Recommendations and Evaluations

Common Name: water pygmyweed

Scientific Name: *Crassula aquatica* (*Tillaea aquatica*)

Recommendation: Insufficient information available at this time

Recommendation Rationale:

There are taxonomic concerns with this species that need to be solved before a recommendation is given. The only evaluators, Bonnie Heidel and Scott Laursen of WYNDD, do not recognize *Crassula aquatica* within WY, instead recognizing and then evaluating *C. solieri*. They apparently rely on Dorn's Vascular Plants of Wyoming 3rd edition, 2001 who in turn references Kew bulletin 39:699-728, 1984. Dorn, 2001, recognizes *C. solieri* and not *C. aquatica* as being present in Wyoming vernal pools and wetland habitats near lakes. The "Plants" database does not contain a reference to *C. solieri*. According to a reference found at http://maphost.dfg.ca.gov/wetlands/vp_ass_rept/app_c_plnt.htm, both *Crassula* species are widespread outside of WY. More information needs to be found before any classification can be placed.
