities are included in the sections to follow. People comment, in general, that the same activities should be permitted in roadless areas that are currently permitted in other areas of National Forest System lands, at least to the extent that current forest management plans allow. Others say the Forest Service should allow currently permitted activities in roadless areas to continue. Some state that a wide variety of activities should be allowed—in designated areas, according to the condition and features of the land, and unless the activities in question are causing environmental damage. Other respondents list a wide array of activities they say should be prohibited or restricted in roadless areas—activities that are harmful to the environment or that present a liability concern, activities that require roads, and activities that cause excessive noise.

Activity Management General

892. Public Concern: The Forest Service should seek public input regarding activities that should be allowed or prohibited.

The public will identify the activities that should, or should not, occur in roadless areas. Some roadless areas should allow timber harvest and motorized use and others should not. There will not be agreement on all, or possibly any, activities that may occur in a particular roadless area. The agency's job is to provide a fair and balanced apportionment of activities among the different roadless areas on the forest, not an all-one-way approach as the Wasatch-Cache proposes. In other words, some roadless areas will become roaded with a variety of activities consistent with that form of management, while other roadless areas will remain without roads and with activities appropriate for that kind of management. Look to the various publics for input on where those uses should occur and then use common sense to provide some balance of those uses on the forest. (Elected Official, Saint Anthony, ID - #A4942.90000)

893. Public Concern: The Forest Service should govern activities through the National Environmental Policy Act process.

OHV use, mining, grazing, and other special uses should be managed through the normal NEPA process. (Organization, Placerville, CA - #A22653.90000)

894. Public Concern: The Forest Service should allow existing individual forest plans to govern activities in roadless areas.

UNTIL THESE PLANS HAVE BEEN AMENDED OR REVISED

Specific activities, prohibited or allowed, can only be determined after the determination is made on what the future management will be for the roadless area. This determination has already been made in the existing Forest Plans and this implementation should continue until that planning is amended or revised. Under the existing Forest Plans, roadless area management direction is given, including specific activities that are allowed or prohibited. We cannot see any reason to change this current direction until these plans have been amended or revised under the current NFMA regulations or under the revised NFMA regulations. (Business, Colville, WA - #A3362.90000)

895. Public Concern: The Forest Service should use the Roadless Area Conservation Rule to govern which activities should be permitted.

Describing Activities—The current rule covers this very well and should not be changed. (Individual, Peck, ID - #A1109.90000)

Now, the Bush Administration is moving to stop the rule and its protections. They have asked for public comments regarding their intention to weaken the rule, so harmful activities, such as logging and new coal, gas, oil and other mineral development, could proceed in roadless areas that were protected by the January rule. (Individual, Austin, TX - #A1125.90000)

The rule represents a balanced approach to forest conservation, saving the last 30% of America's wild national forests from logging, mining, and drilling—activities already allowed on most national forest lands. As written, it also adequately addresses issues of fire management, forest health, access, and local input. (Individual, John Day, OR - #A1126.90000)

896. Public Concern: The Forest Service should consider the current and historic uses of roadless areas.

When evaluating Roadless Areas, the Forest Service should consider:

The current and historic uses of the area (is the area used for canoeing, hiking, camping, cross-country skiing, OHV use, etc.). (Individual, Des Moines, IA - #A12587.45500)

Traditional use should score highest in evaluation. (Individual, No address - #A57.70200)

The description of values needs improvement

Land use history should be noted. Some “roadless” areas have roads, some were logged or farmed during the last 200 years, and some have been developed during the last 30 years. Land use history needs to be documented. Roadless is more of a historical designation than an ecological designation. (Individual, No Address - #A17292.45000)

Local planning should use historic usage (past 100 years) as the baseline. . . . If the forest has not been significantly damaged over the past century, the forest should be deemed robust enough to allow the current usage patterns to continue. (Individual, Tustin, CA - #A20777.30110)

897. Public Concern: The Forest Service should base land management activities on several established systems.

RECREATION OPPORTUNITY SPECTRUM, VISUAL QUALITY OBJECTIVES, AND THE ECOLOGICAL CAPACITY OF THE LAND

Land management activities should be based on established systems: Recreation Opportunity Spectrum, Visual Quality Objectives, and the ecological capacity of the land. (Individual, No Address - #A17292.90000)

Adequacy of Analysis

898. Public Concern: The Forest Service should research references about management of resources and public uses.

TRAVEL MANAGEMENT BRINGING PEOPLE AND PLACES TOGETHER AND THE OUTDOOR RECREATION IN AMERICAN LIFE, A NATIONAL ASSESSMENT OF DEMAND AND SUPPLY TRENDS

To some degree many of these issues/concerns have been discussed in the past, albeit, with the nuances of nomenclature being used to set the tone in addressing ongoing and future direction of resource management and meeting the needs of the public. Two significant examples of reference recommended for your research are: TRAVEL MANAGEMENT BRINGING PEOPLE AND PLACES TOGETHER, Report of the National Access and Travel Management Strategy Team January, 1992; and the Outdoor Recreation in American Life, A National Assessment of Demand and Supply Trends. (Individual, Evansville, IN - #A19627.90000)

Allow Activities

899. Public Concern: The Forest Service should permit a variety of activities in roadless areas.

Any activities should be permitted in the area that are not specifically prohibited in the document establishing the roadless areas. (Individual, Olympia, WA - #A278.90000)

We support the changes that reduce restrictions on the forests. We would like to see plans that allow more heliskiing, snowmobiling, cross country skiing, and other activities in the same areas. Obviously some areas should be restricted from motorized vehicles but common sense must prevail. (Individual, No Address - #A733.90000)

For all inventoried roadless areas, forest plan revisions or amendments should consider a full range of management alternatives, from active management to wilderness recommendations. If the decision for an areas is to remain roadless, permitted activities should include forest health treatments, watershed

improvement activities, motorized and non-motorized recreation, wildfire suppression, insect and disease treatments, and some improvements not requiring permanent road access. (Association, Concord, NH - #A1050.90000)

IN DESIGNATED AREAS

All activities should be allowed at some location. This does not mean that ALL activities should be allowed at ALL locations. Smart land management will need to be applied to make the designations. Unique natural beauty sites such as vistas or waterfalls should not be logged and, at the same time, highly productive timber sites should be logged. When there is a conflict over the same site, then some knowledgeable decisions will need to be made and not just blanket designations. Knowledgeable managers are going to have to have some backbone and stick to their decisions. This has not been the case in the past. (Individual, Corvallis, OR - #A1132.90000)

In Southern Oregon, access to BLM and Forest Service lands range from multiple use roads and trails, to areas exclusive to OHV use, to the famous Pacific Crest Trail (hikers-only). This approach has worked very well. As you develop policies in this area, I ask that you would keep all interests in mind. Many OHV enthusiasts are responsible with the outdoors (myself included), and it would be a shame to outright ban this kind of access. For example, my ability to enjoy the outdoors is often limited by my work schedule; my half-day motorcycle rides into the backcountry allow me to enjoy absolutely beautiful landscapes that may take 1-2 days of hiking. This is a precious privilege to me! (Individual, Talent, OR - #A1160.90000)

The full array of recreation opportunities needs to be provided for through differing levels of roads, trails, uses managed for etc. It was apparent under past management trends the NF would be largely made up of areas designated as wilderness and areas consisting of roads and cutover forests. The great challenge and opportunity is to maintain areas in between these 2 extremes. More acres without roads (acres that will continue to be without roads), where non-wilderness types of recreation activities can take place are needed. Uses such as mountain biking, hiking, motorcycling, ATVing, etc should be provided for in settings other than roaded timber producing areas. Describing this in terms of the Recreation Opportunity Spectrum (ROS), more areas of SPNM and SPM need to be protected and managed as such for the long term. The ROS designations need to be allocated in Forest Plans rather than being simply an inventory of current conditions. Designation of the majority of remaining roadless will provide a proper mix of ROS designations on NFs. (Individual, No Address - #A1702.90000)

IN AREAS APROPRIATE TO THE ACTIVITIES

In general, there shouldn't be any overall forbidden activities, but certainly some limitations based on locale may be appropriate. For example, if an area has dangerous cliffs, then permitting rock-climbing might be reasonable, but having hiking trails or snowmobile trails might pose a threat to human safety. Horses and ORV's should not use areas where there is sandy subsoil in steeply sloping terrain, which might cause undue erosion. Camping or campfires shouldn't be permitted during an especially dry or windy season of the year. Common sense should be the best guide in this part of planning. (Individual, Nashville, TN - #A874.90000)

UNLESS THE ACTIVITIES ARE DAMAGING AN AREA

There should be no activity out right banned unless it is illegal. I love to sing, you may not like my voice, should I be banned form singing? All activities can usually be allowed if properly managed. Each activity should be fairly evaluated and all attempts should be made to manage each activity with proper design and maintenance. If an acceptable result is not achieved, activity should be stopped and re-evaluated for a reasonable amount of time (6 months or so). Experts should be consulted and advice sought. (Individual, No Address - #A57.90000)

Growth in consumption and population make it inevitable that humankind will increasingly face limits with regard to material uses of natural resources and manipulation of ecosystems, so strong preference should be placed on human desires and activities that minimize our per capita ecological footprint on

wild lands. On all public lands, but especially in remaining roadless areas, ecological footprint analysis should be used to determine which activities have the least environmental impact and most social benefits, with market economic benefits placed secondary to water quality, air quality, wildlife habitat and high quality human powered recreation experiences. (Individual, Corvallis, OR - #A650.90000)

There are no activities that should be prohibited unless that activity can be proven to cause MAJOR damage. (Individual, Mount Hood Parkdale, OR - #A1084.90000)

900. Public Concern: The Forest Service should not exempt activities listed in a Schedule of Proposed Actions.

All Projects Must be Reevaluated. Exempting work that is “listed in a schedule of proposed actions” is unacceptable and undermines the policy’s intent. (Organization, Arcata, CA - #A1778.45620)

901. Public Concern: The Forest Service should permit the same activities in roadless areas that are currently allowed in other areas of National Forest System lands.

TO THE EXTENT THAT CURRENT FOREST MANAGEMENT PLANS ALLOW

“Roadless” areas should be managed no differently than any other area of the forest that is not designated by the Congress as Wilderness. There is absolutely no reason to make the FS manage roadless areas as de facto wilderness or any other special designation. All activities that are permitted within the forest should be allowed within “roadless” areas to the extent that current forest management plans allow. If a concession must be made and the agency is compelled to add yet another restrictive management prescription then prohibit the building of new paved or other all weather roads or upgrading of the primitive roads. Allow the primitive, or “jeep” roads to evolve as use and weather dictate (assuming that there is no significant resource damage as a result). (Individual, El Dorado, KS - #A5117.90100)

902. Public Concern: The Forest Service should permit currently allowed activities in roadless areas to continue.

In general, use of the roadless areas should be a continuation of existing use. That is, if grazing is an existing use, it should continue as before and under the same environmental controls. This is a case where “sustainability” should be the guideline. Even limited logging might be considered if it can be done by air and without roads. One use that should not be allowed is mineral extraction since it requires roads and this is not an existing use in a roadless area. The USGS has stated that roadless areas have a small fraction of one per cent of the mineral resources of the country so this is no loss to the country. (Individual, Boulder, CO - #A5250.90110)

903. Public Concern: The Forest Service should protect local communities from sudden restrictions and bans from activities that had previously been legal.

What are the characteristics, environmental values, social and economic considerations, and other factors the Forest Service should consider as it evaluates inventoried roadless areas? The local community should be protected from sudden restrictions and bans on activities that have previously been legal. (Individual, No Address - #A850.45611)

904. Public Concern: The Forest Service should allow some people to live by themselves, in roadless areas.

IN SMALL NUMBERS

Human woods-dwellers and squatters must be treated with tolerance. However, if large groups of people begin perpetually inhabiting roadless areas, they must be approached calmly and asked to leave. Hermits and solitude-seekers should not be disturbed, however. (Individual, Olympia, WA - #A25533.90000)

Do Not Allow/Restrict Activities

905. Public Concern: The Forest Service should prohibit certain activities in roadless areas.

Activities that should be prohibited in roadless areas through Forest Plan revisions or amendments are clear cutting, mining, grazing and recreation/resort development. Those activities that should be allowed are low impact, non-motorized recreation. (Individual, Boise, ID - #A674.90000)

Activities prohibited in Roadless Areas should include mining, logging, drilling of any kind, and the increasing threat of ORV traffic. Motorized use for rescue would be ok. (Individual, Memphis, TN - #A1032.90000)

No road building, or off road vehicle travel, logging or mining should be allowed in the roadless areas. (Individual, Elk City, ID - #A1064.90000)

ACTIVITIES THAT ARE HARMFUL TO THE ENVIRONMENT OR THAT PRESENT A LIABILITY CONCERN

If we allow activities that are inconsistent with the landscape, we will be sacrificing our resources and those of every generation to come for short-term greed. The long-term health of a system is more important than having to deal with a lawsuit from the Snowmobiling Association of America. If you have a sound biological basis for denying an activity, you should not lose in court. Similarly, if you have a solid liability issue for denying an activity, you should not lose in court. For example, if many people using jet skis on public land (water) get hurt and sue the Forest Service, the activity presents a liability concern. Allowing the activity isn't worth accepting the liability attached to it. (Individual, No Address - #A29243.90000)

ACTIVITIES THAT REQUIRE ROADS

It is pretty clear that activities that do not need a road should be allowed and those that need roads or create roads should be banned. Even administrative use of roads in roadless areas is silly as these areas have been maintained for years before vehicles. (Individual, No Address - #A472.90000)

ACTIVITIES THAT CAUSE EXCESSIVE NOISE

Roadless areas because of their roadless status, have "managed" themselves quite successfully through natural selection processes which operate independently of human agency. The only management they require is protection from human-introduced degrading influences, such as motorized vehicles, logging, fire, mining and noise or other encroachment. (Individual, Port Angeles, WA - #A6179.30100)

DRUG RELATED ACTIVITIES

In distinction to many of the radical environmentalists, some of whom are involved with illicit drug cash crops, I believe that illicit drug cash crops should be withheld from these roadless areas. (Individual, Klamath Falls, OR - #A6931.90110)

Excessive amounts of land deemed "roadless" will not be able to be used by most law abiding people but may actually get a lot of usage from illegal aliens, drug smugglers, and in some cases, drug farmers. (Individual, No Address - #A931.90000)

METH labs and dope farms should be prohibited on federal Forestland as it is in all other places. (Individual, Orofino, ID - #A17317.90110)

MILITARY TRAINING

We feel that the following activities should be expressly prohibited in all roadless areas on FS land: livestock grazing, road building, road maintenance, motorized recreational vehicle use, military leases for training, trapping, commercial mining and herbicide use. (Individual, Nine Mile Falls, WA - #A15241.90110)

MILITARY TESTING

Activities prohibited: . . . Military bombing ranges. (Individual, No Address - #A28602.90110)

906. Public Concern: The Forest Service should not allow individual forest plans to make exceptions for specific activities.

Although I myself ride an off-road motorcycle, the use of motorcycles should be prohibited in almost all areas except those specifically designated as such. Motorcycles, the two-wheel variety, are never ridden with care and/or consideration for the land or the environment. They leave ruts in the trails, which cause erosion, and the riders have a tendency to make their own trails without any consideration for anything. (Individual, Maricopa, CA - #A3732.90110)

I am writing because I am against any change to the Roadless Area Conservation Rule. The current rule strikes a balance between preserving our remaining wild lands and accommodating competing uses; there is no good reason to change the rule. I particularly oppose allowing individual national forests to opt out of the rule and decide to go back to logging, building roads in, or otherwise developing these pristine wild areas, above all those in Alaska's Tongass rainforest. (Individual, Cleveland, OH - #A4484.90110)

Travel Management General

Summary

Access – A number of respondents assert that the Forest Service should provide access to roadless areas. One Organization remarks that Forest Service rulemaking must not restrict public access to narrow corridors along a few major roads. They believe this is the current trend and are concerned that forest users will be impacting areas because access is not distributed better. Some state that the Forest Service should not allow the presence of an endangered species to block access to lands; others request that the Agency not penalize the whole population because of the irresponsible actions of a few.

Other respondents assert that the Roadless Area Conservation Rule would have no effect on access. One individual declares that there are so many existing roads to travel, that he does not believe will be closed in the future, that no one should be concerned about be locked out of the forest.

Adequacy of Analysis – A number of respondents suggest that the Forest Service should carefully examine and evaluate the entire road system. Specifically, people ask the Agency to evaluate the use of each road to determine which existing roads are needed for effective long-term management, what new roads should be built, and which roads should be obliterated. As part of this analysis, one organization suggests the Forest Service document visitor usage on all forest travelways, and that it use the FS-643 Roads Analysis publication to determine the specific values of each motorized road and trail.

One point of disagreement among respondents is the adequacy of the evaluation of road impacts presented in the Roadless Area Conservation Rule EIS. According to one state agency, that evaluation is flawed inasmuch as most roads in inventoried roadless areas are temporary roads and “the ecological impact of temporary roads or roads closed to the public is significantly different than those used to describe and justify the conclusions reached in the evaluation.” Another respondent states, however, that the original EIS described the impact roads have on the landscape and it is this person's opinion that no one has proven otherwise.

Funding – A few individuals discuss funding as it applies to travelways in general. These respondents suggest that the Forest Service increase the budget to fix the road system, allocate funds according to specific road priority, not charge fees for road use, and request funding to support trail programs.

Travelways – Some respondents say the Forest Service should remember the purpose of the national forest transportation system—that is, to “support management activities and access needs into the foreseeable future.” One Organization states that the Agency should base road management decisions on the individual merits of each travelway inasmuch as “the cumulative effect of not analyzing each road and trail segment is tremendous.” This same organization also recommends that the Forest Service establish a multiple use review board to guide travel management decisions. On the other hand, at least one individual asserts that dirt roads and trails should be allowed “without the government being involved with or being held accountable in any way shape or form.”

Roads – A number of respondents state that the Forest Service should work with states and respect their authority with regard to road management decisions. One state agency, for example, states that the Forest Service should incorporate management direction for public roads which are under the jurisdiction of local governments. According to others—the Forest Service should give due consideration to the position of local authorities regarding road rights; should respect states’ section line laws; should address roads which appear on older system maps, roads which are of local importance, and Revised Statute 2477 rights of way (see also Chapter 2: Other Legal Concerns: Federal Laws, Acts, and Policies: *Revised Statute 2477*); and should acknowledge the existence of every access road. An Organization states that the Forest Service should not imply there are more roads than there actually are.

Other respondents think that the Forest Service should acknowledge that the Roadless Area Conservation Rule would not close roads or prevent the construction of new roads in already roaded areas; should approve the location of roads at the national level following proposals from local authorities; and should place the burden of proof for justifying road construction on those proposing roads.

Trails – General comments regarding trails include the request that the Forest Service explain how trail rules work with a roadless designation; the suggestion to rotate trails in roadless areas in order to prevent resource damage; and the claim that the Agency should stop turning existing trails into roads inasmuch as “roadless national forest trails should be restored to their traditional uses and purposes as foot and horse trails, not motor vehicle speedways.” One respondent suggests eliminating specific trail width rules, while others suggest that the width rules protect trails from off-road vehicle damage. Finally, one Organization asks the Forest Service to recognize that trails which are not authorized through a public planning process are illegal.

Access

907. Public Concern: The Forest Service should provide access to roadless areas.

BEYOND NARROW CORRIDORS ALONG A FEW MAJOR ROADS

Forest Service rulemaking must avoid restricting public access to narrow corridors along a few major roads. The current trend to restrict public access to narrow corridors in the forest will concentrate over 90% of the forest visitors to less than 10% of the forest area. This trend is occurring in all of our

National Forests. The cumulative impact from concentrating forest visitors to narrow corridors is not reasonable management of our public lands and access to our public lands. The document must evaluate the cumulative impacts from management goals that concentrate visitors and eliminate dispersed recreation opportunities including, impacts to quality of recreation, diversity of recreation, equal allocation of recreation opportunities, wildlife, trails, erosion, vegetation, and reduced recreation opportunities for motorized visitors. (Organization, Helena, MT - #A13226.90000)

TO THE BOUNDARIES OF ROADLESS AREAS

Please provide public access TO THE BOUNDARIES of roadless areas at about 5-mile intervals. (Individual, Billings, MT - #A7295.91110)

908. Public Concern: The Forest Service should not allow the presence of an endangered species to block access to lands.

If GAG [Green Advocacy Group] determines that a 5000-acre parcel of land contains some variant of plant/animal sub-species classified or “classifiable” and “endangered” by the ESA, the 5000-acre number meets the requirements for a wilderness designation. But let’s also say that there is a road running through the center of the parcel leading to something like a privately owned camp. By the presence of supposedly endangered sub-species, the green groups can effectively close off access to the road by claiming that the presence of the road and the traffic it generates are a threat to the plant/animal in question. Once the ESA has been used to close the road and deny access to the private property, the greens can then lobby to have the area declared a “Wilderness Area.” Since the road no longer technically “exists,” it and the land surrounding it are permanently taken out of any meaningful public usage. By the time all the complaints are filed, lawsuits are prepared, pickets are organized, and propaganda is distributed, nearly everyone involved will have forgotten one very important point. It was the ESA that effectively “created” the endangered sub-species where none existed before. This led to the loss of access to both private and public property, and the ultimate designation of a wilderness area that would not have met the requirements for such on its own merits. (Individual, Jefferson, OR - #A775.25100)

By eliminating vast areas from public access to purportedly protect some endangered species is just a subterfuge for controlling and re-engineering citizens’ life styles. This goal of the radical environmentalists disregards the rights of the individual which is an American tradition. (Individual, Crescent City, CA - #A6097.50000)

909. Public Concern: The Forest Service should prohibit new road construction and regulate commercial ventures, but continue to allow access on existing routes.
