

Road Density Based on All Roads Within the Administrative Boundary

These maps depict the range of road densities of all known roads (miles per square mile) found on the National Grasslands. These can include Forest Service system roads, other federal, state, local, private, and undetermined roads.

The road density datasets and these maps were developed by the Forest Service in January 2007. Roads used in developing these road density maps were based on a preliminary road inventory for the National Grasslands (USFS, Nov. 2006).
