

## Not R2 Sensitive Species and Not of Concern

### Recommendations and Evaluations

**Common Name:** Long-legged Myotis

**Scientific Name:** *Myotis volans*

**Recommendation:** Not R2 Sensitive Species and Not of Concern

### Recommendation Rationale:

Species is well distributed within and around R2. Appears to be abundant in suitable habitat. Population and habitat trends assumed to be stable. However, little is known about dispersal capability. Confidence in population and habitat trend information is moderate. No significant perceived threats or life history characteristics that would indicate concern for NFS actions in regards to this species. However, as with most bat species, there is a high degree of uncertainty about many factors related to life history, breeding biology, population trends, winter distribution, and precise habitat associations.
