	<input type="checkbox"/> R2 Sensitive Species (SS)		<input type="checkbox"/> Not R2 SS, but should be considered for other Emphasis Species Lists			
<input checked="" type="checkbox"/>	Not R2 SS and Not of Concern Now		<input type="checkbox"/> Insufficient Information Available to make a recommendation			
Recommendation Rationale						
<p>Lycopodium dendroidium occurs only on the Black Hills National Forest in Region 2. It is disjunct from the main species range, which is boreal North America, extending south along the Appalachian Mountains. It is known from over 100 populations, 36-38 of which occur in Wyoming, the remainder in South Dakota. These occurrences range in size from small to several acres in size. There are no apparent serious threats to this species in the Region. Dave Ode, of the SD heritage program has suggested that this species is common enough that it does not warrant sensitive species status in the region. We recommend that this species be ranked Not R2 SS and not of concern now.</p>
