Acknowledgments

As with most publications, many individuals have contributed to this one. We would like to thank all the reviewers for their insight and comments. They have increased the quality of this publication significantly. Others we would specifically like to thank include: Willard's Sawmill, Trenton, NJ; M&A Tree Service, Garwood, NJ; Wood-Mizer Products, Inc., Indianapolis, IN; Minnesota Department of Natural Resources, Division of Forestry; Wisconsin Department of Natural Resources, Bureau of Forestry; Pennsylvania Department of Environmental Resources, Bureau of Forestry; West Virginia Department of Commerce, Labor, & Environmental Resources, Division of Forestry; Sardo Pallet Lab, Department of Wood Science & Forest Products, Virginia Tech, Blacksburg, VA; and CitiLog, Ewing, NJ. We also would like to specifically thank Jeffery J. Bejune, Forest Products Technologist with the USDA Forest Service, for his diligent work in updating the Appendices and for developing the CitiLog Case Study.

The premise for writing this guide came from a USDA Forest Service Rural Development through Forestry project titled, "Municipal Forest Products Marketing Service." The project was administered by the New Jersey Division of Parks and Forestry, Forestry Services, in 1991. The goal of the project was to provide marketing and technical assistance to New Jersey municipalities in recycling street tree removals. It was found that opportunities to produce and merchandise sawlogs from street tree removals exist. These opportunities can generate income for municipal tree management budgets and provide a wide variety of other benefits. The methods for merchandising street tree sawlogs are described within this guide. If you have a street tree disposal problem, the ideas presented here may provide a solution.

The original version of this document was printed in 1994. Since then, many copies of this publication have been distributed and many presentations on this concept have been made. Almost 10 years later, the concepts in this publication are as relevant today as they were in 1994 and interest in the utilization of the urban log resource continues to grow.

EXECUTIVE SUMMARY

The purpose of this guide is to make officials of municipalities aware of an alternative strategy for using their street tree removals; a "recycling" strategy which can potentially turn a cost-burden scenario into an income-generating opportunity. The strategy involves merchandising sawmill-size logs from street tree removals to sawmills or other companies that have unique uses for street tree logs.

The process includes:

1. Identifying one or more sawmills in your area that may be interested in purchasing your material,

2. Learning what their sawlog requirements are and deciding whether your street tree logs fit these requirements,

3. Locating and removing metal and other foreign material in the logs,

4. Storing sawlogs until a salable quantity is accumulated, and

5. Being flexible and persistent enough to try this concept.

Recycling municipal trees by converting street tree removals to valuable sawlogs could potentially generate income as well as reduce the amount of time and labor costs involved in processing this material into firewood.

Merchandising sawlogs from street tree removals is an alternative recycling strategy that municipalities can use to generate income for tree management and maintenance programs.
Many street tree management programs are run as a cost burden to municipalities because little economic return is generated from street tree management activities.

Street trees improve our quality of life and enhance the beauty of the communities we live in.

Some of a municipality’s street tree removals can generate income.

I. INTRODUCTION

Many municipalities and local governments are currently experiencing budgeting problems in meeting community needs. Street tree management and maintenance budgets are among those becoming strained. As a result, the quality of our street trees cannot help but suffer as economic considerations continue to reduce tree management budgets.

Presently, much of the wood generated from street tree removals brings little economic return to tree management budgets. Because of this, most tree management and maintenance programs are being run as a cost burden to municipal budgets. Although most tree management crews are hardworking and efficient, the products rendered from street tree removals are usually low-value, which returns little money to municipality coffers. In fact, in New Jersey, it is estimated that more than 50 percent of an average municipality’s tree management budget is spent on the cost of tree removals alone.

Tree mortality from natural occurrences like insects, diseases, and storms plus a myriad of man-made circumstances such as roadway widening, right-of-way maintenance, and utility construction activities, takes a huge toll on street trees. This results in a continuing need for tree maintenance on a municipal level. Much of this harvested wood, if produced and marketed effectively, can generate income for municipalities to help support tree management and maintenance programs.
This publication is designed as a guide for municipal officials who deal with disposal of street tree removals. Ideas and suggestions in this guide are offered as potential alternatives for current tree management and disposal practices. They may or may not work in a particular area. But, given the success that several municipalities had in New Jersey by exploring these ideas and suggestions, we believe they are certainly worth examining (see Case Studies on pages 24-31).

The focus of this guide is to emphasize the potential marketability of sawmill-size logs from municipal tree removals. Advantages of merchandising salable sawlogs include:

- potential income generated from selling logs or developing barter arrangements,

Storm damage can generate large quantities of woody material. One method of reducing the volume of wood a municipality handles is to market the larger size material to companies that can process it into usable products, such as lumber or landscape ties.

This dying tree will eventually need to be removed. The trunk is a potential sawlog capable of producing salable lumber products. If sold as a sawlog, the municipality will save itself the work of processing that part of the tree into firewood and save money in the overall cost of disposal.
Merchandising salable sawlogs from street tree removals provides many advantages to municipalities.

- reduction in labor cost by reducing the amount of time work crews need to process logs into firewood,
- reduction in amount of woody material going to landfills,
- reduction in landfill costs for disposal of material,
- reduction in volume of firewood material that must be stored in municipal maintenance yards until it is sold, and
- conservation of forestland resources by generating sawlogs from street trees that must be removed anyway.

Many municipalities, particularly the ones located in urban and suburban areas, are already recycling and marketing street tree removals to some degree. In most cases, the use of tree removals involves providing products directly to residents in the municipality. For example, leaves and twigs are composted and used by residents as fertilizer. Small branches are chipped and used residentially as mulch, and for some municipal operations. Large branches and tree trunks are cut into firewood.

Firewood is the most common product produced from street tree removals. Usually, this material is left at the roadside for local residents to pick up, or it gets transported to a central yard or storage site where it is piled for future processing. Firewood production generally involves tree material from every size class, quality type, and species group.
Whatever there is to be removed, whether it’s oak, sycamore, ash, maple, pine or spruce, usually goes into the firewood pile. In addition, many municipalities split the larger pieces, thus further adding to the labor and costs of removing street trees.

The premise for writing this guide is that there must be a better way; a better way for street tree management than *maximum cost - minimum return*. The removal work itself must be done, but there is a potential opportunity for changing this cost-burden scenario into one that is more cost efficient by exploring the ideas in this guide. Instead of sawing a good log into firewood, leave it "as is" — a readily marketable commodity. The dollar return potential of selling the log for lumber products exceeds the return potential of selling the log for firewood by at least two to four times.

**II. THE MARKET**

The concept of utilizing street trees in sawmills is not new. Some sawmills have been sawing products from street trees for many years because they have found a unique niche for using street tree sawlogs. These mills process both hardwoods (trees which lose their leaves every year, i.e., oaks, maples) and softwoods (trees with needle-like leaves that do not fall off in the dormant season, i.e., white pine, Norway spruce).
Wood pallets, such as the ones supporting these cement blocks, are a common product manufactured from both hardwood and softwood logs.

Street tree logs can be used in the manufacturing of many industrial and consumer products.

High-quality products such as this mantel are constructed of lumber produced from hardwood logs.

From street tree logs, sawmills can manufacture products such as pallets and pallet stock, landscape ties, truck bed stock, fencing, heavy timbers, construction lumber, posts, bridges, and park benches. Furniture grade lumber can also be produced from these logs which can then be used to make products such as mantels and decorative moldings. Sawmills are the market and opportunity to which street tree logs can be merchandised.
Some of the wood generated from municipal trees holds special potential for unique and figurative characteristics. One example is spalted wood, which results when logs are invaded by certain fungi. The fungi produce a highly unique coloration and pattern in the wood that is very appealing and special.

Burlwood and crotchwood also have highly unique and figurative characteristics. These types of wood are valuable and are sometimes found in municipal trees that have been traditionally turned into firewood.

The retail price for some of these figurative woods can be as much as four times the retail price for standard lumber used to produce the same product. Crafters seek these types of wood because of the many special effects they give their finished products.

Unique and figurative designs occur in spalted wood, making it valuable. You may have already had requests from crafters for this type of material.

Burls are defects in trees caused by a variety of factors in nature such as a fungi attack. Lumber sawn from burls provides unique and figurative characteristics.

Many types of high-value products can be produced from burlwood. This lamp uses the whole burl in the finished product.
Forks in trees often develop attractive grain patterns which are desirable characteristics for various products. These photos are examples of crotchwood.

Marketing merchantable sawlogs from street tree removals involves working closely with local sawmills.

Generally, the mills using street trees are not typical high-production operations. They are smaller in size and may have different markets and product lines compared to standard production-oriented sawmills.

The keys to marketing street tree logs are:

1. Locating local sawmills,
2. Working with mills to learn sawlog requirements,
3. Making sure the merchantable sawlogs are free of metal and other foreign material,
4. Storing sawlogs until a salable quantity is accumulated, and
5. Being flexible and persistent enough to try this concept.

III. PRODUCTS & SPECIFICATIONS

Street trees that are at least 12 inches in diameter at breast height (4.5 feet from the ground) and have a log of at least six feet in length have sawlog potential. Normally, the most valuable part of the tree is the first eight to sixteen feet closest to the ground.

This butt log is being processed into firewood. If sold as a sawlog, the net return would include time and labor savings, as well as income which could be returned to the street tree management budget.

This is where the greatest volume of wood is located. It is also where the most valuable wood is found. The first log cut closest to the ground is called the butt log.
A sawmill’s raw material requirements are directly influenced by its markets. Consequently, the demand and price for your potential sawlogs depends on this relationship. Knowing what a sawmill requires is an important first step for successfully merchandising sawlogs. Listed below are general sawlog specifications which should assist you in determining what a sawmill requires. These are general specifications and could vary drastically in your local area.

For example, persimmon is listed as “fair” in species desirability because most sawmills do not have a high demand for these sawlogs. However, in Tennessee there is a large market for persimmon, which centers around its use in manufacturing golf club heads. This drives up the price and demand for persimmon in that region. Similar examples exist for other species such as Osage-orange and mulberry. You must keep in mind that special markets dictate higher values for particular species, depending on local market conditions.

A. General Sawlog Specifications

*General Species Desirability:*

**Best:**  Walnut, Butternut, Ash, Oaks (except Pin Oak), Cherry, Paulownia

**Good:**  Maples, Elms, most Fruitwoods, Basswood, Sycamore, Cedar, Poplar

**Fair:**  White Pine and other softwoods, Mulberry, Osage-orange, Persimmon, Beech

**Poor:**  Gum, Ailanthus, Pin Oak

*General Size Requirements:*

**Best:**  16" or larger diameter at small end of log
8' or longer in length

**Good:**  14" or larger diameter at small end of log
8' or longer in length

**Fair:**  12" or larger diameter at small end of log
6' or longer in length
*(Note: Logs should be generally sound, i.e. relatively free of rot, decay, and holes).*

**Poor:**  Small in length and diameter; or large in length and diameter with many knots, branches, holes, rot, or cracks; or with large or numerous metal objects.

Depending on local market conditions, special markets may dictate higher values for particular species of sawlogs.
B. Metal and Other Foreign Material in Street Trees

One of the primary reasons why demand for street tree sawlogs has been low in the past is because of metal and other foreign material sometimes found in the logs. The reputation of these logs having metal in them (i.e., nails, wire, spikes, or even car parts) is common among sawmillers.

Metal can become a serious problem during log sawing because it dulls and/or damages saw blades and sawmill equipment. It can also be a safety hazard for workers in a mill because of flying debris when a blade hits large metal objects.

The best way to correct this problem is to scan logs for metal before they go through the sawing process. Standard metal detectors are normally adequate. When metal is discovered, it must be removed. If large quantities of metal are detected in a log, it should not be sold as a sawlog. If a metal-laden log is shipped as part of a load to a sawmill, it will probably be the last load you ever sell to that particular mill.

As depicted in these pictures, metal found in street trees comes in all shapes and sizes.
Normally, most metal is located within the first four to six feet of a street tree. This is the section of the tree which people use for hanging signs and securing fencing for yards or pastures. This is also the section that children like to pound nails into. Consequently, butt logs need to be screened more carefully than logs which come from higher up in the tree.

Typical metal detection techniques include a visual inspection of the log surface for metal objects like wire and protruding nails, as well as any discoloration which normally appears as a black/blue stain on the end of the log. Following a thorough visual inspection, a careful scan with a metal detector is needed.
When metal is seen or detected, appropriate steps are needed to remove it. If metal is located at the end of the log, that part can be sawn off (Illustration 1). If metal is detected toward the middle of the log near the surface, then the section containing the metal can be removed (Illustration 2). Caution is needed to avoid injury. See Appendix A for chainsaw safety procedures. If you do not feel comfortable removing the metal, then mark the area with paint and let the log buyer know it contains metal.

Illustration 1: Remove the end section of the log which contains metal. You do not want to remove too much "good" wood beyond the metal, yet at the same time, you do not want to hit the metal with the chainsaw. If you are uncomfortable removing the metal, let your log buyer show you how.

Illustration 2: Remove metal in this area provided that it is not too deep in the log. If metal is located in the first several inches of the log, removal of it will not affect the volume or quality of lumber produced from the log because this section is usually cut off in the sawing process.

Depending on where the metal is located and how deep it is in the log, a determination must be made as to whether it is worth removing (Illustration 3). If it isn't, the log should be classified unusable as a merchantable sawlog. It may be best, for the first couple of sales, to discuss these marginal logs with the log buyer.

Metal detectors vary in size, cost, and capability. Some detectors not only tell you where the metal is, but also its depth. If a municipality wants to test the sawlog market initially, a metal detector could be borrowed for log scanning.

After several successful sawlog sales, a metal detector could be purchased specifically for scanning logs. Basic metal detectors range in price from $250 to $500.
Listed below are some metal detector manufacturers that can be contacted for specific details:

Other foreign material which is sometimes found in street tree logs is cement and car parts. Any non-wood material within a log poses serious problems to sawmill operators and equipment in the sawmilling process; therefore, every precaution needs to be taken to ensure that sawlogs are free of foreign materials. This effort alone could make or break the concept of a municipality merchandising logs to a sawmill.

Illustration 3: When metal is located near the core of the log, removing it would drastically reduce the volume of lumber that could be sawn from the log. Leaving it could cause considerable damage to sawmill equipment. These types of logs having metal should be clearly marked (see below) and discussed with the log buyer or processed into firewood.

The metal object in this log has been clearly marked to indicate its presence.

Metal detectors like the one in this photo can be purchased from many retail outlets.
Once a working relationship has been established with a sawmill and the mill manager realizes that you are taking steps to locate and remove metal and other foreign material from your logs, the mill should then become a consistent outlet for your merchantable sawlogs.

C. Proper Log Manufacturing*

In order to maximize the dollar value of street tree sawlogs, it is imperative that they are properly manufactured. The definition of "properly manufactured logs" depends on the requirements specified by the sawmill. However, the following list provides some general guidelines for proper log manufacturing. See Appendix B for additional illustrated information.

1. Safety always comes first.

2. Follow the sawmill's log specifications correctly.

4. Cut logs for highest quality. Group defects when possible, preferably near the ends of the logs manufactured.

5. Leave trim allowance on all logs in accordance with the sawmill's specifications. Normally, trim allowance is an additional 2", or in other words, a 10' log is actually 10' 2" in length.

6. Trim limbs close to the log.

7. If the base of a tree is hollow, taking a short log first may make the next log higher in quality. If a large hole is present at the base of the tree, cutting a long log would result in a loss of quality, footage, and money.

8. Standard log lengths are 8', 10', 12', 14', & 16' for softwoods and both even and odd lengths between 8' and 16' for hardwoods.

9. After a few logs are cut, have the log buyer from the sawmill come to check your logs and show you the mill's method of determining volume.

D. Log Quantities and Volume Determination

The sawmill will normally require a certain quantity of logs before a log truck is sent to your yard to pick them up. A standard log truck can legally transport about 2,500 to 3,500 board feet of logs measured by the International 1/4 Inch Log Scale Rule. One board foot is a piece of wood that is 12" wide by 12" long by 1" thick.

International 1/4 Inch Log Scale Rule is one of several log scales used in the United States to estimate the amount of lumber on a board foot basis which can be sawn from logs. To determine what log scale is used in your area, contact a local sawmill. For the purpose of this publication, we have assumed it is the International 1/4 Inch Log Scale Rule.

The easiest way to estimate board foot volumes of logs is to measure them with a scaling stick. Although scaling logs might sound complicated, it is quite easy.

In order to scale logs, you need to know several things. They are:

1. Inside bark diameter of small end of log,
2. Length of log to nearest foot, and
3. Estimated amount of non-solid wood in logs (i.e. rot, decay, crookedness, etc.).

A scaling stick is a tool that enables you to determine the board foot volume of a log. It lists volumes based on the inside bark diameter of the small end of the log and its length. Thus, if a log measures 18 inches in diameter at the small end and it is 12 feet in length, you can refer to the scaling stick to determine that the board foot volume of the log is 170 board feet.

Sawlog volumes can easily be determined using a scaling stick.

Knowing sawlog volumes will assist you in determining when you have a salable quantity of sawlogs.
When scaling a log, you need to measure the inside bark diameter of the small end and its overall length. You must also determine the approximate percent of volume loss that will result from decay, sweep, holes, etc.

Note: The diameter to be used is the inside bark diameter of the small end of the log.

If a scaling stick is not available, volume can still be determined by referring to a log volume table.

See table below for details.

Both the scaling stick and table volumes assume that the log is solid and has no defects. If defects are present or if a section of the log is missing, a volume reduction is necessary. To estimate this reduction, ask the log buyer to explain how to estimate volume reductions or refer to the USDA Forest Service publication, Grading Hardwood Logs for Standard Lumber. This publication describes the process of log grading, log scaling, and methods for determining scaling reductions. Copies may be obtained by contacting the Forest Service at the address below:

USDA Forest Service
1720 Peachtree Road, NW
Atlanta, GA 30309
Phone: 404-347-7206
FAX: 404-347-2776
Web site: www.southernregion.fs.fed.us

Remember, you will not be measuring logs as accurately as a sawmill. The purpose of your log scaling is to give you an idea of how much log volume you have.

Log scaling sticks and tally sheets (forms for recording log volumes) can be purchased from the following companies:

- Ben Meadows Company
  P.O. Box 5277
  Janesville, WI 53547-5277
  Phone: 800-241-6401
  FAX: 800-628-2068
  Email: mail@benmeadows.com
  Web site: www.benmeadows.com

- Forestry Suppliers, Inc.
  205 W. Rankin Street
  P.O. Box 8397
  Jackson, MS 39284-8397
  Phone: 800-647-5368
  FAX: 800-543-4203
  Email: fsi@forestry-suppliers.com
  Web site: www.forestry-suppliers.com

E. Storage Requirements

As stated earlier, in order for a sawmill to pick up a load of sawlogs, the mill will need a predetermined quantity of logs. This quantity will depend on the size of the truck. Therefore, the sawmill will give you an estimated volume figure that their log truck can legally handle. For example, if a sawmill’s truck can safely transport about 3,000 board feet (bf) of oak logs at one time, and one 18” x 12’ log is 170 bf, then about 18 oak logs of this size would be the approximate load for this truck.

Maximum load limits are based on weight. Consequently, the quantity of logs shipped on a log truck will vary depending on the species mix, moisture content, log size, etc. For example, red oak logs are heavier than basswood; therefore, fewer red oak logs of the same size can be transported as the same size basswood logs.
The storage area at this municipal yard is relatively small, yet there is enough room to store a truck load of logs.

Adequate log storage space is critical to successfully market your sawlog material. Here, sawlogs were stored by the municipality until enough logs were accumulated for a truck load.

F. Log Loading and Unloading Safety Procedures

Safety should always be the number one priority when dealing with heavy, movable materials such as logs. The Occupational Safety and Health Administration (OSHA) has regulations pertaining to safety in logging operations. Within these regulations, log loading and unloading procedures are identified. Consult Appendix A for a listing of the logging operation safety procedures.
A. Commercial Sawmill Operations

Although typical production-oriented sawmills shy away from street tree logs, some, particularly the smaller mills (such as a mill that saws less than 1.5 million board feet per year), may purchase them. Normally, sawmills located near urban and suburban areas are relatively small and may be best suited for your needs. In fact, some urban and suburban mills actively buy street tree logs (see Case Study on page 27). There are many ways to locate potential sawmills interested in buying street tree logs. The easiest ways include contacting the following:

1. State Forestry Offices
   • Sawmill Directories
   • Marketing Bulletins

2. Consulting Foresters

3. Forestry/Wood Products Extension Offices

4. Resource Conservation & Development (RC&D) Program

5. Word-of-Mouth

1. State Forestry Offices

Most state forestry offices have staff specialists who work closely with the forest products industries of the state. These individuals may be able to direct you to sawmills that buy street tree logs. The addresses and phone numbers of the forestry offices are listed in Appendix C. When contacting a state forestry office, ask to talk with a forest products utilization and marketing specialist. These specialists are generally the best source of assistance in helping you make contact with sawmills.

A service which most state forestry agencies provide is the publication of a state-wide sawmill directory. Normally, these directories list sawmills by county and include helpful information about each. Consulting this type of directory is a good way to locate sawmills in your area. Contact your state forestry office for a copy.
Sawmill directories are helpful because they allow you to learn more about the sawmills located near you. This example is from the West Virginia Forest Industry Directory.

Advertising in state marketing bulletins can be an effective method for locating log buyers. To place an ad, simply contact the appropriate state forestry office.

Another service that some state forestry agencies offer is a monthly or quarterly marketing bulletin. State marketing bulletins serve as an avenue that connects suppliers and buyers of wood products with each other.

Advertisements about your available logs can be placed in your state’s marketing bulletin. Normally, there is no charge for advertising. Appendix D lists state forestry offices that publish a marketing bulletin.
2. Consulting Foresters

Consulting foresters provide forestry services and expertise to landowners for a fee agreed to by the landowner and forester. Consulting foresters are usually familiar with sawmills in their work area. They may be able to direct you to potential sawmills interested in purchasing your logs. Many state forestry offices (Appendix C) maintain listings of consulting foresters in their individual states. Also, the Association of Consulting Foresters of America, Inc., maintains a detailed directory of its members’ services. A copy can be purchased by contacting them at the following address:

The Association of Consulting Foresters of America, Inc.
732 North Washington Street, Suite 4-A
Alexandria, Virginia 22314-1921
Phone: 703-548-0990
FAX: 703-548-6395
Email: director@acf-foresters.com
Web site: www.acf-foresters.com

3. Forestry/Wood Products Extension Offices

Many land grant universities employ forestry/wood products extension specialists as part of their forestry/wood technology programs. These professionals can provide information pertaining to sawmills located in your area. Appendix E lists the land grant universities that employ forestry/wood products extension specialists.

4. RC&D Program

The RC&D program is a national program that assists rural communities in improving their economies through wise use and development of natural resources. Each RC&D area has a full-time coordinator who oversees the daily program operations. Many coordinators are familiar with sawmills in their area (which usually consists of several counties). They may be able to provide you with names and addresses of sawmills that might purchase your logs. Appendix F lists the individual state-wide RC&D program administration offices.

There are many ways to locate sawmills that purchase street tree logs.
5. Word-of-Mouth

Another way to locate sawmills willing to purchase street tree logs is by word-of-mouth. For instance, employees of other municipalities and tree care companies may be able to direct you to potential buyers. Remember, there may be potential buyers in your backyard, it's just a matter of being aware of who they are.

B. Local Crafters/Hobbyists/Custom Sawmillers

Beyond commercial sawmills, many hobbyists and crafters are interested in purchasing unique logs for their hobbies and/or profession. Those who have portable bandmills are often interested in purchasing small quantities of sawlogs to cut into lumber. For example, spalted logs are highly desirable for their beauty and income potential once turned into finished products. Consequently, hobbyists or crafters seeking this type of material can become a good market for your logs. Some ways of locating these people are:

1. State Forestry Offices
2. Sawmill Equipment Manufacturers
3. Craft Organizations
4. Word-of-Mouth
5. The Internet

1. State Forestry Offices

Your state forestry agency’s forest products utilization and marketing specialist may be able to direct you to potential crafters/hobbyists/custom sawmillers who are interested in street tree logs. See Appendix C.

2. Sawmill Equipment Manufacturers

Portable or small-size sawmill manufacturers usually maintain lists of customers that have bought their mills. Often, they are willing to share these lists with potential customers of their mills. If you contact these manufacturers and explain that you want to market sawlogs and are looking for potential buyers, they may share their lists with you. For a listing of portable sawmill manufacturers see Appendix G.
3. Craft Organizations

Most states have some type of state-wide craft organization. Usually, these organizations include crafters who produce specialty wood products. Some of these individuals produce lumber for their own needs. If not, they purchase it. Regardless, these individuals may be able to direct you to small-scale sawmill operators who are interested in purchasing street tree logs. A list of state-wide craft organizations is found in Appendix H.

4. Word-of-Mouth

Many good contacts generated come via word-of-mouth. Do not overlook the knowledge of employees from surrounding municipalities.

5. The Internet

As Internet usage continues to grow, conducting periodic searches on subjects such as urban wood utilization, urban logs, via various Internet search engines may provide you with additional contacts and/or guidance in regard to moving your sawlogs.

---

Portable sawmills offer crafters and other small business people the opportunity to process logs to their desired specifications. Consequently, companies with these types of mills may be a valuable market for your street tree logs.

---

Although portable bandmills are not “high” production mills as are conventional bandmills and circular mills, they are capable of processing street tree logs. Portable bandmill blades are thin, have many teeth, and are relatively inexpensive. Because of this, hitting metal is usually not as damaging and/or costly because the blade can be replaced at a moderate price.

Photo courtesy of Wood-Mizer Products, Inc.
Some municipalities may want to consider purchasing a portable sawmill for processing their own street tree logs.

C. In-house Markets: Viable Options for Municipalities

Today's portable sawmill technology allows municipalities to produce products from street tree removals for their own use. These portable mills are relatively easy to operate and maintain and are usually priced in the $12,000 to $25,000 range. These mills can produce landscape ties, truck bed material, and a broad range of lumber products to satisfy municipal needs. The portable sawmill manufacturers listed on pages 22 and 23 can provide detailed information about costs, production rates, maintenance, and use of these machines.

Many of today's portable sawmills are small-scale bandmills. This type of mill is more tolerant of occasionally hitting a nail or piece of metal than a conventional mill is. If a blade is ruined because of hitting metal, it can be replaced with a new blade. The cost is normally less than $30 for a portable bandmill blade.

V. CASE STUDIES

Case Study A. M&A Tree Service, Garwood, NJ

Following is an example of how a tree service company began utilizing municipal street tree removals profitably.

M&A Tree Service started business seven years ago by providing a standard array of tree service activities, including tree removal and tree maintenance work for both private and public customers. Typically, a tree removal job involved taking the diseased, dead, or hazardous tree down in sections and then cutting the limbs and trunk into short "firewood-size chunks." One by one, these chunks were loaded into trucks for transport to the company's storage yard firewood pile.

This hard labor was followed by more, including handling, splitting, and repiling the wood as firewood for sale. After the wood air dried enough for sale, it was loaded onto a truck for delivery and stacking at the customer's location.

Mike Tomaio, owner of M&A Tree Service, got very tired of the strenuous labor of processing, lifting, and hand-loading firewood.
"In particular, the back-breaking work of firewood was never really economically worth all the effort, especially since the price for firewood around here has dropped significantly," Mr. Tomaio said.

Three years ago, New Jersey Forestry Services contacted M&A Tree Service to explain the "Municipal Forest Products Marketing Service" program the state was undertaking. Mr. Tomaio was visited and introduced to the idea of producing and marketing tree removals to local sawmill markets. Particular specifications of species, size, and length were provided in addition to a list of potential customers for these products. All the considerations for log production, transportation, storage, and quality control were discussed.

After visiting a few sawmills to get a look at the kind of material they were using, Mr. Tomaio realized that many of the trees he was sawing into firewood from his tree removals were every bit as good, and some a lot better, than the logs in the mills' sawlog storage yards. It was then that he decided that the idea was worth a try.

Although the mills seemed interested in working with him, Mike found that the best way for him to operate was to provide the logs for full load mill pick up at his own storage yards in northern New Jersey. With the purchase of a cab-mounted, knuckleboom log loader, the plan turned into reality.

Most of the logs that in the past went into the firewood pile or were taken to the dump now get boom loaded and delivered to M&A's sawlog yard. Firewood is still produced from the upper sections and large branches, but the good logs don't get cut into firewood anymore. The company's work force, which varies from 5 to 15 people depending on the time of year, spends less time working a tree down and a lot less back-breaking work loading big log chunks into trucks.

Typically, log rounds that will be cut into firewood are piled prior to splitting. This work can be very hard and hazardous.
Mr. Tomaio has been able to sell as much sawlog material as his crews can produce. In fact, he's now picking up and marketing sawlogs produced by other tree service businesses and municipalities, as well. He works with about a dozen private businesses and municipalities in the area by hauling logs they generate from their tree removal work.

About 2-3 tractor trailer loads of logs per week are produced during the busy season. These logs come from city streets, local parks, and residential areas.

Mr. Tomaio has found that oak, ash, walnut, hickory, and pine are the best movers for him. Logs that are too rotten for use or those that appear to have metal too deep to remove get cut into firewood or worked into mulch at stump grinding facilities located throughout the state.

Mr. Tomaio gets a strong sense of satisfaction knowing that these trees are being put to good use. He's seen these logs being sawn into high-quality furniture lumber, truck bed stock, landscape ties, fireplace mantels, and many other kinds of products. In most cases, his tree removal work involves trees that are already dead. For every log he markets from the urban resource, it means one less that has to be cut out of the forest.

"Since I've started doing this, I guess I've shipped several thousand logs to sawmills around the state. It's good for business, good for the sawmills, and good for the environment, too," said Mr. Tomaio.
Case Study B. Willard's Sawmill, Trenton, NJ

Following is an example of how a tree service company began utilizing sawlog-size street trees profitably. Today, the tree service company also operates a sawmill.

Sam Willard started Shearer Tree Service Company in 1949. Employing approximately 40 people, his company is involved in normal arboreal services such as pruning, planting, spraying, removal and maintenance. In 1974, the company was paying about $20,000 a year in landfill fees to dispose of tree removals. Because the wood waste was non-compactible and bulky in nature, and because landfill rates were expected to steadily increase, Mr. Willard began to explore other options for his wood waste.

Mr. Willard began his effort with the purchase of a used Frick circular sawmill along with an edger, crosscut saw, planer, stake pointer, and metal detector. Instead of hauling his tree removal material to landfills, he began processing the sawlogs through the mill and converting the tops to firewood. Lumber, timbers, and nursery and survey stakes were the original products manufactured.

The mill has evolved since its first days of operation and now includes a dry kiln and the capability to make free-form furniture, clocks, planters, and decorative plaques.

Much of the wood in this photo was once destined for a landfill. Now, most of it is processed into usable products.

Nursery and survey stakes were some of the first products manufactured by Mr. Willard from street tree logs.
These products are made possible with the use of an “Alaskan Mill” sawing system. This specialized machinery basically consists of a metal frame with guide rollers, two chainsaw power drives, and a large ripping chain.

The logs are first scanned with a metal detector before any processing is attempted. Metal in the form of nails, spikes, or barbed wire is a common component of logs acquired in tree service work. Once located by the metal detector, the metal is removed. This can be a time-consuming process. However, this particular mill does not concern itself with high production, so the extra time taken to remove metal from logs is well spent. Logs are processed on a lumber order basis, and only high-grade lumber is kept in inventory.

Logs suitable for processing through the Alaskan Mill are elevated at one end and diagonally cut with the rip chain which results in thick, matched slabs. Large stumps and abnormal tree butts are also sawn in this fashion, creating unique and decorative patterns. This type of sawing accentuates the wood grain in such a way that the pattern normally produced is quite unlike that shown in standard-sawn lumber.

The cut slabs are used as the raw material for free-form furniture styles: tables of all kinds and sizes, bar and counter tops, plaques, clocks, and many other highly decorative items. Variations in species, grain pattern, color and figure greatly enhance the free-form product’s marketability. Mr. Willard’s suburban location has proved to be a good site for marketing such specialty products to homeowners in the area.

These diagonally cut slabs could easily be turned into beautiful clocks or plaques by a hobbyist or a crafter.

The diagonally cut slabs that are produced are stickered and air dried before kiln drying. The operator uses a small West Air kiln system for drying these thick slabs. Kiln schedules are a very important facet of the operation because the product must be free of any drying defects such as checks or splits if it is to bring the maximum price.
Normal kiln schedules had to be adapted to fit this particular type of material. After kiln drying, the slabs are sanded and sold "as is" or are processed into finished free-form furniture items.

Willard's Sawmill is a classic example of how urban tree removal material can be processed and marketed. His products are a response to the specific and somewhat unique type of raw material handled.

Mr. Willard's operation utilizes every part of a municipal street tree. Logs are processed either through the sawmill or Alaskan Mill into usable lumber, large topwood is marketed as firewood, branches are chipped and sold as mulch, and the sawdust from the mill is sold to local horse owners for use as bedding. This unique urban sawmill is one answer to the problem of municipal street tree utilization.

The logs, once cut into slabs, are stacked and air dried. Eventually, they will be placed in a kiln for the final drying process.

This coffee table was made from slabs of walnut lumber and is an example of the kind of free-form furniture that can be produced from street trees. The piece is both functional and unique.
Case Study C. CitiLog, Ewing, NJ

It was after watching a 100-year old oak street tree be cut up for firewood that Stubby Warmbold realized the opportunity existed to capture more value from urban tree removals. In 1992, Mr. Warmbold started a company in Ewing, New Jersey, to pursue this opportunity. The company would later be named CitiLog.

“I look at a log and see revenue, someone in the tree service business looks at the same log and sees disposal costs,” explained Stubby Warmbold.

The company’s logs are primarily procured through the collection of “municipal wood.” The trees are removed by independent tree removal services and are gathered at a central log yard facility in Irvington, New Jersey. Here they are sorted, stacked, and inspected for quality. Logs that do not make the grade are sold to cogeneration plants for fuel. The higher quality logs are scanned with a metal detector and any metal discovered is removed.

The higher quality logs are loaded on railroad cars and transported by train to Central Pennsylvania for further processing. The logs are sent to one of three Amish sawmills, two of which are band mills and the other a circular mill. Prior to being sawn, the logs are once again scanned to locate and remove any metal objects.

The wood is sent to various Amish businesses and craftsmen. The low-grade material is used for pallet stock and cross ties. The high-grade material is used to create custom cabinets, doors, flooring, furniture, molding, and a variety of other wood products. Orders have ranged in size from a single book cabinet to providing the wood needed for a new addition to the Woods Hole Research Institute headquarters building in Woods Hole, Massachusetts.
It was not until 1998 that Mr. Warmbold began to focus on the production of higher value-added products. Up to this time, most of his wood went into the production of pallet stock and cross ties. He realized the importance of finding the best application for his material that would reap the greatest return. To do this, he began channeling his higher-grade material into higher-value products. At the same time, he stresses the importance of developing a good market to absorb the low-grade material.

In 2001, with financial assistance from the USDA Forest Service Rural Development through Forestry Program, CitiLog had its wood and wood products certified by SmartWood’s Rediscovered Wood Program (www.smartwood.org). This particular certification program is designed to encourage the reuse of wood and wood products that have been reclaimed, recovered, salvaged, or recycled, by assuring consumers that the company’s products come from sustainable sources. Mr. Warmbold believes his company’s certification has driven demand. By servicing this niche, it has opened up other uses for his wood material besides pallet stock and cross ties.

The company receives most of its business by word of mouth. Mr. Warmbold explains that the certified wood community is small and word travels quickly. Since CitiLog offers most of its certified products at market prices, consumers are quick to choose them over non-certified products.

Mr. Warmbold sees endless possibilities for CitiLog. He plans to take what he has learned and the contacts he has made and duplicate this operation in other cities. He believes his business is good for the environment and also supports skilled artisans and small-scale production in local communities. And as an urban business, it provides jobs for the inner-city populace who work in the collection, warehousing, and distribution of the logs and wood products.
VI. APPENDICES

The following appendices contain additional information and contacts that may be useful in instituting a street tree removal recycling program.
Appendix A: Safety Procedures for Logging Operations

Listed below are a selected number of safety procedures produced by the United States Department of Labor, Occupational Safety and Health Administration (OSHA). The safety procedures are from Standard 1910.266 for Logging Operations. A complete listing can be found on the following OSHA web site: (www.osha.gov/SLTC/logging_advisor/standards/standards.html).

Overhead electric lines — 1910.266(d)(8)

(i) Logging operations near overhead electric lines shall be done in accordance with the requirements of 29 CFR 1910.333(c)(3).

(ii) The employer shall notify the power company immediately if a felled tree makes contact with any power line. Each employee shall remain clear of the area until the power company advises that there are no electrical hazards.

Chain saws — 1910.266(e)(2)

(i) Each chain saw placed into initial service after the effective date of this section shall be equipped with a chain brake and shall otherwise meet the requirements of the ANSI B175.1-1991 “Safety Requirements for Gasoline-Powered Chain Saws”, which is incorporated by reference as specified in Sec. 1910.6. Each chain saw placed into service before the effective date of this section shall be equipped with a protective device that minimizes chain-saw kickback. No chain-saw kickback device shall be removed or otherwise disabled.

(ii) Each gasoline-powered chain saw shall be equipped with a continuous pressure throttle control system which will stop the chain when pressure on the throttle is released.

(iii) The chain saw shall be operated and adjusted in accordance with the manufacturer’s instructions.

(iv) The chain saw shall be fueled at least 10 feet (3 m) from any open flame or other source of ignition.

(v) The chain saw shall be started at least 10 feet (3 m) from the fueling area.

(vi) The chain saw shall be started on the ground or where otherwise firmly supported. Drop starting a chain saw is prohibited.

(vii) The chain saw shall be started with the chain brake engaged.
(viii) The chain saw shall be held with the thumbs and fingers of both hands encircling the handles during operation unless the employer demonstrates that a greater hazard is posed by keeping both hands on the chain saw in that particular situation.

(ix) The chain-saw operator shall be certain of footing before starting to cut. The chain saw shall not be used in a position or at a distance that could cause the operator to become off-balance, to have insecure footing, or to relinquish a firm grip on the saw.

(x) Prior to felling any tree, the chain-saw operator shall clear away brush or other potential obstacles which might interfere with cutting the tree or using the retreat path.

(xi) The chain saw shall not be used to cut directly overhead.

(xii) The chain saw shall be carried in a manner that will prevent operator contact with the cutting chain and muffler.

(xiii) The chain saw shall be shut off or the throttle released before the feller starts his retreat.

(xiv) The chain saw shall be shut down or the chain brake shall be engaged whenever a saw is carried further than 50 feet (15.2 m). The chain saw shall be shut down or the chain brake shall be engaged when a saw is carried less than 50 feet if conditions such as, but not limited to, the terrain, underbrush and slippery surfaces, may create a hazard for an employee.

Tree harvesting — 1910.266(h)(1)

(i) Trees shall not be felled in a manner that may create a hazard for an employee, such as but not limited to, striking a rope, cable, power line, or machine.

(ii) The immediate supervisor shall be consulted when unfamiliar or unusually hazardous conditions necessitate the supervisor’s approval before cutting is commenced.
While manual felling is in progress, no yarding machine shall be operated within two tree lengths of trees being manually felled. Exception: This provision does not apply to yarding machines performing tree pulling operations.

No employee shall approach a feller closer than two tree lengths of trees being felled until the feller has acknowledged that it is safe to do so, unless the employer demonstrates that a team of employees is necessary to manually fell a particular tree.

No employee shall approach a mechanical felling operation closer than two tree lengths of the trees being felled until the machine operator has acknowledged that it is safe to do so.

Each danger tree shall be felled, removed or avoided. Each danger tree, including lodged trees and snags, shall be felled or removed using mechanical or other techniques that minimize employee exposure before work is commenced in the area of the danger tree. If the danger tree is not felled or removed, it shall be marked and no work shall be conducted within two tree lengths of the danger tree unless the employer demonstrates that a shorter distance will not create a hazard for an employee.

Each danger tree shall be carefully checked for signs of loose bark, broken branches and limbs or other damage before they are felled or removed. Accessible loose bark and other damage that may create a hazard for an employee shall be removed or held in place before felling or removing the tree.

Felling on any slope where rolling or sliding of trees or logs is reasonably foreseeable shall be done uphill from, or on the same level as, previously felled trees.

Manual felling — 1910.266(h)(2)

(i) Before felling is started, the feller shall plan and clear a retreat path. The retreat path shall extend diagonally away from the expected felling line unless the employer demonstrates that such a retreat path poses a greater hazard than an alternate path. Once the backcut has been made the feller shall immediately move a safe distance away from the tree on the retreat path.

(ii) Before each tree is felled, conditions such as, but not limited to, snow and ice accumulation, the wind, the lean of tree, dead limbs, and the location of other trees, shall be evaluated by the feller and precautions taken so a hazard is not created for an employee.

(iii) Each tree shall be checked for accumulations of snow and ice. Accumulations of snow and ice that may create a hazard for an employee shall be removed before felling is commenced in the area or the area shall be avoided.
(iv) When a spring pole or other tree under stress is cut, no employee other than the feller shall be closer than two trees lengths when the stress is released.

(v) An undercut shall be made in each tree being felled unless the employer demonstrates that felling the particular tree without an undercut will not create a hazard for an employee. The undercut shall be of a size so the tree will not split and will fall in the intended direction.

(vi) A backcut shall be made in each tree being felled. The backcut shall leave sufficient hinge wood to hold the tree to the stump during most of its fall so that the hinge is able to guide the tree’s fall in the intended direction.

(vii) The backcut shall be above the level of the horizontal facecut in order to provide an adequate platform to prevent kickback. Exception: The backcut may be at or below the horizontal facecut in tree pulling operations.

Note to paragraph (vii): This requirement does not apply to open face felling where two angled facecuts rather than a horizontal facecut are used.

**Limbing and bucking — 1910.266(h)(3)**

(i) Limbing and bucking on any slope where rolling or sliding of trees or logs is reasonably foreseeable shall be done on the uphill side of each tree or log.

(ii) Before bucking or limbing wind-thrown trees, precautions shall be taken to prevent the root wad, butt or logs from striking an employee. These precautions include, but are not limited to, chocking or moving the tree to a stable position.

**Loading and unloading — 1910.266(h)(6)**

(i) The transport vehicle shall be positioned to provide working clearance between the vehicle and the deck.

(ii) Only the loading or unloading machine operator and other personnel the employer demonstrates are essential shall be in the loading or unloading work area during this operation.

(iii) No transport vehicle operator shall remain in the cab during loading and unloading if the logs are carried or moved over the truck cab, unless the employer demonstrates that it is necessary for the operator to do so. Where the transport vehicle operator remains in the cab, the employer shall provide operator protection, such as but not limited to, reinforcement of the cab.
(iv) Each log shall be placed on a transport vehicle in an orderly manner and tightly secured.

(v) The load shall be positioned to prevent slippage or loss during handling and transport.

(vi) Each stake and chock which is used to trip loads shall be so constructed that the tripping mechanism is activated on the side opposite the release of the load.

(vii) Each tie down shall be left in place over the peak log to secure all logs until the unloading lines or other protection the employer demonstrates is equivalent has been put in place. A stake of sufficient strength to withstand the forces of shifting or moving logs, shall be considered equivalent protection provided that the logs are not loaded higher than the stake.

(viii) Each tie down shall be released only from the side on which the unloading machine operates, except as follows:

(viii)(A) When the tie down is released by a remote control device; and

(viii)(B) When the employee making the release is protected by racks, stanchions or other protection the employer demonstrates is capable of withstanding the force of the logs.

**Transport — 1910.266(h)(7)**

(i) The transport vehicle operator shall assure that each tie down is tight before transporting the load. While enroute, the operator shall check and tighten the tie downs whenever there is reason to believe that the tie downs have loosened or the load has shifted.

**Storage — 1910.266(h)(8)**

(i) Each deck shall be constructed and located so it is stable and provides each employee with enough room to safely move and work in the area.

Appendix B: Proper Log Manufacturing

The illustrations below show methods for properly manufacturing sawlogs which will be processed into standard lumber products. They are from More Money for Your Logs When Properly Cut, by W.G. Stump, USDA Forest Service, North-eastern Area, State & Private Forestry, Upper Darby, PA.

Logs with handles do not roll. Cut limbs off close to log for easier handling.

Always cut logs at least 2" longer. This is called trim allowance. Check with buyer before cutting logs to be sure of required trim allowance.

Normally, logs should be cut in back of crotch at A. However, this may not be true where a market exists for crotch wood.

Cut at A. to reduce or eliminate sweep in log.
Make 2 logs. Cut at A. and B. if each log can be made 8 feet or longer.

Cut at A. to avoid loss of footage.

Keep logs as free from defects as possible. Do not cut at A. Cut at B. and C. to make 2 clear logs.

Cutting at A. instead of B. yielded an additional 50 board feet of lumber.
Appendix C: State Forestry Offices

Most state forestry agencies have staff personnel with expertise in forest products utilization and marketing. These specialists will be able to assist you in locating sawmills in your area. Furthermore, most state forestry agencies publish some type of forest products directory(s) that could be of assistance to you. These directories have traditionally been oriented toward sawmills and primary processors of wood products. Listed below in italicized type are the names of the directories, which include sawmills and manufacturers of primary wood products. To speak with a forest products utilization and marketing specialist or to obtain copies of directory(s), contact the appropriate agency.

Appendix D: State Marketing Bulletins

As a service to the wood products industry, some State Forestry and Extension offices publish marketing bulletins. These bulletins vary from state to state in content, size, publishing frequency, and circulation. Generally, these bulletins list products and services for sale or wanted, and they often contain articles on subjects affecting the industry and lists of upcoming workshops and events.
