

Proposed for 2020: Herbicide treatment of Japanese knotweed

As presented at the Public Workshop Meeting in the Spring of 2019, the Forest Service continues to propose herbicide treatment of the Japanese knotweed populations located near the Twelve mile cabin site.

This is in conjunction with a recreation objective to construct an administrative road to access the cabin for upgrades to the sanitation system. Conducting the necessary treatments of the Japanese knotweed populations prior to the construction of this road is critical to ensure that these populations do not spread as a result of the disturbance.

At the request of members of the public, the Forest Service will be looking into the viability of using methods to injection the herbicides into the knotweed directly, thereby reducing the amount of herbicide needed and increasing precision.
