| Recommendation Rationale | | | | | |
| <p>This species is distributed from B.C. and Alberta south to OR, ID, MT and northwestern WY (S2). It is uncommon in abundance, although it can be locally abundant in the understory of willow thickets. Most sites are small in area, and it may be restricted to specialized microsites. Population trend data are not available but it is thought to be stable (high confidence). Threats overall are probably low (medium confidence). The Shoshone NF should consider this species for other Emphasis Species lists.</p> | | | | | |
