| Recommendation Rationale | | | | | | |
| <p>Endemic to the mountains of central CO (G2). Considered sensitive by the Park Service. An evaluation was not done for this species, but a draft species assessment recently prepared as part of the Species Conservation Project provides information regarding status, trends, and threats. This species has been reported from approximately 28 locations, most within 4 miles of Gray's Peak, the type location. Population size is typically small (10-30 plants, with each plant growing in a clump with several stems). Although quantitative data are not available, anecdotal evidence suggests that some populations have declined in abundance. Specific threats have been identified, including impacts of recreation (hiking and mountain biking), and mountain goats. Its ability to tolerate competition from non-native plants is speculated to be low. This species merits sensitive species status.</p> | | | | | | |
