Windbreaks are plantings of single or multiple rows of trees, shrubs or grass that protect crops, livestock, wildlife or people from wind’s harmful consequences.

Historically, Windbreaks were planted for a single purpose, such as protecting homes from cold winds or soil from erosive winds. Today, Windbreaks are being used to address numerous other problems and provide a variety of other benefits. When properly designed, located and managed, Windbreaks can produce one or more environmental and economic benefits. It is important to remember that not all potential benefits can be realized from every Windbreak. In fact, some Windbreak purposes will require conflicting design characteristics.

**Benefits of windbreaks**

**Improve income** — Whether a grain, vegetable, hay, vine or orchard crop, net yields can be increased by 10 to 20 percent in fields with Windbreaks. Livestock experience improved weight gains resulting in lower feed costs. Heating and cooling costs for the farmstead can also be reduced. In addition, income producing plants such as fruit trees, nut trees and woody florals can be incorporated into a windbreak without reducing the beneficial functions.

**Provide protection** — Windbreaks protect crops, facilities, livestock, people, soil and water from the damaging effects of wind and wind blown material. Windbreaks can create a more comfortable working and living environment by providing protection from cold winter winds, hot summer winds and blowing and drifting snow.

**Store carbon** — A dense tree and shrub planting, including Windbreaks, will create net gains in carbon storage or sequestration. As the plantings mature this helps to rebalance the global carbon cycle.

**Enhance aesthetics** — Windbreaks generally add desirable plant variety that enhances the appearance of the landscape. Windbreaks also can screen undesirable views and provide opportunities for protecting and viewing wildlife.
Considerations for windbreaks

Vegetation — Final selection of the species of trees and shrubs to plant will vary at each facility and farm site and should be based on: soil type, natural drainage, common wind conditions, annual precipitation, natural range of each woody species and site needs.

Density — The more solid or dense a Windbreak, the greater the wind speed reduction. However, less dense plantings provide protection to a greater distance. Density can be managed by the plant species chosen, the spacing within and between rows and the number of rows.

Orientation — Windbreaks are most effective when oriented at right angles to troublesome winds. To allow for changes in wind direction, Windbreaks are often planted in multiple directions — in an L-shape or an arc. Avoid placement that may interfere with overhead lines, buried cable and road visibility.

Height and Length — The height determines how far downwind the protection will reach. For adequate protection the Windbreak must be taller than what is being protected. The length helps determine the total area that will be protected.

Pest Control — Because every tree counts in a Windbreak, it is important to regularly monitor for the presence of insects and diseases. Early detection and treatment is the most effective way to control pests. Wildlife and livestock can also cause damage that is best prevented with fences or other deterrents.

Management — Proper care of the Windbreak is critical to its long-term functioning. Windbreaks need regular maintenance and attention from the day they are planted. Practices such as weed control, protection from livestock and wildlife damage, corrective pruning, replanting, insect and disease control, and supplemental watering may be needed on a continuing or periodic basis.

The USDA National Agroforestry Center (NAC) is a partnership of the Forest Service (Research & Development and State & Private Forestry) and the Natural Resources Conservation Service. NAC’s staff is located at the University of Nebraska, Lincoln, NE. NAC’s purpose is to accelerate the development and application of agroforestry technologies to attain more economically, environmentally, and socially sustainable land use systems by working with a national network of partners and cooperators to conduct research, develop technologies and tools, establish demonstrations, and provide useful information to natural resource professionals.

The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or part of an individual’s income is derived from any public assistance. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA’s TARGET Center at 202-720-2600 (voice) or 866-632-9992 (TDD). USDA is an equal opportunity provider and employer.
