Project Name: West Drews Commercial Juniper project
Location: Lakeview Stewardship Unit
Map: Commercial Juniper project
Project Contact: Lora Vialpando – USFS – 541-947-6335

Description
The proposed project is located in the Drews Creek Watershed and is a component of the vegetative management and fuels reduction goals of the West Drews Watershed Restoration and Vegetation Management project. Juniper has expanded its range into meadows and low elevation pine stands due to fire suppression. In 2012, approximately 200 acres of the available 2,000 acres of juniper would be extracted using mechanical methods and the existing road system. Juniper 0-21 inches in diameter at breast height will be cut and removed to a landing. Juniper could be used for biomass or other commercial ventures if available at the time of implementation. No treatments will occur within old growth juniper communities and no new permanent or temporary roads will be built to access juniper.
