Revised Land and Resource Management Plan  
Record of Decision**

Page 38, section V, B-1, Management Indicator Species (MIS)

In addition to the five wildlife MIS (Black Oystercatcher, Brown Bear, Dusky Canada Goose, Moose, Mountain Goat), three fish MIS (Coho Salmon, Pink Salmon, Dolly Varden Char) are identified for the Revised Forest Plan.

- a. Coho salmon. Coho salmon represent anadromous fish that are generally limited in their freshwater life-period by stream and lake rearing areas. Conservation of the water-land interface, particularly the riparian zones, is important in the maintenance of long-term productivity of these coho habitats. The likelihood of forest management activities affecting the quantity and quality of coho habitat is low due to the implementation of Forestwide standards and guidelines at the project-level, and the allowance for habitat improvement projects within nearly all management areas on the Chugach.
- b. Pink salmon. Pink salmon were selected to represent anadromous fish, which are limited in their freshwater life-period by spawning gravel quality and quantity. The quality of these spawning gravels may be susceptible to impacts from ground disturbing activities that produce large amounts of fine sediments. The Revised Forest Plan identifies standards and guidelines that will minimize the potential impacts of forest management activities on pink salmon spawning habitat.
- c. Dolly Varden char. The conservation of the habitats for Dolly Varden char, which have widespread distribution throughout nearly all suitable freshwater, particularly small freshwater streams and lakes, is provided through the implementation of Forestwide standards and guidelines. These standards and guidelines are designed to protect key elements of Dolly Varden habitat, such as stream banks, riparian vegetation, and water quality. Implementation of activities in the Revised Forest Plan would have a low probability of impacting Dolly Varden char habitat.
