

## Region 2 Sensitive Species List

### **Wyoming Pocket Gopher (*Thomomys clusius*)**

Recommendation Rationale: **R2 Sensitive Species (SS)**

This species has an extremely limited distribution and its life history is poorly understood. The evaluator indicates that no occurrence has been documented on NFS land, but cites a publication indicating that potential habitat may be found at lower elevations of the Routt, A/R and White River National Forests. Although there is a paucity of available information, the restricted range of the species and indications that it may well occur on NFS lands seem to merit retention on the sensitive species list, pending information to the contrary.
