

**Not R2 SS, But Should Be Considered for other
Emphasis Species Lists**

Recommendations and Evaluations

Common Name: alpine tundra draba

Scientific Name: *Draba streptobrachia*

Recommendation: **Not R2 SS, be should be considered for other Emphasis Species Lists**

Recommendation Rationale:

--CO endemic confined to high-elevation habitats above treeline in San Juan, Sawatch, Mosquito and Front ranges.

--Habitat is largely inaccessible and assumed to be stable

--Most pops (~30 occurrences) have been recently documented and appears to be relatively abundant at some of the sites--Known from the ARRO, WR, SJ, RG, and PSI forests.

--Doesn't warrant SS status as habitat and populations do not appear to be at risk or of viability concern; endemic nature of the species suggests some level of risk and warrants consideration for local emphasis especially on forests with few occurrences.
