<b>Sensitive Species Recommendation</b> (Please check 1 box below)					
<input checked="" type="checkbox"/>	R2 Sensitive Species (SS)	<input type="checkbox"/> Not R2 SS, but should be considered for other Emphasis Species Lists			
<input type="checkbox"/>	Not R2 SS and Not of Concern Now	<input type="checkbox"/> Insufficient Information Available to make a recommendation			
<b>Recommendation Rationale</b>					
<p><b>This is a Wyoming endemic, occurring on the boundary between Regions 2 and 4. Only 8-11 occurrences are known, and the populations in Region 4 may be better considered a single metapopulation. The populations are typically small, with fewer than 1500 individuals estimated in all the populations combined. A population on the Rock Springs Uplift has shown at least a short-term severe decline recently. This plant occurs in rugged habitat, in sandy soils at the base of cliffs, on ledges, and under overhangs in cavities. No risks are currently anticipated for this species, but the low number of populations and individuals are a concern. Due to the low number of individuals, few populations and highly restricted range, we recommend that this species be listed as an R2 Sensitive Species.</b></p>
