| Recommendation Rationale | | | | | | |
| <p>This species is at the northern end of its range in R2. There has been a substantial loss of its habitat (sandhills and sandsage prairies) due to agricultural conversion in Kansas. We infer from the G4G5 ranking that it is much more abundant in the core of its range. There are 3 herbarium specimens collected on the Cimarron NG and it is considered likely to occur on the Comanche NG. Although there are few occurrences in R2, it occurs here at the periphery of its range and there is no evidence that the viability of the species is of concern. It should be considered for other emphasis species lists on the Comanche and Cimarron NGs.</p> | | | | | | |
