

PLANS AND/OR CRITERIA PURSUANT TO C5.1# (OPTION 1) - TEMPORARY ROAD AND LANDING CONSTRUCTION

Upon completion of work, construct entrance closure devices that effectively eliminate motorized vehicle access. The closure device should be blended into native material into the berm to camouflage the road entrance. Natural materials should be of adequate size so it is not easily moved.

Closure devices shall be at least 4 feet high and located to prevent any motorized vehicle access over or around the berm by using areas with steeper side slopes. Depending on the site conditions, more than one berm may be necessary. If additional berms are constructed, the slope into the first embankment and the slope out of the last embankment shall be gradual enough so it is not a safety hazard to any unauthorized vehicle approaching the berms from either direction.
