<b>Sensitive Species Recommendation</b> (Please check 1 box below)						
<input type="checkbox"/> R2 Sensitive Species (SS)		<input type="checkbox"/> Not R2 SS, but should be considered for other Emphasis Species Lists				
<input type="checkbox"/> Not R2 SS and Not of Concern Now		<input checked="" type="checkbox"/> Insufficient Information Available to make a recommendation				
<b>Recommendation Rationale</b>						
<p>Circumboreal distribution, patchy and uncommon (G3). Most occurrences have been found recently, with 7-10 in CO (S2) and 3-5 in WY (S1). It is found in hummocks in calcareous fens or margins of willow-dominated wetlands at 9,300-11,000 ft. May be locally abundant but limited to specialized and restricted habitats. The plants are inconspicuous and surveys are likely incomplete. Population trend thought to be stable but there are no monitoring data. Habitats may be stable but with historical declines, and vulnerable to a number of activities including recreation use, off-road vehicles, road and trail building and maintenance, grazing, and peat mining. At this time, there is insufficient information available to determine whether the species merits sensitive status.</p>
