| Recommendation Rationale | | | | | |
| <p>This species is distributed across northern Eurasia to Alaska and B.C., with disjunct populations in southern Alberta and MT-WY. It can be found in peatlands, willow thickets, depressions below late snowfields, on moist sites on slopes and alpine plateaus. In R2, it is known from a single large occurrence along the MT-WY border covering over 150 acres. This colony has been known since 1938 and is thought to be stable. Individual plants could be threatened by trampling and sheep grazing, but the entire WY occurrence is within a proposed RNA on the Shoshone NF. The Shoshone NF should consider this species for other Emphasis Species lists.</p> | | | | | |
