

Insufficient Information Available at This Time

Recommendations and Evaluations

Common Name: flat-top goldentop

Scientific Name: *Euthamia graminifolia* (*E. graminifolia* var. *major*)

Recommendation: Insufficient information available at this time

Recommendation Rationale:

This plant is known from WY, SD, NE and CO within the broader boundaries of Region 2. It is rare in Wyoming, where it is ranked S1 and known from the Medicine Bow/Routt NF. Outside of R2 it is widespread across Canada and much of the United States, particularly in the north, but also extending southward through the Appalachians and Rockies. It has been reported within a variety of wet meadow and thicket settings as well as disturbed habitats like roadsides. However, the taxon is ranked SR throughout most of its range, including CO, SD, and NE. It may be widespread enough, and possibly tolerant of disturbance, but we do not have sufficient information to determine whether or not there is a regional viability concern.
