What is silvopasture?

Working Trees

Silvopasture is the deliberate integration of trees and grazing livestock operations on the same land. These systems are intensively managed for both forest products and forage. Well managed silvopastures employ agronomic principals, typically including introduced or native pasture grasses, fertilization and nitrogen-fixing legumes, and rotational grazing systems that employ short grazing periods which maximize vegetative plant growth and harvest. Silvopastures are:

Sid Brantly - USDA/NRCS

- **Interactive** - The forest management, pasture management, and grazing management are conducted in harmony so as to enhance the production of multiple harvestable components, while also providing conservation benefits. The combination of the products realized usually exceeds the normal yield of either enterprise individually.
- **Integrated** - The trees, livestock and forage are functionally combined into a single management unit tailored to meet the landowner's objectives.

Potential Benefits of Silvopasture

1. Cooler summer environment for livestock.
2. Shorter timber rotations due to forage fertilization and competition control.
3. High value timber products resulting from pruning and management of tree density.
4. Shaded, cool season forage plants can be more nutritious for livestock.
5. Diversification of income streams spreads out market risk and increases income opportunities.
6. Greater plant nutrient uptake efficiencies - the deep tree roots coupled with pasture plant roots acquire nutrients from a greater range of soil depths.

- **Intentional** - The combinations of pastures, trees, and animals are purposefully managed to provide forage and timber products on a sustained basis. These are not individual practices that occur coincidentally together or are managed independently.

- **Intensive** - Silvopastures are intensively managed to optimize the production of the forest products and forages. Science based grazing, haying, fertilization, tree pruning and trimming and other cultural practices are planned in advance to compliment reforestation, tree protection, market cycles and work load.

Silvopasture is not the same everywhere

Though many silvopasture principals are universal, some management requirements and benefits vary in different parts of the United States.

Silvopasture in the Northwest Douglas-fir, ponderosa pine, red alder, black walnut, black locust, maple, and poplar are options for silvopasture trees, depending on your particular farm and climate. Orchardgrass, tall fescue, and ryegrass with white clover or subterranean clover are likely understory options, depending on the soil type and forage needs. Well managed silvopasture trees in Oregon have been known to produce as much as 16% greater diameter growth than similar trees in a typical forest plantation setting.

Silvopasture in the Southwest Southwestern silvopasture types range from ponderosa pine, Douglas-fir, almond and other nut trees on the west coast to loblolly pine, longleaf pine, pecan and other hardwoods in Texas. Forage types range from annual, cool season grasses in the west to warm season grasses like Bermudagrass as you travel east. It has been noted that the warm season grasses seem to mature a little later in the silvopastures than in open pastures, slowing the cyclic digestibility decline as forages mature.

Silvopasture in the Northeast Black locust, black walnut, other hardwoods and even larch trees in the northern reaches have been used for silvopasture production in the northeast. Orchardgrass, tall fescue, eastern gamagrass, bluegrass, Kura clover, and reed canarygrass have shown promise as understory forage plants for silvopasture. Increases in farm profitability, animal performance, summer forage growth and market diversification have been demonstrated in silvopastures in the northeast.

Silvopasture in Southeast In the southeast region, loblolly pine, slash pine, and longleaf pine are utilized for silvopastures very effectively with bahiagrass and crimson clover understory forage. As you move north in this region, pecan, black walnut, black locust, and even white pine become more feasible, with tall fescue, orchardgrass, red clover and white clover serving as the forage base. Silvopastoralists cite improved farm economics due to efficiencies of soil nutrient uptake, livestock summer heat protection, and improved aesthetics as some of the major benefits afforded by silvopastures.

Tips for Silvopasture Management

- Intensive rotational grazing, modest stocking, and careful monitoring of forage and trees is essential. "Typical" pasture management can result in overgrazed plants, damaged trees, and soil compaction. Hungry, mineral-deprived, or parasitized animals are highly likely to browse or damage trees.
- Grazing management needs to accommodate the susceptibility of seedling/saplings to browsing. In general, livestock are more likely to impact broadleaf trees than conifers (there are exceptions).
- Trees need to be pruned and thinned as needed in order to develop high-quality timber products. Open grown, unpruned trees have very low or no marketable timber value. Trees for fruit or nut production should be pruned according to horticultural standards.
- When selecting tree species for silvopasture; take care to evaluate the potential for livestock poisoning. Some animal species are intolerant of red maple (horses), black cherry, black locust, black and red oak.

The USDA National Agroforestry Center (NAC) is a partnership of the Forest Service (Research & Development and State & Private Forestry) and the Natural Resources Conservation Service. NAC's staff is located at the University of Nebraska, Lincoln, NE. NAC's purpose is to accelerate the development and application of agroforestry technologies to attain more economically, environmentally, and socially sustainable land use systems by working with a national network of partners and cooperators to conduct research, develop technologies and tools, establish demonstrations, and provide useful information to natural resource professionals.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or part of an individual's income is derived from any public assistance. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at 202-720-2600 (voice and TDD).

To file a complaint of discrimination, write USDA, Director, Office of Civil Rights, 1400 Independence Avenue, SW, Washington, DC 20250-9410 or call toll free 866-632-9992 (voice). TDD users can contact USDA through local relay or the Federal relay at 800-877-8339 (TDD) or 866-377-8642 (relay voice). USDA is an equal opportunity provider and employer.
